

Helping Customers Innovate, Improve & Grow

Description

Vectron's VCC6 Crystal Oscillator is a quartz stabilized, differential output oscillator, operating off either a 2.5 or 3.3 volt supply, hermetically sealed 5x7 ceramic package.

Features

- Ultra Low Jitter Performance, Fundamental or 3rd OT Crystal Design
- Output Frequencies to 275.000MHz
- 0.3 ps typical RMS jitter, 12k-20MHz
- Differential Output
- Enable/Disable
- -10/70°C, -40/85°C or -55/125°C Operation
- Hermetically Sealed 5x7 Ceramic Package
- Product is compliant to RoHS directive  and fully compatible with lead free assembly

Applications

- Ethernet, GbE, Synchronous Ethernet
- Fiber Channel
- Enterprise Servers
- Telecom
- Clock source for A/D's, D/A's
- Driving FPGA's
- Test and Measurement
- PON
- Medical
- COTS

Block Diagram

Performance Specifications

Table 1. Electrical Performance, LVPECL Option

Parameter	Symbol	Min	Typical	Maximum	Units
Supply					
Voltage ¹	V_{DD}	3.135 2.375	3.3 2.5	3.465 2.625	V V
Current (No Load)	I_{DD}		50	98	mA
Frequency					
Nominal Frequency ²	f_N	25		275.000	MHz
Stability ^{2,3} (Ordering Option)		±20, ±25, ±50, ±100			ppm
Outputs					
Output Logic Levels ⁴ , -10/70°C					
Output Logic High	V_{OH}	$V_{DD}-1.025$		$V_{DD}-0.880$	V
Output Logic Low	V_{OL}	$V_{DD}-1.810$		$V_{DD}-1.620$	V
Output Logic Levels ⁴ , -40/85°C					
Output Logic High	V_{OH}	$V_{DD}-1.085$		$V_{DD}-0.880$	V
Output Logic Low	V_{OL}	$V_{DD}-1.830$		$V_{DD}-1.555$	V
Output Rise and Fall Time ⁴	t_R/t_F			600	ps
Load		50 ohms into $V_{DD}-1.3V$			
Duty Cycle ⁵		45	50	55	%
Jitter (12 kHz - 20 MHz BW)155.52MHz ⁶	ϕJ		0.3	0.7	ps
Period Jitter ⁷	ϕJ				
RMS			2.3		ps
P/P			20		ps
Random Jitter			2.4		ps
Deterministic Jitter			0		ps
Enable/Disable					
Output Enabled ⁸	V_{IH}	$0.7*V_{DD}$			V
Output Disabled	V_{IL}			$0.3*V_{DD}$	V
Disable Time	t_D			200	ns
Enable/Disable Leakage Current				±200	uA
Enable Pull-Up Resistor					
Output Enabled			33		KOhm
Output Disabled			1		MOhm
Start-Up Time	t_{SU}			10	ms
Operating Temp. (Ordering Option)	T_{OP}	-10/70 or -40/85			°C

1. The VCC6 power supply pin should be filtered, eg, a 0.1 and 0.01uf capacitor.
2. See Standard Frequencies and Ordering Information for more information.
3. Includes calibration tolerance, operating temperature, supply voltage variations, aging and IR reflow.
4. Figure 1 defines the test circuit and Figure 2 defines these parameters.
5. Duty Cycle is defined as the On/Time Period.
6. Measured using an Agilent E5052, 155.520MHz. Please see "Typical Phase Noise and Jitter Report for the VCC6 series".
7. Measured using a Wavecrest SIA3300C, 90K samples.
8. Outputs will be Enabled if Enable/Disable is left open.

Output Disabled	V_{IL}			0.3* V_{DD}	V
Disable Time	t_D			200	ns
Enable/Disable Leakage Current				±200	uA
Enable Pull-Up Resistor			33		KOhm
			1		MOhm
Start-Up Time	t_{SU}			10	ms
Operating Temp. (Ordering Option)	T_{OP}	-10/70 or -40/85			°C

1. The VCC6 power supply pin should be filtered, eg, a 0.1 and 0.01 uf capacitor.
2. See Standard Frequencies and Ordering Information for more information.
3. Includes calibration tolerance, operating temperature, supply voltage variations, aging and IR reflow.
4. Figure 2 defines these parameters and Figure 3 defines the test circuit.
5. Duty Cycle is defined as the On/Time Period.
6. Measured using an Agilent E5052, 155.520MHz. Please see "Typical Phase Noise and Jitter Report for the VCC6 series".
7. Measured using a Wavecrest SIA3300C, 90K samples.
8. Outputs will be Enabled if Enable/Disable is left open.

Figure 3.

Package and Pinout

Table 3. Pinout

Pin #	Symbol	Function
1	E/D or NC	Enable Disable or No Connection
2	E/D or NC	Enable Disable or No Connection
3	GND	Electrical and Lid Ground
4	f_o	Output Frequency
5	Cf_o	Complementary Output Frequency
6	V_{DD}	Supply Voltage

The Enable/Disable function is set at the factory on either pin 1 or pin 2 and is an ordering option. Outputs will be Enabled if the Enable/Disable is left open.

Figure 4. Package Outline Drawing

Figure 5. Pad Layout

LVPECL Application Diagrams

Figure 6. Standard PECL Output Configuration

Figure 7. Single Resistor Termination Scheme
Resistor values are typically 140 ohms for 3.3V operation and 84 ohms for 2.5V operation.

Figure 8. Pull-Up Pull Down Termination
Resistor values are typically for 3.3V operation. For 2.5V operation, the resistor to ground is 62 ohms and the resistor to supply is 240 ohms

The VCC6 incorporates a standard PECL output scheme, which are un-terminated emitters as shown in Figure 6. There are numerous application notes on terminating and interfacing PECL logic and the two most common methods are a single resistor to ground, Figure 7, and a pull-up/pull-down scheme as shown in Figure 8. An AC coupling capacitor is optional, depending on the application and the input logic requirements of the next stage.

LVDS Application Diagrams

Figure 9. Standard LVDS Output Configuration

Figure 10. LVDS to LVDS Connection, Internal 100ohm
Some LVDS structures have an internal 100 ohm resistor on the input and do not need additional components.

Figure 11. LVDS to LVDS Connection External 100ohm and AC blocking caps
Some input structures may not have an internal 100 ohm resistor on the input and will need an external 100ohm resistor for impedance matching. Also, the input may have an internal DC bias which may not be compatible with LVDS levels, AC blocking capacitors can be used.

One of the most important considerations is terminating the Output and Complementary Outputs equally. An unused output should not be left un-terminated, and if one of the two outputs is left open it will result in excessive jitter on both. PC board layout must take this and 50 ohm impedance matching into account. Load matching and power supply noise are the main contributors to jitter related problems.

Environmental and IR Compliance

Parameter	Condition
Mechanical Shock	MIL-STD-883 Method 2002
Mechanical Vibration	MIL-STD-883 Method 2007
Temperature Cycle	MIL-STD-883 Method 1010
Solderability	MIL-STD-883 Method 2003
Fine and Gross Leak	MIL-STD-883 Method 1014
Resistance to Solvents	MIL-STD-883 Method 2015
Moisture Sensitivity Level	MSL1
Contact Pads	Gold over Nickel

IR Compliance

Suggested IR Profile

Devices are built using lead free epoxy and can be subjected to standard lead free IR reflow conditions shown in Table 5. Contact pads are gold over nickel and lower maximum temperatures can also be used, such as 220C.

Parameter	Symbol	Value
PreHeat Time	t_s	200 sec Max
Ramp Up	R_{UP}	3°C/sec Max
Time above 217°C	t_L	150 sec Max
Time to Peak Temperature	t_{AMB-P}	480 sec Max
Time at 260°C	t_P	30 sec Max
Time at 240°C	t_{P2}	60 sec Max
Ramp down	R_{DN}	6°C/sec Max

Maximum Ratings, Tape & Reel

Absolute Maximum Ratings and Handling Precautions

Stresses in excess of the absolute maximum ratings can permanently damage the device. Functional operation is not implied or any other excess of conditions represented in the operational sections of this data sheet. Exposure to absolute maximum ratings for extended periods may adversely affect device reliability.

Although ESD protection circuitry has been designed into the VCC6, proper precautions should be taken when handling and mounting. VI employs a Human Body Model and Charged Device Model for ESD susceptibility testing and design evaluation.

ESD thresholds are dependent on the circuit parameters used to define the model. Although no industry standard has been adopted for the CDM a standard resistance of 1.5kOhms and capacitance of 100pF is widely used and therefor can be used for comparison purposes.

Parameter	Symbol	Rating	Unit
Storage Temperature	T_{STORE}	-55/125	°C
Supply Voltage		-0.5 to 5.0	V
Enable/Disable Voltage		-0.5 to $V_{DD}+0.5$	V
ESD, Human Body Model		1500	V
ESD, Charged Device Model		1000	V

Table 7. Tape and Reel Information

Tape Dimensions (mm)					Reel Dimensions (mm)
