AM571x Sitara™ Processors

Silicon Revision 2.0 and 2.1

1 Device Overview

1.1 Features

- Arm® Cortex®-A15 microprocessor subsystem
- C66x floating-point VLIW DSP cores
 - Fully object-code compatible with C67x and C64x+
 - Up to thirty-two 16 × 16-bit fixed-point multiplies per cycle
- Up to 512KB of on-chip L3 RAM
- Level 3 (L3) and level 4 (L4) interconnects
- DDR3/DDR3L External Memory Interface (EMIF) module
 - Supports up to DDR3-1333 (667 MHz)
 - Up to 2GB across single chip select
- 2x Dual Arm® Cortex®-M4 coprocessors (IPU1 and IPU2)
- IVA-HD subsystem
 - 4K @ 15fps encode and decode support for H.264 CODEC
 - Other CODECs are up to 1080p60
- Display subsystem
 - Full-HD video (1920 × 1080p, 60 fps)
 - Multiple video inputs and video outputs
 - 2D and 3D graphics
 - Display controller with DMA engine and up to three pipelines
 - HDMI™ encoder: HDMI 1.4a and DVI 1.0 compliant
- 2x dual-core Programmable Real-Time Unit and Industrial Communication Subsystem (PRU-ICSS)
- Accelerator (BB2D) subsystem
 - Vivante® GC320 core
- Video Processing Engine (VPE)
- Available single-core PowerVR® SGX544 3D GPU
- Secure boot support
 - Hardware-enforced root-of-trust
 - Customer programmable keys (SR 2.1)
 - Support for takeover protection, IP protection, and anti-roll back protection
- Cryptographic acceleration support
 - Supports cryptographic cores
 - AES – 128/192/256-bits key sizes
 - 3DES – 56/112/168-bits key sizes
 - MD5, SHA1
 - SHA2 – 224/256/384/512
 - True random number generator
 - DMA support
- Debug security
 - Secure software controlled debug access
 - Security aware debugging
- Trusted Execution Environment (TEE) support
 - Arm® TrustZone® based TEE
 - Extensive firewall support for isolation
 - Secure DMA path and interconnect
 - Secure Watchdog/Timer/IPC
- One Video Input Port (VIP) module
 - Support for up to four multiplexed input ports
- General-Purpose Memory Controller (GPMC)
- Enhanced Direct Memory Access (EDMA) controller
- 2-Port Gigabit Ethernet switch
- Sixteen 32-bit general-purpose timers
- 32-bit MPU watchdog timer
- Five high speed Inter-Integrated Circuit (I²C™) ports
- HDQ/ 1-Wire® interface
- Ten configurable UART/IrDA/CIR modules
- Four Multichannel Serial Peripheral Interfaces (McSPI)
- Quad Serial Peripheral Interface (QSPI)
- SATA Gen2 interface
- Eight Multichannel Audio Serial Port (McASP) modules
- SuperSpeed USB 3.0 dual-role device
- High Speed USB 2.0 dual-role device
- Four MultiMedia Card/ Secure Digital®/Secure Digital Input Output interfaces (MMC™/SD®/SDIO)
- PCI-Express® (PCIe®) revision 3.0 subsystems with two 5-Gbps lanes
 - One 2-lane Gen2-compliant port
 - or Two 1-lane Gen2-compliant ports
- Dual Controller Area Network (DCAN) modules
 - CAN 2.0B protocol
- MIPI® Camera Serial Interface 2 (CSI-2)
- Up to 215 General-Purpose I/O (GPIO) pins
- Power, reset, and clock management
- On-chip debug with CTools technology
- 28-nm CMOS technology
- 23 mm × 23 mm, 0.8-mm pitch, 760-pin BGA

1.2 Applications

- Industrial communication
- Human Machine Interface (HMI)
- Automation and control
- High performance applications
- Other general use

1.3 Description

AM571x Sitara™ processors are Arm® applications processors built to meet the intense processing needs of modern embedded products.

AM571x devices bring high processing performance through the maximum flexibility of a fully integrated mixed processor solution. The devices also combine programmable video processing with a highly integrated peripheral set.

Programmability is provided by a single-core Arm® Cortex®-A15 RISC CPU with Arm® Neon™ extensions and a TI C66x VLIW floating-point DSP core. The Arm® processor lets developers keep control functions separate from vision algorithms programmed on the DSP and coprocessors, thus reducing the complexity of the system software.

Additionally, TI provides a complete set of development tools for the Arm® and C66x DSP, including C compilers, a DSP assembly optimizer to simplify programming and scheduling, and a debugging interface for visibility into source code execution.

Cryptographic acceleration is available in all devices. All other supported security features, including support for secure boot, debug security and support for trusted execution environment is available on High-Security (HS) devices. For more information about HS devices, contact your TI representative.

The AM571x Sitara Arm processor family is qualified according to the AEC-Q100 Standard.

2 Revision History

Changes from June 1, 2018 to April 5, 2019 (from G Revision (May 2018) to H Revision)	Page
• Added Device Security Features for Silicon revision 2.1 in Section 1.1, Features	1
• Added vpp details for Silicon revision 2.1 in Table 4-1, Unused Balls Specific Connection Requirements , Table 4-2, Ball Characteristics and Table 4-35, Power Supply Signal Descriptions	10
• Updated OPP_HIGH power supply value in note (6) under Table 5-8, Voltage Domains Operating Performance Points	148
• Updated SYS_32K to FUNC_32K_CLK in Table 5-10, Maximum Supported Frequency and Section 5.10, Power Supply Sequences	149
• Added Section 5.8, VPP Specifications for One-Time Programmable (OTP) eFuses for Silicon revision 2.1	175
• Updated porz and rstoutn descriptions under Figure 5-2, Power-Up Sequencing	179
• Updated system clock names in Section 6, Clock Specifications	183
• Added PRU-ICSS sync and latch signals to IOSETs in Table 7-154, PRU-ICSS1 IOSETs and Table 7-155, PRU-ICSS2 IOSETs	341
• Added Silicon revision 2.1 in support in Figure 9-1, Printed Device Reference and Table 9-1, Nomenclature Description	393
• Updated note for cosmetic marks on package.....	393

Changes from April 6, 2019 to November 15, 2019 (from H Revision (April 2019) to I Revision)	Page
• Added reminders to disable unused pulls and RX pads in Section 4.2, Ball Characteristics	11
• Removed uart2_rxd for Muxmode 0	13
• Added clarification notes for EMU[1:0] connections in Table 4-24, GPIOs Signal Descriptions and Table 4-28, Debug Signal Descriptions	120
• Updated clock names in Table 5-10, Maximum Supported Frequency	149
• Updated EMIF_DLL_FCLK max rate in Table 6-15, DLL Characteristics	196
• Updated GPMC timing table footnotes.....	233
• Updated information about WD_TIMER1 in Section 7.12, Timers	256
• Updated parameter number in Table 7-46, Timing Requirements for QSPI	271
• Added MII_TXER timing to Section 7.23.1, GMAC MII Timings	297
• Updated MDIO Timing Diagram and MDIO7 parameter values	298
• Updated timing specification values for MMC.....	312
• Updated Delay time for MMC2 in Table 7-110, Switching Characteristics for MMC2 - JC64 High Speed DDR Mode	320
• Added note regarding DDR ECC solutions to Table 8-4, Supported DDR3 Device Combinations	365
• Added clarifications about validated DDR topology	374
• Updated reference name to errata document in Section 9.3, Documentation Support	396

3 Device Comparison

(1) Features noted as “not supported,” must not be used. Their functionality is not supported by TI for this family of devices. These features are subject to removal without notice on future device revisions. Any information regarding the unsupported features has been retained in the documentation solely for the purpose of clarifying signal names or for consistency with previous feature descriptions.

(2) RTC-only mode is not a supported feature.

(3) For more details about the CTRL_WKUP_STD_FUSE_DIE_ID_2 register and Base PN bit field, see the *AM571x Technical Reference Manual*.

3.1 Related Products

Sitara™ processors Broad family of scalable processors based on Arm® Cortex®-A cores and TI C66x DSP cores with flexible accelerators, peripherals, connectivity and unified software support – perfect for sensors to servers. Sitara processors have the reliability needed for use in industrial applications.

AM57x Sitara™ processors AM57x Sitara™ processors are highly integrated devices that enable high-performance and multimedia applications. In addition to the Arm® Cortex®-A15 cores and TI C66x DSP cores, on-board accelerators provide enhanced vision and machine learning capabilities, support for multiple industrial Ethernet protocols, and video processing.

Sitara™ processors applications Sitara™ processors provide scalable solutions for a wide range of applications from HMI and gateways to more complex equipment such as drives and substation automation equipment. Sitara processors also offer multi-protocol support for industrial communication protocols such as EtherCAT®, Ethernet/IP, and Profinet.

Reference Designs and **Evaluation Modules** TI provides many reference designs containing 'building block' solutions to enable customers to rapidly develop their own unique products and solutions. EVMs are also provided to help kick-start product development.

4 Terminal Configuration and Functions

4.1 Terminal Assignment

Figure 4-1 shows the ball locations for the 760 plastic ball grid array (PBGA) package and is used in conjunction with Table 4-2 through Table 4-35 to locate signal names and ball grid numbers.

Figure 4-1. ABC S-PBGA-N760 Package (Bottom View)

NOTE

The following bottom balls are not pinned out: AF7 / AF10 / AF13 / AF16 / AF19 / AE4 / AE25 / AB26 / W3 / W26 / T3 / T26 / N3 / N26 / K3 / K26 / G3 / D4 / D25 / C10 / C13 / C16 / C19 / C22.

These balls do not exist on the package.

NOTE

The following bottom balls are not connected: AH11 / AH12 / AG2 / AG8 / AG11 / AG12 / AF4 / AF6 / AF8 / AF9 / AE3 / AE5 / AE6 / AE8 / AE9 / AD3 / AD8 / AD9 / Y15 / Y16 / V18 / V19 / U18 / U19 / U22 / U23 / U24 / U25 / U26 / U27 / U28 / T22 / T23 / T27 / T28 / R20 / R22 / R23 / R24 / R25 / R26 / R27 / R28 / P19 / P22 / P23 / P24 / P25 / P26 / P27 / N20 / N22 / N23 / N27 / N28 / M20 / M21 / M22 / M23 / M24 / M25 / M26 / M27 / M28 / L20 / L21 / L22 / L23 / L24 / L25 / L26 / L27 / L28 / K20 / K21 / K22 / K23 / K27 / K28 / J20 / J21 / J22 / J23 / J24 / J25 / J26 / J27 / H20 / H21 / H22 / H23 / H24 / H25 / H26 / H27 / H28 / G22 / G23 / G24 / G25 / G26 / G27 / G28 / F24 / F25 / F26 / F27 / F28 / E24 / E26 / E27 / E28.

These balls can be connected as desired, including to vss.

4.1.1 Unused Balls Connection Requirements

This section describes the Unused/Reserved balls connection requirements.

NOTE

The following balls are reserved: A27 / Y5 / Y10 / B28

These balls must be left unconnected.

NOTE

All unused power supply balls must be supplied with the voltages specified in the [Section 5.4, Recommended Operating Conditions](#), unless alternative tie-off options are included in [Section 4.4, Signal Descriptions](#).

Table 4-1. Unused Balls Specific Connection Requirements

BALLS	CONNECTION REQUIREMENTS
AE15 / AC15 / AE14 / D20 / AD17 / AC16 / V27 / AH25 / AE27 / AD27 / Y28	These balls must be connected to GND through an external pull resistor if unused
E20 / D21 / E23 / C20 / C21 / V28 / F18 / AG25 / AE28 / AD28 / Y27 / F17 / C25	These balls must be connected to the corresponding power supply through an external pull resistor if unused
K14 (vpp)	This ball must be left unconnected if unused
AF14 (rtc_iso)	This ball should be connected to the corresponding power supply through an external pull resistor if unused; or can be connected to F22 (porz) when RTC unused (level translation may be needed)
AB17 (rtc_porz)	This ball should be connected to VSS when RTC is unused; or can be connected to F22 (porz) when RTC unused (level translation may be needed)

NOTE

All other unused signal balls **with** a Pad Configuration Register can be left unconnected with their internal pullup or pulldown resistor enabled.

NOTE

All other unused signal balls **without** a Pad Configuration Register can be left unconnected.

4.2 Ball Characteristics

[Table 4-2](#) describes the terminal characteristics and the signals multiplexed on each ball. The following list describes the table column headers:

1. **BALL NUMBER:** Ball number(s) on the bottom side associated with each signal on the bottom.
2. **BALL NAME:** Mechanical name from package device (name is taken from muxmode 0).
3. **SIGNAL NAME:** Names of signals multiplexed on each ball (also notice that the name of the ball is the signal name in muxmode 0).

NOTE

[Table 4-2](#) does not take into account the subsystem multiplexing signals. Subsystem multiplexing signals are described in [Section 4.4, Signal Descriptions](#).

NOTE

In the Driver off mode, the buffer is configured in high-impedance.

NOTE

In some cases [Table 4-2](#) may present more than one signal name per muxmode for the same ball. First signal in the list is the dominant function as selected via CTRL_CORE_PAD_* register.

All other signals are virtual functions that present alternate multiplexing options. This virtual functions are controlled via CTRL_CORE_ALT_SELECT_MUX or CTRL_CORE_VIP_MUX_SELECT register. For more information on how to use these options, see *Pad Configuration Registers* section, *Control Module* chapter in the device TRM.

4. **PN:** This column shows if the functionality is applicable for **AM5716** device. Note that the Ball Characteristics table presents a functionality of **AM5718**. If the cell is empty it means that the signal is available in all devices.
 - **Yes** - Functionality is presented in **AM5716**
 - **No** - Functionality is not presented in **AM5716**
 An empty box means Yes.
 5. **MUXMODE:** Multiplexing mode number:
 - a. MUXMODE 0 is the primary mode; this means that when MUXMODE=0 is set, the function mapped on the pin corresponds to the name of the pin. The primary muxmode is not necessarily the default muxmode.
-

NOTE

The default mode is the mode at the release of the reset; also see the RESET REL. MUXMODE column.

- b. MUXMODE 1 through 15 are possible muxmodes for alternate functions. On each pin, some muxmodes are effectively used for alternate functions, while some muxmodes are not used. Only MUXMODE values which correspond to defined functions should be used.
 - c. An empty box means Not Applicable.
 6. **TYPE:** Signal type and direction:
 - I = Input
 - O = Output
 - IO = Input or Output
 - D = Open drain
 - DS = Differential Signaling
 - A = Analog
 - PWR = Power
 - GND = Ground
 - CAP = LDO Capacitor
-

NOTE

The RX buffer within the pad logic should be disabled on all pins that are not being used as an input. For more information, see the *Control Module / Control Module Functional Description / PAD Functional Multiplexing and Configuration* section in the device TRM.

7. **BALL RESET STATE:** The state of the terminal at power-on reset:
 - drive 0 (OFF): The buffer drives V_{OL} (pulldown or pullup resistor not activated).
 - drive 1 (OFF): The buffer drives V_{OH} (pulldown or pullup resistor not activated).
 - OFF: High-impedance
 - PD: High-impedance with an active pulldown resistor
 - PU: High-impedance with an active pullup resistor
 - An empty box means Not Applicable

NOTE

Designs that contain pullup or pulldown resistors, either on the board or in attached devices that oppose internal pullup or pulldown resistors, that are active while the device is held in reset, must not remain in reset for long periods of time.

8. **BALL RESET REL. STATE:** The state of the terminal at the deactivation of the rstoutn signal (also mapped to the PRCM SYS_WARM_OUT_RST signal).
- drive 0 (OFF): The buffer drives V_{OL} (pulldown or pullup resistor not activated).
 - drive clk (OFF): The buffer drives a toggling clock (pulldown or pullup resistor not activated).
 - drive 1 (OFF): The buffer drives V_{OH} (pulldown or pullup resistor not activated).
 - OFF: High-impedance
 - PD: High-impedance with an active pulldown resistor
 - PU: High-impedance with an active pullup resistor
 - An empty box means Not Applicable

NOTE

For more information on the CORE_PWRON_RET_RST reset signal and its reset sources, see *Power, Reset, and Clock Management* chapter in the device TRM.

9. **BALL RESET REL. MUXMODE:** This muxmode is automatically configured at the release of the rstoutn signal (also mapped to the PRCM SYS_WARM_OUT_RST signal).
An empty box means Not Applicable.
10. **IO VOLTAGE VALUE:** This column describes the IO voltage value (VDD5 supply).
An empty box means Not Applicable.
11. **POWER:** The voltage supply that powers the terminal IO buffers.
An empty box means Not Applicable.

NOTE

VOUT1, VOUT2 and VOUT3 are only supported at 1.8V and not at 3.3V. This must be considered in the pin mux programming and VDDSHVx supply connections.

12. **HYS:** Indicates if the input buffer is with hysteresis:
- Yes: With hysteresis
 - No: Without hysteresis
 - An empty box: Not Applicable

NOTE

For more information, see the hysteresis values in [Section 5.7](#), *Electrical Characteristics*.

13. **BUFFER TYPE:** Drive strength of the associated output buffer.
An empty box means Not Applicable.

NOTE

For programmable buffer strength:

- The default value is given in [Table 4-2](#).
- A note describes all possible values according to the selected muxmode.

14. **PULLUP / PULLDOWN TYPE:** Denotes the presence of an internal pullup or pulldown resistor. Pullup and pulldown resistors can be enabled or disabled via software.
- PU: Internal pullup
 - PD: Internal pulldown
 - PU/PD: Internal pullup and pulldown

- PUx/PDy: Programmable internal pullup and pulldown
- PDy: Programmable internal pulldown
- An empty box means No pull

NOTE

Internal pullup or pulldown resistors must be disabled when opposed by an external pullup or pulldown resistor on the board or within an attached device.

15. **DSIS:** The deselected input state (DSIS) indicates the state driven on the peripheral input (logic "0" or logic "1") when the peripheral pin function is not selected by any of the PINCNTLx registers.

- 0: Logic 0 driven on the peripheral's input signal port.
- 1: Logic 1 driven on the peripheral's input signal port.
- blank: Pin state driven on the peripheral's input signal port.

NOTE

Configuring two pins to the same input signal is not supported as it can yield unexpected results. This can be easily prevented with the proper software configuration (Hi-Z mode is not an input signal).

NOTE

When a pad is set into a multiplexing mode which is not defined by pin multiplexing, that pad's behavior is undefined. This should be avoided.

NOTE

Some of the EMIF1 signals have an additional state change at the release of porz. The state that the signals change to at the release of porz is as follows:

drive 0 (OFF) for: ddr1_csn0, ddr1_ck, ddr1_nck, ddr1_casn, ddr1_rasn, ddr1_wen, ddr1_ba[2:0], ddr1_a[15:0].

OFF for: ddr1_ecc_d[7:0], ddr1_dqm[3:0], ddr1_dqm_ecc, ddr1_dqs[3:0], ddr1_dqsn[3:0], ddr1_dqs_ecc, ddr1_dqsn_ecc, ddr1_d[31:0].

NOTE

Dual rank support is not available on this device, but signal names are retained for consistency with the AM57xx family of devices.

- (1) N/A stands for Not Applicable.
- (2) For more information on recommended operating conditions, see [Table 5-5, Recommended Operating Conditions](#).
- (3) The pullup or pulldown block strength is equal to: minimum = 50 μ A, typical = 100 μ A, maximum = 250 μ A.
- (4) The output impedance settings of this IO cell are programmable; by default, the value is DS[1:0] = 10, this means 40 Ω . For more information on DS[1:0] register configuration, see the device TRM.
- (5) IO drive strength for usb1_dp, usb1_dm, usb2_dp and usb2_dm: minimum 18.3 mA, maximum 89 mA (for a power supply vdda33v_usb1 and vdda33v_usb2 = 3.46 V).
- (6) Minimum PU = 900 Ω , maximum PU = 3.090 k Ω and minimum PD = 14.25 k Ω , maximum PD = 24.8 k Ω .
For more information, see chapter 7 of the USB2.0 specification, in particular section Signaling / Device Speed Identification.
- (7) This function will not be supported on some pin-compatible roadmap devices. Pin compatibility can be maintained in the future by not using these GPIO signals.
- (8) In PUX / PDY, x and y = 60 to 200 μ A.
The output impedance settings (or drive strengths) of this IO are programmable (34 Ω , 40 Ω , 48 Ω , 60 Ω , 80 Ω) depending on the values of the I[2:0] registers.
- (9) The internal pull resistors for balls K7, M7, J5, K6, J4, J6, H4, H5 are permanently disabled when sysboot15 is set to 0 as described in the section Sysboot Configuration of the Device TRM. If internal pull-up/down resistors are desired on these balls then sysboot15 should be set to 1. If gpmc boot mode is used with SYSBOOT15=0 (not recommended) then external pull-downs should be implemented to keep the address bus at logic-1 value during boot since the gpmc ms-address bits are high-z during boot.
- (10) This signal is valid only for High-Security devices. For more details, see [Section 5.8 VPP Specification for One-Time Programmable \(OTP\) eFUSES](#). For General Purpose devices do not connect any signal, test point, or board trace to this signal.

4.3 Multiplexing Characteristics

[Table 4-3](#) describes the device multiplexing (no characteristics are available).

NOTE

This table doesn't take into account subsystem multiplexing signals. Subsystem multiplexing signals are described in [Section 4.4, Signal Descriptions](#).

NOTE

For more information, see the *Control Module chapter, PAD Functional Multiplexing and Configuration* section in the device TRM.

NOTE

Configuring two pins to the same input signal is not supported as it can yield unexpected results. This can be easily prevented with the proper software configuration (Hi-Z mode is not an input signal).

NOTE

When a pad is set into a multiplexing mode which is not defined by pin multiplexing, that pad's behavior is undefined. This should be avoided.

NOTE

In some cases [Table 4-3](#) may present more than one signal per muxmode for the same ball. First signal in the list is the dominant function as selected via CTRL_CORE_PAD_* register.

All other signals are virtual functions that present alternate multiplexing options. This virtual functions are controlled via CTRL_CORE_ALT_SELECT_MUX or CTRL_CORE_VIP_MUX_SELECT register. For more information on how to use these options, see *Pad Configuration Registers* section, *Control Module* chapter in the device TRM.

NOTE

Dual rank support is not available on this device, but signal names are retained for consistency with the AM57xx family of devices.

CAUTION

The I/O timings provided in [Section 7, Timing Requirements and Switching Characteristics](#) are valid only if signals within a single IOSET are used. The IOSETs are defined in the corresponding tables.

4.4 Signal Descriptions

Many signals are available on multiple pins, according to the software configuration of the pin multiplexing options.

Texas Instruments has developed an application called Pin Mux Utility that helps a system designer select the appropriate pin-multiplexing configuration for their device-based product design. The Pin Mux Utility provides a way to select valid IO Sets of specific peripheral interfaces to ensure the pinmultiplexing configuration selected for a design only uses valid IO Sets supported by the device.

1. **SIGNAL NAME:** The name of the signal passing through the pin.

NOTE

The subsystem multiplexing signals are not described in [Table 4-2](#) and [Table 4-3](#).

2. **DESCRIPTION:** Description of the signal

3. **TYPE:** Signal direction and type:

- I = Input
- O = Output
- IO = Input or output
- D = Open Drain
- DS = Differential
- A = Analog
- PWR = Power
- GND = Ground

4. **BALL:** Associated ball(s) bottom

NOTE

For more information, see *Control Module* chapter, *Control Module Register Manual* section in the device TRM.

4.4.1 Video Input Ports (VIP)

CAUTION

The IO timings provided in [Section 7, Timing Requirements and Switching Characteristics](#) are valid only for VIN1 and VIN2 if signals within a single IOSET are used. The IOSETs are defined in [Table 7-4](#) and [Table 7-5](#).

NOTE

For more information, see *Video Input Port* chapter in the device TRM.

4.4.2 Display Subsystem – Video Output Ports

NOTE

VOUT1, VOUT2 and VOUT3 only qualified for use at 1.8 V.

CAUTION

The IO timings provided in [Section 7 Timing Requirements and Switching Characteristics](#) are valid only if signals within a single IOSET are used. The IOSETs are defined in [Table 7-18](#).

(1) This clock signal is implemented as 'pad loopback' inside the device - the output signal is looped back through the input buffer to serve as the internal reference signal. Series termination is recommended (as close to device pin as possible) to improve signal integrity of the clock input. Any nonmonotonicity in voltage that occurs at the pad loopback clock pin between V_{IH} and V_{IL} must be less than V_{HYS} .

(2) The gpio6_16.clkout1 signal can be used as an "always-on" alternative to gpmc_clk provided that the external device can support the associated timing. See [Table 7-25 GPMC/NOR Flash Interface Switching Characteristics - Synchronous Mode - Default](#) and [Table 7-27 GPMC/NOR Flash Interface Switching Characteristics - Synchronous Mode - Alternate](#) for timing information.

(3) The internal pull resistors for balls K7, M7, J5, K6, J4, J6, H4, H5 are permanently disabled when sysboot15 is set to 0 as described in

the section Sysboot Configuration of the Device TRM. If internal pull-up/down resistors are desired on these balls then sysboot15 should be set to 1. If gpmc boot mode is used with SYSBOOT15=0 (not recommended) then external pull-downs should be implemented to keep the address bus at logic-1 value during boot since the gpmc ms-address bits are high-z during boot.

4.4.11 Multichannel Serial Peripheral Interface (McSPI)

CAUTION

The I/O timing provided in [Section 7, Timing Requirements and Switching Characteristics](#) are applicable for all combinations of signals for SPI1 and SPI2. However, the timings are valid only for SPI3 and SPI4 if signals within a single IOSET are used. The IOSETS are defined in [Table 7-44](#).

NOTE

For more information, see *Multichannel Serial Peripheral Interface* section in the device TRM.

(1) By default, this clock signal is implemented as 'pad loopback' inside the device - the output signal is looped back through the input buffer to serve as the internal reference signal. mmc1_clk and mmc2_clk have an optional software programmable setting to use an 'internal loopback clock' instead of the default 'pad loopback clock'. If the 'pad loopback clock' is used, series termination is recommended (as close to device pin as possible) to improve signal integrity of the clock input. Any nonmonotonicity in voltage that occurs at the pad loopback clock pin between V_{IH} and V_{IL} must be less than V_{HYS} .

(1) gpio8_30 is multiplexed with EMU0 and gpio8_31 is multiplexed with EMU1. These pins will be sampled at reset release by the test and emulation logic. Therefore, if they are used as GPIO pins, they must return to the high state whenever the device enters reset. This can be controlled by logic driven from rstoutn. After the device exits reset (indicated by rstoutn rising), these can return to GPIO mode.

4.4.24 Programmable Real-Time Unit Subsystem and Industrial Communication Subsystem (PRU-ICSS)

CAUTION

The I/O timing provided in [Section 7, Timing Requirements and Switching Characteristics](#) are valid only if signals within a single IOSET are used. The IOSETs are defined in the [Table 7-154](#) and [Table 7-155](#).

NOTE

For more information, see *Programmable Real-Time Unit Subsystem and Industrial Communication Subsystem* chapter in the device TRM.

NOTE

PRU-ICSS has an internal wrapper multiplexing that allows MII_RT, EnDAT[®], and Sigma Delta functionality to be muxed with the PRU GPIO signals. See **PRU-ICSS IO Interface** in device TRM. Additionally, the EGPIO module can also be configured to export additional functions to EGPIO pins in place of simple GPIO. See **Enhanced General-Purpose Module/Serial Capture Unit** in device TRM.

4.4.25 Test Interfaces

CAUTION

The I/O timing provided in [Section 7, Timing Requirements and Switching Characteristics](#) are valid only if signals within a single IOSET are used. The IOSETs are defined in [Table 7-178](#).

NOTE

For more information, see *On-Chip Debug Support* chapter in the device TRM.

- (1) EMU0 and EMU1 are multiplexed with GPIO. These pins will be sampled at reset release by the test and emulation logic. Therefore, if they are used as GPIO pins, they must return to the high state whenever the device enters reset. This can be controlled by logic driven from rstoutn. After the device exits reset (indicated by rstoutn rising), these can return to GPIO mode.

4.4.26.2 Power, Reset, and Clock Management (PRCM)

NOTE

For more information, see the *Power, Reset, and Clock Management* chapter in the device TRM.

Table 4-30. PRCM Signal Descriptions

SIGNAL NAME	DESCRIPTION	TYPE	BALL
clkout1	Device Clock output 1. Can be used externally for devices with non-critical timing requirements, or for debug, or as a reference clock on GPMC as described in Table 7-25 GPMC/NOR Flash Interface Switching Characteristics - Synchronous Mode - Default and Table 7-27 GPMC/NOR Flash Interface Switching Characteristics - Synchronous Mode - Alternate .	O	F21 / P7
clkout2	Device Clock output 2. Can be used externally for devices with non-critical timing requirements, or for debug.	O	D18 / N1
clkout3	Device Clock output 3. Can be used externally for devices with non-critical timing requirements, or for debug.	O	C23
rstoutn	Reset out (Active low). This pin asserts low in response to any global reset condition on the device. ⁽²⁾	O	F23
resetrn	Device Reset Input	I	E23
porz	Power on Reset (active low). This pin must be asserted low until all device supplies are valid (see reset sequence/requirements)	I	F22
xref_clk0	External Reference Clock 0. For Audio and other Peripherals.	I	D18
xref_clk1	External Reference Clock 1. For Audio and other Peripherals.	I	E17
xref_clk2	External Reference Clock 2. For Audio and other Peripherals.	I	B26
xref_clk3	External Reference Clock 3. For Audio and other Peripherals.	I	C23
xi_osc0	System Oscillator OSC0 Crystal input / LVCMOS clock input. Functions as the input connection to a crystal when the internal oscillator OSC0 is used. Functions as an LVCMOS-compatible input clock when an external oscillator is used.	I	AE15
xo_osc0	System Oscillator OSC0 Crystal output	O	AD15
xi_osc1	Auxiliary Oscillator OSC1 Crystal input / LVCMOS clock input. Functions as the input connection to a crystal when the internal oscillator OSC1 is used. Functions as an LVCMOS-compatible input clock when an external oscillator is used	I	AC15
xo_osc1	Auxiliary Oscillator OSC1 Crystal output	O	AC13
RMII_MHZ_50_CLK ⁽¹⁾	RMII Reference Clock (50MHz). This pin is an input when external reference is used or output when internal reference is used.	IO	U3

(1) This clock signal is implemented as 'pad loopback' inside the device - the output signal is looped back through the input buffer to serve as the internal reference signal. Series termination is recommended (as close to device pin as possible) to improve signal integrity of the clock input. Any nonmonotonicity in voltage that occurs at the pad loopback clock pin between V_{IH} and V_{IL} must be less than V_{HYS} .

(2) Note that rstoutn is only valid after vddshv3 is valid. If the rstoutn signal will be used as a reset into other devices attached to the SOC, it must be AND'ed with porz. This will prevent glitches occurring during supply ramping being propagated.

4.4.26.3 Real-Time Clock (RTC) Interface

NOTE

For more information, see *the Real-Time Clock (RTC) chapter* in the device TRM.

NOTE

RTC-only mode is not a supported feature.

Table 4-31. RTC Signal Descriptions

SIGNAL NAME	DESCRIPTION	TYPE	BALL
Wakeup0	RTC External Wakeup Input 0	I	AD17
Wakeup3	RTC External Wakeup Input 3	I	AC16
rtc_porz	RTC Power Domain Power-On Reset Input	I	AB17
rtc_osc_xi_clkln32	RTC Oscillator Input. Crystal connection to internal RTC oscillator. Functions as an RTC clock input when an external oscillator is used.	I	AE14
rtc_osc_xo	RTC Oscillator Output	O	AD14
rtc_iso ⁽¹⁾	RTC Domain Isolation Signal	I	AF14

Table 4-31. RTC Signal Descriptions (continued)

SIGNAL NAME	DESCRIPTION	TYPE	BALL
on_off	RTC Power Enable output pin	O	Y11

(1) This signal must be kept 0 if device power supplies are not valid during RTC mode and 1 during normal operation. This can typically be achieved by connecting rtc_iso to the same signal driving porz (not rtc_porz) with appropriate voltage level translation if necessary.

4.4.26.4 System Direct Memory Access (SDMA)

NOTE

NOTE

For more information, see *Interrupt Controllers* section in the device TRM.

Table 4-33. INTC Signal Descriptions

SIGNAL NAME	DESCRIPTION	TYPE	BALL
nmin_dsp	Non maskable interrupt input, active-low. This pin can be optionally routed to the DSP NMI input or as generic input to the Arm cores. Note that by default this pin has an internal pulldown resistor enabled. This internal pulldown should be disabled or countered by a stronger external pullup resistor before routing to the DSP or Arm processors.	I	D21

- (1) This pin must always be connected via a 1- μ F capacitor to vss.
- (2) This signal is valid only for High-Security devices. For more details, see [Section 5.8 VPP Specification for One-Time Programmable \(OTP\) eFUSEs](#). For General Purpose devices do not connect any signal, test point, or board trace to this signal.

5 Specifications

NOTE

For more information, see *Power, Reset, and Clock Management* section in the device TRM.

NOTE

The index numbers 1 which is part of the EMIF1 signal prefixes (ddr1_*) listed in [Table 4-8, EMIF Signal Descriptions](#), column "SIGNAL NAME" not to be confused with DDR1 type of SDRAM memories.

NOTE

Audio Back End (ABE) module is not supported for this family of devices, but "ABE" name is still present in some clock or DPLL names.

CAUTION

All IO Cells are NOT Fail-safe compliant and should not be externally driven in absence of their IO supply.

5.1 Absolute Maximum Ratings

Stresses beyond those listed as absolute maximum ratings may cause permanent damage to the device. These are stress ratings only, and functional operation of the device at these or any other conditions beyond those listed under [Section 5.4, Recommended Operating Conditions](#), is not implied. Exposure to absolute maximum rated conditions for extended periods may affect device reliability.

- (1) See I/Os supplied by this power pin in [Table 4-2 Ball Characteristics](#)
- (2) VDD is the voltage on the corresponding power-supply pin(s) for the IO.
- (3) Per JEDEC JESD78 at 125°C with specified I/O pin injection current and clamp voltage of 1.5 times maximum recommended I/O voltage and negative 0.5 times maximum recommended I/O voltage.
- (4) Per JEDEC JESD78 at 125°C.
- (5) The maximum valid input voltage on an IO pin cannot exceed 0.3 volts when the supply powering the IO is turned off. This requirement applies to all the IO pins which are not fail-safe and for all values of IO supply voltage. Special attention should be applied anytime peripheral devices are not powered from the same power sources used to power the respective IO supply. It is important the attached peripheral never sources a voltage outside the valid input voltage range, including power supply ramp-up and ramp-down sequences.

(1) JEDEC document JEP155 states that 500-V HBM allows safe manufacturing with a standard ESD control process.

(2) JEDEC document JEP157 states that 250-V CDM allows safe manufacturing with a standard ESD control process.

5.3 Power-On-Hour (POH) Limits

The information in the section below is provided solely for your convenience and does not extend or modify the warranty provided under TI's standard terms and conditions for TI semiconductor products.

NOTE

POH is a function of voltage, temperature and time. Usage at higher voltages and temperatures will result in a reduction in POH.

(1) Unless specified in [Table 5-4](#), all voltage domains and operating conditions are supported in the device at the noted temperatures.

(2) Power-On-Hour (POH) assume HDMI is used at the maximum supported bit rate continuously and/or operating the device continuously at the VD_MPU operating point (OPP) noted.

(3) 90k POH only if SuperSpeed USB 3.0 Dual-Role-Device (at 5 Gbps) or PCIe in Gen-II mode (at 5 Gbps) are used.

(4) Automotive profile is defined as 20000 power on hours with junction temperature as follows: 5%@-40°C, 65%@70°C, 20%@110°C, 10%@125°C.

5.4 Recommended Operating Conditions

The device is used under the recommended operating conditions described in [Table 5-5](#).

NOTE

Logic functions and parameter values are not assured out of the range specified in the recommended operating conditions.

(1) Refer to Power on Hours table for limitations.

(2) The voltage at the device ball should never be below the MIN voltage or above the MAX voltage for any amount of time. This requirement includes dynamic voltage events such as AC ripple, voltage transients, voltage dips, etc.

(3) The DC voltage at the device ball should never be above the MAX DC voltage to avoid impact on device reliability and lifetime POH (Power-On-Hours). The MAX DC voltage is defined as the highest allowed DC regulated voltage, without transients, seen at the ball.

5.5 Operating Performance Points

This section describes the operating conditions of the device. This section also contains the description of each Operating Performance Point (OPP) for processor clocks and device core clocks.

Table 5-6 describes the maximum supported frequency per speed grade for AM571x devices.

(1) N/A stands for Not Applicable.

(2) Device will boot up initially at 588MHz. An intermediate boot program must immediately reprogram the PLL to a frequency not over 500MHz.

5.5.1 AVS and ABB Requirements

Adaptive Voltage Scaling (AVS) and Adaptive Body Biasing (ABB) are required on most of the vdd_* supplies as defined in Table 5-7.

Table 5-7. AVS and ABB Requirements per vdd_* Supply

(1) The voltage ranges in this table are preliminary, and final voltage ranges may be different than shown. Systems should be designed with the ability to modify the voltage to comply with future recommendations.

(2) In a typical implementation, the power supply should target the NOM voltage.

(3) The voltage at the device ball should never be below the MIN voltage or above the MAX voltage for any amount of time. This requirement includes dynamic voltage events such as AC ripple, voltage transients, voltage dips, etc.

(4) The DC voltage at the device ball should never be above the MAX DC voltage to avoid impact on device reliability and lifetime POH (Power-On-Hours). The MAX DC voltage is defined as the highest allowed DC regulated voltage, without transients, seen at the ball.

(5) For all OPPs, AVS must be enabled to avoid impact on device reliability, lifetime POH (Power-On-Hours), and device power.

(6) The AVS voltages are device-dependent, voltage domain-dependent, and OPP-dependent. They must be read from the STD_FUSE_OPP Registers. For information about STD_FUSE_OPP Registers address, please refer to the *Control Module* chapter in the device TRM. The power supply should be adjustable over the following ranges for each required OPP:

- OPP_NOM for MPU: 0.85 V – 1.15 V
- OPP_NOM for CORE and Others: 0.85 V - 1.15 V
- OPP_OD: 0.94 V - 1.15 V
- OPP_HIGH: 1.01 V - 1.25 V

The AVS voltages will be within the above specified ranges.

(7) VD_RTC can optionally be tied to VD_CORE and operate at the VD_CORE AVS voltages.

(8) The power supply must be programmed with the AVS voltages for the MPU and the CORE voltage domain, either just after the ROM boot or at the earliest possible time in the secondary boot loader before there is significant activity seen on these domains.

(2) Maximum supported frequency is limited to the device speed grade (see [Table 5-6](#), Speed Grade Maximum Frequency).

5.5.3 Maximum Supported Frequency

Device modules either receive their clock directly from an external clock input, directly from a PLL, or from a PRCM. [Table 5-10](#) lists the clock source options for each module on this device, along with the maximum frequency that module can accept. To ensure proper module functionality, the device PLLs and dividers must be programmed not to exceed the maximum frequencies listed in this table.

5.6 Power Consumption Summary

NOTE

Maximum power consumption for this SoC depends on the specific use conditions for the end system. Contact your TI representative for assistance in estimating maximum power consumption for the end system use case.

5.7 Electrical Characteristics

NOTE

The data specified in [Section 5.7.1](#) through [Section 5.7.14](#) are subject to change.

NOTE

The interfaces or signals described in [Section 5.7.1](#) through [Section 5.7.14](#) correspond to the interfaces or signals available in multiplexing mode 0 (Function 1).

All interfaces or signals multiplexed on the balls described in these tables have the same DC electrical characteristics, unless multiplexing involves a PHY/GPIO combination in which case different DC electrical characteristics are specified for the different multiplexing modes (Functions).

5.7.1 LVC MOS DDR DC Electrical Characteristics

[Table 5-11](#) summarizes the DC electrical characteristics for LVC MOS DDR Buffers.

NOTE

For more information on the I/O cell configurations (*i*[2:0], *sr*[1:0]), see *Control Module* chapter in the device TRM.

(1) The IHHV1833 buffer exists in the dual-voltage IO logic that can be powered by either 1.8V or 3.3V provided by vddshv3. However, the vddshv3 supply is only used for input protection circuitry, not for logic functionality. The logic in this buffer operates entirely on the vdds18v supply. Therefore, IHHV control is asserted whenever the input is low and vdds18v is valid.

V_{CMRXDC}	Differential input common-mode voltage ^{(5) (6)}	70		330	mV
Z_{ID}	Differential input impedance	80	100	125	Ω

(1) V_{ITH} is the voltage at which the receiver is required to detect a high state in the input signal.

(2) V_{ITL} is the voltage at which the receiver is required to detect a low state in the input signal. V_{ITL} is larger than the maximum single-ended line high voltage during HS transmission. Therefore, both low-power (LP) receivers will detect low during HS signaling.

(3) To reduce noise sensitivity on the received signal, the LP receiver is required to incorporate a hysteresis, V_{HYS} . V_{HYS} is the difference between the V_{ITH} threshold and the V_{ITL} threshold.

(4) V_{ITL} is the voltage at which the receiver is required to detect a low state in the input signal. Specification is relaxed for detecting 0 during ultralow power (ULP) state. The LP receiver is not required to detect HS single-ended voltage as 0 in this state.

(5) Excluding possible additional RF interference of 200 mV_{PP} beyond 450 MHz.

(6) This value includes a ground difference of 50 mV between the transmitter and the receiver, the static common-mode level tolerance and variations below 450 MHz.

(7) This number corresponds to the V_{ODMAX} transmitter.

(8) Common mode is defined as the average voltage level of X and Y: $V_{CMRX} = (V_X + V_Y) / 2$.

(9) Common mode ripple may be due to t_R or t_F and transmission line impairments in the PCB.

(10) For more information regarding the pin name (or ball name) and corresponding signal name, see [Table 4-7, CSI 2 Signal Descriptions](#).

I_{DRIVE}	Pin Drive strength at PAD Voltage = 0.45V or VDDS-0.45V	6			mA
I_{IN}	Input current at each I/O pin			65	μA
I_{OZ}	$I_{OZ}(I_{PAD} \text{ Current})$ for BIDI cell. This current is contributed by the tristated driver leakage + input current of the Rx + weak pullup/pulldown leakage. PAD is swept from 0 to VDDS and the $\text{Max}(I_{PAD})$ is measured and is reported as I_{OZ}			65	μA
I_{IN} with pulldown enabled	Input current at each I/O pin with weak pulldown enabled measured when PAD = VDDS	40	100	200	μA
I_{IN} with pullup enabled	Input current at each I/O pin with weak pullup enabled measured when PAD = 0	10	100	290	μA
C_{PAD}	Pad capacitance (including package capacitance)			4	pF
Z_O	Output impedance (drive strength)		40		Ω

(1) VDDS stands for corresponding power supply. For more information on the power supply name and the corresponding ball, see [Table 4-2, POWER \[11\]](#) column.

5.7.13 SATAPHY DC Electrical Characteristics

NOTE

The SATA module is compliant with the electrical parameters specified in the *SATA-IO SATA Specification*, Revision 3.2, August 7, 2013.

5.7.14 SERDES DC Electrical Characteristics

NOTE

The PCIe interfaces are compliant with the electrical parameters specified in *PCI-Express® Base Specification* Revision 3.0.

NOTE

USB1 instance is compliant with the USB3.0 SuperSpeed Transmitter and Receiver Normative Electrical Parameters as defined in the USB3.0 Specification Rev 1.0 dated Jun 6, 2011.

5.8 VPP Specifications for One-Time Programmable (OTP) eFuses

NOTE

This functionality is available only for Silicon Revision 2.1.

This section specifies the operating conditions required for programming the OTP eFuses and is applicable only for High-Security Devices.

Table 5-21. Recommended Operating Conditions for OTP eFuse Programming

over operating free-air temperature range (unless otherwise noted)

PARAMETER	DESCRIPTION	MIN	NOM	MAX	UNIT
vdd	Supply voltage range for the core domain during OTP operation	1.11	1.15	1.2	V
vpp	Supply voltage range for the eFuse ROM domain during normal operation	NC			V
	Supply voltage range for the eFuse ROM domain during OTP programming ⁽¹⁾⁽²⁾	1.8			V
I(vpp)				100	mA
Temperature (junction)		0	25	85	°C

(1) Supply voltage range includes DC errors and peak-to-peak noise. TI power management solutions [TLV70718](#) from the TLV707x family meet the supply voltage range needed for vpp.

(2) During normal operation, no voltage should be applied to vpp. This can be typically achieved by disabling the regulator attached to the vpp terminal. For more details, see [TLV707](#), [TLV707P 200-mA, Low-I_Q, Low-Noise, Low-Dropout Regulator for Portable Devices](#).

5.8.1 Hardware Requirements

The following hardware requirements must be met when programming keys in the OTP eFuses:

- The vpp power supply must be disabled when not programming OTP registers.
- The vpp power supply must be ramped up after the proper device power-up sequence (for more details, see [Section 5.10](#)).

5.8.2 Programming Sequence

Programming sequence for OTP eFuses:

1. Power on the board per the power-up sequencing. No voltage should be applied on the vpp terminal during power up and normal operation.
2. Load the OTP write software required to program the eFuse (contact your local TI representative for the OTP software package).
3. Apply the voltage on the vpp terminal according to the specification in [Table 5-21](#).
4. Run the software that programs the OTP registers.
5. After validating the content of the OTP registers, remove the voltage from the vpp terminal.

5.8.3 *Impact to Your Hardware Warranty*

You accept that e-Fusing the TI Devices with security keys permanently alters them. You acknowledge that the e-Fuse can fail, for example, due to incorrect or aborted program sequence or if you omit a sequence step. Further the TI Device may fail to secure boot if the error code correction check fails for the Production Keys or if the image is not signed and optionally encrypted with the current active Production Keys. These types of situations will render the TI Device inoperable and TI will be unable to confirm whether the TI Devices conformed to their specifications prior to the attempted e-Fuse. CONSEQUENTLY, TI WILL HAVE NO LIABILITY (WARRANTY OR OTHERWISE) FOR ANY TI DEVICES THAT HAVE BEEN e-FUSED WITH SECURITY KEYS.

5.9 Thermal Characteristics

For reliability and operability concerns, the maximum junction temperature of the Device has to be at or below the T_J value identified in [Table 5-5, Recommended Operating Conditions](#).

It is recommended to perform thermal simulations at the system level with the worst case device power consumption.

5.9.1 Package Thermal Characteristics

[Table 5-22](#) provides the thermal resistance characteristics for the package used on this device.

NOTE

Power dissipation of 1.5 W and an ambient temperature of 85°C is assumed for ABC package.

Table 5-22. Thermal Resistance Characteristics

NO.	PARAMETER	DESCRIPTION	°C/W ⁽¹⁾	AIR FLOW (m/s) ⁽²⁾

5.10 Power Supply Sequences

This section describes the power-up and power-down sequence required to ensure proper device operation. The power supply names described in this section comprise a superset of a family of compatible devices. Some members of this family will not include a subset of these power supplies and their associated device modules. Refer to the [Section 4.2, Ball Characteristics](#) of the [Section 4, Terminal Configuration and Functions](#) to determine which power supplies are applicable.

NOTE

RTC-only mode is not a supported feature.

Figure 5-2 and Figure 5-3 describe the device Power Sequencing when RTC-mode is NOT used.

SPRS906_ELCH_04

Figure 5-2. Power-Up Sequencing

- (1) Grey shaded areas are windows where it is valid to ramp the voltage rail.
- (2) Blue dashed lines are not valid windows but show alternate ramp possibilities based on the associated note.
- (3) RTC-only mode is not used and the following combinations are approved:

- vdda_rtc can be combined with vdds18v
- vdd_rtc can be combined with vdd
- vddshv5 can be combined with other 1.8V or 3.3V vddshvn rails.

If combinations listed above are not followed then sequencing for these 3 voltage rails should follow the RTC mode timing requirements.

When using RTC mode timing:

- vdda_rtc rises coincident with, or before, the 1.8V interface supplies (such as vdds18v).
- vdd_rtc rises coincident with vdd, or it may rise earlier. If rising earlier, it must rise after the 1.8V interface supplies.
- vddshv5 rises coincident with the other vddshvn rails (of the same voltage) or it can rise about the same time as the 1.8V PHY supplies (such as vdd_usb1).

- (4) vdd must ramp before or at the same time as vdd_mpu, vdd_gpu, vdd_dsp and vdd_iva.
- (5) vdd_mpu, vdd_gpu, vdd_dsp, vdd_iva can be ramped at the same time or can be staggered.
- (6) If any of the vddshv[1-7,9-11] rails (not including vddshv8) are used as 1.8V only, then these rails can be combined with vdds18v.
- (7) vddshv5 is separated out to show support for dual voltage. If single voltage is used then vddshv8 can be combined with other vddshvn rails but vddshv8 must ramp after vdd.
- (8) vdds and vdda rails must not be combined together, with the one exception of vdda_rtc when RTC-mode is not supported.
- (9) Pulse duration: rtc_porz must remain low 1ms after vdda_rtc, vddshv5, and vdd_rtc are ramped and stable.
- (10) The FUNC_32K_CLK source must be stable and at a valid frequency 1ms prior to de-asserting rtc_porz high.
- (11) porz must remain asserted low until all of the following conditions are met:
 - All device supply rails reach stable operational levels.
 - xi_osc0 is stable and at a valid frequency.
 - Minimum of 12P after both of the above conditions are met, where $P = 1 / (\text{SYS_CLK1}/610)$, units in ns. resetn must be high prior to, or rise simultaneous with, porz but not before its power supply, vddshv3, rising.
- (12) Setup time: sysboot[15:0] pins must be valid $2P^{(15)}$ before porz is de-asserted high.
- (13) Hold time: sysboot[15:0] pins must be valid $15P^{(15)}$ after porz is de-asserted high.
- (14) rstoutn will be asserted low when porz is low, and de-asserted following an internal 2ms delay. rstoutn is only valid after vddshv3 reaches an operational level. If used as a peripheral component reset, it should be AND gated with porz to avoid possible reset glitches during power up.
- (15) $P = 1/(\text{SYS_CLK1}/610)$ frequency in ns.
- (16) ddr1_vref0 may rise coincident with vdds_ddr1 or at a later time. However, it must be valid before porz rising.

SPRS906_ELCH_05

Figure 5-3. Power-Down Sequencing (10)(12)

- (1) Grey shaded areas are windows where it is valid to ramp the voltage rail.
- (2) Blue dashed lines are not valid windows but show alternate ramp possibilities based on the associated note.
- (3) xi_osc0 can be turned off anytime after porz assertion and must be turned off before vdda_osc voltage rail is shutdown.
- (4) RTC-only mode is not used and the following combinations are approved:
 - vdda_rtc can be combined with vdds18v
 - vdd_rtc can be combined with vdd
 - vddshv5 can be combined with other 1.8V or 3.3V vddshvn rails
 If combinations listed above are not followed then sequencing for these 3 voltage rails should follow the RTC mode timing requirements. When using RTC mode timing:
 - vdda_rtc falls coincident with, or later than, the 1.8V interface supplies (such as vdds18v).
 - vdd_rtc falls coincident with vdd, or it may fall later. If falling later, it must fall before, or coincident with, the 1.8V interface supplies.
 - vddshv5 falls coincident with the other vddshvn rails (of the same voltage) or it can fall about the same time as the 1.8V PHY supplies (such as vdd_usb1).
- (5) vdd_mpu, vdd_gpu, vdd_dsp, vdd_iva can be ramped at the same time or can be staggered.

- (6) vdd must ramp after or at the same time as vdd_mpu, vdd_gpu, vdd_dsp and vdd_iva
- (7) If any of the vddshv[1-7,9-11] rails (not including vddshv8) are used as 1.8V only, then these rails can be combined with vdds18v.
 - vddshv[1-7,9-11] is allowed to ramp down at either of the two points shown in the timing diagram in either 1.8V mode or in 3.3V mode.
 - If vddshv[1-7,9-11] ramps down at the later time in the diagram then the board design must ensure that the vddshv[1-7,9-11] rail is never higher than 2.0 V above the vdds18v rail.
- (8) vddshv8 is separated out to show support for dual voltage. If a dedicated LDO/supply source is used for vddshv8, then vddshv8 ramp down should occur at one of the two earliest points in the timing diagram. If vddshv8 is powered by the same supply source as the other vddshv[1-7,9-11] rails, then it is allowed to ramp down at either of the last two points in the timing diagram.
- (9) The 1.8V vdda_* supplies can either ramp down at the earlier time period shown or can be delayed to ramp down after the core supplies coincident with the vdds18v supply as long as porz is asserted (low) during the power down sequence.
- (10) The power down sequence shown is the most general case and is always valid. An accelerated power down sequence is also available but is only valid when porz is asserted (low). This accelerated power down sequence has been implemented in the companion PMIC that is recommended for use with this SOC. The accelerated sequence has porz go low first, then all 3.3V supplies simultaneously second, core supplies, DDR supplies and DDR references simultaneously third and all 1.8V supplies simultaneously last.
- (11) ddr1_vref0 may fall coincident with vdds_dds1, or at a prior time but after porz is asserted low.
- (12) Ramped Down is defined as reaching a voltage level of no more than 0.6V.

Figure 5-4 describes vddshv[1-7,9-11] Supplies Falling Before vdds18v Supplies Delta.

6 Clock Specifications

NOTE

For more information, see *Power, Reset, and Clock Management* chapter in the device TRM.

NOTE

Audio Back End (ABE) module is not supported for this family of devices, but “ABE” name is still present in some clock or DPLL names.

The device operation requires the following clocks:

- The 32 kHz frequency is used for low frequency operation. It supplies the wake-up domain for operation in lowest power mode. This is an optional clock and will be supplied by on chip divider + mux (FUNC_32K_CLK) incase it is not available on external pin.
- The system clocks, SYS_CLK1 (Mandatory) and SYS_CLK2 (Optional) are the main clock sources of the device. They supply the reference clock to the DPLLs as well as functional clock to several modules.

The Device also embeds an internal free-running 32-kHz oscillator that is always active as long as the the wake-up (WKUP) domain is supplied.

[Figure 6-1](#) shows the external input clock sources and the output clocks to peripherals.

Figure 6-1. Clock Interface

6.1 Input Clock Specifications

6.1.1 Input Clock Requirements

- The source of the internal system clock (SYS_CLK1) could be either:
 - A CMOS clock that enters on the xi_osc0 ball (with xo_osc0 left unconnected on the CMOS clock case).
 - A crystal oscillator clock managed by xi_osc0 and xo_osc0.
- The source of the internal system clock (SYS_CLK2) could be either:
 - A CMOS clock that enters on the xi_osc1 ball (with xo_osc1 left unconnected on the CMOS clock case).
 - A crystal oscillator clock managed by xi_osc1 and xo_osc1.
- The source of the internal system clock (FUNC_32K_CLK) could be either:
 - A CMOS clock that enters on the rtc_osc_xi_clkin32 ball and supports external LVCMOS clock generators
 - A crystal oscillator clock managed by rtc_osc_xi_clkin32 and rtc_osc_xo.

6.1.2 System Oscillator OSC0 Input Clock

SYS_CLK1 is received directly from oscillator OSC0. For more information about SYS_CLK1, see *Power, Reset, and Clock Management* chapter in the device TRM.

6.1.2.1 OSC0 External Crystal

An external crystal is connected to the device pins. [Figure 6-2](#) describes the crystal implementation.

Figure 6-2. Crystal Implementation

NOTE

The load capacitors, C_{f1} and C_{f2} in [Figure 6-2](#), should be chosen such that the below equation is satisfied. C_L in the equation is the load specified by the crystal manufacturer. All discrete components used to implement the oscillator circuit should be placed as close as possible to the associated oscillator xi_osc0 , xo_osc0 , and $vssa_osc0$ pins.

$$C_L = \frac{C_{f1} C_{f2}}{(C_{f1} + C_{f2})}$$

Figure 6-3. Load Capacitance Equation

The crystal must be in the fundamental mode of operation and parallel resonant. [Table 6-1](#) summarizes the required electrical constraints.

Table 6-1. OSC0 Crystal Electrical Characteristics

NAME	DESCRIPTION	MIN	TYP	MAX	UNIT

		Ethernet RGMII and RMII using derived clock			±50		
		Ethernet MII using derived clock			±100		

(1) Crystal characteristics should account for tolerance+stability+aging.

When selecting a crystal, the system design must take into account the temperature and aging characteristics of a crystal versus the user environment and expected lifetime of the system.

Table 6-2 details the switching characteristics of the oscillator and the requirements of the input clock.

6.1.2.2 OSC0 Input Clock

A 1.8-V LVCMOS-Compatible Clock Input can be used instead of the internal oscillator to provide the SYS_CLK1 clock input to the system. The external connections to support this are shown in Figure 6-4. The xi_osc0 pin is connected to the 1.8-V LVCMOS-Compatible clock source. The xi_osc0 pin is left unconnected. The vssa_osc0 pin is connected to board ground (VSS).

(1) Period jitter is meant here as follows:

- The maximum value is the difference between the longest measured clock period and the expected clock period
- The minimum value is the difference between the shortest measured clock period and the expected clock period

(2) Crystal characteristics should account for tolerance+stability+aging.

Figure 6-5. xi_osc0 Input Clock

6.1.3 Auxiliary Oscillator OSC1 Input Clock

SYS_CLK2 is received directly from oscillator OSC1. For more information about SYS_CLK2, see *Power, Reset, and Clock Management* chapter in the device TRM.

6.1.3.1 OSC1 External Crystal

An external crystal is connected to the device pins. Figure 6-6 describes the crystal implementation.

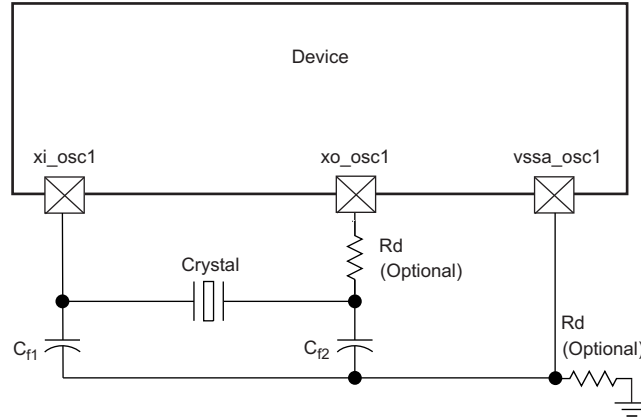

Figure 6-6. Crystal Implementation

NOTE

The load capacitors, C_{f1} and C_{f2} in Figure 6-6, should be chosen such that the below equation is satisfied. C_L in the equation is the load specified by the crystal manufacturer. All discrete components used to implement the oscillator circuit should be placed as close as possible to the associated oscillator xi_osc1 , xo_osc1 , and $vssa_osc1$ pins.

$$C_L = \frac{C_{f1} C_{f2}}{(C_{f1} + C_{f2})}$$

- (1) To switch from bypass mode to crystal or from crystal mode to bypass mode, there is a waiting time about 100 μ s; however, if the chip comes from bypass mode to crystal mode the crystal will start-up after time mentioned in [Table 6-6](#), t_{SX} parameter.
- (2) Before the processor boots up and the oscillator is set to bypass mode, there is a waiting time when the internal oscillator is in application mode and receives a wave. The switching time in this case is about 100 μ s.

[Table 6-8](#) details the OSC1 input clock timing requirements.

(1) Period jitter is meant here as follows:

- The maximum value is the difference between the longest measured clock period and the expected clock period
- The minimum value is the difference between the shortest measured clock period and the expected clock period

(2) Crystal characteristics should account for tolerance+stability+aging.

(3) The Period jitter requirement for osc1 can be relaxed to $0.02 \times t_{c(xiosc1)}$ under the following constraints:

- a. The osc1/SYS_CLK2 clock bypasses all device PLLs
- b. The osc1/SYS_CLK2 clock is only used to source the DSS pixel clock outputs

Figure 6-10. Crystal Implementation

NOTE

The load capacitors, C_{f1} and C_{f2} in Figure 6-10, should be chosen such that the below equation is satisfied. C_L in the equation is the load specified by the crystal manufacturer. All discrete components used to implement the oscillator circuit should be placed as close as possible to the associated oscillator $rtc_osc_xi_clkln32$ and rtc_osc_xo pins.

$$C_L = \frac{C_{f1} C_{f2}}{(C_{f1} + C_{f2})}$$

Figure 6-11. Load Capacitance Equation

The crystal must be in the fundamental mode of operation and parallel resonant. Table 6-9 summarizes the required electrical constraints.

When selecting a crystal, the system design must take into account the temperature and aging characteristics of a crystal versus the user environment and expected lifetime of the system.

Table 6-10 details the switching characteristics of the oscillator and the requirements of the input clock.

6.1.4.2 RTC Oscillator Input Clock

A 1.8-V LVCMOS-Compatible Clock Input can be used instead of the internal oscillator to provide the FUNC_32K_CLK clock input to the system. The external connections to support this are shown in Figure 6-12. The rtc_osc_xi_clkin32 pin is connected to the 1.8-V LVCMOS-Compatible clock sources. The rtc_osc_xo pin is left unconnected.

6.1.4.3 RC On-die Oscillator Clock

NOTE

The OSC_32K_CLK clock, provided by the On-die 32K RC oscillator, inside of the SoC, is not accurate 32kHz clock.

The frequency may significantly vary with temperature and silicon characteristics.

For more information about OSC_32K_CLK, see *Power, Reset, and Clock Management* chapter in the device TRM.

6.2 DPLLs, DLLs Specifications

NOTE

For more information, see *Power, Reset, and Clock Management* and *Display Subsystem* chapters in the device TRM.

To generate high-frequency clocks, the device supports multiple on-chip DPLLs controlled directly by the PRCM module. They are of two types: type A and type B DPLLs.

- They have their own independent power domain (each one embeds its own switch and can be controlled as an independent functional power domain)
- They are fed with ALWAYS ON system clock, with independent control per DPLL.

The different DPLLs managed by the PRCM are listed below:

- DPLL_MPU: It supplies the MPU subsystem clocking internally.
- DPLL_IVA: It feeds the IVA subsystem clocking.
- DPLL_CORE: It supplies all interface clocks and also few module functional clocks.
- DPLL_PER: It supplies several clock sources: a 192-MHz clock for the display functional clock, a 96-MHz functional clock to subsystems and peripherals.
- DPLL_ABE: It provides clocks to various modules within the device.
- DPLL_USB: It provides 960M clock for USB modules (USB1/2/3/4).
- DPLL_GMAC: It supplies several clocks for the Gigabit Ethernet Switch (GMAC_SW).
- DPLL_DSP: It feeds the DSP Subsystem clocking.
- DPLL_GPU: It supplies clock for the GPU Subsystem.
- DPLL_DDR: It generates clocks for the two External Memory Interface (EMIF) controllers and their associated EMIF PHYs.
- DPLL_PCIE_REF: It provides reference clock for the APLL_PCIE in PCIE Subsystem.
- APLL_PCIE: It feeds clocks for the device Peripheral Component Interconnect Express (PCIe) controllers.

NOTE

The following DPLLs are controlled by the clock manager located in the always-on Core power domain (CM_CORE_AON):

- DPLL_MPU, DPLL_IVA, DPLL_CORE, DPLL_ABE, DPLL_DDR, DPLL_GMAC, DPLL_PCIE_REF, DPLL_PER, DPLL_USB, DPLL_DSP, DPLL_GPU, APLL_PCIE_REF.
-

For more information on CM_CORE_AON and CM_CORE or PRCM DPLLs, see *Power, Reset, and Clock Management* chapter in the device TRM.

The following DPLLs are not managed by the PRCM:

- DPLL_VIDEO1; (It is controlled from DSS)

- DPLL_HDMI; (It is controlled from DSS)
- DPLL_SATA; (It is controlled from SATA)
- DPLL_DEBUG; (It is controlled from DEBUGSS)
- DPLL_USB_OTG_SS; (It is controlled from OCP2SCP1)

NOTE

For more information for not controlled from PRCM DPLL's see the related chapters in TRM.

6.2.1 DPLL Characteristics

The DPLL has three relevant input clocks. One of them is the reference clock (CLKINP) used to generated the synthesized clock but can also be used as the bypass clock whenever the DPLL enters a bypass mode. It is therefore mandatory. The second one is a fast bypass clock (CLKINPULOW) used when selected as the bypass clock and is optional. The third clock (CLKINPHIF) is explained in the next paragraph.

The DPLL has three output clocks (namely CLKOUT, CLKOUTX2, and CLKOUTHIF). CLKOUT and CLKOUTX2 run at the bypass frequency whenever the DPLL enters a bypass mode. Both of them are generated from the lock frequency divided by a post-divider (namely M2 post-divider). The third clock, CLKOUTHIF, has no automatic bypass capability. It is an output of a post-divider (M3 post-divider) with the input clock selectable between the internal lock clock (Fdpll) and CLKINPHIF input of the PLL through an asynchronous multiplexing.

For more information, see *Power, Reset, and Clock Management* chapter in the device TRM.

7 Timing Requirements and Switching Characteristics

7.1 Timing Test Conditions

All timing requirements and switching characteristics are valid over the recommended operating conditions unless otherwise specified.

7.2 Interface Clock Specifications

7.2.1 Interface Clock Terminology

The interface clock is used at the system level to sequence the data and/or to control transfers accordingly with the interface protocol.

7.2.2 Interface Clock Frequency

The two interface clock characteristics are:

- The maximum clock frequency
- The maximum operating frequency

The interface clock frequency documented in this document is the maximum clock frequency, which corresponds to the maximum frequency programmable on this output clock. This frequency defines the maximum limit supported by the Device IC and does not take into account any system consideration (PCB, peripherals).

The system designer will have to consider these system considerations and the Device IC timing characteristics as well to define properly the maximum operating frequency that corresponds to the maximum frequency supported to transfer the data on this interface.

7.3 Timing Parameters and Information

The timing parameter symbols used in the timing requirement and switching characteristic tables are created in accordance with JEDEC Standard 100. To shorten the symbols, some of pin names and other related terminologies have been abbreviated as follows:

Table 7-1. Timing Parameters

SUBSCRIPTS	
SYMBOL	PARAMETER

7.3.1 Parameter Information

NOTE: The data sheet provides timing at the device pin. For output timing analysis, the tester pin electronics and its transmission line effects must be taken into account. A transmission line with a delay of 2 ns can be used to produce the desired transmission line effect. The transmission line is intended as a load only. It is not necessary to add or subtract the transmission line delay (2 ns) from the data sheet timings.

Input requirements in this data sheet are tested with an input slew rate of < 4 Volts per nanosecond (4 V/ns) at the device pin.

pm_tstcirc_prs403

Figure 7-1. Test Load Circuit for AC Timing Measurements

The load capacitance value stated is only for characterization and measurement of AC timing signals.

This load capacitance value does not indicate the maximum load the device is capable of driving.

7.3.1.1 1.8V and 3.3V Signal Transition Levels

All input and output timing parameters are referenced to V_{ref} for both "0" and "1" logic levels. $V_{ref} = (V_{DD} I/O)/2$.

pm_io_volt_prs403

Figure 7-2. Input and Output Voltage Reference Levels for AC Timing Measurements

All rise and fall transition timing parameters are referenced to $V_{IL} MAX$ and $V_{IH} MIN$ for input clocks, $V_{OL} MAX$ and $V_{OH} MIN$ for output clocks.

Figure 7-3. Rise and Fall Transition Time Voltage Reference Levels

7.3.1.2 1.8V and 3.3V Signal Transition Rates

The default SLEWCONTROL settings in each pad configuration register must be used to ensure timings, unless specific instructions otherwise are given in the individual timing sub-sections of the datasheet.

All timings are tested with an input edge rate of 4 volts per nanosecond (4 V/ns).

7.3.1.3 Timing Parameters and Board Routing Analysis

The timing parameter values specified in this data manual do not include delays by board routes. As a good board design practice, such delays must always be taken into account. Timing values may be adjusted by increasing/decreasing such delays. TI recommends using the available I/O buffer information specification (IBIS) models to analyze the timing characteristics correctly. To properly use IBIS models to attain accurate timing analysis for a given system, see the [Using IBIS Models for timing Analysis](#). If needed, external logic hardware such as buffers may be used to compensate any timing differences.

7.4 Recommended Clock and Control Signal Transition Behavior

All clocks and control signals must transition between V_{IH} and V_{IL} (or between V_{IL} and V_{IH}) in a monotonic manner. Monotonic transitions are more easily ensured with faster switching signals. Slower input transitions are more susceptible to glitches due to noise and special care should be taken for slow input clocks.

7.5 Virtual and Manual I/O Timing Modes

Some of the timings described in the following sections require the use of Virtual or Manual I/O Timing Modes. [Table 7-2](#) provides a summary of the Virtual and Manual I/O Timing Modes across all device interfaces. The individual interface timing sections found later in this document provide the full description of each applicable Virtual and Manual I/O Timing Mode. Refer to the "Pad Configuration" section of the TRM for the procedure on implementing the Virtual and Manual Timing Modes in a system.

7.6 Video Input Ports (VIP)

The Device includes 1 Video Input Ports (VIP)

Table 7-3, Figure 7-4 and Figure 7-5 present timings and switching characteristics of the VIPs.

CAUTION

The I/O timings provided in this section are valid only for VIN1 and VIN2 if signals within a single IOSET are used. The IOSETs are defined in Table 7-4 and Table 7-5.

Table 7-3. Timing Requirements for VIP (3)(4)(5)

NO.	PARAMETER	DESCRIPTION	MIN	MAX	UNIT
V1	$t_{c(CLK)}$	Cycle time, $vinx_clki$ (3) (5)	6.06 (2)		ns
V2	$t_{w(CLKH)}$	Pulse duration, $vinx_clki$ high (3) (5)	0.45*P (2)		ns
V3	$t_{w(CLKL)}$	Pulse duration, $vinx_clki$ low (3) (5)	0.45*P (2)		ns
V4	$t_{su(CTL/DATA-CLK)}$	Input setup time, Control ($vinx_dei$, $vinx_vsynci$, $vinx_fdi$, $vinx_hsynci$) and Data ($vinx_dn$) valid to $vinx_clki$ transition (3) (4) (5)	3.11 (2)		ns
V6	$t_{h(CLK-CTL/DATA)}$	Input hold time, Control ($vinx_dei$, $vinx_vsynci$, $vinx_fdi$, $vinx_hsynci$) and Data ($vinx_dn$) valid from $vinx_clki$ transition (3) (4) (5)	-0.05 (2)		ns

- (1) For maximum frequency of 165 MHz.
- (2) P = $vinx_clki$ period.
- (3) x in $vinx$ = 1a, 1b, 2a, 2b.
- (4) n in dn = 0 to 7 when x = 1b, 2b.
n = 0 to 23 when x = 1a, 2a.
- (5) i in $clki$, dei , $vsynci$, $hsynci$ and fdi = 0 or 1.

These alternate functions are controlled via CTRL_CORE_VIP_MUX_SELECT register. For more information on how to use these options, see *Pad Configuration Registers* section, *Control Module* chapter in the device TRM.

NOTE

To configure the desired Manual IO Timing Mode the user must follow the steps described in section "*Manual IO Timing Modes*" in the device TRM.

The associated registers to configure are listed in the **CFG REGISTER** column. For more information, see *Control Module* chapter in the device TRM.

Manual IO Timings Modes must be used to ensure some IO timings for VIP1. See [Table 7-2 Modes Summary](#) for a list of IO timings requiring the use of Manual IO Timings Modes. See *Manual Functions Mapping for VIP1 1A IOSET7 and 2A IOSET10* for a definition of the Manual modes.

[Table 7-6](#) lists the A_DELAY and G_DELAY values needed to calculate the correct values to be set in the CFG_x registers.

(1) Some signals listed are manual functions that present alternate multiplexing options. These manual functions are controlled via CTRL_CORE_ALT_SELECT_MUX or CTRL_CORE_VIP_MUX_SELECT registers. For more information on how to use these options, see *Pad Configuration Registers* section, *Control Module* chapter in the device TRM.

Manual IO Timings Modes must be used to ensure some IO timings for VIP1. See [Table 7-2 Modes Summary](#) for a list of IO timings requiring the use of Manual IO Timings Modes. See [Table 7-10 Manual Functions Mapping for VIN1A \(IOSET5/6\) and VIN2A \(IOSET7/8/9\)](#) for a definition of the Manual modes.

[Table 7-10](#) lists the A_DELAY and G_DELAY values needed to calculate the correct values to be set in the CFG_x registers.

7.7 Display Subsystem - Video Output Ports

Three Display Parallel Interfaces (DPI) channels are available in DSS named DPI Video Output 1, DPI Video Output 2 and DPI Video Output 3.

NOTE

The DPI Video Output i ($i = 1$ to 3) interface is also referred to as VOUT i .

Every VOUT interface consists of:

- 24-bit data bus (data[23:0])
- Horizontal synchronization signal (HSYNC)
- Vertical synchronization signal (VSYNC)
- Data enable (DE)
- Field ID (FID)
- Pixel clock (CLK)

NOTE

For more information, see *Display Subsystem* chapter in the device TRM.

NOTE

VOUT1, VOUT2 and VOUT3 only qualified for use at 1.8 V.

CAUTION

The I/O Timings provided in this section are valid only if signals within a single IOSET are used. The IOSETs are defined in [Table 7-18](#).

CAUTION

The I/O Timings provided in this section are valid only for some DSS usage modes when the corresponding Virtual I/O Timings or Manual I/O Timings are configured as described in the tables found in this section.

CAUTION

All pads/balls configured as vout $_i$ signals must be programmed to use slow slew rate by setting the corresponding CTRL_CORE_PAD_ $_i$ [SLEWCONTROL] register field to SLOW (0b1).

[Table 7-14](#) through [Table 7-17](#), and [Figure 7-6](#) assume testing over the recommended operating conditions and electrical characteristic conditions.

NOTE

To configure the desired virtual mode the user must set MODESELECT bit and DELAYMODE bit field for each corresponding pad control register.

The pad control registers are presented in [Table 4-3](#) and described in Device TRM, *Control Module Chapter*.

Virtual IO Timings Modes must be used to ensure some IO timings for VOUT1. See [Table 7-2 Modes Summary](#) for a list of IO timings requiring the use of Virtual IO Timings Modes. See [Table 7-19 Virtual Functions Mapping for VOUT1](#) for a definition of the Virtual modes.

[Table 7-19](#) presents the values for DELAYMODE bit field.

NOTE

To configure the desired Manual IO Timing Mode the user must follow the steps described in section "Manual IO Timing Modes" in the device TRM.

The associated registers to configure are listed in the **CFG REGISTER** column. For more information, see *Control Module* chapter in the device TRM.

Manual IO Timings Modes must be used to ensure some IO timings for VOUT1. See [Table 7-2 Modes Summary](#) for a list of IO timings requiring the use of Manual IO Timings Modes. See [Table 7-20 Manual Functions Mapping for DSS VOUT1](#) for a definition of the Manual modes.

7.8 Display Subsystem - High-Definition Multimedia Interface (HDMI)

The High-Definition Multimedia Interface is provided for transmitting digital television audiovisual signals from DVD players, set-top boxes and other audiovisual sources to television sets, projectors and other video displays. The HDMI interface is aligned with the HDMI TMDS single stream standard v1.4a (720p @60Hz to 1080p @24Hz) and the HDMI v1.3 (1080p @60Hz): 3 data channels, plus 1 clock channel is supported (differential).

NOTE

For more information, see *High-Definition Multimedia Interface* section in the device TRM

7.9 Camera Serial Interface 2 CAL bridge (CSI2)

NOTE

For more information, see *Camera Interface Subsystem* chapter in the device TRM

The camera adaptation layer (CAL) deals with the processing of the pixel data coming from an external image sensor, data from memory. The CAL is a key component for the following multimedia applications: camera viewfinder, video record, and still image capture. The CAL has two serial camera interfaces (primary and secondary):

- The primary serial interface (CSI2 Port A) is compliant with MIPI CSI-2 protocol with four data lanes.
- The secondary serial interface (CSI2 Port B) is compliant with MIPI CSI-2 protocol with two data lanes.

7.9.1 CSI-2 MIPI D-PHY

The CSI-2 port A is compliant with the MIPI D-PHY RX specification v1.00.00 and the MIPI CSI-2 specification v1.00, with 4 data differential lanes plus 1 clock differential lane in synchronous mode, double data rate:

- 1.5 Gbps (750 MHz) @OPP_NOM for each lane.

The CSI-2 port B is compliant with the MIPI D-PHY RX specification v1.00.00 and the MIPI CSI-2 specification v1.00, with 2 data lanes plus 1 clock lane (differential) in synchronous mode, double data rate:

- 1.5 Gbps (750 MHz) @OPP_NOM for each lane, in synchronous mode.

7.10 External Memory Interface (EMIF)

The device has a dedicated interface to DDR3 and DDR3L SDRAM. It supports JEDEC standard compliant DDR3 and DDR3L SDRAM devices with the following features:

- 16-bit or 32-bit data path to external SDRAM memory
- Memory device capacity: 128Mb, 256Mb, 512Mb, 1Gb, 2Gb, 4Gb and 8Gb devices
- One interface with associated DDR3/DDR3L PHYs

NOTE

For more information, see *EMIF Controller* section in the device TRM.

7.11 General-Purpose Memory Controller (GPMC)

The GPMC is the unified memory controller that interfaces external memory devices such as:

- Asynchronous SRAM-like memories and ASIC devices
- Asynchronous page mode and synchronous burst NOR flash
- NAND flash

NOTE

For more information, see *General-Purpose Memory Controller* section in the device TRM.

7.11.1 GPMC/NOR Flash Interface Synchronous Timing

CAUTION

The I/O Timings provided in this section are valid only for some GPMC usage modes when the corresponding Virtual I/O Timings or Manual I/O Timings are configured as described in the tables found in this section.

Table 7-24 and Table 7-25 assume testing over the recommended operating conditions and electrical characteristic conditions below (see Figure 7-7, Figure 7-8, Figure 7-9, Figure 7-10, Figure 7-11 and Figure 7-12).

NOTE

To configure the desired virtual mode the user must set MODESELECT bit and DELAYMODE bit field for each corresponding pad control register.

The pad control registers are presented in [Table 4-3](#) and described in Device TRM, *Control Module* Chapter.

Virtual IO Timings Modes must be used to ensure some IO timings for GPMC. See [Table 7-2 Modes Summary](#) for a list of IO timings requiring the use of Virtual IO Timings Modes. See [Table 7-32 Virtual Functions Mapping for GPMC](#) for a definition of the Virtual modes.

[Table 7-32](#) presents the values for DELAYMODE bit field.

- (1) Some signals listed are virtual functions that present alternate multiplexing options. These virtual functions are controlled via CTRL_CORE_ALT_SELECT_MUX or CTRL_CORE_VIP_MUX_SELECT registers. For more information on how to use these options, see *Pad Configuration Registers* section, *Control Module* chapter in the device TRM.

7.12 Timers

The device has 16 general-purpose (GP) timers (TIMER1 - TIMER16), two watchdog timers, and a 32-kHz synchronized timer (COUNTER_32K) that have the following features:

- Dedicated input trigger for capture mode and dedicated output trigger/pulse width modulation (PWM) signal
- Interrupts generated on overflow, compare, and capture
- Free-running 32-bit upward counter
- Supported modes:
 - Compare and capture modes
 - Auto-reload mode
 - Start-stop mode
- On-the-fly read/write register (while counting)

The device has two system watchdog timer (WD_TIMER1 and WD_TIMER2) that have the following features:

- Free-running 32-bit upward counter
- On-the-fly read/write register (while counting)
- Reset upon occurrence of a timer overflow condition

WD_TIMER2 is available in all devices as a system watchdog timer. WD_TIMER1 is only supported in security enabled devices.

The watchdog timer is used to provide a recovery mechanism for the device in the event of a fault condition, such as a non-exiting code loop.

NOTE

For additional information on the Timer Module, see the Device TRM.

7.13 Inter-Integrated Circuit Interface (I2C)

The device includes 5 inter-integrated circuit (I2C) modules which provide an interface to other devices compliant with Philips Semiconductors Inter-IC bus (I2C) specification version 2.1. External components attached to this 2-wire serial bus can transmit/receive 8-bit data to/from the device through the I2C module.

NOTE

Note that, on I2C1 and I2C2, due to characteristics of the open drain IO cells, HS mode is not supported.

NOTE

Inter-integrated circuit *i* (*i*=1 to 5) module is also referred to as I2Ci.

NOTE

For more information, see *Multimaster High Speed I2C Controller* section in the device TRM.

- (1) The I2C pins SDA and SCL do not feature fail-safe I/O buffers. These pins could potentially draw current when the device is powered down.
- (2) A Fast-mode I2C device can be used in a Standard-mode I2C system, but the requirement $t_{su(SDA-SCLH)} \geq 250$ ns must then be met. This will automatically be the case if the device does not stretch the LOW period of the SCL signal. If such a device does stretch the LOW period of the SCL signal, it must output the next data bit to the SDA line $t_r \text{ max} + t_{su(SDA-SCLH)} = 1000 + 250 = 1250$ ns (according to the Standard-mode I2C Specification) before the SCL line is released.
- (3) A device must internally provide a hold time of at least 300 ns for the SDA signal (referred to the V_{IHmin} of the SCL signal) to bridge the undefined region of the falling edge of SCL.
- (4) The maximum $t_{h(SDA-SCLL)}$ has only to be met if the device does not stretch the low period [$t_{w(SCLL)}$] of the SCL signal.
- (5) C_b = total capacitance of one bus line in pF. If mixed with HS-mode devices, faster fall-times are allowed.

- (1) I2C HS-Mode is only supported on I2C3/4/5. I2C HS-Mode is not supported on I2C1/2.
- (2) For bus line loads C_b between 100 and 400 pF the timing parameters must be linearly interpolated.
- (3) A device must internally provide a Data hold time to bridge the undefined part between V_{IH} and V_{IL} of the falling edge of the SCLH signal. An input circuit with a threshold as low as possible for the falling edge of the SCLH signal minimizes this hold time.

- (1) C_b = total capacitance of one bus line in pF. If mixed with HS-mode devices, faster fall-times are allowed.
- (2) Software must properly configure the I2C module registers to achieve the required timing parameters. For more information, see *Multimaster High Speed I2C Controller* section in the device TRM.
- (3) These timings apply only to I2C1 and I2C2. I2C3, I2C4, and I2C5 use standard LVCMOS buffers to emulate open-drain buffers and their rise/fall times should be referenced in the device IBIS model.

NOTE

I2C emulation is achieved by configuring the LVCMOS buffers to output Hi-Z instead of driving high when transmitting logic-1.

7.14 HDQ / 1-Wire Interface (HDQ1W)

The module is intended to work with both HDQ and 1-Wire protocols. The protocols use a single wire to communicate between the master and the slave. The protocols employ an asynchronous return to one mechanism where, after any command, the line is pulled high.

NOTE

For more information, see *HDQ/1-Wire* section in the device TRM.

7.15 Universal Asynchronous Receiver Transmitter (UART)

The UART performs serial-to-parallel conversions on data received from a peripheral device and parallel-to-serial conversion on data received from the CPU. There are 10 UART modules in the device. Only one UART supports IrDA features. Each UART can be used for configuration and data exchange with a number of external peripheral devices or interprocessor communication between devices

The UART_i (where $i = 1$ to 10) include the following features:

- 16C750 compatibility

- 64-byte FIFO buffer for receiver and 64-byte FIFO for transmitter
- Baud generation based on programmable divisors N (where N = 1...16 384) operating from a fixed functional clock of 48 MHz or 192 MHz
- Break character detection and generation
- Configurable data format:
 - Data bit: 5, 6, 7, or 8 bits
 - Parity bit: Even, odd, none
 - Stop-bit: 1, 1.5, 2 bit(s)
- Flow control: Hardware (RTS/CTS) or software (XON/XOFF)
- Only UART1 module has extended modem control signals (CD, RI, DTR, DSR)
- Only UART3 supports IrDA

NOTE

For more information, see *UART/IrDA/CIR* section in the device TRM.

7.16 Multichannel Serial Peripheral Interface (McSPI)

The McSPI is a master/slave synchronous serial bus. There are four separate McSPI modules (SPI1, SPI2, SPI3, and SPI4) in the device. All these four modules support up to four external devices (four chip selects) and are able to work as both master and slave.

The McSPI modules include the following main features:

- Serial clock with programmable frequency, polarity, and phase for each channel
- Wide selection of SPI word lengths, ranging from 4 to 32 bits
- Up to four master channels, or single channel in slave mode
- Master multichannel mode:
 - Full duplex/half duplex
 - Transmit-only/receive-only/transmit-and-receive modes
 - Flexible input/output (I/O) port controls per channel
 - Programmable clock granularity
 - SPI configuration per channel. This means, clock definition, polarity enabling and word width
- Power management through wake-up capabilities
- Programmable timing control between chip select and external clock generation
- Built-in FIFO available for a single channel.
- Each SPI module supports multiple chip select pins `spim_cs[i]`, where $i = 1$ to 4.

NOTE

For more information, see *Multichannel Serial Peripheral Interface* section in the device TRM.

NOTE

The McSPIm module ($m = 1$ to 4) is also referred to as SPIm.

CAUTION

The I/O timings provided in this section are applicable for all combinations of signals for SPI1 and SPI2. However, the timings are valid only for SPI3 and SPI4 if signals within a single IOSET are used. The IOSETS are defined in [Table 7-44](#).

[Table 7-42](#), [Figure 7-33](#) and [Figure 7-34](#) present Timing Requirements for McSPI - Master Mode.

(1) This timing applies to all configurations regardless of SPI_CLK polarity and which clock edges are used to drive output data and capture input data.

(2) Related to the SPI_CLK maximum frequency.

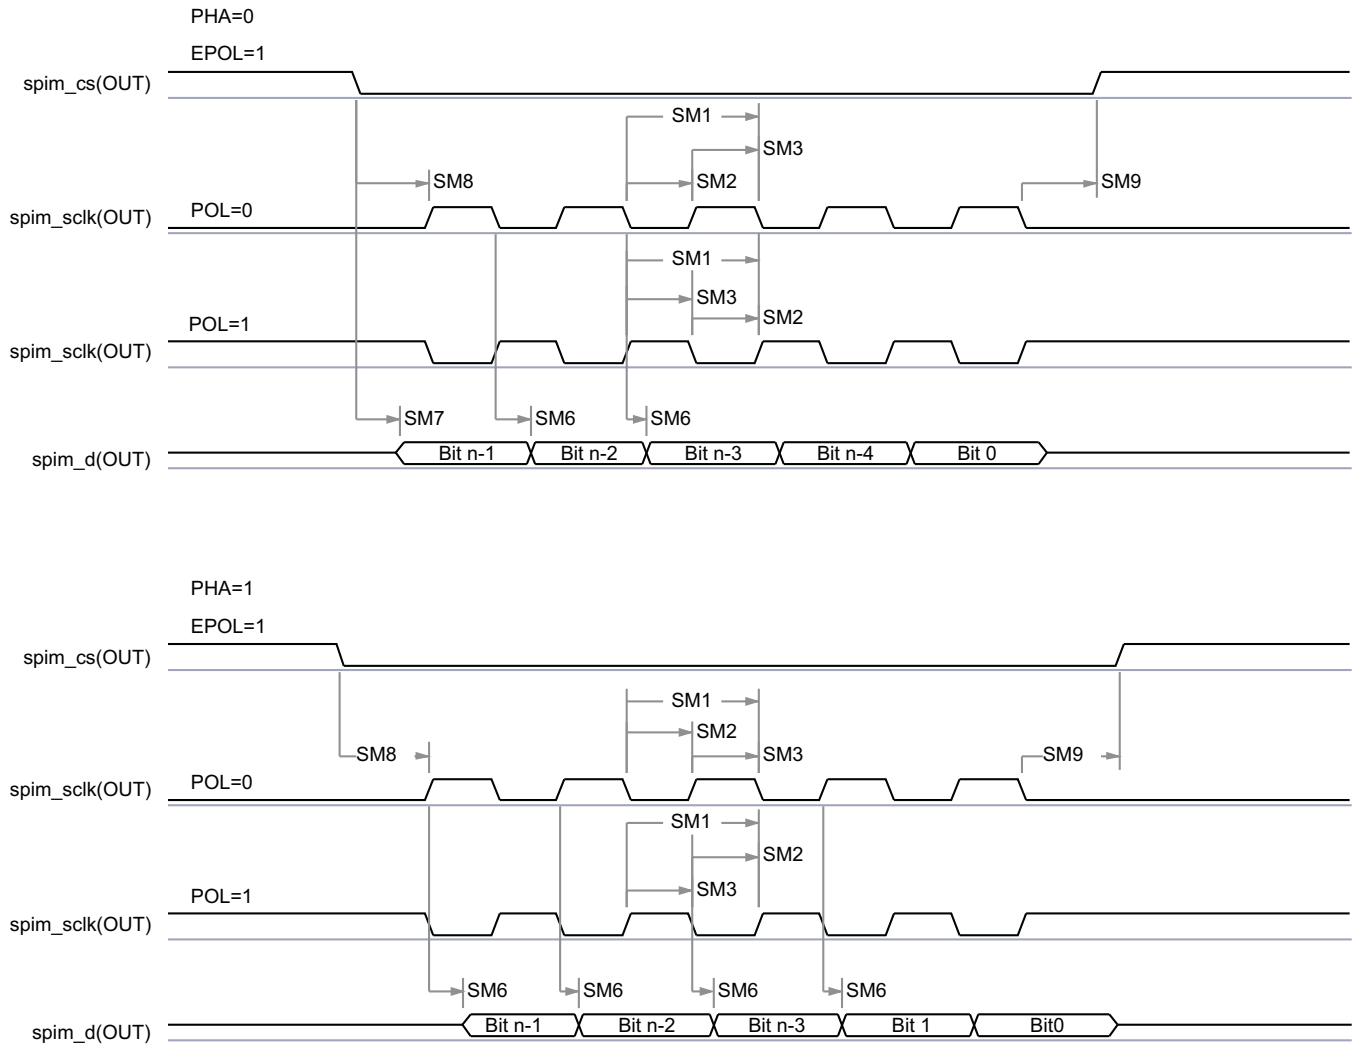

(3) 20.8ns cycle time = 48MHz

(4) P = SPICLK period.

(5) SPI_CLK phase is programmable with the PHA bit of the SPI_CH(i)CONF register.

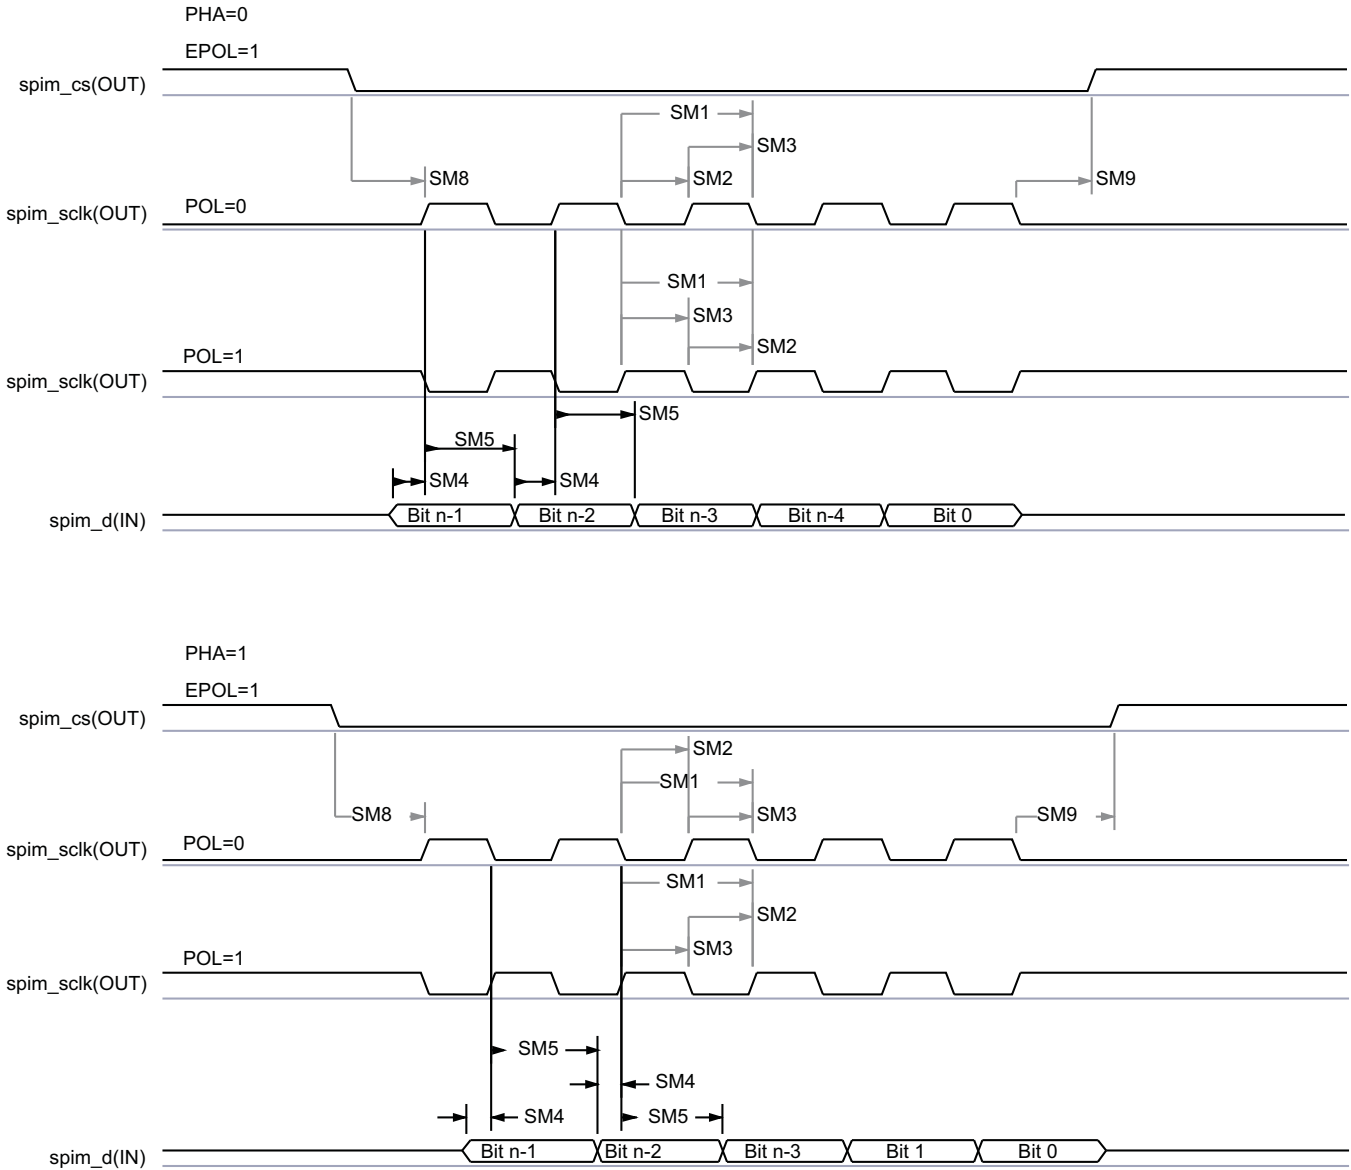

(6) $B = (TCS + 0.5) * TSPICLKREF * Fratio$, where TCS is a bit field of the SPI_CH(i)CONF register and Fratio = Even ≥ 2 .

(7) When P = 20.8 ns, $A = (TCS + 1) * TSPICLKREF$, where TCS is a bit field of the SPI_CH(i)CONF register. When P > 20.8 ns, $A = (TCS + 0.5) * Fratio * TSPICLKREF$, where TCS is a bit field of the SPI_CH(i)CONF register.

7.17 Quad Serial Peripheral Interface (QSPI)

The Quad SPI (QSPI) module is a type of SPI module that allows single, dual or quad read access to external SPI devices. This module has a memory mapped register interface, which provides a direct interface for accessing data from external SPI devices and thus simplifying software requirements. It works as a master only. There is one QSPI module in the device and it is primary intended for fast booting from quad-SPI flash memories.

General SPI features:

- Programmable clock divider
- Six pin interface (DCLK, CS_N, DOUT, DIN, QDIN1, QDIN2)
- 4 external chip select signals
- Support for 3-, 4- or 6-pin SPI interface
- Programmable CS_N to DOUT delay from 0 to 3 DCLKs
- Programmable signal polarities
- Programmable active clock edge
- Software controllable interface allowing for any type of SPI transfer

NOTE

For more information, see *Quad Serial Peripheral Interface* section in the device TRM.

CAUTION

The IO Timings provided in this section are only valid when all QSPI Chip Selects used in a system are configured to use the same Clock Mode (either Clock Mode 0 or Clock Mode 3).

CAUTION

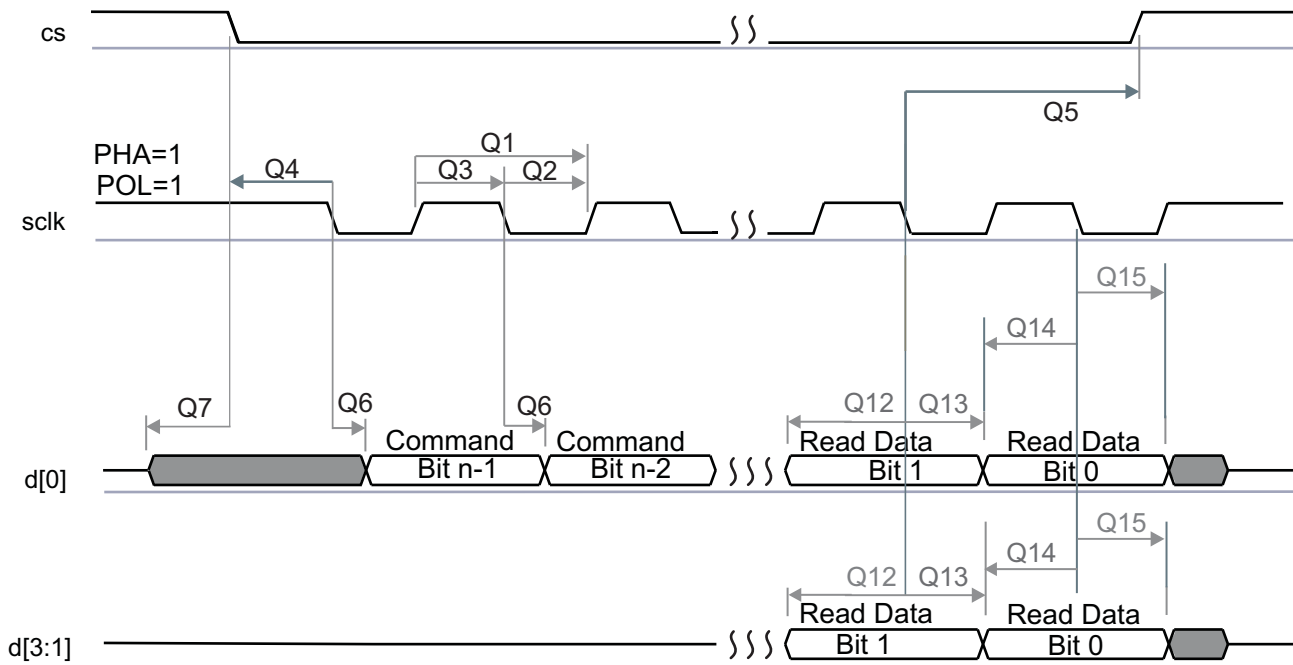

The I/O Timings provided in this section are valid only for some QSPI usage modes when the corresponding Virtual I/O Timings or Manual I/O Timings are configured as described in the tables found in this section.

- (1) The Y parameter is defined as follows:
 If DCLK_DIV is 0 or ODD then, Y equals 0.5.
 If DCLK_DIV is EVEN then, Y equals (DCLK_DIV/2) / (DCLK_DIV+1).
 For best performance, it is recommended to use a DCLK_DIV of 0 or ODD to minimize the duty cycle distortion. The HSDIVIDER on CLKOUTX2_H13 output of DPLL_PER can be used to achieve the desired clock divider ratio. All required details about clock division factor DCLK_DIV can be found in the device-specific Technical Reference Manual.
- (2) P = SCLK period.
- (3) M=QSPI_SPI_DC_REG.DDx + 1 when Clock Mode 0.
 M=QSPI_SPI_DC_REG.DDx when Clock Mode 3.
 N = 2 when Clock Mode 0.
 N = 3 when Clock Mode 3.

- (1) P = SCLK period.
- (2) Clock Modes 1 and 2 are not supported.
- (3) The Device captures data on the falling clock edge in Clock Mode 0 and 3, as opposed to the traditional rising clock edge. Although non-standard, the falling-edge-based setup and hold time timings have been designed to be compatible with standard SPI devices that launch data on the falling edge in Clock Modes 0 and 3.

CAUTION

The I/O Timings provided in this section are valid only for some QSPI usage modes when the corresponding Virtual I/O Timings or Manual I/O Timings are configured as described in the tables found in this section.

NOTE

To configure the desired Manual IO Timing Mode the user must follow the steps described in section Manual IO Timing Modes of the Device TRM.

The associated registers to configure are listed in the **CFG REGISTER** column. For more information see *Control Module* chapter in the device TRM.

Manual IO Timings Modes must be used to ensure some IO timings for QSPI. See [Table 7-2 Modes Summary](#) for a list of IO timings requiring the use of Manual IO Timings Modes. See [Table 7-47 Manual Functions Mapping for QSPI](#) for a definition of the Manual modes.

[Table 7-47](#) lists the A_DELAY and G_DELAY values needed to calculate the correct values to be set in the CFG_x registers.

7.18 Multichannel Audio Serial Port (McASP)

The multichannel audio serial port (McASP) functions as a general-purpose audio serial port optimized for the needs of multichannel audio applications. The McASP is useful for time-division multiplexed (TDM) stream, Inter-Integrated Sound (I2S) protocols, and intercomponent digital audio interface transmission (DIT).

The device have integrated 8 McASP modules (McASP1-McASP8) with:

- McASP1 and McASP2 modules supporting 16 channels with independent TX/RX clock/sync domain
- McASP3 through McASP8 modules supporting 4 channels with independent TX/RX clock/sync domain
- The McASP1 is instantiated in IPU power domain
- McASP2 through McASP8 are part of the L4_PER2 peripheral power domain

NOTE

For more information, see *Multichannel Audio Serial Port* section in the device TRM.

CAUTION

The I/O Timings provided in this section are valid only for some McASP usage modes when the corresponding Virtual I/O Timings or Manual I/O Timings are configured as described in the tables found in this section.

NOTE

To configure the desired virtual mode the user must set MODESELECT bit and DELAYMODE bit field for each corresponding pad control register.

The pad control registers are presented in [Table 4-3](#) and described in Device TRM, *Control Module* Chapter.

CAUTION

The I/O Timings provided in this section are valid only for some McASP usage modes when the corresponding Virtual I/O Timings or Manual I/O Timings are configured as described in the tables found in this section.

Virtual IO Timings Modes must be used to ensure some IO timings for McASP1. See [Table 7-2, Modes Summary](#) for a list of IO timings requiring the use of Virtual IO Timings Modes. See [Table 7-62, Virtual Functions Mapping for McASP1](#) for a definition of the Virtual modes.

[Table 7-62](#) presents the values for DELAYMODE bit field.

7.19 Universal Serial Bus (USB)

SuperSpeed USB DRD Subsystem has four instances in the device providing the following functions:

- USB1: SuperSpeed (SS) USB 3.0 Dual-Role-Device (DRD) subsystem with integrated SS (USB3.0) PHY and HS/FS (USB2.0) PHY.
- USB2: High Speed (HS) USB 2.0 Dual-Role-Device (DRD) subsystem with integrated HS/FS PHY.

NOTE

For more information, see *SuperSpeed USB DRD* section in the device TRM.

7.19.1 USB1 DRD PHY

The USB1 DRD interface supports the following applications:

- USB2.0 High Speed PHY port (1.8 V and 3.3 V): this asynchronous high speed interface is compliant with the USB2.0 PHY standard with an internal transceiver (USB2.0 standard v2.0), for a maximum data rate of 480 Mbps.
- USB3.0 SuperSpeed PHY port (1.8 V): this asynchronous differential super speed interface is compliant with the USB3.0 RX/TX PHY standard (USB3.0 standard v1.0) for a maximum data bit rate of 5Gbps.

7.19.2 USB2 PHY

The USB2 interface supports the following applications:

- USB2.0 High Speed PHY port (1.8 V and 3.3 V): this asynchronous high speed interface is compliant with the USB2.0 PHY standard with an internal transceiver (USB2.0 standard v2.0), for a maximum data rate of 480 Mbps.

7.20 Serial Advanced Technology Attachment (SATA)

The SATA RX/TX PHY interface is compliant with the SATA standard v2.6 for a maximum data rate:

- Gen2i, Gen2m, Gen2x: 3Gbps.
- Gen1i, Gen1m, Gen1x: 1.5Gbps.

NOTE

For more information, see *SATA Controller* section in the device TRM.

7.21 Peripheral Component Interconnect Express (PCIe)

The device supports connections to PCIe-compliant devices via the integrated PCIe master/slave bus interface. The PCIe module is comprised of a dual-mode PCIe core and a SerDes PHY. Each PCIe subsystem controller has support for PCIe Gen-II mode (5.0 Gbps /lane) and Gen-I mode (2.5 Gbps/lane) (Single Lane and Flexible dual lane configuration).

The device PCIe supports the following features:

- 16-bit operation @250 MHz on PIPE interface (per 16-bit lane)
- Supports 2 ports x 1 lane or 1 port x 2 lanes configuration
- Single virtual channel (VC0), single traffic class (TC0)
- Single function in end-point mode
- Automatic width and speed negotiation
- Max payload: 128 byte outbound, 256 byte inbound
- Automatic credit management

- ECRC generation and checking
- Configurable BAR filtering
- Legacy interrupt reception (RC) and generation (EP)
- MSI generation and reception
- PCI-Express Active State Power Management (ASPM) state L0s and L1 (with exceptions)
- All PCI Device Power Management D-states with the exception of D3_{cold} / L2 state

The PCIe controller on this device conforms to the PCI-Express Base 3.0 Specification, revision 1.0 and the PCI Local Bus Specification, revision 3.0

NOTE

For more information, see *PCIe Controller* section in the device TRM.

7.22 Controller Area Network Interface (DCAN)

The device provides two DCAN interfaces for supporting distributed realtime control with a high level of security. The DCAN interfaces implement the following features:

- Supports CAN protocol version 2.0 part A, B
- Bit rates up to 1 MBit/s
- 64 message objects
- Individual identifier mask for each message object
- Programmable FIFO mode for message objects
- Programmable loop-back modes for self-test operation
- Suspend mode for debug support
- Software module reset
- Automatic bus on after Bus-Off state by a programmable 32-bit timer
- Direct access to Message RAM during test mode
- CAN Rx/Tx pins are configurable as general-purpose IO pins
- Two interrupt lines (plus additional parity-error interrupts line)
- RAM initialization
- DMA support

NOTE

For more information, see *DCAN* section in the device TRM.

NOTE

The Controller Area Network Interface x (x = 1 to 2) is also referred to as DCANx.

NOTE

Refer to the CAN Specification for calculations necessary to validate timing compliance. Jitter tolerance calculations must be performed to validate the implementation.

[Table 7-65](#) and [Table 7-66](#) present timing and switching characteristics for DCANx Interface.

Table 7-65. Timing Requirements for DCANx Receive

NO.	PARAMETER	DESCRIPTION	MIN	NOM	MAX	UNIT
-	$f_{(\text{baud})}$	Maximum programmable baud rate			1	Mbps
-	$t_{d(\text{DCANRX})}$	Delay time, DCANx_RX pin to receive shift register			15	ns

Table 7-66. Switching Characteristics Over Recommended Operating Conditions for DCANx Transmit

NO.	PARAMETER	DESCRIPTION	MIN	MAX	UNIT
-	$f_{(\text{baud})}$	Maximum programmable baud rate		1	Mbps
-	$t_{d(\text{DCANTX})}$	Delay time, Transmit shift register to DCANx_TX pin ⁽¹⁾		23	ns

(1) These values do not include rise/fall times of the output buffer.

7.23 Ethernet Interface (GMAC_SW)

The three-port gigabit ethernet switch subsystem (GMAC_SW) provides ethernet packet communication and can be configured as an ethernet switch. It provides the Gigabit Media Independent Interface (G/MII) in MII mode, Reduced Gigabit Media Independent Interface (RGMII), Reduced Media Independent Interface (RMII), and the Management Data Input/Output (MDIO) for physical layer device (PHY) management.

NOTE

For more information, see *Gigabit Ethernet Switch (GMAC_SW)* section in the device TRM.

NOTE

The Gigabit, Reduced and Media Independent Interface n (n = 0 to 1) are also referred to as MII_n, RMII_n and RGMII_n.

CAUTION

The I/O timings provided in this section are valid only if signals within a single IOSET are used. The IOSETs are defined in [Table 7-71](#), [Table 7-74](#), [Table 7-79](#) and [Table 7-86](#).

CAUTION

The I/O Timings provided in this section are valid only for some GMAC usage modes when the corresponding Virtual I/O Timings or Manual I/O Timings are configured as described in the tables found in this section.

[Table 7-67](#) and [Figure 7-51](#) present timing requirements for MII_n in receive operation.

7.23.3 GMAC RMII Timings

The main reference clock REF_CLK (RMII_50MHZ_CLK) of RMII interface is internally supplied from PRCM. The source of this clock could be either externally sourced from the RMII_MHZ_50_CLK pin of the device or internally generated from DPLL_GMAC output clock GMAC_RMII_HS_CLK. Please see the PRCM chapter of the device TRM for full details about RMII reference clock.

CAUTION

The I/O Timings provided in this section are valid only for some GMAC usage modes when the corresponding Virtual I/O Timings or Manual I/O Timings are configured as described in the tables found in this section.

6	$t_{h(RXCH-RXD)}$	Hold time, receive selected signals valid after rgmiin_rxc high/low	RGMII0/1	1		ns

(1) For RGMII, receive selected signals include: rgmiin_rxd[3:0] and rgmiin_rxctl.

- A. rgmiin_rxc must be externally delayed relative to the data and control pins.
- B. Data and control information is received using both edges of the clocks. rgmiin_rxd[3:0] carries data bits 3-0 on the rising edge of rgmiin_rxc and data bits 7-4 on the falling edge of rgmiin_rxc. Similarly, rgmiin_rxctl carries RXDV on rising edge of rgmiin_rxc and RXERR on falling edge of rgmiin_rxc.

			RGMI11, Internal Delay Enabled, 1000 Mbps	1.05 (3)		ns
			RGMI11, Internal Delay Enabled, 10/100 Mbps	1.2		ns

- (1) For RGMII, transmit selected signals include: rgmiin_txd[3:0] and rgmiin_txctl.
- (2) RGMIIO requires that the 4 data pins rgmii0_txd[3:0] and rgmii0_txctl have their board propagation delays matched within 50pS of rgmii0_txc.
- (3) RGMII1 requires that the 4 data pins rgmii1_txd[3:0] and rgmii1_txctl have their board propagation delays matched within 50pS of rgmii1_txc.

SPRS906 TIMING GMAC RGMII TX 09

- A. TXC is delayed internally before being driven to the rgmiin_txc pin. This internal delay is always enabled.
- B. Data and control information is transmitted using both edges of the clocks. rgmiin_txd[3:0] carries data bits 3-0 on the rising edge of rgmiin_txc and data bits 7-4 on the falling edge of rgmiin_txc. Similarly, rgmiin_txctl carries TXEN on rising edge of rgmiin_txc and TXERR on falling edge of rgmiin_txc.

The eMMC/SD/SDIO_i (i = 1 to 4) controller is also referred to as MMC_i.

7.24.1 MMC1-SD Card Interface

MMC1 interface is compliant with the SD Standard v3.01 and it supports the following SD Card applications:

- Default speed, 4-bit data, SDR, half-cycle
- High speed, 4-bit data, SDR, half-cycle
- SDR12, 4-bit data, half-cycle
- SDR25, 4-bit data, half-cycle
- UHS-I SDR50, 4-bit data, half-cycle
- UHS-I SDR104, 4-bit data, half-cycle
- UHS-I DDR50, 4-bit data

NOTE

For more information, see *eMMC/SD/SDIO* chapter in the device TRM.

NOTE

To configure the desired virtual mode the user must set MODESELECT bit and DELAYMODE bit field for each corresponding pad control register.

The pad control registers are presented in Table 4-3 and described in Device TRM, Control Module Chapter.

Virtual IO Timings Modes must be used to ensure some IO timings for MMC1. See Table 7-2 Modes Summary for a list of IO timings requiring the use of Virtual IO Timings Modes. See Table 7-102 Virtual Functions Mapping for MMC1 for a definition of the Virtual modes.

Table 7-102 presents the values for DELAYMODE bit field.

NOTE

To configure the desired Manual IO Timing Mode the user must follow the steps described in section Manual IO Timing Modes of the Device TRM.

The associated registers to configure are listed in the CFG REGISTER column. For more information, see Control Module chapter in the device TRM.

Manual IO Timings Modes must be used to ensure some IO timings for MMC1. See Table 7-2 Modes Summary for a list of IO timings requiring the use of Manual IO Timings Modes. See Table 7-103 Manual Functions Mapping for MMC1 for a definition of the Manual modes.

NOTE

To configure the desired Manual IO Timing Mode the user must follow the steps described in section Manual IO Timing Modes of the Device TRM.

The associated registers to configure are listed in the **CFG REGISTER** column. For more information, see *Control Module* chapter in the device TRM.

Manual IO Timings Modes must be used to ensure some IO timings for MMC2. See [Table 7-2 Modes Summary](#) for a list of IO timings requiring the use of Manual IO Timings Modes. See [Table 7-112 Manual Functions Mapping for MMC2](#) for a definition of the Manual modes.

[Table 7-112](#) lists the A_DELAY and G_DELAY values needed to calculate the correct values to be set in the CFG_x registers.

7.24.3 MMC3 and MMC4-SDIO/SD

MMC3 and MMC4 interfaces are compliant with the SDIO3.0 standard v1.0, SD Part E1 and for generic SDIO devices, it supports the following applications:

- MMC3 8-bit data and MMC4 4-bit data, SD Default speed, SDR
- MMC3 8-bit data and MMC4 4-bit data, SD High speed, SDR
- MMC3 8-bit data and MMC4 4-bit data, UHS-1 SDR12 (SD Standard v3.01), 4-bit data, SDR, half cycle
- MMC3 8-bit data and MMC4 4-bit data, UHS-I SDR25 (SD Standard v3.01), 4-bit data, SDR, half cycle
- MMC3 8-bit data, UHS-I SDR50

NOTE

The eMMC/SD/SDIOj (j = 3 to 4) controller is also referred to as MMCj.

NOTE

For more information, see eMMC/SD/SDIO chapter in the device TRM.

NOTE

To configure the desired Manual IO Timing Mode the user must follow the steps described in section Manual IO Timing Modes of the Device TRM.

The associated registers to configure are listed in the **CFG REGISTER** column. For more information, see *Control Module* chapter in the device TRM.

Manual IO Timings Modes must be used to ensure some IO timings for MMC3. See [Table 7-2 Modes Summary](#) for a list of IO timings requiring the use of Manual IO Timings Modes. See [Table 7-131 Manual Functions Mapping for MMC3](#) for a definition of the Manual modes.

NOTE

To configure the desired virtual mode the user must set MODESELECT bit and DELAYMODE bit field for each corresponding pad control register.

The pad control registers are presented in [Table 4-3](#) and described in Device TRM, *Control Module* Chapter.

7.25 General-Purpose Interface (GPIO)

The general-purpose interface combines eight general-purpose input/output (GPIO) banks. Each GPIO module provides up to 32 dedicated general-purpose pins with input and output capabilities; thus, the general-purpose interface supports up to 215 pins.

These pins can be configured for the following applications:

- Data input (capture)/output (drive)
- Keyboard interface with a debounce cell
- Interrupt generation in active mode upon the detection of external events. Detected events are processed by two parallel independent interrupt-generation submodules to support biprocessor operations
- Wake-up request generation in idle mode upon the detection of external events

NOTE

For more information, see *General-Purpose Interface* chapter in the device TRM.

NOTE

The general-purpose input/output *i* (*i* = 1 to 8) bank is also referred to as GPIO_{*i*}.

7.26 PRU-ICSS Interfaces

The device Programmable Real-Time Unit Subsystem and Industrial Communication Subsystem (PRU-ICSS) consists of dual 32-bit Load / Store RISC CPU cores - Programmable Real-Time Units (PRU0 and PRU1), shared, data, and instruction memories, internal peripheral modules, and an interrupt controller (PRU-ICSS_INTC). The programmable nature of the PRUs, along with their access to pins, events and all SoC resources, provides flexibility in implementing fast real-time responses, specialized data handling operations, customer peripheral interfaces, and in off-loading tasks from the other processor cores of the system-on-chip (SoC).

The each PRU-ICSS includes the following main features:

- 21x Enhanced GPIs (EGPIs) and 21x Enhanced GPOs (EGPOs) with asynchronous capture and serial support per each PRU CPU core
- One Ethernet MII_RT module (PRU-ICSS_MII_RT) with two MII ports and configurable connections to PRUs
- 1 MDIO Port (PRU-ICSS_MII_MDIO)
- One Industrial Ethernet Peripheral (IEP) to manage/generate Industrial Ethernet functions
- 1 x 16550-compatible UART with a dedicated 192 MHz clock to support 12Mbps Profibus
- 1 Industrial Ethernet timer with 7/9 capture and 8 compare events
- 1 Enhanced Capture Module (ECAP)
- 1 Interrupt Controller (PRU-ICSS_INTC)
- A flexible power management support
- Integrated switched central resource with programmable priority
- Parity control supported by all memories

CAUTION

The I/O timings provided in this section are valid only if signals within a single IOSET are used. The IOSETs are defined in the [Table 7-154](#) and [Table 7-155](#).

NOTE

For more information, see *Programmable Real-Time Unit Subsystem and Industrial Communication Subsystem* chapter in the device TRM.

NOTE

To configure the desired virtual mode the user must set MODESELECT bit and DELAYMODE bit field for each corresponding pad control register.

The pad control registers are presented in [Table 4-3](#) and described in Device TRM, *Control Module* Chapter.

(1) These signals are internally muxed with the PRU GPI/GPO signals. When PRUSS1_MII pins are selected from IOSet3, the PRUSS internal wrapper multiplexing must be configured for PRUSS_MII functionality (or MII2 mode). In this configuration, the PRU pins listed below are not available for any other I/O functionality and cannot be selected. Refer to *Programmable Real-Time Unit Subsystem and Industrial Communication Subsystem* chapter in the device TRM for more details about the PRU-ICSS internal wrapper multiplexing.

- PRUSS1_MII0 pins selected from IOSet3:
 - pr2_pru1_* cannot be used.
- PRUSS1_MII1 pins selected from IOSet4:
 - pr1_pru1_*, pr2_pru0_*, pr2_pru1_* cannot be used.

(2) These IOSETS (PRU-ICSS1 IOSET3 and IOSET4) are combined in the TI PinMux Tool and renamed PRUSS1_MII_IOSet_3.

In [Table 7-155](#), [Table 7-156](#) and [Table 7-157](#) are presented the specific groupings of signals (IOSET) for use with PRU-ICSS2.

7.26.5 PRU-ICSS Manual Functional Mapping

NOTE

To configure the desired Manual IO Timing Mode the user must follow the steps described in section "Manual IO Timing Modes" of the Device TRM.

The associated registers to configure are listed in the **CFG REGISTER** column. For more information, see *Control Module* chapter in the device TRM.

Manual IO Timings Modes must be used to ensure some IO timings for PRU-ICSS1 PRU1 Direct Input mode. See [Table 7-2 Modes Summary](#) for a list of IO timings requiring the use of Manual IO Timings Modes. See [Table 7-158 Manual Functions Mapping for PRU-ICSS1 PRU1 Direct Input mode](#) for a definition of the Manual modes.

[Table 7-158](#) lists the A_DELAY and G_DELAY values needed to calculate the correct values to be set in the CFG_x registers.

7.27 System and Miscellaneous interfaces

The Device includes the following System and Miscellaneous interfaces:

- Sysboot Interface
- System DMA Interface
- Interrupt Controllers (INTC) Interface
- Observability Signal (OBS) Interface

7.28 Test Interfaces

The Device includes the following Test interfaces:

- IEEE 1149.1 Standard-Test-Access Port (JTAG)
- Trace Port Interface Unit (TPIU)
- Advanced Event Triggering Interface (AET)

7.28.1 IEEE 1149.1 Standard-Test-Access Port (JTAG)

The JTAG (IEEE Standard 1149.1-1990 Standard-Test-Access Port and Boundary Scan Architecture) interface is used for BSDL testing and emulation of the device. The *trstn* pin only needs to be released when it is necessary to use a JTAG controller to debug the device or exercise the device's boundary scan functionality. For maximum reliability, the device includes an internal Pulldown (IPD) on the *trstn* pin to ensure that *trstn* is always asserted upon power up and the device's internal emulation logic is always properly initialized. JTAG controllers from Texas Instruments actively drive *trstn* high. However, some third-party JTAG controllers may not drive *trstn* high but expect the use of a Pullup resistor on *trstn*. When using this type of JTAG controller, assert *trstn* to initialize the device after powerup and externally drive *trstn* high before attempting any emulation or boundary-scan operations.

The main JTAG features include:

- 32KB embedded trace buffer (ETB)
- 5-pin system trace interface for debug
- Supports Advanced Event Triggering (AET)
- All processors can be emulated via JTAG ports
- All functions on EMU pins of the device:
 - EMU[1:0] - cross-triggering, boot mode (WIR), STM trace
 - EMU[4:2] - STM trace only (single direction)

8 Applications, Implementation, and Layout

NOTE

Information in the following Applications section is not part of the TI component specification, and TI does not warrant its accuracy or completeness. TI's customers are responsible for determining suitability of components for their purposes. Customers should validate and test their design implementation to confirm system functionality.

8.1 Power Supply Mapping

[TPS65916](#) or [TPS659037](#) are the Power Management ICs (PMICs) that should be used for the Device designs. TI requires use of these PMICs for the following reasons:

- TI has validated their use with the Device
- Board level margins including transient response and output accuracy are analyzed and optimized for the entire system
- Support for power sequencing requirements (refer to [Section 5.10 Power Supply Sequences](#))
- Support for Adaptive Voltage Scaling (AVS) Class 0 requirements, including TI provided software

Whenever we allow for combining of rails mapped on any of the SMPSes, the PDN guidelines that are the most stringent of the rails combined should be implemented for the particular supply rail.

It is possible that some voltage domains on the device are unused in some systems. In such cases, to ensure device reliability, it is still required that the supply pins for the specific voltage domains are connected to some core power supply output.

These unused supplies though can be combined with any of the core supplies that are used (active) in the system. For example if IVA and GPU domains are not used, they can be combined with the CORE domain, thereby having a single power supply driving the combined CORE, IVA and GPU domains.

For the combined rail, the following relaxations do apply:

- The AVS voltage of active rail in the combined rail needs to be used to set the power supply
- The decoupling capacitance should be set according to the active rail in the combined rail

[Table 8-1](#) illustrates the approved and validated power supply connections to the Device for the SMPS outputs of the TPS659037 PMIC.

- (1) Power consumption is highly application-specific. Separate analysis must be performed to ensure output current ratings (average and peak) is within the limits of the PMIC for all rails of the device.
- (2) Refer to the PMIC data manual for the latest [TPS659037](#) specifications.
- (3) For more information on connectivity with the [TPS659037](#) PMIC, see the [TPS659037 User's Guide to Power AM572x](#).
- (4) A product's maximum ambient temperature, thermal system design & heat spreading performance could limit the maximum power dissipation below the full PMIC capacity in order to not exceed recommended SoC max Tj.

8.2 DDR3 Board Design and Layout Guidelines

8.2.1 DDR3 General Board Layout Guidelines

To help ensure good signaling performance, consider the following board design guidelines:

- Avoid crossing splits in the power plane.
- Minimize Vref noise.
- Use the widest trace that is practical between decoupling capacitors and memory module.
- Maintain a single reference.
- Minimize ISI by keeping impedances matched.
- Minimize crosstalk by isolating sensitive bits, such as strobes, and avoiding return path discontinuities.
- Use proper low-pass filtering on the Vref pins.
- Keep the stub length as short as possible.
- Add additional spacing for on-clock and strobe nets to eliminate crosstalk.
- Maintain a common ground reference for all bypass and decoupling capacitors.
- Take into account the differences in propagation delays between microstrip and stripline nets when evaluating timing constraints.

8.2.2 DDR3 Board Design and Layout Guidelines

8.2.2.1 Board Designs

TI only supports board designs using DDR3 memory that follow the guidelines in this document. The switching characteristics and timing diagram for the DDR3 memory controller are shown in [Table 8-3](#) and [Figure 8-1](#).

Table 8-3. Switching Characteristics Over Recommended Operating Conditions for DDR3 Memory Controller

NO.	PARAMETER		MIN	MAX	UNIT
1	t _{c(DDR_CLK)}	Cycle time, DDR_CLK	1.5	2.5 ⁽¹⁾	ns

- (1) This is the absolute maximum the clock period can be. Actual maximum clock period may be limited by DDR3 speed grade and operating frequency (see the DDR3 memory device data sheet).

8.2.2.2 DDR3 EMIF

The processor contains one DDR3 EMIF.

8.2.2.3 DDR3 Device Combinations

Because there are several possible combinations of device counts and single- or dual-side mounting, Table 8-4 summarizes the supported device configurations.

Table 8-4. Supported DDR3 Device Combinations

NUMBER OF DDR3 DEVICES	DDR3 DATA DEVICE WIDTH (BITS)	MIRRORED?	DDR3 EMIF WIDTH (BITS)
1	16	N	16
2	8	Y ⁽¹⁾	16
2	16	N	32
2	16	Y ⁽¹⁾	32
3	16	N ⁽³⁾⁽⁴⁾	32
4	8	N	32
4	8	Y ⁽²⁾	32
5	8	N ⁽³⁾⁽⁴⁾	32

- (1) Two DDR3 devices are mirrored when one device is placed on the top of the board and the second device is placed on the bottom of the board.
- (2) This is two mirrored pairs of DDR3 devices.
- (3) Three or five DDR3 device combination is not available on this device, but combination types are retained for consistency with the AM57xx family of devices.
- (4) The DDR memory connected to the DDR ECC bus does NOT need to be the same part number as the DDR memories connected to the DDR data bus. However, some constraints do apply. When selecting a memory for the DDR ECC bus, the following restrictions must be adhered to as compared to the DDR memories on the data bus:
- Match the same DDR3 speed grade
 - Have an equal number of internal banks
 - Have an equal number of columns
 - Have a greater or equal number of rows

8.2.2.4 DDR3 Interface Schematic

8.2.2.4.1 32-Bit DDR3 Interface

The DDR3 interface schematic varies, depending upon the width of the DDR3 devices used and the width of the bus used (16 or 32 bits). General connectivity is straightforward and very similar. 16-bit DDR devices look like two 8-bit devices. Figure 8-2 and Figure 8-3 show the schematic connections for 32-bit interfaces using x16 devices.

8.2.2.4.2 16-Bit DDR3 Interface

Note that the 16-bit wide interface schematic is practically identical to the 32-bit interface (see Figure 8-2 and Figure 8-3); only the high-word DDR memories are removed and the unused DQS inputs are tied off.

When not using all or part of a DDR interface, the proper method of handling the unused pins is to tie off the `ddrx_dqsi` pins to ground via a 1k- Ω resistor and to tie off the `ddrx_dqsn` pins to the corresponding `vdds_ddrx` supply via a 1k- Ω resistor. This needs to be done for each byte not used. Although these signals have internal pullups and pulldowns, external pullups and pulldowns provide additional protection against external electrical noise causing activity on the signals.

The `vdds_ddrx` and `ddrx_vref0` power supply pins need to be connected to their respective power supplies even if `ddrx` is not being used. All other DDR interface pins can be left unconnected. Note that the supported modes for use of the DDR EMIF are 32-bits wide, 16-bits wide, or not used.

8.2.2.5 Compatible JEDEC DDR3 Devices

Table 8-5 shows the parameters of the JEDEC DDR3 devices that are compatible with this interface. Generally, the DDR3 interface is compatible with DDR3-1333 devices in the x8 or x16 widths.

Table 8-5. Compatible JEDEC DDR3 Devices (Per Interface)

NO.	PARAMETER	CONDITION	MIN	MAX	UNIT
1	JEDEC DDR3 device speed grade ⁽¹⁾	DDR clock rate = 400MHz	DDR3-800	DDR3-1600	
		400MHz < DDR clock rate ≤ 533MHz	DDR3-1066	DDR3-1600	
		533MHz < DDR clock rate ≤ 667MHz	DDR3-1333	DDR3-1600	
2	JEDEC DDR3 device bit width		x8	x16	Bits
3	JEDEC DDR3 device count ⁽²⁾		2	4	Devices

(1) Refer to Table 8-3 Switching Characteristics Over Recommended Operating Conditions for DDR3 Memory Controller for the range of supported DDR clock rates.

(2) For valid DDR3 device configurations and device counts, see Section 8.2.2.4, Figure 8-2, and Figure 8-3.

8.2.2.6 PCB Stackup

The minimum stackup for routing the DDR3 interface is a six-layer stack up as shown in Table 8-6. Additional layers may be added to the PCB stackup to accommodate other circuitry, enhance SI/EMI performance, or to reduce the size of the PCB footprint. Complete stackup specifications are provided in Table 8-7.

Table 8-6. Six-Layer PCB Stackup Suggestion

LAYER	TYPE	DESCRIPTION
1	Signal	Top routing mostly vertical
2	Plane	Ground
3	Plane	Split power plane
4	Plane	Split power plane or Internal routing
5	Plane	Ground
6	Signal	Bottom routing mostly horizontal

Table 8-7. PCB Stackup Specifications

NO.	PARAMETER	MIN	TYP	MAX	UNIT
PS1	PCB routing/plane layers	6			
PS2	Signal routing layers	3			
PS3	Full ground reference layers under DDR3 routing region ⁽¹⁾	1			
PS4	Full 1.5-V power reference layers under the DDR3 routing region ⁽¹⁾	1

PS8	PCB trace width, w		4		Mils
PS9	Single-ended impedance, Z ₀	50		75	Ω
PS10	Impedance control ⁽⁵⁾	Z-5	Z	Z+5	Ω

- (1) Ground reference layers are preferred over power reference layers. Be sure to include bypass caps to accommodate reference layer return current as the trace routes switch routing layers.
- (2) No traces should cross reference plane cuts within the DDR routing region. High speed signal traces crossing reference plane cuts create large return current paths which can lead to excessive crosstalk and EMI radiation.
- (3) Reference planes are to be directly adjacent to the signal plane to minimize the size of the return current loop.
- (4) An 18-mil pad assumes Via Channel is the most economical BGA escape. A 20-mil pad may be used if additional layers are available for power routing. An 18-mil pad is required for minimum layer count escape.
- (5) Z is the nominal singled-ended impedance selected for the PCB specified by PS9.

8.2.2.7 Placement

Figure 8-4 shows the required placement for the processor as well as the DDR3 devices. The dimensions for this figure are defined in Table 8-8. The placement does not restrict the side of the PCB on which the devices are mounted. The ultimate purpose of the placement is to limit the maximum trace lengths and allow for proper routing space. For a 16-bit DDR memory system, the high-word DDR3 devices are omitted from the placement.

- (1) DDR3 keepout region to encompass entire DDR3 routing area.
- (2) Non-DDR3 signals allowed within DDR3 keepout region provided they are separated from DDR3 routing layers by a ground plane.
- (3) If a device has more than one DDR controller, the signals from the other controller(s) are considered non-DDR3 and should be separated by this specification.

8.2.2.8 DDR3 Keepout Region

The region of the PCB used for DDR3 circuitry must be isolated from other signals. The DDR3 keepout region is defined for this purpose and is shown in Figure 8-5. The size of this region varies with the placement and DDR routing. Additional clearances required for the keepout region are shown in Table 8-8. Non-DDR3 signals should not be routed on the DDR signal layers within the DDR3 keepout region. Non-DDR3 signals may be routed in the region, provided they are routed on layers separated from the DDR signal layers by a ground layer. No breaks should be allowed in the reference ground layers in this region. In addition, the 1.5-V DDR3 power plane should cover the entire keepout region. Also note that the two signals from the DDR3 controller should be separated from each other by the specification in Table 8-8, (see KOD37).

8.2.2.9 Bulk Bypass Capacitors

Bulk bypass capacitors are required for moderate speed bypassing of the DDR3 and other circuitry. [Table 8-9](#) contains the minimum numbers and capacitance required for the bulk bypass capacitors. Note that this table only covers the bypass needs of the DDR3 controllers and DDR3 devices. Additional bulk bypass capacitance may be needed for other circuitry.

Table 8-9. Bulk Bypass Capacitors

NO.	PARAMETER	MIN	MAX	UNIT
1	vdds_ddrx bulk bypass capacitor count ⁽¹⁾	1		Devices
2	vdds_ddrx bulk bypass total capacitance	22		μF

(1) These devices should be placed near the devices they are bypassing, but preference should be given to the placement of the High Speed (HS) bypass capacitors and DDR3 signal routing.

8.2.2.10 High Speed Bypass Capacitors

High Speed (HS) bypass capacitors are critical for proper DDR3 interface operation. It is particularly important to minimize the parasitic series inductance of the HS bypass capacitors, processor/DDR power, and processor/DDR ground connections. [Table 8-10](#) contains the specification for the HS bypass capacitors as well as for the power connections on the PCB. Generally speaking, it is good to:

1. Fit as many HS bypass capacitors as possible.
2. Minimize the distance from the bypass cap to the pins/balls being bypassed.
3. Use the smallest physical sized capacitors possible with the highest capacitance readily available.
4. Connect the bypass capacitor pads to their vias using the widest traces possible and using the largest hole size via possible.
5. Minimize via sharing. Note the limites on via sharing shown in [Table 8-10](#).

(2) Closer/shorter is better.

(3) Measured from the nearest processor power/ground ball to the center of the capacitor package.

(4) Three of these capacitors should be located underneath the processor, between the cluster of DDR_1V5 balls and ground balls, between the DDR interfaces on the package.

(5) See the Via Channel™ escape for the processor package.

(6) Measured from the DDR3 device power/ground ball to the center of the capacitor package.

(7) Per DDR3 device.

(8) An additional HS bypass capacitor can share the connection vias only if it is mounted on the opposite side of the board. No sharing of vias is permitted on the same side of the board.

- (9) An HS bypass capacitor may share a via with a DDR device mounted on the same side of the PCB. A wide trace should be used for the connection and the length from the capacitor pad to the DDR device pad should be less than 150 mils.
- (10) Up to a total of two pairs of DDR power/ground balls may share a via.
- (11) The capacitor recommendations in this data manual reflect only the needs of this processor. Please see the memory vendor's guidelines for determining the appropriate decoupling capacitor arrangement for the memory device itself.

8.2.2.10.1 Return Current Bypass Capacitors

Use additional bypass capacitors if the return current reference plane changes due to DDR3 signals hopping from one signal layer to another. The bypass capacitor here provides a path for the return current to hop planes along with the signal. As many of these return current bypass capacitors should be used as possible. Because these are returns for signal current, the signal via size may be used for these capacitors.

8.2.2.11 Net Classes

Table 8-11 lists the clock net classes for the DDR3 interface. Table 8-12 lists the signal net classes, and associated clock net classes, for signals in the DDR3 interface. These net classes are used for the termination and routing rules that follow.

Table 8-11. Clock Net Class Definitions

8.2.2.12 DDR3 Signal Termination

Signal terminators are required for the CK and ADDR_CTRL net classes. The data lines are terminated by ODT and, thus, the PCB traces should be unterminated. Detailed termination specifications are covered in the routing rules in the following sections.

8.2.2.13 VREF_DDR Routing

ddrx_vref0 (VREF) is used as a reference by the input buffers of the DDR3 memories as well as the processor. VREF is intended to be half the DDR3 power supply voltage and is typically generated with the DDR3 VDD5 and VTT power supply. It should be routed as a nominal 20-mil wide trace with 0.1 μ F bypass capacitors near each device connection. Narrowing of VREF is allowed to accommodate routing congestion.

8.2.2.14 VTT

Like VREF, the nominal value of the VTT supply is half the DDR3 supply voltage. Unlike VREF, VTT is expected to source and sink current, specifically the termination current for the ADDR_CTRL net class Thevinen terminators. VTT is needed at the end of the address bus and it should be routed as a power sub-plane. VTT should be bypassed near the terminator resistors.

8.2.2.15 CK and ADDR_CTRL Topologies and Routing Definition

The CK and ADDR_CTRL net classes are routed in a fly-by topology. They are routed in a similar manner and are length matched to minimize skew between them. CK is a bit more complicated because it runs at a higher transition rate and is differential. The following subsections show the topology and routing for various DDR3 configurations for CK and ADDR_CTRL. The figures in the following subsections define the terms for the routing specification detailed in Table 8-13. Balanced-T routing is not recommended.

8.2.2.15.1 Four DDR3 Devices

Four DDR3 devices are supported on the DDR EMIF consisting of four x8 DDR3 devices arranged as one bank (CS). These four devices may be mounted on a single side of the PCB, or may be mirrored in two pairs to save board space at a cost of increased routing complexity and parts on the backside of the PCB.

Two DDR3 devices are supported on the DDR EMIF consisting of two x8 DDR3 devices arranged as one bank (CS), 16 bits wide, or two x16 DDR3 devices arranged as one bank (CS), 32 bits wide. These two devices may be mounted on a single side of the PCB, or may be mirrored in a pair to save board space at a cost of increased routing complexity and parts on the backside of the PCB.

8.2.2.16 Data Topologies and Routing Definition

No matter the number of DDR3 devices used, the data line topology is always point to point, so its definition is simple.

Care should be taken to minimize layer transitions during routing. If a layer transition is necessary, it is better to transition to a layer using the same reference plane. If this cannot be accommodated, ensure there are nearby ground vias to allow the return currents to transition between reference planes if both reference planes are ground or vdds_dds. Ensure there are nearby bypass capacitors to allow the return currents to transition between reference planes if one of the reference planes is ground. The goal is to minimize the size of the return current loops.

8.2.2.16.1 DQS and DQ/DM Topologies, Any Number of Allowed DDR3 Devices

DQS lines are point-to-point differential, and DQ/DM lines are point-to-point singled ended. Figure 8-22 and Figure 8-23 show these topologies.

8.2.2.17 Routing Specification

8.2.2.17.1 CK and ADDR_CTRL Routing Specification

Skew within the CK and ADDR_CTRL net classes directly reduces setup and hold margin and, thus, this skew must be controlled. The only way to practically match lengths on a PCB is to lengthen the shorter traces up to the length of the longest net in the net class and its associated clock. A metric to establish this maximum length is Manhattan distance. The Manhattan distance between two points on a PCB is the length between the points when connecting them only with horizontal or vertical segments. A reasonable trace route length is to within a percentage of its Manhattan distance. CACLM is defined as Clock Address Control Longest Manhattan distance.

Given the clock and address pin locations on the processor and the DDR3 memories, the maximum possible Manhattan distance can be determined given the placement. Figure 8-26 and Figure 8-27 show this distance for four loads and two loads, respectively. It is from this distance that the specifications on the lengths of the transmission lines for the address bus are determined. CACLM is determined similarly for other address bus configurations; that is, it is based on the longest net of the CK/ADDR_CTRL net class. For CK and ADDR_CTRL routing, these specifications are contained in Table 8-13.

SPRS906_PCB_DDR3_26

- A. It is very likely that the longest CK/ADDR_CTRL Manhattan distance will be for Address Input 8 (A8) on the DDR3 memories. CACLM is based on the longest Manhattan distance due to the device placement. Verify the net class that satisfies this criteria and use as the baseline for CK/ADDR_CTRL skew matching and length control.

The length of shorter CK/ADDR_CTRL stubs as well as the length of the terminator stub are not included in this length calculation. Non-included lengths are grayed out in the figure.

Assuming A8 is the longest, CALM = CACLMY + CACLMX + 300 mils.
The extra 300 mils allows for routing down lower than the DDR3 memories and returning up to reach A8.

- (1) Max value is based upon conservative signal integrity approach. This value could be extended only if detailed signal integrity analysis of rise time and fall time confirms desired operation.
- (2) The use of vias should be minimized.
- (3) Additional bypass capacitors are required when using the DDR_1V5 plane as the reference plane to allow the return current to jump between the DDR_1V5 plane and the ground plane when the net class switches layers at a via.
- (4) Non-mirrored configuration (all DDR3 memories on same side of PCB).
- (5) Mirrored configuration (one DDR3 device on top of the board and one DDR3 device on the bottom).
- (6) While this length can be increased for convenience, its length should be minimized.
- (7) ADDR_CTRL net class only (not CK net class). Minimizing this skew is recommended, but not required.
- (8) CK net class only.
- (9) Center-to-center spacing is allowed to fall to minimum 2w for up to 1250 mils of routed length.
- (10) The ADDR_CTRL net class of the other DDR EMIF is considered *other DDR3 trace spacing*.
- (11) CK spacing set to ensure proper differential impedance.
- (12) The most important thing to do is control the impedance so inadvertent impedance mismatches are not created. Generally speaking, center-to-center spacing should be either 2w or slightly larger than 2w to achieve a differential impedance equal to twice the singleended impedance, Zo.
- (13) Source termination (series resistor at driver) is specifically not allowed.
- (14) Termination values should be uniform across the net class.
- (15) Via count difference may increase by 1 only if accurate 3-D modeling of the signal flight times – including accurately modeled signal propagation through vias – has been applied to ensure all segment skew maximums are not exceeded.

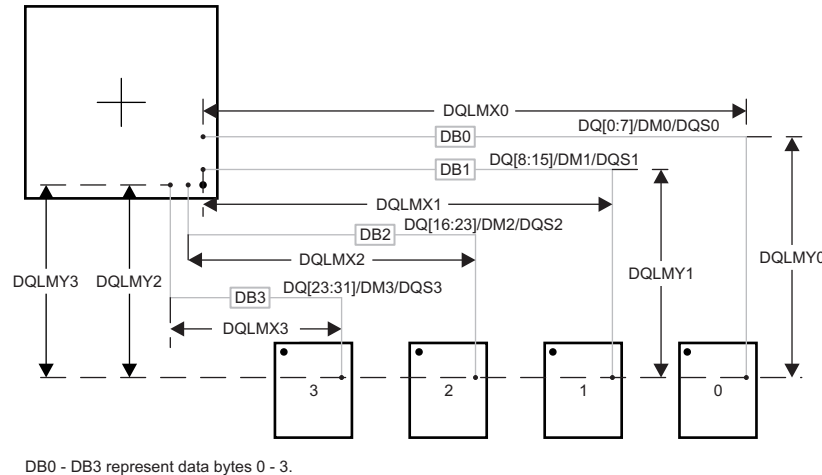

8.2.2.17.2 DQS and DQ Routing Specification

Skew within the DQS and DQ/DM net classes directly reduces setup and hold margin and thus this skew must be controlled. The only way to practically match lengths on a PCB is to lengthen the shorter traces up to the length of the longest net in the net class and its associated clock. As with CK and ADDR_CTRL, a reasonable trace route length is to within a percentage of its Manhattan distance. DQLMn is defined as DQ Longest Manhattan distance n, where n is the byte number. For a 32-bit interface, there are four DQLMs, DQLM0-DQLM3. Likewise, for a 16-bit interface, there are two DQLMs, DQLM0-DQLM1.

NOTE

It is not required, nor is it recommended, to match the lengths across all bytes. Length matching is only required within each byte.

Given the DQS and DQ/DM pin locations on the processor and the DDR3 memories, the maximum possible Manhattan distance can be determined given the placement. [Figure 8-28](#) shows this distance for four loads. It is from this distance that the specifications on the lengths of the transmission lines for the data bus are determined. For DQS and DQ/DM routing, these specifications are contained in [Table 8-14](#).

SPRS906_PCB_DDR3_28

There are four DQLMs, one for each byte (32-bit interface). Each DQLM is the longest Manhattan distance of the byte; therefore:

$$DQLM0 = DQLMX0 + DQLMY0$$

$$DQLM1 = DQLMX1 + DQLMY1$$

$$DQLM2 = DQLMX2 + DQLMY2$$

$$DQLM3 = DQLMX3 + DQLMY3$$

DRS312	DQSn center-to-center spacing ^{(8) (9)}				
DRS313	DQSn center-to-center spacing to other net	4			w ⁽⁵⁾

(1) Max value is based upon conservative signal integrity approach. This value could be extended only if detailed signal integrity analysis of rise time and fall time confirms desired operation.

(2) External termination disallowed. Data termination should use built-in ODT functionality.

(3) Length matching is only done within a byte. Length matching across bytes is neither required nor recommended.

(4) Each DQS pair is length matched to its associated byte.

(5) Center-to-center spacing is allowed to fall to minimum 2w for up to 1250 mils of routed length.

(6) Other DDR3 trace spacing means other DDR3 net classes not within the byte.

(7) This applies to spacing within the net classes of a byte.

(8) DQS pair spacing is set to ensure proper differential impedance.

(9) The most important thing to do is control the impedance so inadvertent impedance mismatches are not created. Generally speaking, center-to-center spacing should be either 2w or slightly larger than 2w to achieve a differential impedance equal to twice the singleended impedance, Zo.

(10) Via count difference may increase by 1 only if accurate 3-D modeling of the signal flight times – including accurately modeled signal propagation through vias – has been applied to ensure DBn skew and DQSn to DBn skew maximums are not exceeded.

8.3 High Speed Differential Signal Routing Guidance

The [High Speed Interface Layout Guidelines](#) provides guidance for successful routing of the high speed differential signals. This includes PCB stackup and materials guidance as well as routing skew, length and spacing limits. TI supports *only* designs that follow the board design guidelines contained in the application report.

8.4 Power Distribution Network Implementation Guidance

The [Sitara Processor Power Distribution Networks: Implementation and Analysis](#) provides guidance for successful implementation of the power distribution network. This includes PCB stackup guidance as well as guidance for optimizing the selection and placement of the decoupling capacitors. TI supports *only* designs that follow the board design guidelines contained in the application report.

8.5 Thermal Solution Guidance

The [Thermal Design Guide for DSP and ARM Application Processors](#) and the [AM572x Thermal Considerations](#) provide guidance for successful implementation of a thermal solution for system designs that contain an AM57xx application processor. They provide background information on common terms and methods related to thermal solutions. Test data and thermal calculations are also provided for a sample design. TI supports only designs that follow the system design guidelines contained in the application reports. Devices must be operated within their rated temperature ranges at all times to maintain proper function and rated Power On Hours.

8.6 Single-Ended Interfaces

8.6.1 General Routing Guidelines

The following paragraphs detail the routing guidelines that must be observed when routing the various functional LVCMOS interfaces.

- Line spacing:
 - For a line width equal to W , the spacing between two lines must be $2W$, at least. This minimizes the crosstalk between switching signals between the different lines. On the PCB, this is not achievable everywhere (for example, when breaking signals out from the device package), but it is recommended to follow this rule as much as possible. When violating this guideline, minimize the length of the traces running parallel to each other (see [Figure 8-29](#)).

Figure 8-29. Ground Guard Illustration

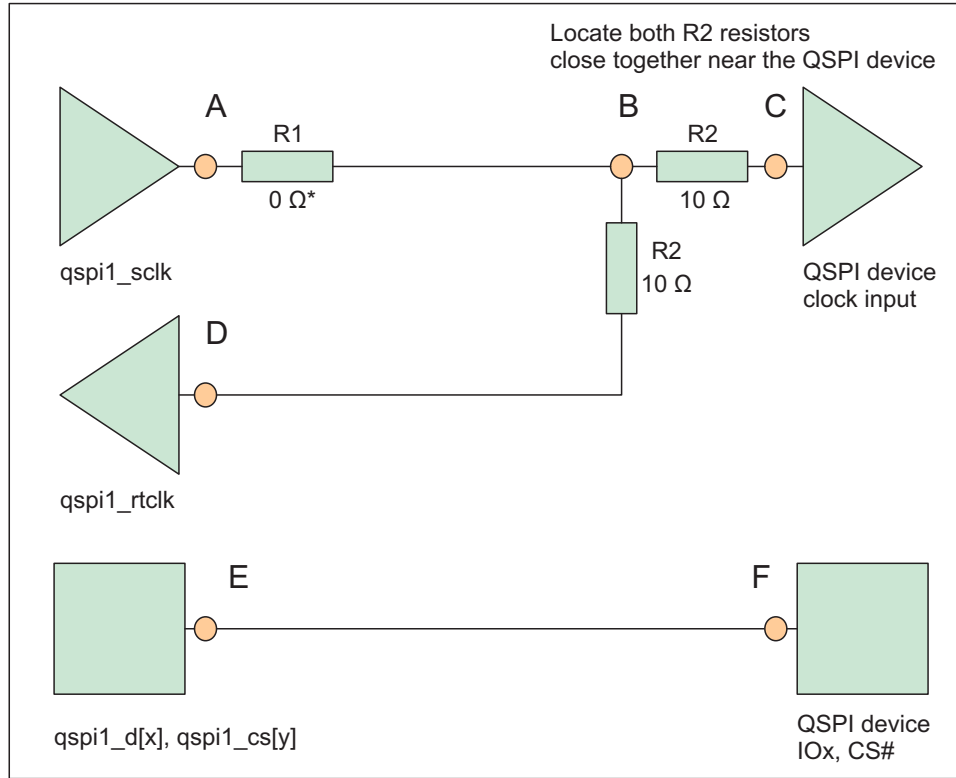

- Length matching (unless otherwise specified):
 - For bus or traces at frequencies less than 10 MHz, the trace length matching (maximum length difference between the longest and the shortest lines) must be less than 25 mm.
 - For bus or traces at frequencies greater than 10 MHz, the trace length matching (maximum length difference between the longest and the shortest lines) must be less than 2.5 mm.

- Characteristic impedance
 - Unless otherwise specified, the characteristic impedance for single-ended interfaces is recommended to be between 35- Ω and 65- Ω .
- Multiple peripheral support
 - For interfaces where multiple peripherals have to be supported in the star topology, the length of each branch has to be balanced. Before closing the PCB design, it is highly recommended to verify signal integrity based on simulations including actual PCB extraction.

8.6.2 QSPI Board Design and Layout Guidelines

The following section details the routing guidelines that must be observed when routing the QSPI interfaces.

- The qspi1_sclk output signal must be looped back into the qspi1_rtclk input.
- The signal propagation delay from the qspi1_sclk ball to the QSPI device CLK input pin (A to C) must be approximately equal to the signal propagation delay from the QSPI device CLK pin to the qspi1_rtclk ball (C to D).
- The signal propagation delay from the QSPI device CLK pin to the qspi1_rtclk ball (C to D) must be approximately equal to the signal propagation delay of the control and data signals between the QSPI device and the SoC device (E to F, or F to E).
- The signal propagation delay from the qspi1_sclk signal to the series terminators ($R2 = 10 \Omega$) near the QSPI device must be $< 450\text{pS}$ ($\sim 7\text{cm}$ as stripline or $\sim 8\text{cm}$ as microstrip)
- 50 Ω PCB routing is recommended along with series terminations, as shown in [Figure 8-30](#).
- Propagation delays and matching:
 - A to C = C to D = E to F.
 - Matching skew: $< 60\text{pS}$
 - A to B $< 450\text{pS}$
 - B to C = as small as possible ($< 60\text{pS}$)

SPRS906_PCB_QSPI_01

*0 Ω resistor (R1), located as close as possible to the qspi1_sclk pin, is placeholder for fine-tuning if needed.

8.7 LJCB_REFN/P Connections

A Common Refclk Rx Architecture is required to be used for the device PCIe interface. Specifically, two modes of Common Refclk Rx Architecture are supported:

- **External REFCLK Mode:** An common external 100MHz clock source is distributed to both the Device and the link partner
- **Output REFCLK Mode:** A 100MHz HCSL clock source is output by the device and used by the link partner

In **External REFCLK Mode**, a high-quality, low-jitter, differential HCSL 100MHz clock source compliant to the PCIe REFCLK AC Specifications should be provided on the Device’s ljcb_clkn / ljcb_clkp inputs.

Alternatively, an LVDS clock source can be used with the following additional requirements:

- External AC coupling capacitors described in should be populated at the ljcb_clkn / ljcb_clkp inputs.
- All termination requirements (ex. parallel 100 Ω termination) from the clock source manufacturer should be followed.

In **Output REFCLK Mode**, the 100MHz clock from the Device’s DPLL_PCIE_REF should be output on the Device’s ljcb_clkn / ljcb_clkp pins and used as the HCSL REFCLK by the link partner. External near-side termination to ground described in is required on both of the ljcb_clkn / ljcb_clkp outputs in this mode.

- (1) EIA LxW units, that is, a 0402 is a 40x20 mils surface mount capacitor.
- (2) The physical size of the capacitor should be as small as practical. Use the same size on both lines in each pair placed side by side.

8.8 Clock Routing Guidelines

8.8.1 32-kHz Oscillator Routing

When designing the printed-circuit board:

- Keep the crystal as close as possible to the crystal pins X1 and X2.
- Keep the trace lengths short and small to reduce capacitor loading and prevent unwanted noise pickup.
- Place a guard ring around the crystal and tie the ring to ground to help isolate the crystal from unwanted noise pickup.
- Keep all signals out from beneath the crystal and the X1 and X2 pins to prevent noise coupling.
- Finally, an additional local ground plane on an adjacent PCB layer can be added under the crystal to shield it from unwanted pickup from traces on other layers of the board. This plane must be isolated from the regular PCB ground plane and tied to the GND pin of the RTC. The plane must not be any larger than the perimeter of the guard ring. Make sure that this ground plane does not contribute to significant capacitance (a few pF) between the signal line and ground on the connections that run from X1 and X2 to the crystal.

Figure 8-31. Slow Clock PCB Requirements

8.8.2 Oscillator Ground Connection

Although the impedance of a ground plane is low it is, of course, not zero. Therefore, any noise current in the ground plane causes a voltage drop in the ground. Figure 8-32 shows the grounding scheme for slow (low frequency) clock generated from the internal oscillator.

9 Device and Documentation Support

TI offers an extensive line of development tools, including methods to evaluate the performance of the processors, generate code, develop algorithm implementations, and fully integrate and debug software and hardware modules as listed below.

9.1 Device Nomenclature

To designate the stages in the product development cycle, TI assigns prefixes to the part numbers of all microprocessors (MPUs) and support tools. Each device has one of three prefixes: X, P, or null (no prefix) (for example, AM571x). Texas Instruments recommends two of three possible prefix designators for its support tools: TMDX and TMDS. These prefixes represent evolutionary stages of product development from engineering prototypes (TMDX) through fully qualified production devices and tools (TMDS).

Device development evolutionary flow:

- X** Experimental device that is not necessarily representative of the final device's electrical specifications and may not use production assembly flow.
- P** Prototype device that is not necessarily the final silicon die and may not necessarily meet final electrical specifications.
- null** Production version of the silicon die that is fully qualified.

Support tool development evolutionary flow:

- TMDX** Development-support product that has not yet completed Texas Instruments internal qualification testing.
- TMDS** Fully-qualified development-support product.

X and P devices and TMDX development-support tools are shipped against the following disclaimer:

"Developmental product is intended for internal evaluation purposes."

Production devices and TMDS development-support tools have been characterized fully, and the quality and reliability of the device have been demonstrated fully. TI's standard warranty applies.

Predictions show that prototype devices (X or P) have a greater failure rate than the standard production devices. Texas Instruments recommends that these devices not be used in any production system because their expected end-use failure rate still is undefined. Only qualified production devices are to be used.

For orderable part numbers of AM571x devices in the ABC package type, see the Package Option Addendum of this document, the TI website (ti.com), or contact your TI sales representative.

9.1.1 Standard Package Symbolization

NOTE

Some devices may have a cosmetic circular marking visible on the top of the device package which results from the production test process. In addition, some devices may also show a color variation in the package substrate which results from the substrate manufacturer. These differences are cosmetic only with no reliability impact.

9.2 Tools and Software

The following products support development for AM571x platforms:

Design Kits and Evaluation Modules

AM572x Evaluation Module The AM572x Evaluation Module provides an affordable platform to quickly start evaluation of Sitara™ Arm® Cortex®-A15 AM57x Processors (AM5728, AM5726, AM5718, AM5716) and accelerate development for HMI, machine vision, networking, medical imaging and many other industrial applications. It is a development platform based on the dual Arm Cortex-A15, dual C66x DSP processor that is integrated with tons of connectivity such as PCIe, SATA, HDMI, USB 3.0/2.0, Dual Gigabit Ethernet, and more.

Development Tools

Clock Tree Tool for Sitara, Automotive, Vision Analytics, & Digital Signal Processors The Clock Tree Tool (CTT) for Sitara™ Arm®, Automotive, and Digital Signal Processors is an interactive clock tree configuration software that provides information about the clocks and modules in these TI devices. It allows the user to:

- Visualize the device clock tree
- Interact with clock tree elements and view the effect on PRCM registers
- Interact with the PRCM registers and view the effect on the device clock tree
- View a trace of all the device registers affected by the user interaction with clock tree

Code Composer Studio™ Integrated Development Environment Code Composer Studio (CCS) Integrated Development Environment (IDE) is a development environment that supports TI's Microcontroller and Embedded Processors portfolio. Code Composer Studio comprises a suite of tools used to develop and debug embedded applications. It includes an optimizing C/C++ compiler, source code editor, project build environment, debugger, profiler, and many other features. The intuitive IDE provides a single user interface taking you through each step of the application development flow. Familiar tools and interfaces allow users to get started faster than ever before. Code Composer Studio combines the advantages of the Eclipse software framework with advanced embedded debug capabilities from TI resulting in a compelling feature-rich development environment for embedded developers.

Pin mux tool The Pin MUX Utility is a software tool which provides a Graphical User Interface for configuring pin multiplexing settings, resolving conflicts and specifying I/O cell characteristics for TI MPUs. Results are output as C header/code files that can be imported into software development kits (SDKs) or used to configure customer's custom software. Version 4 of the Pin Mux utility adds the capability of automatically selecting a mux configuration that satisfies the entered requirements.

Power Estimation Tool (PET) Power Estimation Tool (PET) provides users the ability to gain insight in to the power consumption of select TI processors. The tool includes the ability for the user to choose multiple application scenarios and understand the power consumption as well as how advanced power saving techniques can be applied to further reduce overall power consumption.

9.7 Electrostatic Discharge Caution

This integrated circuit can be damaged by ESD. Texas Instruments recommends that all integrated circuits be handled with appropriate precautions. Failure to observe proper handling and installation procedures can cause damage.

ESD damage can range from subtle performance degradation to complete device failure. Precision integrated circuits may be more susceptible to damage because very small parametric changes could cause the device not to meet its published specifications.

(1) The marketing status values are defined as follows:

ACTIVE: Product device recommended for new designs.

LIFEBUY: TI has announced that the device will be discontinued, and a lifetime-buy period is in effect.

NRND: Not recommended for new designs. Device is in production to support existing customers, but TI does not recommend using this part in a new design.

PREVIEW: Device has been announced but is not in production. Samples may or may not be available.

OBSELETE: TI has discontinued the production of the device.

(2) **RoHS:** TI defines "RoHS" to mean semiconductor products that are compliant with the current EU RoHS requirements for all 10 RoHS substances, including the requirement that RoHS substance do not exceed 0.1% by weight in homogeneous materials. Where designed to be soldered at high temperatures, "RoHS" products are suitable for use in specified lead-free processes. TI may reference these types of products as "Pb-Free".

RoHS Exempt: TI defines "RoHS Exempt" to mean products that contain lead but are compliant with EU RoHS pursuant to a specific EU RoHS exemption.

Green: TI defines "Green" to mean the content of Chlorine (Cl) and Bromine (Br) based flame retardants meet JS709B low halogen requirements of <=1000ppm threshold. Antimony trioxide based flame retardants must also meet the <=1000ppm threshold requirement.

(3) MSL, Peak Temp. - The Moisture Sensitivity Level rating according to the JEDEC industry standard classifications, and peak solder temperature.

(4) There may be additional marking, which relates to the logo, the lot trace code information, or the environmental category on the device.

(5) Multiple Device Markings will be inside parentheses. Only one Device Marking contained in parentheses and separated by a "~" will appear on a device. If a line is indented then it is a continuation of the previous line and the two combined represent the entire Device Marking for that device.

(6) Lead finish/Ball material - Orderable Devices may have multiple material finish options. Finish options are separated by a vertical ruled line. Lead finish/Ball material values may wrap to two lines if the finish value exceeds the maximum column width.
