THE DATASHEET OF

TMX320C6472CZTZ7

TMS320C6472 Fixed-Point Digital Signal Processor

1 Features

- Six On-Chip TMS320C64x+ Megamodules
- Endianess: Little Endian, Big Endian
- C64x+ Megamodule Main Features:
  - High-Performance, Fixed-Point TMS320C64x+ DSP
  - 500/625/700 MHz
  - Eight 32-Bit Instructions/Cycle
  - 4000 MIPS/MMACS (16-Bits) at 500 MHz
  - Dedicated SPLOOP Instruction
  - Compact Instructions (16-Bit)
  - Instruction Set Enhancements
  - Exception Handling
  - L1/L2 Memory Architecture:
    - 256K-Bit (32K-Byte) L1P Program RAM/Cache [Direct Mapped, Flexible Allocation]
    - 256K-Bit (32K-Byte) L1D RAM/Cache [2-Way Set-Associative, Flexible Allocation]
    - 4.75M-Bit (608K-Byte) L2 Unified Mapped RAM/Cache [4-Way Set-Associative, Flexible Allocation]
    - L1P Memory Controller
    - L1D Memory Controller
    - L2 Memory Controller
  - Time Stamp Counter
  - One 64-Bit General-Purpose/Watchdog Timer
- Shared Peripherals and Interfaces
  - EDMA Controller (64 Independent Channels)
  - Shared Memory Architecture
    - Shared L2 Memory Controller
    - 768K-Byte of RAM
    - Boot ROM
  - Three Telecom Serial Interface Ports (TSIPs)
    - Each TSIP is 8 Links of 8 Mbps per Direction
  - 32-Bit DDR2 Memory Controller (DDR2-533 SDRAM)
    - 256 M-Byte x 2 Addressable Memory Space
  - Two 1x Serial RapidIO® Links, v1.2 Compliant
    - 1.25-, 2.5-, 3.125-Gbps Link Rates
    - Message Passing, DirectIO Support, Error Management Extensions, and Congestion Control
    - IEEE 1149.6 Compliant I/Os
  - UTOPIA
    - UTOPIA Level 2 Slave ATM Controller
    - 8/16-Bit Transmit and Receive Operations up to 50 MHz per Direction
    - User-Defined Cell Format up to 64 Bytes
  - Two 10/100/1000 Mb/s Ethernet MACs (EMACs)
    - Both EMACs are IEEE 802.3 Compliant
    - EMAC0 Supports:
      - MII, RMII, SS-SMII, GMII, and RGMII
      - 8 Independent Transmit (TX) Channels
      - 8 Independent Receive (RX) Channels
    - EMAC1 Supports:
      - RMII, SS-SMII and RGMII
      - 8 Independent Transmit (TX) Channels
      - 8 Independent Receive (RX) Channels
    - Both EMACs (EMAC0 and EMAC1) Share MDIO Interface
  - 16-Bit Host-Port Interface (HPI)
  - One Inter-Integrated Circuit (I^2C) Bus
  - Six Shared 64-Bit General-Purpose Timers
- System PLL and PLL Controller
- Secondary PLL and PLL Controller, Dedicated to EMAC
- Third PLL and PLL Controller Dedicated to DDR2 Memory Controller
- 16 General-Purpose I/O (GPIO) Pins
- IEEE-1149.1 (JTAG™) Boundary-Scan-Compatible
- 737-Pin Ball Grid Array (BGA) Package (ZTZ Suffix), 0.8-mm Ball Pitch
- 0.09-μm/7-Level Cu Metal Process (CMOS)
- 3.3-, 1.8-, 1.5-, 1.2-V I/O Supplies
- 1.0-/1.1-, 1.2-V Core Supplies
- Commercial Temperature [0°C to 85°C]
- Extended Temperature [-40°C to 100°C]

PRODUCT PREVIEW

1.1 ZTZ BGA Package (Bottom View)

The TMS320C6472 devices are designed for a package temperature range of 0°C to 85°C (commercial temperature range) or -40°C to 100°C (extended temperature range).

NOTE

Extended temperature (A) range is available only on 500-MHz and 625-MHz devices.

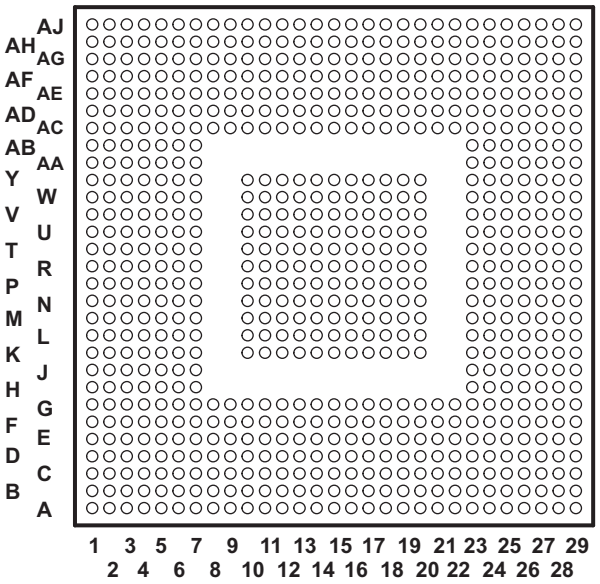

Figure 1-1. ZTZ 737-Pin Ball Grid Array (BGA) Package (Bottom View)

1.2 Description

The TMS320C6472 device is a Texas Instruments next-generation fixed-point digital signal processor (DSP) targeting high-performance computing applications, including high-end industrial, mission-critical, high-end image and video, communication, media gateways, and remote access servers. This device was designed with these applications in mind. A common key requirement of these applications is the availability of large on-chip memories to handle vast amounts of data during processing. With 768K-Byte of shared RAM and 608K-Byte local L2 RAM per C64x+ Megamodule, the TMS320C6472 device can eliminate the need for external memory, thereby reducing system power dissipation and system cost and optimizing board density.

The TMS320C6472 device has six optimized TMS320C64x+™ megamodules, which combine high performance with the lowest power dissipation per port. The TMS320C6472 device includes three different speeds: 500 MHz, 625 MHz, and 700 MHz. The C64x+ megamodules are the highest-performance fixed-point DSP generation in the TMS320C6000™ DSP platform. The C64x+ megamodule is based on the third-generation high-performance, advanced VelociTI™ very-long-instruction-word (VLIW) architecture developed by Texas Instruments (TI), making devices like TMS320C6472 an excellent choice for applications including video and telecom infrastructure, imaging/medical, and wireless infrastructure (WI). The C64x+™ devices are upward code-compatible from previous devices that are part of the C6000™ DSP platform.

The C64x+ megamodule core employs eight functional units, two register files, and two data paths. Like the earlier C6000 devices, two of these eight functional units are multipliers or .M units. Each C64x+ megamodule core .M unit doubles the multiply throughput versus the C64x core by performing four 16-bit x 16-bit multiply-accumulates (MACs) every clock cycle. Thus, eight 16-bit x 16-bit MACs can be executed every cycle on the C64x+ core. At a 500-MHz clock rate, this means 4000 16-bit MMACs can occur every second. Moreover, each multiplier on the C64x+ megamodule core can compute one 32-bit x 32-bit MAC or four 8-bit x 8-bit MACs every clock cycle.

The C64x+ megamodule integrates a large amount of on-chip memory organized as a two-level memory system. The level-1 (L1) program and data memories on this C64x+ megamodule are 32KB each. This memory can be configured as mapped RAM, cache, or some combination of the two. When configured as cache, L1 program (L1P) is a direct mapped cache where as L1 data (L1D) is a two-way set associative cache. The level 2 (L2) memory is shared between program and data space and is 608K-Byte in size. L2 memory can also be configured as mapped RAM, cache, or some combination of the two. The C64x+ megamodule also has a 32-bit peripheral configuration (CFG) port, an internal DMA (IDMA) controller, a system component with reset/boot control, interrupt/exception control, a power-down control, and a free-running 32-bit timer for time stamp.

The peripheral set includes: three Telecom Serial Interface Port (TSIPs); an 16/8 bit Universal Test and Operations PHY Interface for Asynchronous Transfer Mode (ATM) Slave [UTOPIA Slave] port; two 10/100/1000 Ethernet media access controllers (EMACs), which provide an efficient interface between the C6472 DSP core processor and the network; a management data input/output (MDIO) module (shared by both EMACs) that continuously polls all 32 MDIO addresses in order to enumerate all PHY devices in the system; a Serial RapidIO® with two 1x lanes and support for packet forwarding; a 32-bit DDR2 SDRAM interface; 12 64-bit general-purpose timers; an inter-integrated circuit bus module (I2C); 16 general-purpose input/output ports (GPIO) with programmable interrupt/event generation modes; and a 16-bit multiplexed host-port interface (HPI16).

The C6472 device has a complete set of development tools which includes: a C compiler, an assembly optimizer to simplify programming and scheduling, and a Windows® debugger interface for visibility into source code execution.

2.2 CPU (DSP Core) Description

The C64x+ Central Processing Unit (CPU) consists of eight functional units, two register files, and two data paths as shown in Figure 2-1. The two general-purpose register files (A and B) each contain 32 32-bit registers for a total of 64 registers. The general-purpose registers can be used for data or can be data address pointers. The data types supported include packed 8-bit data, packed 16-bit data, 32-bit data, 40-bit data, and 64-bit data. Values larger than 32 bits, such as 40-bit-long or 64-bit-long values are stored in register pairs, with the 32 LSBs of data placed in an even register and the remaining 8 or 32 MSBs in the next upper register (which is always an odd-numbered register).

The eight functional units (.M1, .L1, .D1, .S1, .M2, .L2, .D2, and .S2) are each capable of executing one instruction every clock cycle. The .M functional units perform all multiply operations. The .S and .L units perform a general set of arithmetic, logical, and branch functions. The .D units primarily load data from memory to the register file and store results from the register file into memory.

The C64x+ CPU extends the performance of the C64x core through enhancements and new features.

Each C64x+ .M unit can perform one of the following each clock cycle: one 32 x 32 bit multiply, two 16 x 16 bit multiplies, two 16 x 32 bit multiplies, four 8 x 8 bit multiplies, four 8 x 8 bit multiplies with add operations, and four 16 x 16 multiplies with add/subtract capabilities (including a complex multiply). There is also support for Galois field multiplication for 8-bit and 32-bit data. Many communications algorithms such as FFTs and modems require complex multiplication. The complex multiply (CMPY) instruction takes four 16-bit inputs and produces a 32-bit real and a 32-bit imaginary output. There are also complex multiplies with rounding capability that produce one 32-bit packed output that contains 16-bit real and 16-bit imaginary values. The 32 x 32 bit multiply instructions provide the extended precision necessary for audio and other high-precision algorithms on a variety of signed and unsigned 32-bit data types.

The .L or Arithmetic Logic Unit now incorporates the ability to do parallel add/subtract operations on a pair of common inputs. Versions of this instruction exist to work on 32-bit data or on pairs of 16-bit data performing dual 16-bit add and subtracts in parallel. There are also saturated forms of these instructions.

The C64x+ core enhances the .S unit in several ways. In the C64x core, dual 16-bit MIN2 and MAX2 comparisons were only available on the .L units. On the C64x+ core they are also available on the .S unit which increases the performance of algorithms that do searching and sorting. Finally, to increase data packing and unpacking throughput, the .S unit allows sustained high performance for the quad 8-bit/16-bit and dual 16-bit instructions. Unpack instructions prepare 8-bit data for parallel 16-bit operations. Pack instructions return parallel results to output precision including saturation support.

Other new features include:

- **SPLOOP** - A small instruction buffer in the CPU that aids in creation of software pipelining loops where multiple iterations of a loop are executed in parallel. The SPLOOP buffer reduces the code size associated with software pipelining. Furthermore, loops in the SPLOOP buffer are fully interruptible.
- **Compact Instructions** - The native instruction size for the C6000 devices is 32 bits. Many common instructions such as MPY, AND, OR, ADD, and SUB can be expressed as 16 bits if the C64x+ compiler can restrict the code to use certain registers in the register file. This compression is performed by the code generation tools.

- **Instruction Set Enhancements** - As noted above, there are new instructions such as 32-bit multiplications, complex multiplications, packing, sorting, bit manipulation, and 32-bit Galois field multiplication.
- **Exception Handling** - Intended to aid the programmer in isolating bugs. The C64x+ CPU is able to detect and respond to exceptions, both from internally detected sources (such as illegal op-codes) and from system events (such as a watchdog time expiration).
- **Privilege** - Defines user and supervisor modes of operation, allowing the operating system to give a basic level of protection to sensitive resources. Local memory is divided into multiple pages, each with read, write, and execute permissions.
- **Time-Stamp Counter** - Primarily targeted for Real-Time Operating System (RTOS) robustness, a free-running time-stamp counter is implemented in the CPU which is ***not*** sensitive to system stalls.

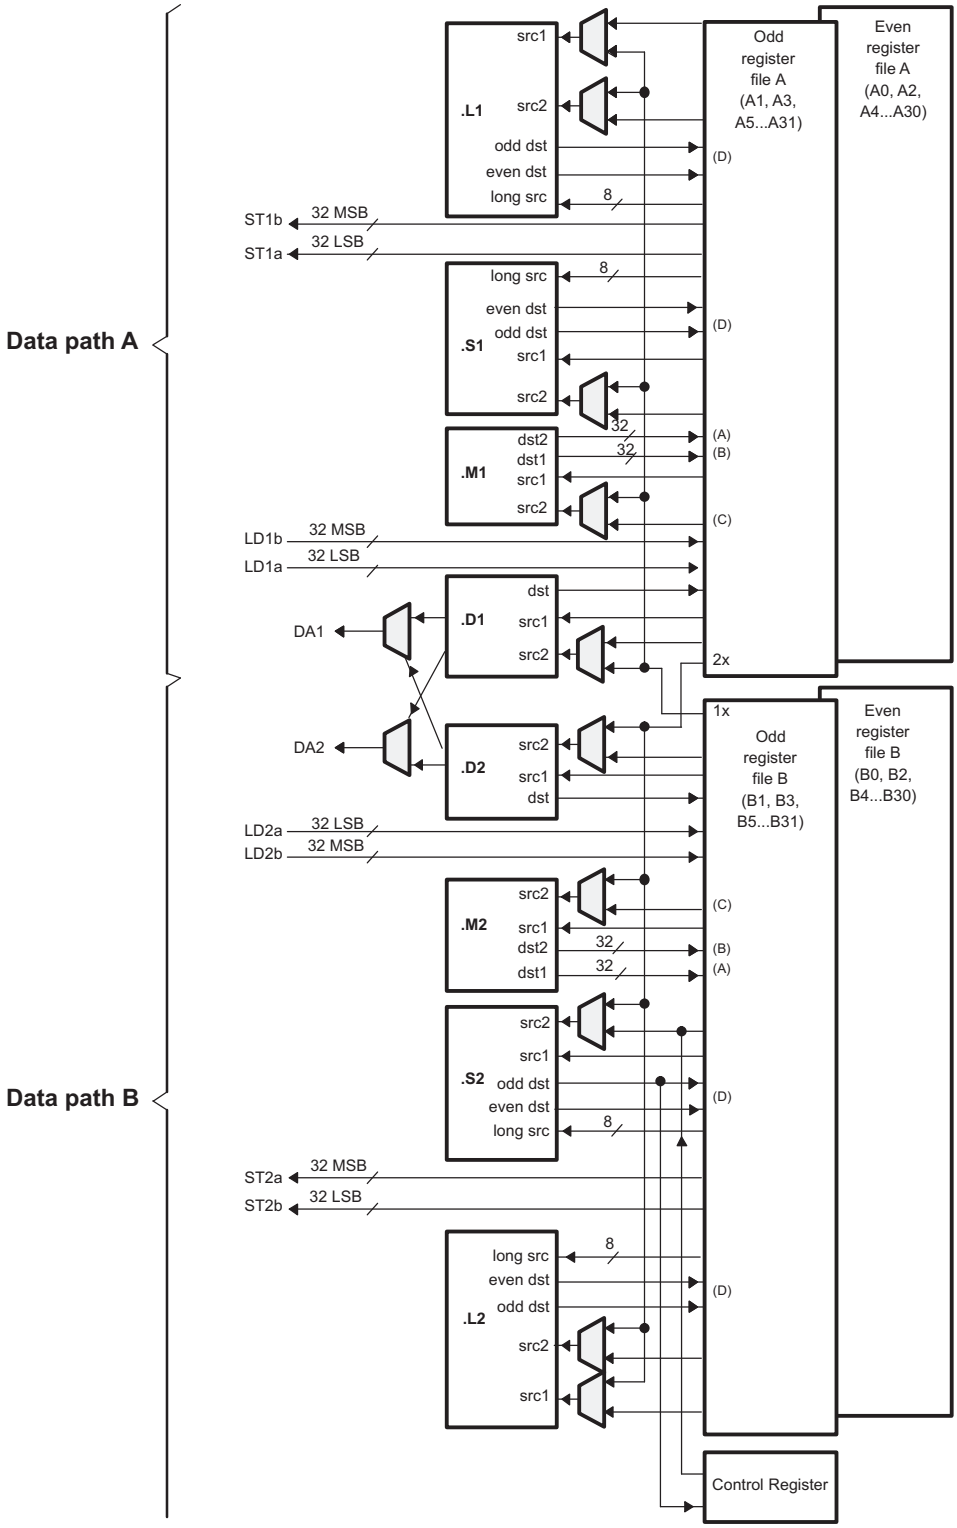
PRODUCT PREVIEW



A. On .M unit, *dst2* is 32 MSB.
B. On .M unit, *dst1* is 32 LSB.
C. On C64x CPU .M unit, *src2* is 32 bits; on C64x+ CPU .M unit, *src2* is 64 bits.
D. On .L and .S units, *odd dst* connects to odd register files and *even dst* connects to even register files.

2.3 Memory Map Summary

Table 2-2 shows the memory map address ranges of the C6472 device. This table provides a combined view of both local and global addresses. The C64x+ megamodule local memories have both local and global addresses. The megamodule registers only have local addresses. Local addresses can only be resolved within the megamodule. They cannot be accessed from outside the megamodule. All of the other addresses listed in this table are global addresses. Global addresses can be accessed from any bus master including all six C64x+ megamodules, the transfer controllers within the EDMA3 block, and any peripheral that can master the bus.

Note: 1K = 1024, 1M = 1024K.

2.4 Boot Mode Sequence

The boot sequence is a process by which the DSP's internal memory is loaded with program and data sections and the DSP's internal registers are programmed with predetermined values. The boot sequence is started automatically after each power-on, warm, and system reset. For more details on the initiators of these resets, see Section 7.7, *Reset Controller*.

There are several methods by which the memory and register initialization can take place. Each of these methods is referred to as a boot mode. The boot mode to be used is selected at reset through the BOOTMODE[3:0] pins.

2.4.1 Boot Modes Supported

The TMS320C6472 has a dedicated Boot Controller, which is responsible for managing the boot process for single and multiple C64x+ megamodule core boots. There are two types of resets on the C6472 device:

1. Device-level Resets (Global Resets)
   - Power-on Reset; initiated by $\overline{\text{POR}}$
   - Chip-level Warm Reset (or Device Reset); initiated by $\overline{\text{RESET}}$
   - System Reset; initiated by a watchdog timeout or emulation
2. C64x+ megamodule-level Resets (Local Resets)
   - External C64x+ megamodule selectable LRESET
   - Local reset of the C64x+ megamodule initiated by on-chip Reset Controller
   - Power Sleep Controller initiated by local C64x+ megamodule reset

After $\overline{\text{POR}}$ and $\overline{\text{RESET}}$ asserted resets, the boot controller selects the boot mode based on the status of BOOTMODE[3:0] pins. When a system reset occurs, the boot mode used is determined by the BOOTMODE field in the DEVSTAT register. All possible bootmodes are listed in Table 2-3. For a detailed explanation of this operation, see the *TMS320C645x/C647x Bootloader User's Guide* (literature number SPRUEC6).

Following a device-level reset, each C64x+ megamodule core can set its boot mode choice for subsequent local resets using the registers BOOTMODE0 through BOOTMODE5 to either immediate boot mode or host boot mode. The default values of these registers are set to immediate boot mode.

Table 2-3. Boot Mode Operation

BOOTMODE[3:0]	DESCRIPTION	TYPE	CFGGP[4:0]
0 (0000)	Immediate boot	Immediate Boot	Don't Care

- Immediate boot

  When immediate boot is selected after global reset, the C64x+ megamodule core executes directly from the internal L2 SRAM address programmed in the DSP_BOOT_ADDRx register. Note: device operation is undefined if invalid code is address programmed in the DSP_BOOT_ADDRx register. Executing invalid code may prevent connection by an emulator.

  The default start addresses for megamodule core 0-5 boot are listed in Table 2-4.

Table 2-4. Megamodule Core 0-5 Boot Start Addresses

MEGAMODULE CORE NAME	DEFAULT START ADDRESSES FOR DEVICE RESET/ BOOT MODE 0-1	DEFAULT START ADDRESSES FOR DEVICE RESET/ BOOT MODE 2-15	DEFAULT START ADDRESSES FOR LOCAL RESET
Megamodule Core 0	0x0080_0000	0x0010_0000	0x0010_0000, if the device reset was boot mode 2-15; otherwise 0x0080_0000
Megamodule Core 1	0x0080_0000	0x0080_0000	0x0080_0000
Megamodule Core 2	0x0080_0000	0x0080_0000	0x0080_0000
Megamodule Core 3	0x0080_0000	0x0080_0000	0x0080_0000
Megamodule Core 4	0x0080_0000	0x0080_0000	0x0080_0000
Megamodule Core 5	0x0080_0000	0x0080_0000	0x0080_0000

  For boot mode 1, these addresses can be modifed by the host before it releases each megamodule core from reset; for details, see Section 3.9.5. For boot mode 2-15, it is possible to have megamodule core 0 modify the default address of megamodule core 1-5 before it releases each megamodule core from reset; for details, see Section 2.4.1. For local reset, if all cores are required to begin from a particular address, the default addresses have to be modified. One example is that only the megamodule core 0's default address is modified to match megamodule core 1-5.

- Host boot

  If host boot is selected after global reset, all C64x+ megamodule cores are internally "held in reset" while the remainder of the device (including all memory subsystems of the C64x+ megamodule) is released from reset. During this period, an external host can initialize the C6472 device memory space (shared memory as well as the C64x+ megamodule memory), as necessary through an HPI interface, including internal configuration registers such as those that control the DDR2 or other peripherals. Once the host is finished with all necessary initialization, it must write a 1 to bit fields BC0 through BC5 of the BOOT_COMPLETE_STAT register (inside the Boot Controller) indicating boot complete of the

corresponding C64x+ megamodule. This transition causes the Boot Controller to bring the C64x+ megamodule core out of the "held-in-reset" state. The CPU then begins execution from the internal L2 SRAM address programmed in the DSP_BOOT_ADDRx register. All memory may be written to and read by the host. This allows for the host to verify what it sends to the DSP, if required.

For the C6472 device, only the Host Port Interface (HPI) peripheral can be used for host boot. PLL1, which provides CPU/6 clock to the HPI module, will initially be running in bypass mode. Therefore, the HPI interface will be very slow and $\overline{\text{HRDY}}$ must be observed. Initial HPI accesses can configure PLL1 for full-speed operation to make HPI accesses shorter.

- Master I2C boot

  After global reset, the C64x+ megamodule core 0 comes out of RESET and starts executing the shared ROM code from the address provided by the Boot Controller based on the I2C boot mode selection. Then C64x+ megamodule core 0 configures I2C and acts as a master to the I2C bus and copies data from an I2C EPROM or a device acting as an I2C slave to the DSP using a predefined boot table format. The destination address and length are contained within the boot table. After initializing the on-chip memory to the known state and initializing the start address of the other C64x+ megamodule cores, C64x+ megamodule core 0 brings the other cores out of reset by writing a 1 to bit fields BC1 through BC5 of the BOOT_COMPLETE_STAT register. After this, C64x+ megamodule cores 1 through 5 start executing from the start address provided by C64x+ megamodule core 0.

- Slave I2C boot

  A Slave I2C boot is also implemented, which programs the DSP as an I2C slave. A DSP in I2C slave mode will never transmit on the I2C bus. The slave DSP must first receive a three-word transmission from the master. This transmission includes a 16-bit length field (length is in bytes, should be 6 for this block), a 16-bit checksum field for which a value of zero means ignore the checksum, and the 16-bit options field described in the boot parameter table for standard I2C boot. This option field informs the slave what information is contained in the next data blocks. Typically, the option field is set to 1 to indicate boot tables will be received next. Only core 0 is active during the boot process. Using the slave I2C boot, a single DSP or device acting as an I2C master can simultaneously boot multiple slave DSPs connected to the same I2C bus. Note that the master DSP may require booting via an I2C EEPROM before acting as a master and booting other DSPs.

- Ethernet MAC boot

  When BOOTMODE [3:0] = 1001 is selected, Ethernet MAC boot is initiated on EMAC0 with the mode specified by the MACSEL0[2:0] pins. Alternately, when BOOTMODE [3:0] = 1010 is selected, Ethernet MAC boot is initiated on EMAC1 with the mode specified by the MACSEL1[1:0] pins.

  After reset, the C64x+ megamodule core 0 comes out of RESET and starts executing the shared ROM code from the address provided by the Boot Controller based on the Ethernet boot mode selection (1001b or 1010b). The C64x+ megamodule core 0 configures the appropriate Ethernet MAC and brings the code image into the on-chip memory via the protocol defined. After initializing the on-chip memory to the known state and initializing the start address of the other C64x+ megamodule cores (1 through 5), C64x+ megamodule core 0 brings the other cores out of reset by writing a 1 to bit fields BC1 through BC5 of the BOOT_COMPLETE_STAT register. After this, C64x+ megamodule cores 1 through 5 start executing from the start address provided by C64x+ megamodule core 0.

- Serial RapidIO boot

  After reset, the C64x+ megamodule core 0 comes out of RESET and starts executing the shared ROM code from the address provided by the Boot Controller based on the Serial RapidIO boot mode selection (1011b, 1100b, 1101b, or 1110b). The C64x+ megamodule core 0 configures Serial RapidIO and EDMA, if required, and brings the code image into the on-chip memory via the protocol defined by the boot method (SRIO bootloader). After initializing the on-chip memory to the known state and initializing the start address of the other C64x+ megamodule cores (1 through 5), C64x+ megamodule core 0 brings the other cores out of reset by writing a 1 to bit fields BC1 through BC5 of the BOOT_COMPLETE_STAT register. After this, the C64x+ megamodule cores 1 through 5 start executing from the start address provided by C64x+ megamodule core 0.

- UTOPIA boot

After reset, the C64x+ megamodule core 0 comes out of RESET and starts executing the shared ROM code from the address provided by the Boot Controller based on the UTOPIA boot mode selection (0101b, 0110b, 0111b, 1000b). The C64x+ megamodule core 0 configures the UTOPIA and brings the code image into the on-chip memory via the protocol defined. After initializing the on-chip memory to the known state and initializing the start address of the other C64x+ megamodule cores (1 through 5), C64x+ megamodule core 0 brings the other cores out of reset by writing a 1 to bit fields ofBC1 through BC5 the BOOT_COMPLETE_STAT register. After this, C64x+ megamodule cores 1 through 5 start executing from the start address provided by C64x+ megamodule core 0.

After local resets, the C6472 device supports two boot modes via BOOTMODE0-BOOTMODE5 device-level registers:

- Immediate boot

  When immediate boot is selected after global reset, the C64x+ megamodule core (x) executes directly from the internal L2 SRAM address programmed in the DSP_BOOT_ADDRx register upon being given a local reset. Note: device operation is undefined if invalid code is address programmed in the DSP_BOOT_ADDRx register. Executing invalid code may prevent connection by an emulator.
- Host boot

  If host boot is selected after global reset, the C64x+ megamodule core (x) is internally "held in reset" while the remainder of the C64x+ megamodule is released from reset upon being given a local reset. During this period, an external host can initialize the C64x+ megamodule (x) memory space, as necessary, through an HPI interface. Once the host is finished with all necessary initialization, it must write a 1 to the corresponding bit field BCx of the BOOT_COMPLETE_STAT register (inside the Boot Controller) indicating boot complete of the corresponding C64x+ megamodule. This transition causes the Boot Controller to bring the C64x+ megamodule core out of the "held-in-reset" state. The core (x) then begins execution from the internal L2 SRAM programmed in the DSP_BOOT_ADDRx register. All memory may be written to and read by the host. This allows for the host to verify what it sends to the DSP, if required.

2.4.2 BOOTACTIVE

The output pin, BOOTACTIVE, is asserted upon reset and de-asserted on boot complete. In the case of BOOTMODE 0, all cores are released from reset immediately. BOOTACTIVE also goes low within a small number of cycles, as all cores are out of reset and running. In the case of BOOTMODE 1, the host needs to write to the boot complete bit in the BOOT_COMPLETE_STAT register corresponding to each C64x+ megamodule that is to be taken out of reset. BOOTACTIVE will be high if any cores are held in reset. In the case of any other boot, core 0 comes out of RESET immediately, but all other cores are still in RESET, so BOOTACTIVE will be high. The ROM code will not write to either the BOOT_COMPLETE_STAT or the BOOT_ADDRESS register unless explicitly directed to do so by the data provided in the boot process. Any active core can set bits in BOOT_COMPLETE_STAT at any time to begin code execution on inactive cores. BOOTACTIVE will go low after the boot complete bit (BCx) in the BOOT_COMPLETE_STAT register is set for all six cores. For a detailed explanation of this operation, see the *TMS320C645x/C647x Bootloader User's Guide* (literature number SPRUEC6).

2.5 Pin Assignments

A. The SYSCLKOUTEN pin is muxed with GP[15]. For more details, see Section 3.
B. These CONFIG pins are muxed with the GPIO peripheral pins. For more details, see Section 3.
C. These BOOTMODE pins are muxed with the GPIO peripheral pins. For more details, see Section 3.
D. These pins are muxed with GPIO peripheral pins. For more details, see Section 3.

2.7 Terminal Functions

The terminal functions table (Table 2-5) identifies the external signal names, the associated pin (ball) numbers along with the mechanical package designator, the pin type (I, O/Z, or I/O/Z), whether the pin has any internal pullup/pulldown resistors and a functional pin description. For more detailed information on device configuration, peripheral selection, multiplexed/shared pins, and debugging considerations, see Section 3.

Table 2-5. Terminal Functions

SIGNAL NAME	NO.	TYPE(1)	IPD/IPU(2) (3)	DESCRIPTION
CONFIGURATION PINS				
MACSEL0[0]	AE6	I	IPD	EMAC0 configuration select pin (for details, see Table 3-1).
MACSEL0[1]	AG5	I	IPD	
MACSEL0[2]	AF6	I	IPD	
LENDIAN	AH4	I	IPU	Device Endian pin. 0 = System operates in Big-Endian mode 1 = System operates in Little-Endian mode (default)
MACSEL1[0]	AF5	I	IPD	EMAC1 configuration select pin (for details, see Table 3-1).
MACSEL1[1]	AH5	I	IPD	
DDREN	E20	I	IPD	DDR2 Memory Controller enable 0 = disabled (only use this mode if DDR is not powered) 1 = enabled
RIOEN	U26	I	IPD	RapidIO enable 0 = disabled (only use this mode if RapidIO is not powered) 1 = enabled
HOST EVENT PINS				
HOUT	AH23	O/Z	IPU	Host event output.
GENERAL-PURPOSE INPUT/OUTPUT PINS				
GP00/HPI_EN	M1	I/O/Z	IPD	General-purpose input/output pin 0 multiplexed with HPI internal pulls enable/disable 0 = Internal pulls on HPI IO are enabled and buffers are turned off. 1 = Internal pulls on most HPI IO are disabled and all buffers are turned on. For more detail about internal pull options, see Section 3.3.1.
GP01/UTOPIA_EN	N5	I/O/Z	IPD	General-purpose input/output pin 1 multiplexed with UTOPIA internal pulls enable/disable 0 = Internal pulls on UTOPIA IO are enabled and buffers are turned off. 1 = Internal pulls on UTOPIA IO are disabled and buffers are turned on. For more detail about internal pull options, see Section 3.3.1.
GP02/TSIP0_EN	M3	I/O/Z	IPD	General-purpose input/output pin [4:2] multiplexed with TSIP[2:0] internal pulls enable/disable 0 = Internal pulls on TSIPx IO are enabled and buffers are turned off. 1 = Internal pulls on TSIPx IO are disabled and buffers are turned on. For more detail about internal pull options, see Section 3.3.1.
GP03/TSIP1_EN	K5	I/O/Z	IPD	
GP04/TSIP2_EN	M5	I/O/Z	IPD	
GP05/EMAC1_EN	N4	I/O/Z	IPD	General-purpose input/output pin 5 multiplexed with EMAC1 internal pulls enable/disable 0 = Internal pulls on EMAC1 IO are enabled and buffers are turned off. 1 = Internal pulls on EMAC1 IO are disabled and buffers are turned on. For more detail about internal pull options, see Section 3.3.1.

(1) I = Input, O = Output, Z = High impedance, S = Supply voltage, GND = Ground, A = Analog signal
(2) IPD = Internal pulldown, IPU = Internal pullup. (These IPD/IPU signal pins feature a 30-kΩ IPD or IPU resistor. To pull up a signal to the opposite supply rail, a 1-kΩ resistor should be used.)
(3) IPU/IPD logic on some pins can be disabled based on configuration. For more information, see Section 3.3.1.

Table 2-5. Terminal Functions (continued)

SIGNAL NAME	NO.	TYPE[1]	IPD/IPU[2] [3]	DESCRIPTION
GP06/BOOTMODE0	L5	I/O/Z	IPU	General-purpose input/output pin [9:6] multiplexed with BOOTMODE selection pin [3:0] (for details, see Table 3-1 and Section 2.4).
GP07/BOOTMODE1	L4	I/O/Z	IPU	
GP08/BOOTMODE2	K3	I/O/Z	IPU	
GP09/BOOTMODE3	K4	I/O/Z	IPU	
GP10/CFGGP0	M2	I/O/Z	IPD	General-purpose input/output pin [14:10] multiplexed with configuration selection pin [4:0].
GP11/CFGGP1	N3	I/O/Z	IPD	
GP12/CFGGP2	M4	I/O/Z	IPD	
GP13/CFGGP3	L1	I/O/Z	IPD	
GP14/CFGGP4	L2	I/O/Z	IPD	
GP15/SYSCLKOUTEN	L3	I/O/Z	IPD	General-purpose input/output pin 15 multiplexed with SYSCLKOUT enable. 0 = SYSCLKOUT is disabled (default) 1 = SYSCLKOUT is enabled
DDR2 MEMORY CONTROLLER				
BSDDQM3	C16	O/Z		DDR2 Memory Controller byte-enable controls • Decoded from the low-order address bits. The number of address bits or byte enables used depends on the width of external memory. • Byte-write enables for most types of memory. • Can be directly connected to SDRAM read and write mask signal (SDQM).
BSDDQM2	B15	O/Z		
BSDDQM1	G4	O/Z		
BSDDQM0	A3	O/Z		
$\overline{\text{BCS1}}$	E9	O/Z		DDR2 Memory Controller memory space enable. When the DDR2 Memory Controller is enabled, it first sets these pins low. Then as accesses occur to the DDR2 memory, only the chip select corresponding to the accessed DDR2 memory is low.
$\overline{\text{BCS0}}$	A4	O/Z		
BBA2	A6	O/Z		DDR2 Memory Controller bank address control
BBA1	B6	O/Z		
BBA0	C7	O/Z		
BEA00	B12	O/Z		DDR2 Memory Controller address bus

Table 2-5. Terminal Functions (continued)

SIGNAL NAME	NO.	TYPE(1)	IPD/IPU(2) (3)	DESCRIPTION
BSDDQGATE3	E14	I/O/Z		DDR2 Memory Controller data strobe gate [3:0]
BSDDQGATE2	B16	I/O/Z		
BSDDQGATE1	D2	I/O/Z		
BSDDQGATE0	C2	I/O/Z		
RESETS				
$\overline{\text{LRESET}}$	J4	I	IPU	External $\overline{\text{LRESET}}$ input pin to assert/de-assert LRESET to the core specified by CORESEL[2:0] is latched when $\overline{\text{LRESETNMIEN}}$ is rising.
$\overline{\text{NMI}}$	K2	I	IPU	External nonmaskable interrupt input to assert/de-assert $\overline{\text{NMI}}$ to the core specified by CORESEL[2:0] is latched when $\overline{\text{LRESETNMIEN}}$ is rising.
CORESEL0	H3	I	IPU	Core Select input pins used to identify the designated megamodule(s) for $\overline{\text{LRESET}}$ or $\overline{\text{NMI}}$ 000 = C64x+ megamodule 0 001 = C64x+ megamodule 1 010 = C64x+ megamodule 2 011 = C64x+ megamodule 3 100 = C64x+ megamodule 4 101 = C64x+ megamodule 5 110 = Reserved 111 = All C64x+ megamodules
CORESEL1	G3	I	IPU	
CORESEL2	G2	I	IPU	
$\overline{\text{LRESETNMIEN}}$	J3	I	IPU	$\overline{\text{LRESET}}$ and $\overline{\text{NMI}}$ latch enable. The state of the $\overline{\text{LRESET}}$ and $\overline{\text{NMI}}$ inputs is latched to the selected megamodule(s) on the rising edge.
$\overline{\text{RESET}}$	G1	I		Device reset
$\overline{\text{RESETSTAT}}$	J5	O	IPU	Reset status pin. The $\overline{\text{RESETSTAT}}$ output is active (low) when the device is in reset.
BOOTACTIVE	K1	O/Z	IPU	Bootactive indication from the boot controller that boot is active (see Section 3.9.2).
$\overline{\text{POR}}$	H1	I		Power-on reset
PLL				
CLKIN1	K28	I	IPD	Clock input for PLL1 (core clock)
CLKIN2	AH13	I	IPD	Clock input for PLL2 (EMAC clock)
CLKIN3	A23	I	IPD	Clock input for PLL3 (DDR2 clock)
SYSCLKOUT	K27	O/Z	IPU	Clock output (PLL1 output clock/6)
RAPIDIO				
RIOCLKP	U25	I		RapidIO serial port source (reference) clock positive/negative
RIOCLKN	T25			
RIORXP0	P27	I		RapidIO receive port 0 positive/negative (differential)
RIORXN0	N27			
RIORXP1	T29	I		RapidIO receive port 1 positive/negative (differential)
RIORXN1	U29			
RIOTXP0	N29	O		RapidIO transmit port 0 positive/negative (differential)
RIOTXN0	P29			
RIOTXP1	U27	O		RapidIO transmit port 1 positive/negative (differential)
RIOTXN1	T27			
TIMERS				
$\overline{\text{WDOUT}}$	H2	O/Z	IPU	Watchdog timer output (logical combination of six watchdog timers)
TIMI0	V28	I	IPD	Timer input pin
TIMI1	V29	I	IPD	Timer input pin
TIMO2	V27	O/Z	IPD	Timer output pin

URDATA13	AD27			
URDATA14	AF29			
URDATA15	AD26			
$\overline{\text{URENB}}$	AE27	I	IPU	UTOPIA receive interface enable input signal. Asserted by the Master ATM Controller to indicate to the UTOPIA slave to receive one or more cells on the URDATA bus with URSOC active on the first data cycle.
URSOC	AA25	I	IPD	Receive start-of-cell signal. This signal is output by the Master ATM Controller to indicate to the UTOPIA Slave that the first valid byte of the cell is available to sample on the 16-bit Receive Data Bus (URDATA[15:0]).
UXCLK	J26	I	IPD	Source clock for UTOPIA transmit driven by Master ATM Controller.
UXCLAV	H27	O/Z	IPD	Transmit cell available status output signal from UTOPIA Slave. 0 indicates a complete cell is NOT available for transmit. 1 indicates a complete cell is available for transmit.
UXADDR0	W29	I	IPD	UTOPIA transmit address bus
UXADDR1	W28			
UXADDR2	W27			
UXADDR3	W26			
UXADDR4	W25

UXDATA15	H29			
$\overline{\text{UXENB}}$	AA26	I	IPU	UTOPIA transmit interface enable input signal. Asserted by the Master ATM Controller to indicate that the UTOPIA slave should transmit one or more cells on the UXDATA bus with UXSOC active on the first data cycle.
UXSOC	F29	O/Z	IPD	Transmit start-of-cell signal. This signal is output by the UTOPIA Slave on the rising edge of the UXCLK, indicating that the first valid byte of the cell is available on the 16-bit Transmit Data Bus (UXDATA[15:0]).
MANAGEMENT DATA INPUT/OUTPUT (MDIO)				
GMDIO	AH10	I/O/Z	IPU	MDIO serial data input/output. Only active if MACSEL0[2:0] is any value but 011 (RGMII).
GMDCLK	AG9	O/Z	IPU	MDIO serial clock output. Only active if MACSEL0[2:0] is any value but 011 (RGMII).
RGMDIO	AG18	I/O		MDIO serial data input/output. Only active if MACSEL0[2:0] = 011 (RGMII).
RGMDCLK	AF18	O		MDIO serial clock output. Only active if MACSEL0[2:0] = 011 (RGMII).
ETHERNET MAC (EMAC0 and EMAC1) (MII0/GMII0/RMII[1:0]/S3MII[1:0])				
MRXD00/RMRXD00/SRXD0	AH11	I	IPU	EMAC Receive Data 0 (MRXD0) for MII0 [default], GMII0 and RMII0 or Receive Data (RXD) for S3MII0. Pin function defined by MACSEL0[2:0] (see Table 3-1).
MRXD01/RMRXD01/SRXSYNC0	AG12	I	IPU	EMAC Receive Data 1 (MRXD1) for MII0 [default], GMII0 and RMII0 or Receive Sync (RXSYNC) for S3MII0. Pin function defined by MACSEL0[2:0] (see Table 3-1).
MRXD02/SRXD1	AJ11	I	IPU	EMAC Receive Data 2 (MRXD2) for MII0 [default] and GMII0 or Receive Data (RXD) for S3MII1. Pin function defined by MACSEL0[2:0] and MACSEL1[1:0] (see Table 3-1).
MRXD03/SRXSYNC1	AJ10	I	IPU	EMAC Receive Data 3 (MRXD3) for MII0 [default] and GMII0 or Receive Sync (RXSYNC) for S3MII1. Pin function defined by MACSEL0[2:0] and MACSEL1[1:0] (see Table 3-1).
MRXD04/RMRXD10	AH9	I	IPU	EMAC Receive Data 4 (MRXD4) for GMII0 or Receive Data 0 (RXD0) for RMII1. Pin function defined by MACSEL0[2:0] and MACSEL1[1:0] (see Table 3-1).
MRXD05/RMRXD11	AG7	I	IPU	EMAC Receive Data 5 (MRXD5) for GMII0 or Receive Data 1 (RXD1) for RMII1. Pin function defined by MACSEL0[2:0] and MACSEL1[1:0] (see Table 3-1).

PRODUCT PREVIEW

Table 2-5. Terminal Functions (continued)

SIGNAL NAME	NO.	TYPE[1]	IPD/IPU[2] [3]	DESCRIPTION
MRXD06/RMRXER1	AJ13	I	IPU	EMAC Receive Data 6 (MRXD6) for GMII0 or Receive Error (RXER) for RMII1. Pin function defined by MACSEL0[2:0] and MACSEL1[1:0] (see Table 3-1).
MRXD07	AJ6	I	IPU	EMAC Receive Data 7 (MRXD7) for GMII0. Pin function defined by MACSEL0[2:0] (see Table 3-1).
MRCLK0/SRXCLK1	AG10	I	IPU	EMAC Receive Clock (MRCLK) for MII0 [default] and GMII0 or Receive Clock (RXCLK) for S3MII1. Pin function defined by MACSEL0[2:0] and MACSEL1[1:0] (see Table 3-1).
MRXDV0/RMCRSDV1	AE12	I	IPU	EMAC Receive Data Valid (MRDV) for MII0 [default] and GMII0 or Receive Carrier Sense/Data Valid (CRSDV) for S3MII1. Pin function defined by MACSEL0[2:0] and MACSEL1[1:0] (see Table 3-1).
MRXER0/RMRXER0/SRXCLK0	AF12	I	IPU	EMAC Receive Error (MRXER) for MII0 [default], GMII0 and RMII0 or Receive Clock (RXCLK) for S3MII0. Pin function defined by MACSEL0[2:0] (see Table 3-1).
MCRS0/RMCRSDV0	AF10	I	IPD	EMAC Receive Carrier Sense (MCRS) for MII0 [default] and GMII0 or Receive Carrier Sense/Data Valid (CRSDV) for RMII0. Pin function defined by MACSEL0[2:0] (see Table 3-1).
GMTCLK0/REFCLK1/SREFCLK1	AG6	I/O	IPU	EMAC Transmit Clock output (GMTCLK) for GMII0 or Reference clock input (REFCLK) for RMII1 and S3MII1. Pin function defined by MACSEL0[2:0] and MACSEL1[1:0] (see Table 3-1).
MTCLK0/REFCLK0/SREFCLK0	AJ9	I	IPU	EMAC Transmit Clock input (MTCLK) for MII0 [default] and GMII0 or Reference clock input (REFCLK) for RMII0 and S3MII0. Pin function defined by MACSEL0[2:0] (see Table 3-1).
MTXD00/RMTXD00/STXD0	AF8	O	IPU	EMAC Transmit Data 0 (MTXD0) for MII0 [default], GMII0 and RMII0 or Transmit Data (TXD) for S3MII0. Pin function defined by MACSEL0[2:0] (see Table 3-1).
MTXD01/RMTXD01/STXSYNC0	AH7	O	IPU	EMAC Transmit Data 1 (MTXD1) for MII0 [default], GMII0 and RMII0 or Transmit Sync (TXSYNC) for S3MII0. Pin function defined by MACSEL0[2:0] (see Table 3-1).
MTXD02/STXD1	AG8	O	IPU	EMAC Transmit Data 2 (MTXD2) for MII0 [default] and GMII0 or Transmit Data (TXD) for S3MII1. Pin function defined by MACSEL0[2:0] and MACSEL1[1:0] (see Table 3-1).
MTXD03/STXSYNC1	AF9	O	IPU	EMAC Transmit Data 3 (MTXD3) for MII0 [default] and GMII0 or Transmit Sync (TXSYNC) for S3MII1. Pin function defined by MACSEL0[2:0] and MACSEL1[1:0] (see Table 3-1).
MTXD04/RMTXD10/STXCLK1	AE7	O	IPU	EMAC Transmit Data 4 (MTXD4) for GMII0 or Transmit Data 0 (TXD0) for RMII1 or Transmit Clock (TXCLK) for S3MII1. Pin function defined by MACSEL0[2:0] and MACSEL1[1:0] (see Table 3-1).
MTXD05/RMTXD11	AJ7	O	IPU	EMAC Transmit Data 5 (MTXD5) for GMII0 or Transmit Data 1 (TXD1) for RMII1. Pin function defined by MACSEL0[2:0] and MACSEL1[1:0] (see Table 3-1).
MTXD06/RMTXEN1	AE11	O	IPU	EMAC Transmit Data 6 (MTXD6) for GMII0 or Transmit Enable (TXEN) for RMII1. Pin function defined by MACSEL0[2:0] and MACSEL1[1:0] (see Table 3-1).
MTXD07/STXCLK0	AG11	O	IPU	EMAC Transmit Data 7 (MTXD7) for GMII0 or Transmit Clock (TXCLK) for S3MII0. Pin function defined by MACSEL0[2:0] (see Table 3-1).
MTXEN0/RMTXEN0	AF11	O	IPU	EMAC Transmit Enable (MTXEN) for MII0 [default], GMII0 and RMII0. Pin function defined by MACSEL0[2:0] (see Table 3-1).
MCOL0	AE8	I	IPD	EMAC Collision (MCOL) for MII0 [default]. Pin function defined by MACSEL0[2:0] (see Table 3-1).

Table 2-5. Terminal Functions (continued)

SIGNAL NAME	NO.	TYPE(1)	IPD/IPU(2) (3)	DESCRIPTION
ETHERNET MAC (EMAC) (RGMII[1:0])				
RGTXC0	AH19	O		EMAC Transmit Clock (TXC) for RGMII0 if enabled by MACSEL0[2:0] (see Table 3-1).
RGTD00	AE18	O		EMAC Transmit Data bus (TD[3:0]) for RGMII0 if enabled by MACSEL0[2:0] (see Table 3-1).
RGTD01	AG19			
RGTD02	AF17			
RGTD03	AJ19			
RGTXCTL0	AF19	O		EMAC Transmit Control (TXCTL) for RGMII0 if enabled by MACSEL0[2:0] (see Table 3-1).
RGRXC0	AH21	I		EMAC Receive Clock (RXC) for RGMII0 if enabled by MACSEL0[2:0] (see Table 3-1).
RGRD00	AF21	I		EMAC Receive Data bus (RD[3:0]) for RGMII0 if enabled by MACSEL0[2:0] (see Table 3-1).
RGRD01	AG21			
RGRD02	AF20			
RGRD03	AE19			
RGRXCTL0	AJ21	I		EMAC Receive Control (RXCTL) for RGMII0 if enabled by MACSEL0[2:0] (see Table 3-1).
RGCLK0	AG20	O		EMAC Reference Clock (REFCLK) for RGMII0 if enabled by MACSEL0[2:0] (see Table 3-1).
RGTXC1	AH17	O		EMAC Transmit Clock (TXC) for RGMII1 if enabled by MACSEL1[1:0] (see Table 3-1).
RGTD10	AH18	O		EMAC Transmit Data bus (TD[3:0]) for RGMII1 if enabled by MACSEL1[1:0] (see Table 3-1).
RGTD11	AG17			
RGTD12	AE16			
RGTD13	AF16			
RGTXCTL1	AH16	O		EMAC Transmit Control (TXCTL) for RGMII1 if enabled by MACSEL1[1:0] (see Table 3-1).
RGRXC1	AG15	I		EMAC Receive Clock (RXC) for RGMII1 if enabled by MACSEL1[1:0] (see Table 3-1).
RGRD10	AE15	I		EMAC Receive Data bus (RD[3:0]) for RGMII1 if enabled by MACSEL1[1:0] (see Table 3-1).
RGRD11	AF15			
RGRD12	AH15			
RGRD13	AJ15			
RGRXCTL1	AJ16	I		EMAC Receive Control (RXCTL) for RGMII1 if enabled by MACSEL1[1:0] (see Table 3-1).
RGCLK1	AG16	O		EMAC Reference Clock (REFCLK) for RGMII1 if enabled by MACSEL1[1:0] (see Table 3-1).
I2C				
SDA	K26	I/O/Z		I2C data. When the I2C module is used, ensure that there is an external pull-up resistor.
SCL	L25	I/O/Z		I2C clock. When the I2C module is used, ensure that there is an external pull-up resistor.

SUPPLY VOLTAGE MONITOR PINS				
CV_{DDMON}	AE9			Die-side core supply (CV_{DD}) voltage monitor pin. The monitor pins indicate the voltage on the die and, therefore, provide the best probe point for voltage monitoring purposes. For more information regarding the use of this and other voltage monitoring pins, see the *TMS320C6472/TMS320TCI6486 Hardware Design Guide* application report (literature number SPRAAQ4). If the CV_{DDMON} pin is not used, it should be connected directly to the die-side core supply (CV_{DD}).
$DV_{DD15MON}$	AG13			Die-side 1.5-/1.8-V I/O supply (DV_{DD15}) voltage monitor pin. The monitor pins indicate the voltage on the die and, therefore, provide the best probe point for voltage monitoring purposes. For more information regarding the use of this and other voltage monitoring pins, see the *TMS320C6472/TMS320TCI6486 Hardware Design Guide* application report (literature number SPRAAQ4). If the $DV_{DD15MON}$ pin is not used, it should be connected directly to the 1.5-/1.8-V I/O supply (DV_{DD15}). **NOTE:** If the RGMII mode of the EMAC is not used, the DV_{DD15}, $DV_{DD15MON}$, $V_{REFHSTL}$, PTV15P, PTV15N, and HHV15EN pins can be NC or connected directly to V_{SS} (GND) to save power. However, connecting these pins in this way will prevent boundary-scan from functioning on the RGMII pins of the EMAC. To preserve boundary-scan functionality on the RGMII pins, see Section 7.3.3.
$DV_{DD18MON}$	D12			Die-side 1.8-V I/O supply (DV_{DD18}) voltage monitor pin. The monitor pins indicate the voltage on the die and, therefore, provide the best probe point for voltage monitoring purposes. For more information regarding the use of this and other voltage monitoring pins, see the *TMS320C6472/TMS320TCI6486 Hardware Design Guide* application report (literature number SPRAAQ4). If the $DV_{DD18MON}$ pin is not used, it should be connected directly to the 1.8-V I/O supply (DV_{DD18}). When DDR is used, connect to DV_{DD18} (1.8V) NC or connected to V_{SS}, if DDR is not used **NOTE:** If the DDR2 Memory Controller is not used, the DV_{DD18}, $DV_{DD18MON}$, $V_{REFSSTL}$, AV_{DD3}, AV_{DD4}, CV_{DD1}, PTV18P, PTV18N, and HHV18EN pins can be NC or connected directly to V_{SS} (GND) to save power. However, connecting these pins this way prevents boundary scan from functioning on the DDR2 Memory Controller pins. To preserve boundary-scan functionality on the DDR2 Memory Controller pins, see Section 7.3.3.
$DV_{DD33MON}$	V5			Die-side 3.3-V I/O supply (DV_{DD33}) voltage monitor pin. The monitor pins indicate the voltage on the die and, therefore, provide the best probe point for voltage monitoring purposes. For more information regarding the use of this and other voltage monitoring pins, see the *TMS320C6472/TMS320TCI6486 Hardware Design Guide* application report (literature number SPRAAQ4). If the $DV_{DD33MON}$ pin is not used, it should be connected directly to the 3.3-V I/O supply (DV_{DD33}).

PRODUCT PREVIEW

Table 2-5. Terminal Functions (continued)

SIGNAL NAME	NO.	TYPE[1]	IPD/IPU[2] [3]	DESCRIPTION
PTV PINS				
PTV18P	C20	I		If DDR is used, connect to V_{SS} (GND) via 200-Ω precision resistor NC or connected to V_{SS}, if DDR is not used **NOTE:** If the DDR2 Memory Controller is not used, the DV_{DD18}, $DV_{DD18MON}$, $V_{REFSSTL}$, AV_{DD3}, AV_{DD4}, CV_{DD1}, PTV18P, PTV18N, and HHV18EN pins can be NC or connected directly to V_{SS} (GND) to save power. However, connecting these pins this way prevents boundary scan from functioning on the DDR2 Memory Controller pins. To preserve boundary-scan functionality on the DDR2 Memory Controller pins, see Section 7.3.3.
PTV18N	C19	I		If DDR is used, connect to DV_{DD18} (1.8 V) via 200-Ω precision resistor NC or connected to V_{SS}, if DDR is not used **NOTE:** If the DDR2 Memory Controller is not used, the DV_{DD18}, $DV_{DD18MON}$, $V_{REFSSTL}$, AV_{DD3}, AV_{DD4}, CV_{DD1}, PTV18P, PTV18N, and HHV18EN pins can be NC or connected directly to V_{SS} (GND) to save power. However, connecting these pins this way prevents boundary scan from functioning on the DDR2 Memory Controller pins. To preserve boundary-scan functionality on the DDR2 Memory Controller pins, see Section 7.3.3.
PTV15P	AF14	I		If RGMII is used, connect to V_{SS} (GND) via 200-Ω precision resistor NC or connected to V_{SS}, if RGMII is not used **NOTE:** If the RGMII mode of the EMAC is not used, the DV_{DD15}, $DV_{DD15MON}$, $V_{REFHSTL}$, PTV15P, PTV15N, and HHV15EN pins can be NC or connected directly to V_{SS} (GND) to save power. However, connecting these pins in this way will prevent boundary-scan from functioning on the RGMII pins of the EMAC. To preserve boundary-scan functionality on the RGMII pins, see Section 7.3.3.
PTV15N	AE14	I		If RGMII is used, connect to DV_{DD15} (1.5 V/1.8 V) via 200-Ω precision resistor NC or connected to V_{SS}, if RGMII is not used **NOTE:** If the RGMII mode of the EMAC is not used, the DV_{DD15}, $DV_{DD15MON}$, $V_{REFHSTL}$, PTV15P, PTV15N, and HHV15EN pins can be NC or connected directly to V_{SS} (GND) to save power. However, connecting these pins in this way will prevent boundary-scan from functioning on the RGMII pins of the EMAC. To preserve boundary-scan functionality on the RGMII pins, see Section 7.3.3.

SIGNAL NAME	NO.	TYPE(1)	IPD/IPU(2) (3)	DESCRIPTION
AV_{DDA3}	B21	I		1.8-V DDR PLL analog supply voltage NC or connected to V_{SS}, if DDR is not used **NOTE:** If the DDR2 Memory Controller is not used, the DV_{DD18}, $DV_{DD18MON}$, $V_{REFSSTL}$, AV_{DDA3}, AV_{DDA4}, CV_{DD1}, PTV18P, and PTV18N pins can be NC or connected directly to V_{SS} (GND) to save power. However, connecting these pins this way prevents boundary scan from functioning on the DDR2 Memory Controller pins. To preserve boundary-scan functionality on the DDR2 Memory Controller pins, see Section 7.3.3.
AV_{DDA4}	H4 A21	I		1.8-V DDR analog supply voltage NC or connected to V_{SS}, if DDR is not used **NOTE:** If the DDR2 Memory Controller is not used, the DV_{DD18}, $DV_{DD18MON}$, $V_{REFSSTL}$, AV_{DDA3}, AV_{DDA4}, CV_{DD1}, PTV18P, and PTV18N pins can be NC or connected directly to V_{SS} (GND) to save power. However, connecting these pins this way prevents boundary scan from functioning on the DDR2 Memory Controller pins. To preserve boundary-scan functionality on the DDR2 Memory Controller pins, see Section 7.3.3.
DV_{DDD}	T23 V23	I		1.2-V RapidIO digital supply voltage NC or connected to V_{SS}, if RapidIO is not used Do not connect this SERDES supply to CV_{DD1} **NOTE:** If the RapidIO interface is not used, the CV_{DD2}, AV_{DDA}, DV_{DDD}, DV_{DDR}, and AV_{DDT} pins can be NC or connected directly to V_{SS} (GND) to reduce power use. However, connecting these pins in this way prevents boundary scan from functioning on the RapidIO pins. To preserve boundary-scan functionality on the RapidIO pins, see Section 7.3.3.
DV_{DDR}	R28	I		1.5-V/1.8-V RapidIO regulator supply voltage NC or connected to V_{SS}, if RapidIO is not used **NOTE:** If the RapidIO interface is not used, the CV_{DD2}, AV_{DDA}, DV_{DDD}, DV_{DDR}, and AV_{DDT} pins can be NC or connected directly to V_{SS} (GND) to reduce power use. However, connecting these pins in this way prevents boundary scan from functioning on the RapidIO pins. To preserve boundary-scan functionality on the RapidIO pins, see Section 7.3.3.
DV_{DD18}	A1 A19 B10 B14 B5 E1 E12 E16 E6 F15 F17 F19 G10 G12 G14 G16 G18 G6 G8 H7 J6	I		1.8-V I/O supply voltage for DDR2 buffers NC or connected to V_{SS}, if DDR is not used **NOTE:** If the DDR2 Memory Controller is not used, the DV_{DD18}, $DV_{DD18MON}$, $V_{REFSSTL}$, AV_{DDA3}, AV_{DDA4}, CV_{DD1}, PTV18P, and PTV18N pins can be NC or connected directly to V_{SS} (GND) to save power. However, connecting these pins this way prevents boundary scan from functioning on the DDR2 Memory Controller pins. To preserve boundary-scan functionality on the DDR2 Memory Controller pins, see Section 7.3.3.

2.8 Development

2.8.1 Development Support

For customers that will develop their own features and software on the C6472 device, TI offers an extensive line of development tools for the TMS320C6000™ DSP platform, including tools to evaluate the performance of the processors, generate code, develop algorithm implementations, and fully integrate and debug software and hardware modules. The tool's support documentation is electronically available within the Code Composer Studio™ Integrated Development Environment (IDE).

The following products support development of C6000™ DSP-based applications:

Software Development Tools: Code Composer Studio™ Integrated Development Environment (IDE) including Editor, C/C++/Assembly Code Generation, and Debug plus additional development tools scalable Real-Time Foundation Software (DSP/BIOS™), which provides the basic run-time target software needed to support any DSP application.

Hardware Development Tools: Extended Development System (XDS™) Emulators (support C6000/C64x+ DSP multiprocessor system debug) and Evaluation Module (EVM).

2.8.2 Device Support

2.8.2.1 Device and Development-Support Tool Nomenclature

To designate the stages in the product development cycle, TI assigns prefixes to the part numbers of all DSP devices and support tools. Each DSP commercial family member has one of three prefixes: TMX, TMP, or TMS (e.g., **TMX**320C6472ZTZ). Texas Instruments recommends one of two prefix designators for its support tools: TMDX and TMDS. These prefixes represent evolutionary stages of product development from engineering prototypes (TMX/TMDX) through fully qualified production devices/tools (TMS/TMDS).

Device development evolutionary flow:

TMX Experimental device that is not necessarily representative of the final device's electrical specifications

TMP Final silicon die that conforms to the device's electrical specifications but has not completed quality and reliability verification

TMS Fully qualified production device

Support tool development evolutionary flow:

TMDX Development-support product that has not yet completed Texas Instruments internal qualification testing.

TMDS Fully qualified development-support product

TMX and TMP devices and TMDX development-support tools are shipped with the following disclaimer:

"Developmental product is intended for internal evaluation purposes."

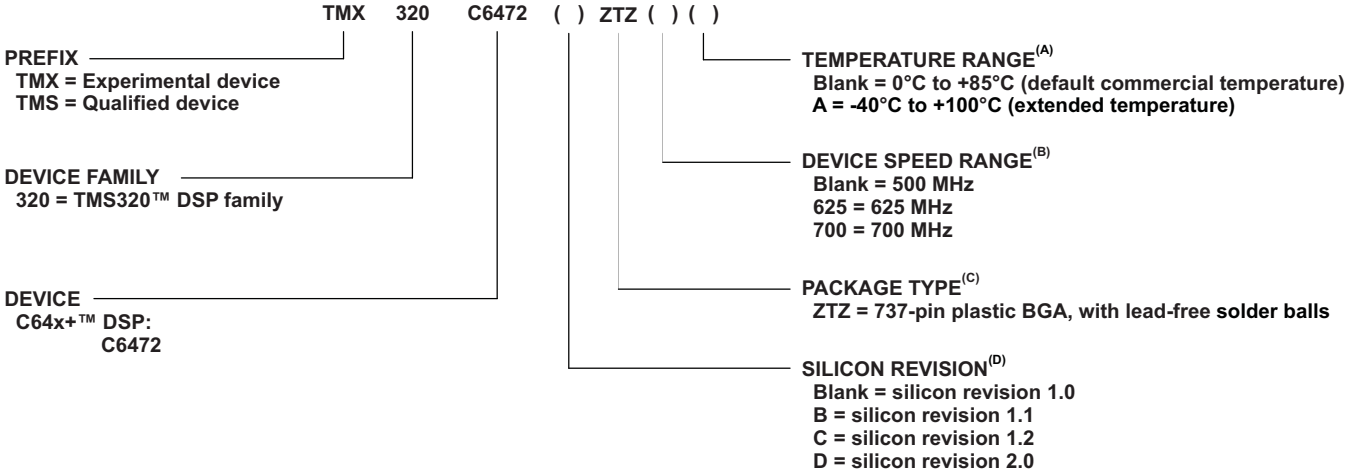
TMS devices and TMDS development-support tools have been characterized fully, and the quality and reliability of the device has been demonstrated fully. TI's standard warranty applies.

Predictions show that prototype devices (TMX or TMP) have a greater failure rate than the standard production devices. Texas Instruments recommends that these devices not be used in any production system because their expected end-use failure rate still is undefined. Only qualified production devices are to be used.

PRODUCT PREVIEW

TI device nomenclature also includes a suffix with the device family name. This suffix indicates the package type (for example, ZTZ), the temperature range (for example, blank is the default commercial temperature range), and the device speed range, in megahertz (for example, blank is 500 MHz). Figure 2-13 provides a legend for reading the complete device name for any TMS320C64x+™ DSP generation member.

For a complete list of all valid device part numbers and further ordering information for TMS320C6472 in the ZTZ package type, see online ordering at www.ti.com or contact your TI sales representative. For specific references to package symbolization as well as device errata and advisories, see the *TMS320C6472 Digital Signal Processor Silicon Errata* (literature number SPRZ300).



A. A (extended temperature) temperature range is available only on 500-MHz and 625-MHz devices.
B. Device Speed Range marking is placed in upper right hand corner of device.
C. BGA = Ball Grid Array
D. Silicon revision correlates to the lot trace code found on the second line of the package marking. For more information, see the *TMS320C6472 Digital Signal Processor Silicon Errata* (literature number SPRZ300).

Figure 2-13. TMS320C64x+™ DSP Device Nomenclature (including the TMS320C6472 DSP)

2.8.2.2 Documentation Support

The following documents describe the TMS320C6472 Fixed-Point Digital Signal Processor. Copies of these documents are available on the Internet at www.ti.com. *Tip*: Enter the literature number in the search box provided at www.ti.com.

The current documentation that describes the TMS320C6472, related peripherals, and other technical collateral, is available in the C6000 DSP product folder at: www.ti.com/c6000.

User's Guides/Reference Manuals:

SPRZ300 ***TMS320C6472 Digital Signal Processor Silicon Errata.*** This document describes the silicon updates to the functional specifications for the TMS320C6472 digital signal processor.

SPRU732 ***TMS320C64x/C64x+ DSP CPU and Instruction Set Reference Guide.*** Describes the CPU architecture, pipeline, instruction set, and interrupts for the TMS320C64x and TMS320C64x+ digital signal processors (DSPs) of the TMS320C6000 DSP family. The C64x/C64x+ DSP generation comprises fixed-point devices in the C6000 DSP platform. The C64x+ DSP is an enhancement of the C64x DSP with added functionality and an expanded instruction set.

SPRU871 ***TMS320C64x+ DSP Megamodule Reference Guide.*** Describes the TMS320C64x+ digital signal processor (DSP) megamodule. Included is a discussion on the internal direct memory access (IDMA) controller, the interrupt controller, the power-down controller, memory protection, bandwidth management, and the memory and cache.

PRODUCT PREVIEW

SPRU862 ***TMS320C64x+ DSP Cache User's Guide.*** Explains the fundamentals of memory caches and describes how the two-level cache-based internal memory architecture in the TMS320C64x+ digital signal processor (DSP) of the TMS320C6000 DSP family can be efficiently used in DSP applications. Shows how to maintain coherence with external memory, how to use DMA to reduce memory latencies, and how to optimize your code to improve cache efficiency. The internal memory architecture in the C64x+ DSP is organized in a two-level hierarchy consisting of a dedicated program cache (L1P) and a dedicated data cache (L1D) on the first level. Accesses by the CPU to the these first level caches can complete without CPU pipeline stalls. If the data requested by the CPU is not contained in cache, it is fetched from the next lower memory level, L2 or external memory.

SPRU395 ***TMS320C64x Technical Overview.*** Provides an introduction to the TMS320C64x digital signal processors (DSPs) of the TMS320C6000 DSP family.

SPRU198 ***TMS320C6000 Programmer's Guide.*** Reference for programming the TMS320C6000 digital signal processors (DSPs). Before you use this manual, you should install your code generation and debugging tools. Includes a brief description of the C6000 DSP architecture and code development flow, includes C code examples and discusses optimization methods for the C code, describes the structure of assembly code and includes examples and discusses optimizations for the assembly code, and describes programming considerations for the C64x DSP.

SPRUEC6 ***TMS320C645x/C647x Bootloader User's Guide.*** This document describes the features of the on-chip bootloader provided with the TMS320C645x/C647x Digital Signal Processors (DSPs).

SPRU806 ***TMS320C6472/TMS320TCI648x DSP Software-Programmable Phase-Locked Loop (PLL) Controller User's Guide.*** This document describes the operation of the software-programmable phase-locked loop (PLL) controller in the TMS320C6472/TMS320TCI648x digital signal processors (DSPs). The PLL controller offers flexibility and convenience by way of software-configurable multiplier and dividers to modify the input signal internally. The resulting clock outputs are passed to the C6472/TCI648x DSP core, peripherals, and other modules inside the C6472/TCI648x DSP.

SPRUEG1 ***TMS320C6472/TMS320TCI6486 DSP Host Port Interface (HPI) User's Guide.*** This guide describes the host port interface (HPI) on the TMS320C6472/TMS320TCI6486 digital signal processors (DSPs). The HPI enables an external host processor (host) to directly access the internal or external memory of the DSP using a 16-bit (HPI16) interface.

SPRUEG4 ***TMS320C6472/TMS320TCI6486 DSP Telecom Serial Interface Port (TSIP) User's Guide.*** This document describes the operation of the TMS320C6472/TMS320TCI6486 DSP Telecom Serial Interface Port (TSIP).

SPRU725 ***TMS320C6472/TMS320TCI648x DSP General-Purpose Input/Output (GPIO) User's Guide.*** This document describes the general-purpose input/output (GPIO) peripheral in the digital signal processors (DSPs) of the TMS320C6472/TMS320TCI648x DSP family.

SPRU818 ***TMS320C6472/TMS320TCI648x DSP 64-Bit Timer User's Guide.*** This document provides an overview of the 64-bit timer in the TMS320C6472/TMS320TCI648x DSP. The timer can be configured as a general-purpose 64-bit timer, dual general-purpose 32-bit timers, or a watchdog timer.

SPRU727 ***TMS320C6472/TMS320TCI648x DSP Enhanced DMA (EDMA3) Controller User's Guide.*** This document describes the Enhanced DMA (EDMA3) Controller in the TMS320C6472/TMS320TCI648x DSP.

PRODUCT PREVIEW

SPRUE11 ***TMS320C6472/TMS320TCI648x DSP Inter-Integrated Circuit (I2C) Module User's Guide.*** This document describes the inter-integrated circuit (I2C) module in the TMS320C6472/TMS320TCI648x Digital Signal Processor (DSP). The I2C provides an interface between the C6472/TCI648x device and other devices compliant with Philips Semiconductors Inter-IC bus (I2C-bus) specification version 2.1 and connected by way of an I2C-bus. This document assumes the reader is familiar with the I2C-bus specification.

SPRUEF8 ***TMS320C6472/TMS320TCI6486 DSP Ethernet Media Access Controller (EMAC)/Management Data Input/Output (MDIO) Module User's Guide.*** This document provides a functional description of the Ethernet Media Access Controller (EMAC) and Physical layer (PHY) device Management Data Input/Output (MDIO) module integrated with TMS320C6472/TMS320TCI6486 DSPs.

SPRUEG2 ***TMS320C6472/TMS320TCI6486 DSP Universal Test and Operations PHY Interface for ATM 2 (UTOPIA2) User's Guide.*** This document describes the universal test and operations PHY interface for asynchronous transfer mode (ATM) 2 (UTOPIA2) in the TMS320C6472/TMS320TCI6486 digital signal processors (DSPs).

SPRUE13 ***TMS320C6472/TMS320TCI648x Serial RapidIO (SRIO) User's Guide.*** This document describes the Serial RapidIO (SRIO) on the TMS320C6472/TMS320TCI648x DSPs.

SPRU894 ***TMS320C6472/TMS320TCI648x DSP DDR2 Memory Controller User's Guide.*** This document describes the DDR2 memory controller in the TMS320C6472/TMS320TCI648x digital-signal processors (DSPs).

SPRU889 ***High-Speed DSP Systems Design Reference Guide.*** Provides recommendations for meeting the many challenges of high-speed DSP system design. These recommendations include information about DSP audio, video, and communications systems for the C5000 and C6000 DSP platforms.

SPRU655 ***Emulation and Trace Headers Technical Reference Manual.*** Describes how to incorporate Texas Instruments next-generation emulation header on a board with a TMS320C55x or TMS320C64x DSP with advanced emulation features, such as HS RTDX.

SPRU589 ***XDS560 Emulator Technical Reference.*** This technical reference describes the fundamentals of XDS560 Emulator and Pod and how to interface it to a target system. It also provides guidelines for implementing 14-pin emulation on the target design.

SPRU187 ***TMS320C6000 Optimizing Compiler User's Guide.*** Describes the TMS320C6000 C compiler and the assembly optimizer. This C compiler accepts ANSI standard C source code and produces assembly language source code for the TMS320C6000 platform of devices (including the C64x+ and C67x+ generations). The assembly optimizer helps you optimize your assembly code.

SPRU186 ***TMS320C6000 Assembly Language Tools User's Guide.*** Describes the assembly language tools (assembler, linker, and other tools used to develop assembly language code), assembler directives, macros, common object file format, and symbolic debugging directives for the TMS320C6000 platform of devices (including the C64x+ and C67x+ generations).

SPRUEC5 ***TMS320C64x+ DSP Big-Endian DSP Library Programmer's Reference.*** This document describes the C64x+ digital signal processor big-endian (DSP) Library.

SPRUEB8 ***TMS320C64x+ DSP Little-Endian DSP Library Programmer's Reference.*** This document describes the C64x+ digital signal processor little-endian (DSP) Library, or DSPLIB for short.

SPRUEG3 ***TMS320C6472/TMS320TCI6486 PSC User's Guide.*** This document describes the power sleep controller (PSC) in the TMS320TCI6486 DSP.

SPRUEG5 ***TMS320C6472/TMS320TCI6486 Shared-Memory Controller User's Guide.*** This document describes the shared-memory controller (SMC) for the TMS320TCI6486 DSP.

Application Reports:

PRODUCT PREVIEW

SPRAA84 ***TMS320C64x to TMS320C64x+ CPU Migration Guide.*** Describes migrating from the Texas Instruments TMS320C64x digital signal processor (DSP) to the TMS320C64x+ DSP. The objective of this document is to indicate differences between the two cores. Functionality in the devices that is identical is not included.

SPRAAQ4 ***TMS320C6472/TMS320TCI6486 Hardware Design Guide.*** This application report describes system design considerations for the TMS320C6472/TMS320TCI6486 digital signal processor (DSP).

SPRAAT9 ***TMS320C6472/TMS320TCI6486 Serial RapidIO Implementation Guidelines.*** This application report contains implementation instructions for the Serial RapidIO (SRIO) interface on the TMS320C6472/TMS320TCI6486 DSP.

SPRAAT7 ***TMS320C6472/TMS320TCI6486 DDR2 Implementation Guidelines.*** This application report contains implementation instructions for the DDR2 interface contained on the TMS320C6472/TMS320TCI6486 DSP.

SPRAAU2 ***TMS320C6472/TMS320TCI6486 EMAC Implementation Guide.*** This application report contains implementation instructions for the Ethernet interface contained on the TMS320C6472/TMS320TCI6486 DSP.

SPRAAS4 ***TMS320C6472/TMS320TCI6486 Power Consumption Summary.*** This application report discusses the power consumption of the TMS320C6472/TMS320TCI6486 digital signal processor (DSP).

SPRAAY0 ***TMS320C6472/TMS320TCI6486 Throughput.*** This application report provides designers a basis for estimating memory access performance based on throughput measurements under various operating conditions. Some factors affecting memory access performance are discussed. It also addresses throughput to/from the interfaces to memories of the C6472/TCI6486 device. This can be used to estimate transport performance of the C6472/TCI6486 device to facilitate system design.

SPRA839 ***Using IBIS Models for Timing Analysis.*** Describes how to properly use IBIS models to attain accurate timing analysis for a given system.

SPRA753 ***Using Advanced Event Triggering to Find and Fix Intermittent Real-Time Bugs.*** Advanced Event Triggering (AET) provides a way to examine the system while it is in operation, and to trigger conditional events with no overhead. This document describes how to use these powerful tools to debug a system.

SPRA387 ***Using Advanced Event Triggering to Debug Real-Time Problems in High-Speed Embedded Microprocessor Systems.*** This application report instructs the user on how to take advantage of the advanced event triggering (AET) embedded components available on TI's new digital signal processors.

SPRM384 ***TMS320C6472 BSDL Model.***

SLVR307 ***TNETV3020/TCI6486 Power Reference Design.***

PRODUCT PREVIEW

3 Device Configuration

On the C6472 device, boot mode and certain device configurations/peripheral selections are determined at device reset. Following device reset, the software needs to enable and configure the desired peripheral modules.

3.1 Device Configuration at Device Reset

Table 3-1 describes the C6472 device configuration pins. The logic level of these pins is latched at reset to determine the device configuration. The logic level on the device configuration pins can be set by using external pullup/pulldown resistors or by using some control device (e.g., FPGA/CPLD) to intelligently drive these pins. When using a control device, care should be taken to ensure there is no contention on the lines when the device is out of reset. The RESETSTAT pin can be monitored for this purpose. The device configuration pins are sampled during reset and may be driven after the reset is removed. At this time, the control device should ensure it has stopped driving the device configuration pins of the DSP to avoid contention.

Table 3-1. C6472 Device Configuration Pins

CONFIGURATION PIN	NO.	IPD/ IPU(1)	FUNCTIONAL DESCRIPTION
GP[9:6]_BOOTMODE[3:0]		IPU	For more detailed information on the boot modes, see Section 2.4, *Boot Mode Sequence*, of this document.
GP[14:10]_CFGGP[4:0]		IPD	Configuration GPI (General-Purpose Inputs for Configuration purposes CFGGP[4:0]) These pins are used in S/W routines located in internal ROM for boot operations. For more detailed information on the use of the configuration pins for boot operation, see Section 2.4, *Boot Mode Sequence*, of this document.
GP[15]_SYSCLKOUTEN		IPD	Enable SYSCLKOUT 0 - SYSCLKOUT is disabled (default) 1 - SYSCLKOUT is enabled
MACSEL1[1:0]		IPD	EMAC Interface selection for EMAC 1 (EMAC1_EN in the DEVCTL register must be a 1 for these to be functional) 00 - Reserved 01 - SS-SMII (SS Mode) 10 - RGMII 11 - RMII
MACSEL0[2:0]		IPD	EMAC Interface selection for EMAC 0 000 - MII 001 - RMII 010 - GMII 011 - RGMII 100 - Reserved 101 - SS-SMII (SS Mode) 110 - Reserved 111 - Disabled
LENDIAN		IPU	Device Endian mode (LENDIAN) 0 - System operates in Big Endian mode 1 - System operates in Little Endian mode (default)
DDREN		IPD	DDR2 Memory Controller enable (DDR2_EN) 0 - DDR2 Memory Controller module and pins are disabled (default) 1 - DDR2 Memory Controller module and pins are enabled Note that this is a static configuration input from reset.
RIOEN		IPD	RIOEN RapidIO enable 0 - RapidIO module and pins are disabled (default) 1 - RapidIO module and pins are enabled Note that this is a static configuration input from reset.

(1) IPD = Internal pulldown, IPU = Internal pullup. (These IPD/IPU signal pins feature a 30-kΩ IPD or IPU resistor. To pull up a signal to the opposite supply rail, a 1-kΩ resistor should be used.)

3.1.1 Debugging Considerations

It is recommended that external connections be provided to device configuration pins, including all GPIO, MACSEL, DDREN, and RIOEN pins. Although internal pullup/pulldown resistors exist on these pins, providing external connectivity adds convenience to the user in debugging and flexibility in switching operating modes. It also improves noise immunity for critical mode control inputs.

For the internal pullup/pulldown resistors for all device pins, see Table 2-5, *Terminal Functions*.

3.2 Device Configuration Register Descriptions

Table 3-2 is a summary of the primary chip-level registers that are discussed in Section 3.3 through Section 3.11.

Table 3-2. Device Configuration Registers (Chip-Level Registers)

HEX ADDRESS RANGE	ACRONYM	REGISTER NAME	COMMENTS
02A8 0000	DEVSTAT	Device Status Register	Provides status of the user's device configuration on reset.
02A8 0004	PRI_ALLOC	Priority Allocation Register	Sets DMA access priorities for master peripherals.
02A8 0008	DEVICE_ID	Device ID Register	Identifies the device.
02A8 000C - 02A8 01FC	-	Reserved	
02A8 0200	DEVCTL	Device Control Register	Controls the internal pulls on I/O interfaces.
02A8 0204	DEVCTL_KEY	Device Control Key Register	This key register controls the writes to DEVCTL register. Key value is 0A1E 183Ah.
02A8 0208	RMIIRESET0	RMII0 Reset Register	Provides reset to RMII. Used when changing speed or duplex setting.
02A8 020C	RMIIRESET1	RMII1 Reset Register	
02A8 0210 - 02A8 0408	-	Reserved	
02A8 040C	HOSTPRIV	Host Memory Privilege Register	This register configures privilege modes.
02A8 0410 - 02A8 0418	-	Reserved	
02A8 041C	PRIVPERM	Memory Privilege Permission Register	This register overrides the memory protection for leaf node in the CFG SCR.
02A8 0420	PRIVKEY	Memory Privilege Key Register	This register is used for key based protection of HOSTPRIV and PRIVPERM to control the changes in the permission levels.
02A8 0424 - 02A8 04FC	-	Reserved	
02A8 0500	NMIGR0	NMI Generation Registers	NMIGRx register creates NMI event to C64x+ Megamodulex
02A8 0504	NMIGR1		
02A8 0508	NMIGR2		
02A8 050C	NMIGR3		
02A8 0510	NMIGR4		
02A8 0514	NMIGR5		
02A8 0518 - 02A8 053C	-	Reserved	
02A8 0540	IPCGR0	IPC Generation Registers	IPCGRx register generates an interrupt pulse to C64x+ Megamodulex.
02A8 0544	IPCGR1		
02A8 0548	IPCGR2		
02A8 054C	IPCGR3		
02A8 0550	IPCGR4		
02A8 0554	IPCGR5		
02A8 0558 - 02A8 0578	-	Reserved	

PRODUCT PREVIEW

Table 3-2. Device Configuration Registers (Chip-Level Registers) (continued)

HEX ADDRESS RANGE	ACRONYM	REGISTER NAME	COMMENTS
02A8 057C	IPCGR15 or IPCGRH	Host Interrupt Pulse Generation Register	IPCGRH register generates an interrupt pulse to host.
02A8 0580	IPCAR0	IPC Acknowledgment Registers	IPCARx register acknowledges an interrupt pulse to C64x+ Megamodulex.
02A8 0584	IPCAR1		
02A8 0588	IPCAR2		
02A8 058C	IPCAR3		
02A8 0590	IPCAR4		
02A8 0594	IPCAR5		
02A8 0598 - 02A8 05B8	-	Reserved	
02A8 05BC	IPCAR15 or IPCARH	Host Interrupt pulse Acknowledgment Register	IPCARH register acknowledges an interrupt pulse to host.
02A8 05C0 - 02A8 06FC	-	Reserved	
02A8 0700		MAC ID	
02A8 0708 - 02A8 0710	-	Reserved	
02A8 0714	TPMGR	Timer Pin Manager Register	TPMGR register configures the timer pin manager block.
02A8 0718	RSTMUX0	Reset Mux Registers	These registers decide the actions taken upon receiving a timer event/watchdog reset event.
02A8 071C	RSTMUX1		
02A8 0720	RSTMUX2

Table 3-2. Device Configuration Registers (Chip-Level Registers) (continued)

HEX ADDRESS RANGE	ACRONYM	REGISTER NAME	COMMENTS
BOOT CONTROLLER REGISTERS			
02AB 0000	RESET_STAT	Reset Status	This register tells the status of the local reset for all 6 C64x+ megamodules.
02AB 0004	BOOT_COMPLETE_STAT	Boot Complete Status Register	signals the Boot Completion process to Boot Controller
02AB 0008	BOOTPROGRESS	Boot Progress Register	This register tracks the progress of the boot sequence
02AB 000C - 02AB 01FC	-	Reserved	
02AB 0200	BOOTMODE0	Boot Mode 0 Register	Sets the local boot option for C64x+ Megamodule0.
02AB 0204	DSP_BOOT_ADDR0	DSP Boot Address Register 0	Boot address for C64x+ Megamodule0.
02AB 0208 - 02AB 021C	-	Reserved	
02AB 0220	BOOTMODE1	Boot Mode 1 Register	Sets the local boot option for C64x+ Megamodule1.
02AB 0224	DSP_BOOT_ADDR1	DSP Boot Address Register 1	Boot address for C64x+ Megamodule1.
02AB 0228 - 02AB 023C	-	Reserved	
02AB 0240	BOOTMODE2	Boot Mode 2 Register	Sets the local boot option for C64x+ Megamodule2.
02AB 0244	DSP_BOOT_ADDR2	DSP Boot Address Register 2	Boot address for C64x+ Megamodule2.
02AB 0248 - 02AB 025C	-	Reserved	
02AB 0260	BOOTMODE3	Boot Mode 3 Register	Sets the local boot option for C64x+ Megamodule3.
02AB 0264	DSP_BOOT_ADDR3	DSP Boot Address Register 3	Boot address for C64x+ Megamodule3.
02AB 0268 - 02AB 027C	-	Reserved	
02AB 0280	BOOTMODE4	Boot Mode 4 Register	Sets the local boot option for C64x+ Megamodule4.
02AB 0284	DSP_BOOT_ADDR4	DSP Boot Address Register 4	Boot address for C64x+ Megamodule4.
02AB 0288 - 02AB 029C	-	Reserved	
02AB 02A0	BOOTMODE5	Boot Mode 5 Register	Sets the local boot option for C64x+ Megamodule5.
02AB 02A4	DSP_BOOT_ADDR5	DSP Boot Address Register 5	Boot address for C64x+ Megamodule5.
02AB 02A8 - 02AB 7FFC	-	Reserved	

PRODUCT PREVIEW

3.3 Peripheral Selection After Device Reset

3.3.1 Controlling Internal Pulls on the Peripherals

3.3.1.1 Device Control Register (DEVCTL)

The device control register (DEVCTL) controls the internal pulls on the I/O interfaces. The bits are initialized on the rising edge of the Power-On Reset from the GPIO pins [5:0], then software can override these latched values. When the DSP is out of reset, the DEVCTL bits control the pullup and pulldown resistors. When the DSP is held in reset, the GPIO pins enable the pullup and pulldown resistors, directly. These bits also enable or disable the output buffers on these interfaces. When the pull-up or pull-down resistors are enabled, the output buffers are disabled. When not in use, all the inputs should be in a known state (i.e., needs to be internally pulled) and the corresponding I/O buffers should be powered down to save I/O power. The DEVCTL register is shown in Figure 3-1 and described in Table 3-3.

Section 3.3.1.3 contains more detail about the operation of the internal resistor pulls and the output buffer operation. It explicitly lists the relevant pins individually under all possible configurations and states whether the output buffers are enabled or disabled and whether the internal pull resistors are enabled or disabled.

Figure 3-1. Device Control Register (DEVCTL)

Table 3-3. Device Control Register (DEVCTL) Field Descriptions

Bit	Field	Value	Description
31:13	Reserved		Reserved
12	EMAC1_EN		EMAC1 Internal Pulls Enable. Initialized at reset from GP05/EMAC1_EN pin.
		0	Enable the pulls on the 3.3-V EMAC1 I/O pins and power down the corresponding I/O buffers. Also disable the EMAC1 RGMII I/O pins.
		1	Allow the pulls on the 3.3-V EMAC1 I/O to be disabled and the corresponding I/O buffers to be powered up. Also allow the RGMII I/O buffers to be powered up. This input is combined with the MACSEL1[1:0] configuration inputs to determine which I/O pins are enabled and which are disabled. All disabled 3.3-V I/O pins will have internal pulls active.
11	TSIP2_EN[2]		TSIP2 Internal Pulls Enable[2]. Initialized at reset from GP04/TSIP2_EN pin.
		0	Enable the pulls on TX[7:4] and TR[7:4] of the TSIP2 I/O pins and power down the corresponding I/O buffers.
		1	Disable the pulls on TX[7:4] and TR[7:4] of the TSIP2 I/O pins and power up the corresponding I/O buffers.
10	TSIP2_EN[1]		TSIP2 Internal Pulls Enable[1]. Initialized at reset from GP04/TSIP2_EN pin.
		0	Enable the pulls on TX[3:2] and TR[3:2] of the TSIP2 I/O pins and power down the corresponding I/O buffers.
		1	Disable the pulls on TX[3:2] and TR[3:2] of the TSIP2 I/O pins and power up the corresponding I/O buffers.

Table 3-3. Device Control Register (DEVCTL) Field Descriptions (continued)

Bit	Field	Value	Description
9	TSIP2_EN[0]		TSIP2 Internal Pulls Enable[0]. Initialized at reset from GP04/TSIP2_EN pin.
		0	Enable the pulls on all TSIP2 I/O pins and power down the I/O buffers. When this bit is low, the values of TSIP2_EN[2:1] = don't care.
		1	Disable the pulls on CLKA, CLKB, FSA, FSB, TX[1:0], and TR[1:0] of the TSIP2 I/O pins and power up the corresponding I/O buffers.
8	TSIP1_EN[2]		TSIP1 Internal Pulls Enable[2]. Initialized at reset from GP03/TSIP1_EN pin.
		0	Enable the pulls on TX[7:4] and TR[7:4] of the TSIP1 I/O pins and power down the corresponding I/O buffers.
		1	Disable the pulls on TX[7:4] and TR[7:4] of the TSIP1 I/O pins and power up the corresponding I/O buffers.
7	TSIP1_EN[1]		TSIP1 Internal Pulls Enable[1]. Initialized at reset from GP03/TSIP1_EN pin.
		0	Enable the pulls on TX[3:2] and TR[3:2] of the TSIP1 I/O pins and power down the corresponding I/O buffers.
		1	Disable the pulls on TX[3:2] and TR[3:2] of the TSIP1 I/O pins and power up the corresponding I/O buffers.
6	TSIP1_EN[0]		TSIP1 Internal Pulls Enable[0]. Initialized at reset from GP03/TSIP1_EN pin.
		0	Enable the pulls on all TSIP1 I/O pins and power down the I/O buffers. When this bit is low, the values of TSIP1_EN[2:1] = don't care.
		1	Disable the pulls on CLKA, CLKB, FSA, FSB, TX[1:0], and TR[1:0] of the TSIP1 I/O pins and power up the corresponding I/O buffers.
5	TSIP0_EN[2]		TSIP0 Internal Pulls Enable[2]. Initialized at reset from GP02/TSIP0_EN pin.
		0	Enable the pulls on TX[7:4] and TR[7:4] of the TSIP0 I/O pins and power down the corresponding I/O buffers.
		1	Disable the pulls on TX[7:4] and TR[7:4] of the TSIP0 I/O pins and power up the corresponding I/O buffers.
4	TSIP0_EN[1]		TSIP0 Internal Pulls Enable[1]. Initialized at reset from GP02/TSIP0_EN pin.
		0	Enable the pulls on TX[3:2] and TR[3:2] of the TSIP0 I/O pins and power down the corresponding I/O buffers.
		1	Disable the pulls on TX[3:2] and TR[3:2] of the TSIP0 I/O pins and power up the corresponding I/O buffers.
3	TSIP0_EN[0]		TSIP0 Internal Pulls Enable[0]. Initialized at reset from GP02/TSIP0_EN pin.
		0	Enable the pulls on all TSIP0 I/O pins and power down the I/O buffers. When this bit is low, the values of TSIP0_EN[2:1] = don't care.
		1	Disable the pulls on the clock inputs and control inputs and outputs of the UTOPIA I/O pins and power up the corresponding I/O buffers.
2	UTOPIA_EN[1]		UTOPIA Internal Pulls Enable[1]. Initialized at reset from GP01/UTOPIA_EN pin.
		0	Enable the pulls on UXDATA[15:8] and URDATA[15:8] of the UTOPIA I/O pins and power down the corresponding I/O buffers.
		1	Disable the pulls on UXDATA[15:8] and URDATA[15:8] of the UTOPIA I/O pins and power up the corresponding I/O buffers.
1	UTOPIA_EN[0]		UTOPIA Internal Pulls Enable [0]. Initialized at reset from GP01/UTOPIA_EN pin.
		0	Enable the pulls on all UTOPIA I/O pins and power down the I/O buffers. When this bit is low, the value of UTOPIA_EN[1] = don't care.
		1	Disable the pulls on the UTOPIA clock inputs, control inputs and outputs, UXDATA[7:0], and URDATA[7:0] and power up the corresponding I/O buffers.
0	HPI_EN		HPI Internal Pulls Enable. Initialized at reset from GP01/UTOPIA_EN pin.
		0	Enable the pulls on the HPI I/O pins and power down the corresponding I/O buffers.
		1	Disable the pulls on all HPI I/O pins except $\overline{\text{HAS}}$, $\overline{\text{HCS}}$, and $\overline{\text{HINT}}$ and power up all HPI I/O buffers.

PRODUCT PREVIEW

3.3.1.2 Device Control Key Register (DEVCTL_KEY)

The device control key register (DEVCTL_KEY) protects against inadvertently updating the DEVCTL register with errant software. The DEVCTL_KEY register is shown in Figure 3-2.

31	0
KEY	
R/W-0000 0000 0000 0000	

LEGEND: R/W = Read/Write; -*n* = value after reset

Figure 3-2. Device Control Key Register (DEVCTL_KEY)

To update/write the DEVCTL register:

1. When the *correct* key value (KEY = 0A1E 183Ah) is written to the DEVCTL_KEY register, the DEVCTL register becomes amenable for a single write anytime after this.
2. Once the DEVCTL register is written, no further writes to the DEVCTL register are allowed without repeating Step 1.

The software should disable all the interrupts during the update of the DEVCTL register.

3.3.1.3 IPU/IPD Control

This section augments Table 3-3 in Section 3.3.1.1. It contains more detail about the operation of the internal resistor pulls and the output buffer operation. It explicitly lists the relevant pins individually under all possible configurations and states whether internal pull resistors are enabled or disabled. The 3.3-V EMAC0 and EMAC1 pins are listed in Table 3-4, the HPI pins are listed in Table 3-5, the TSIP pins are listed in Table 3-6, Table 3-7, Table 3-8 and the UTOPIA pins are listed in Table 3-9.

Use the following legend for Table 3-4 through Table 3-9:

- EN = Internal pull-up or pull-down resistors are enabled and output buffers are disabled.
- DIS = Internal pull-up or pull-down resistors are disabled and output buffers are enabled.

This is true for all cases except for three HPI control signals ($\overline{\text{HAS}}$, $\overline{\text{HCS}}$, and $\overline{\text{HINT}}$) that always have their internal pull resistors activated (see Table 3-5).

3.5 RMII*n* Reset Registers (RMIIRESET0 and RMIIRESET1)

RMII supports switching of 10/100 Mbps modes and switching between half and full-duplex. The RMIIRESET0 and RMIIRESET1 registers are used to reset the RMII interface to switch the speed and duplex settings. The selection of 10/100 Mbps and half- and full-duplex modes is determined by registers in the EMAC modules. For more information, see the *TMS320C6472/TMS320TCI6486 DSP Ethernet Media Access Controller (EMAC)/Management Data Input/Output (MDIO) Module User's Guide* (literature number SPRUEF8).

3.6 Memory Privilege Registers

3.6.1 Host Memory Privilege Permission Register (HOSTPRIV)

Memory privilege is an extension of the memory protection defined in the C64x+ megamodule. It defines the supervisor user mode privilege required to access peripherals that do not inherently have the protection built in. For more information, see the *TMS320C64x+ DSP Megamodule Reference Guide* (literature number SPRU871).

The host memory privilege permission register (HOSTPRIV) configures host memory privilege modes. HOSTPRIV defines the privilege to be used when an external host uses direct IO with SRIO or HPI to access any on-chip memory or peripherals or external memory via the EMIF. Writing a 1 makes supervisor-mode accesses from the peripheral; writing a 0 makes user-mode accesses from the peripheral. The default for these bits is supervisor-mode access.

LEGEND: R/W = Read/Write; R = Read only; -*n* = value after reset

Figure 3-5. Host Memory Privilege Permission Register (HOSTPRIV)

3.6.2 Memory Privilege Permission Register (PRIVPERM)

The memory privilege permission register (PRIVPERM) defines the permission level necessary to access peripheral registers on the CFG SCR. The defaults allow both user- and supervisor-level accesses to these peripheral groups. If desired, the software can override accesses to these peripheral groups by writing the values shown in Table 3-11 to the register bits. For the purposes of protection, certain peripherals are grouped together (see Table 3-12), thus, the selected protection applies to the entire group; i.e., setting 0 to the RIO bit field would make user-mode accesses to SRIO and SRIO wrappers configuration space.

Table 3-11. Permission Values

ACCESSES	PERMISSION VALUE

3.6.3 Key-Based Protection for HOSTPRIV and PRIVPERM Registers (PRIVKEY)

Key-based protection of HOSTPRIV and PRIVPERM is provided for a higher level of protection or control over changing the permission levels. The PRIVKEY register, shown in Figure 3-7 and described in Table 3-13, is needed to service the key requirement. Updates to the HOSTPRIV and PRIVPERM registers are only allowed when PRIVKEY contains the lower 16-bit key value (BEA7h). Protection is provided by a following write to PRIVKEY to clear the register. The PRIVKEY is a 32-bit register with the lower 16 bits as key field and upper 16 bits reserved to 0.

PRODUCT PREVIEW

3.7 Host and Inter-DSP Interrupt Registers

3.7.1 NMI Generator Registers (NMIGR0-NMIGR5)

The NMI generator registers (NMIGR0-NMIGR5) create an NMI event to each C64x+ megamodule. The NMIGR0 register generates an NMI event to C64x+ Megamodule0, the NMIGR1 register generates an NMI event to C64x+ Megamodule1, etc. Writing a 1 to the NMIG field generates an NMI pulse. Writing a 0 has no effect; reads return 0 and have no other effect. The source ID fields found in IPCGR0-IPCGR5 can be used along with the NMI generation registers to identify the source of the NMI.

PRODUCT PREVIEW

3.7.2 Inter-DSP Interrupt Registers (IPCGR0-IPCGR5 and IPCAR0-IPCAR5)

The IPCGR*n* (IPCGR0 thru IPCGR5) and IPCAR*n* (IPCAR0 thru IPCAR5) registers facilitate inter-DSP interrupts. This can be utilized by external hosts or C64x+ megamodules to generate interrupts to other DSPs. A write of 1 to the IPCG field of IPCGR*n* register generates an interrupt pulse to C64x+ Megamodule*n* (*n* = 0-5). These registers also provide a source ID, by which up to 28 different sources of interrupts can be identified.

3.7.3 Host Interrupt and Event Pulse Generation Registers (IPCGR15 and IPCAR15)

The host interrupt and event pulse generation registers (IPCGR15 (or IPCGRH) and IPCAR15 (or IPCARH)) facilitate host CPU interrupt. Operation and use of the IPCGR15 register is the same as registers IPCGR0-5 and the IPCAR15 register is the same as registers IPCAR0-5. The interrupt output pulse created by the IPCGR15 register is driven on a device pin host interrupt/event output (HOUT). The interrupt output pulse is asserted for 4 CPU/6 cycles followed by a deassertion of 4 CPU/6 cycles.

Figure 3-14. Reset Mux Registers (RSTMUX0-RSTMUX5)

Table 3-19. Reset Mux Registers (RSTMUX0-RSTMUX5) Field Descriptions

Bit	Field	Value	Description
31:9	Reserved		Reserved
8:6	DELAY	000	256 CPU/6 cycles delay between NMI and local reset, when OMODE = 100.
		001	512 CPU/6 cycles delay between NMI and local reset, when OMODE = 100.
		010	1024 CPU/6 cycles delay between NMI and local reset, when OMODE = 100.
		011	2048 CPU/6 cycles delay between NMI and local reset, when OMODE = 100.
		100	4096 CPU/6 cycles delay between NMI and local reset, when OMODE = 100 (default).
		101	8192 CPU/6 cycles delay between NMI and local reset, when OMODE = 100.
		110	16384 CPU/6 cycles delay between NMI and local reset, when OMODE = 100.
		111	32768 CPU/6 cycles delay between NMI and local reset, when OMODE = 100.
5	Reserved		Reserved
4	EVTSTAT		The EVTSTAT bit indicates if any local timer event is received. The event could be a timeout event (when the timer is configured in watchdog mode). Since there is only one output pin of a watchdog event (WDOUT), the software can read this bit to know which one of the 6 timers has timed out. Writing a 0 clears this bit.
		0	No event received (default).
		1	Timer event received by the reset mux block.
3:1	OMODE		The OMODE bits determine how to handle the local timer events.
		000	Timer event input to the reset mux block does not cause any output event (default).
		001	Reserved
		010	Timer event input to the reset mux block causes local reset input to C64x+ megamodule.
		011	Timer event input to the reset mux block causes NMI input to C64x+ megamodule.
		100	Timer event input to the reset mux block causes NMI input followed by local reset input to C64x+ megamodule. Delay between NMI and local reset is set in the DELAY bit field.
		101	Timer event input to the reset mux block causes system reset to the PLL controller.
		110	Reserved
		111	Reserved
0	LOCK		The LOCK field prevents further writes to the register when set to 1. After the software configures the timer in watchdog mode and the appropriate routing of events to C64x+ megamodule, it is expected to set the LOCK bit to 1. This will prevent accidental modification of the bit fields of this register. The LOCK bit is reset to 0 only on the next reset that resets the Timer64.
		0	Register fields are not locked (default).
		1	Register fields are locked until the next timer reset.

PRODUCT PREVIEW

3.9 Reset and Boot Registers

3.9.1 Reset Status Register (RESET_STAT)

The reset status register (RESET_STAT) indicates the status of global (device) reset and of the local reset for all six C64x+ megamodules.

PRODUCT PREVIEW

3.9.3 Boot Progress Register (BOOTPROGRESS)

The boot progress register (BOOTPROGRESS) tracks the progress of the boot sequence. The ROM boot code periodically writes values to this register to indicate progress. This can also be used by other software as a debugging tool.

31	0
BOOTPROGRESS	
R/W-0000 0000 0000 0000 0000 0000 0000 0000	

LEGEND: R/W = Read/Write; R = Read only; -*n* = value after reset

Figure 3-17. Boot Progress Register (BOOTPROGRESS)

3.9.4 BOOTMODEn Register (BOOTMODE0-BOOTMODE5)

The chip-level boot modes are set using the BOOTMODE[3:0] device pins. In addition to this, for local boot purposes, each core can set its BOOTMODE choice using the registers BOOTMODE0 through BOOTMODE5. The default values of these registers are set to immediate boot mode.

31	4	3	0

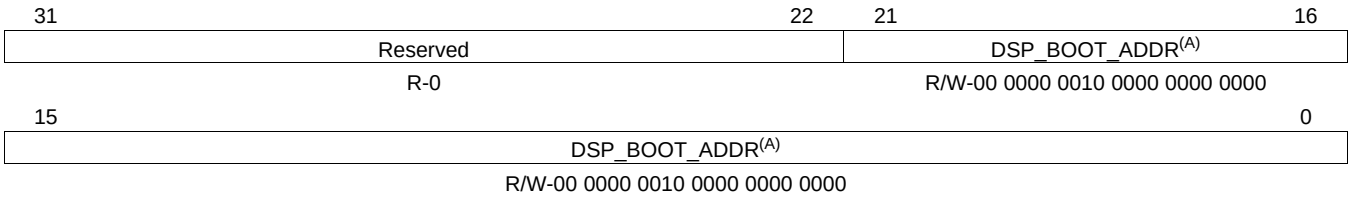
		0000	Immediate boot (default).
		0001	Host boot.
		0010-1111	Reserved

3.9.5 DSP_BOOT_ADDRn Register (DSP_BOOT_ADDR0-DSP_BOOT_ADDR5)

Each C64x+ megamodule has its own boot address register (DSP_BOOT_ADDR*n*) associated with it. The contents of these registers are the 22 MSBs of the initial fetch address of the C64x+ megamodule*n* from where it starts executing after the boot complete bit is set.

In Immediate Boot (Boot mode 0) and HPI Boot (Boot mode 1) modes, all six registers have the L2 RAM base address tie-off value 00 2000h as default, which corresponds to 0080 0000h. In the case of HPI boot mode, the host can overwrite these registers before boot complete is set to change the boot address for each C64x+ megamodule.

For other boot modes (boot modes 2 - 15), DSP_BOOT_ADDR0 has SL2 ROM base address tie-off value 00 0400h as the default. Other GEM_BOOT_ADDR*n* registers have L2 RAM base address tie-off values 00 2000h as default. In this mode, the application can set individual boot addresses for individual C64x+ megamodules by programming different values in the GEM_BOOT_ADDR*n* registers.



LEGEND: R/W = Read/Write; R = Read only; -*n* = value after reset

A. For boot modes 2 - 15, DSP_BOOT_ADDR0 has default address 00 0400h and DSP_BOOT_ADDR1 - DSP_BOOT_ADDR5 have default address 00 2000h. For boot mode 0 and 1, all registers have default address 00 2000h.

Figure 3-19. DSP_BOOT_ADDR*n* Register (DSP_BOOT_ADDR0-DSP_BOOT_ADDR5)

Table 3-23. DSP_BOOT_ADDR*n* Register (DSP_BOOT_ADDR0-DSP_BOOT_ADDR5) Field Descriptions

(1) For boot modes 2 - 15, DSP_BOOT_ADDR0 has default address 00 0400h and DSP_BOOT_ADDR1 - DSP_BOOT_ADDR5 have default address 00 2000h. For boot mode 0 and 1, all registers have default address 00 2000h.

PRODUCT PREVIEW

3.10 JTAG ID Register Description

The JTAG ID register is a read-only register that identifies to the customer the JTAG ID (DEVICE_ID). For the C6472 device, the JTAG ID register resides at address location 02A8 0008h. It reads 0009 102Fh. For the actual register bit names and their associated bit field descriptions, see Figure 3-20 and Table 3-24.

(2) Fixed value irrespective of the silicon revision.

PRODUCT PREVIEW

4 System Interconnect

On the C6472 device, the C64x+ megamodule, the EDMA3 transfer controllers, and the system peripherals are interconnected through two switch fabrics. The switch fabrics allow for low-latency, concurrent data transfers between peripherals and memories. The switch fabrics also allow for seamless arbitration between the system masters when accessing system slaves.

4.1 Internal Buses, Bridges, and Switch Fabrics

Two types of buses exist in the C6472 device: data buses and configuration buses. Some C6472 peripherals have both a data bus and a configuration bus interface, while others only have one type of interface. Furthermore, the bus interface width and speed varies from peripheral to peripheral. Configuration buses are mainly used to access the register space of a peripheral and the data buses are used mainly for data transfers.

The C64x+ megamodule, the EDMA3 transfer controllers, and the various system peripherals can be classified into two categories: masters and slaves. Masters are capable of initiating read and write transfers in the system and do not rely on the EDMA3 for their data transfers. Slaves, on the other hand, rely on the EDMA3 to perform transfers to and from them. Masters include the EDMA3 transfer controllers, EMAC, TSIP, HPI, UTOPIA, and SRIO. Slaves include the EMIF and I2C.

The C6472 device contains two switch fabrics through which masters and slaves communicate: the data switch fabric, known as the data switched central resource (SCR) and configuration switch fabric, known as the configuration switched central resource (SCR). The data SCR is a high-throughput interconnect mainly used to move data across the system (for more information, see Section 4.2). The data SCR connects masters to slaves via 128-bit data buses running at a SYSCLK7 frequency, generated from the PLL1 controller. Peripherals that have a 128-bit data bus interface running at this speed can connect directly to the data SCR; other peripherals require a bridge. The configuration SCR is mainly used by the C64x+ megamodules to access peripheral registers (for more information, see Section 4.4). The configuration SCR connects C64x+ megamodules to slaves via 32-bit configuration buses also running at a SYSCLK7 frequency. As with the data SCR, some peripherals require the use of a bridge to interface to the configuration SCR. Note that the data SCR also connects to the configuration SCR.

Bridges perform a variety of functions:

- Conversion between configuration bus and data bus.
- Width conversion between peripheral bus width and SCR bus width.
- Frequency conversion between peripheral bus frequency and SCR bus frequency.

For example, TSIP modules require a bridge to convert their 32-bit data bus interface into a 128-bit interface so that they can connect to the data SCR. Note that some peripherals can be accessed through the data SCR and also through the configuration SCR.

4.2 Data Switch Fabric Connections

Figure 4-1 shows the connection between slaves and masters through the data switched central resource (SCR). Masters are shown on the right and slaves on the left. The data SCR connects masters to slaves via 128-bit data buses running at frequency equal to the CPU frequency divided by 3.

Some peripherals and the C64x+ megamodule have both slave and master ports. Note that each EDMA3 transfer controller has an independent connection to the data SCR.

The Serial RapidIO (SRIO) peripheral has two connections to the data SCR. The first connection is used when descriptors are being fetched from system memory. The other connection is used for all other data transfers.

Note that masters can access the configuration SCR through the data SCR. The configuration SCR is described in Section 4.4. Not all masters on the C6472 DSP may connect to all slaves. Allowed connections are summarized in Table 4-1.

Xconn1_M	N	N	Y	Y	Y	Y	Y	Y	N	N
Xconn2_M	N	N	Y	Y	Y	Y	Y	Y	N	N

(1) Y = Direct connection in SCR.
C = Logical connection through Xconn1 or Xconn2 bridges.
N = No physical connection.

4.3 Priority Allocation

On the C6472 device, DMA data transfers use a priority-based arbitration. The C64x+ megamodule, EDMA, TSIP, and SRIO peripherals define their own priorities. The Ethernet and HPI peripherals do not define their own priorities, while the UTOPIA-PDMA only partially defines its own priority. Priorities for Ethernet, HPI, and UTOPIA-PDMA transfers should be assigned via the Priority Allocation (PRI_ALLOC) register (see Figure 4-2). A value of 000b has the highest priority, while 111b has the lowest priority. (For more information on the default priority values in the C64x+ megamodule, EDMA, TSIP, and SRIO peripheral registers, see the device-compatible reference guides). TI recommends that these priority registers be reprogrammed upon initial use.

31	16
Reserved	
R-1111 1111 1111 1111	

15	14	12	11	8
UTOPIA-PDMA(A)	EMAC1		Reserved	
R/W-1	R/W-111		R-1111	

7	6	5	3	2	0
Reserved		HPI		EMAC0	
R-11		R/W-111		R/W-111	

LEGEND: R/W = Read/Write; R = Read only; *-n* = value at reset

A. UTOPIA-PDMA has 2 bits of priority in the module. The PRI_ALLOC register supplies only the **middle significant bit** of the priority for this module.

Figure 4-2. Priority Allocation Register (PRI_ALLOC)

4.4 Configuration Switch Fabric

Figure 4-3 shows the connection between the C64x+ megamodule and the configuration switched central resource (SCR). The configuration SCR is mainly used by the C64x+ megamodules to access peripheral registers. The data SCR also has a connection to the configuration SCR which allows masters to access most peripheral registers. The only registers not accessible by the data SCR through the configuration SCR are the C64x+ megamodule configuration registers; these can only be accessed by the C64x+ megamodules.

The configuration SCR uses 32-bit configuration buses running at a frequency equal to the CPU frequency divided by 3.

PRODUCT PREVIEW

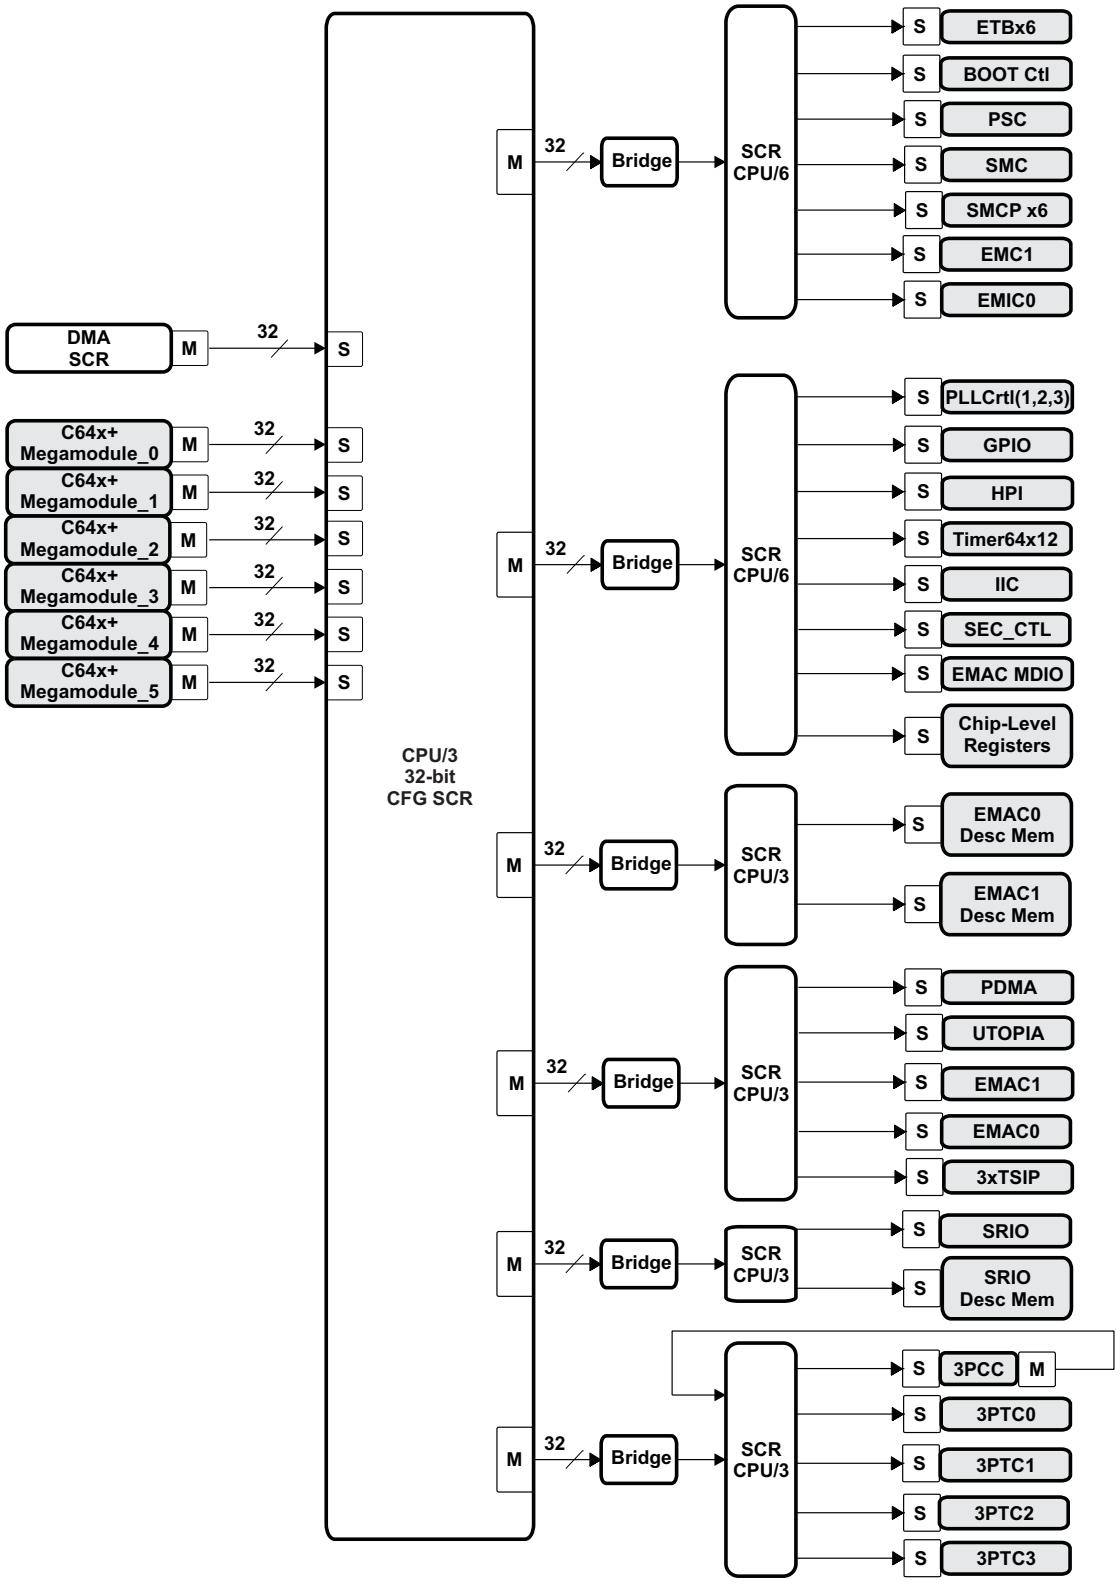

Figure 4-3. Configuration Switched Central Resource

5 C64x+ Megamodule

The C64x+ Megamodule consists of several components — the C64x+ CPU, the L1 program and data memory controllers, the L2 memory controller, the internal DMA (IDMA), the interrupt controller, power-down controller, and external memory controller. The C64x+ Megamodule also provides support for memory protection (for L1P, L1D, and L2 memories) and bandwidth management (for resources local to the C64x+ Megamodule). Figure 5-1 shows a block diagram of the C64x+ Megamodule.

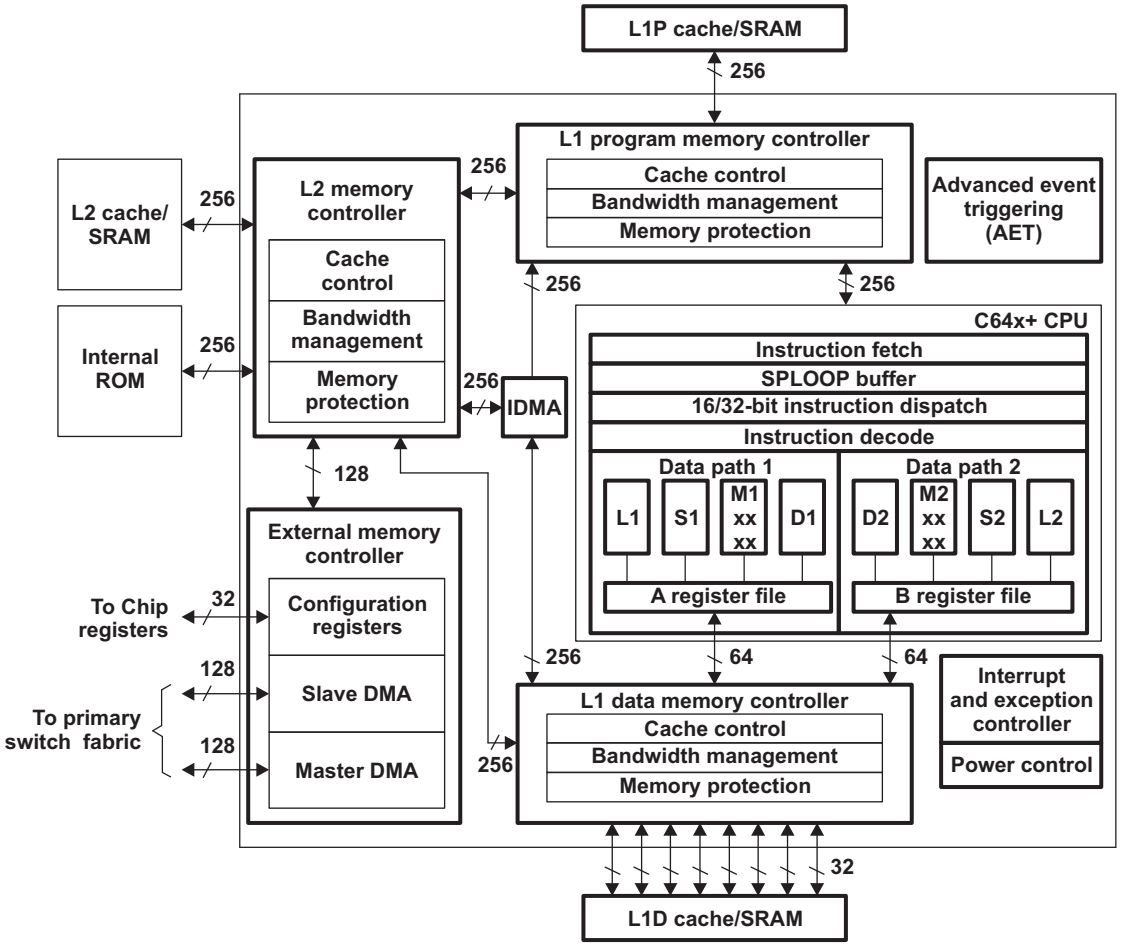

Figure 5-1. 64x+ Megamodule Block Diagram

For more detailed information on the TMS320C64x+ megamodule on the C6472 device, see the *TMS320C64x+ DSP Megamodule Reference Guide* (literature number SPRU871).

5.1 Memory Architecture

The TMS320C6472 device contains a 608KB level-2 memory (L2), a 32KB level-1 program memory (L1P), and a 32KB level-1 data memory (L1D).

The L1P memory configuration for the C6472 device is as follows:

- Region 0 size is 0K bytes (disabled).
- Region 1 size is 32K bytes with no wait states.

The L1D memory configuration for the C6472 device is as follows:

- Region 0 size is 0K bytes (disabled).
- Region 1 size is 32K bytes with no wait states.

PRODUCT PREVIEW

L1D is a two-way set-associative cache while L1P is a direct-mapped cache.

The L1P and L1D cache can be reconfigured via software through the L1PMODE field of the L1P Configuration Register (L1PCFG) and the L1DMODE field of the L1D Configuration Register (L1DCFG) of the C64x+ Megamodule. After device reset, L1P and L1D cache are configured as all cache or all SRAM. The on-chip Bootloader changes the reset configuration for L1P and L1D. For more information, see the *TMS320C645x/C647x Bootloader User's Guide* (literature number SPRUEC6).

Figure 5-2 and Figure 5-3 show the available SRAM/cache configurations for L1P and L1D, respectively.

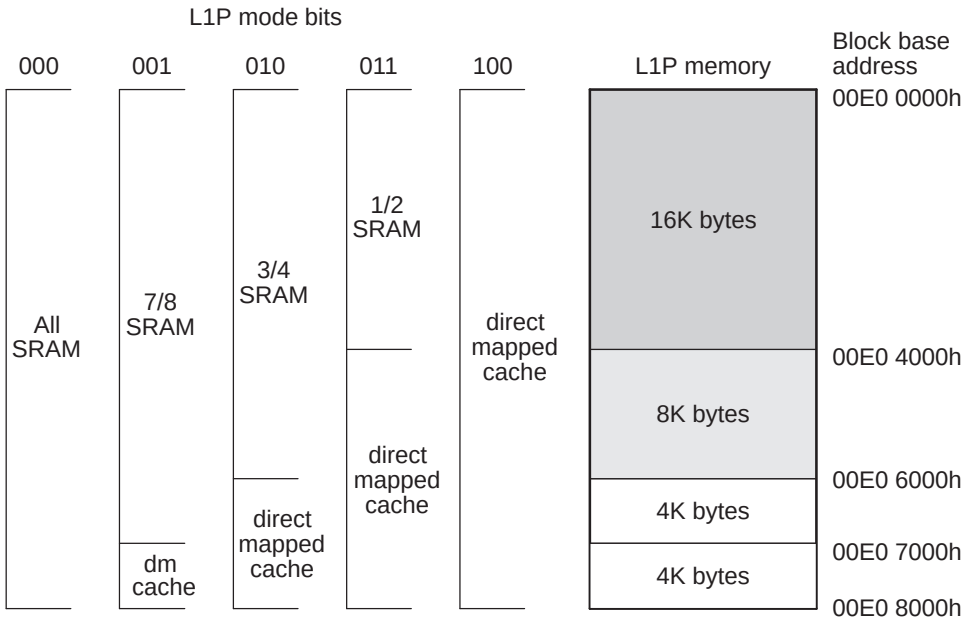

Figure 5-2. TMS320C6472 L1P Memory Configurations

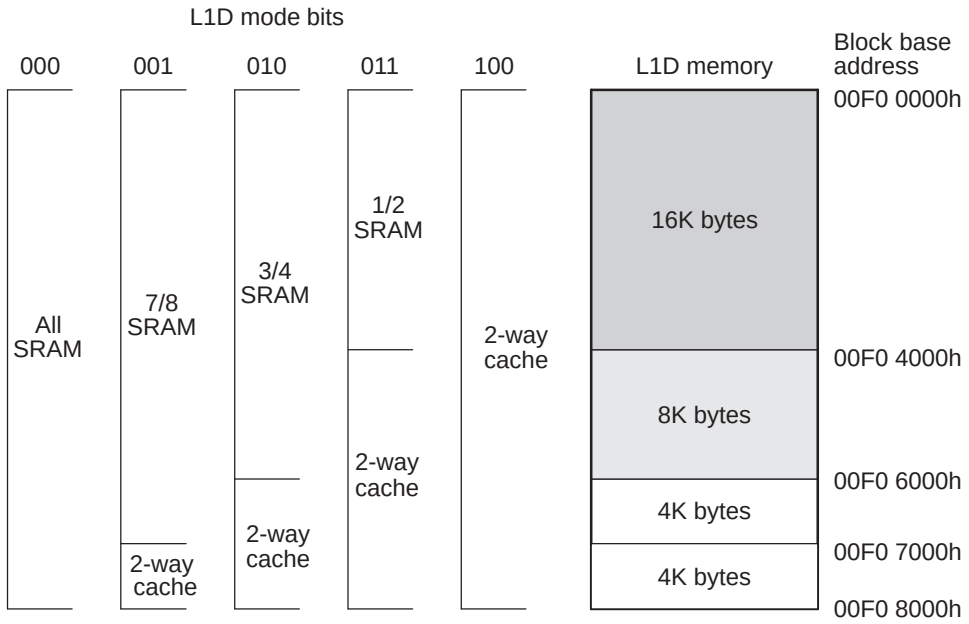

Figure 5-3. TMS320C6472 L1D Memory Configurations

The L2 memory configuration for the C6472 device is as follows:

- Port 0 configuration:
  - Memory size is 608KB
  - Starting address is 0080 0000h
  - 2-cycle latency
  - 4 × 128-bit bank configuration
- Port 1 configuration:
  - Memory size is 768KB shared RAM
  - Starting address is 0010 0000h
  - 1-cycle latency
  - 4 × 256-bit bank configuration

L2 memory can be configured as all SRAM or as part 4-way set-associative cache. The amount of L2 memory that is configured as cache is controlled through the L2MODE field of the L2 Configuration Register (L2CFG) of the C64x+ Megamodule. Figure 5-4 shows the available SRAM/cache configurations for L2. By default, L2 is configured as all SRAM after device reset.

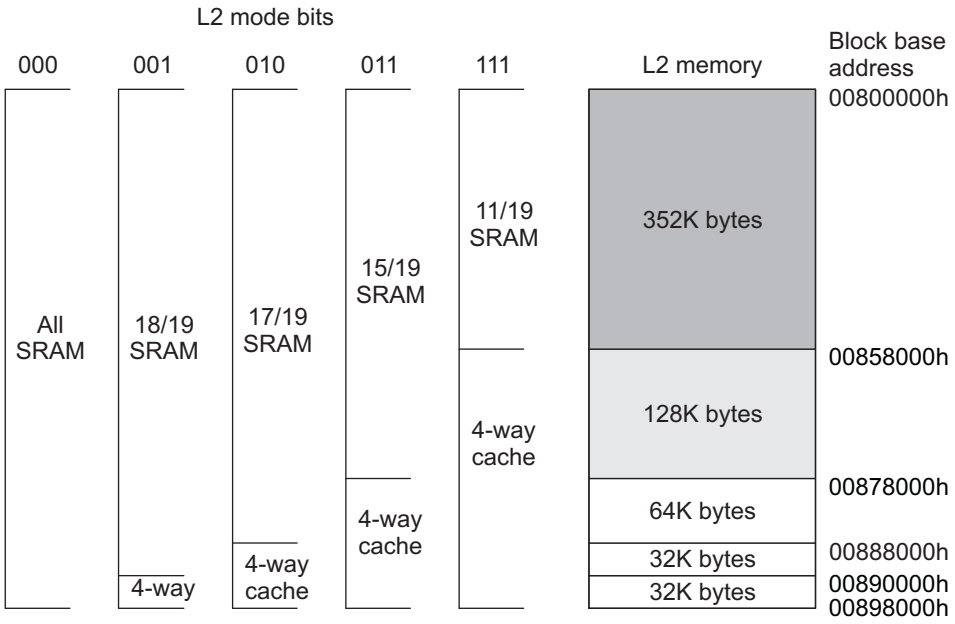

Figure 5-4. TMS320C6472 L2 Memory Configurations

For more information on the operation L1 and L2 caches, see the *TMS320C64x+ DSP Cache User's Guide* (literature number SPRU862).

All memory on the C6472 has a unique location in the memory map (see Table 2-2, *C6472 Memory Map Summary*).

PRODUCT PREVIEW

5.2 Memory Protection Support

Memory protection allows an operating system to define who or what is authorized to access L1D, L1P, and L2 memory. To accomplish this, the L1D, L1P, and L2 memories are divided into pages. There are 16 pages of L1P (2KB each), 16 pages of L1D (2KB each), and up to 64 pages of L2. The L1D, L1P, and L2 memory controllers in the C64x+ Megamodule are equipped with a set of registers that specify the permissions for each memory page. For L2, the number of protection pages and their sizes depend on the L2 configuration of the device, as defined in the previous section. The actual sizes are listed in Table 5-1.

Table 5-1 shows the memory addresses used to access the L2 memory.

Table 5-1. L2 Memory Protection Page Sizes

ADDRESS	L2					
	C64x+ MEGAMODULE CORE 0	C64x+ MEGAMODULE CORE 1	C64x+ MEGAMODULE CORE 2	C64x+ MEGAMODULE CORE 3	C64x+ MEGAMODULE CORE 4	C64x+ MEGAMODULE CORE 5
Shared L2						
0020 0000h - 002B FFFFh	64 KB	64 KB	64 KB	64 KB	64 KB	64 KB
002C 0000h - 002F FFFFh	N/A	N/A	N/A	N/A	N/A	N/A
Local L2						
0080 0000h - 0089 7FFFh	32 KB	32 KB	32 KB	32 KB	32 KB	32 KB
0089 8000h - 008F FFFFh	N/A	N/A	N/A	N/A	N/A	N/A

Each page may be assigned with fully orthogonal user and supervisor read, write, and execute permissions. Additionally, a page may be marked as either (or both) locally or globally accessible. A local access is a direct CPU access to L1D, L1P, and L2, while a global access is initiated by a DMA (either IDMA or the EDMA3) or by other system masters.

CPU 0 and all non-EDMA system masters on the device are assigned the same privilege ID. CPUs 1-5 are each assigned a unique privilege ID (see Table 5-2). It is only possible to specify whether the memory pages are locally or globally accessible. The AIDx (x=0,1,2,3,4,5, or X) and LOCAL bits of the memory protection page attribute registers specify the memory page protection scheme as listed in Table 5-3.

Whenever the CPU is the initiator of a memory transaction, the privilege mode (user or supervisor) in which the CPU is running at that time is carried with those transactions. This includes EDMA3 transfers that are programmed by the CPU. For most peripheral masters (EMAC0, EMAC1, UTOPIA, TSIP0, TSIP1, and TSIP2), the privilege mode is always user mode. Two peripherals (HPI and SRIO) have programmable privilege modes through a chip-level register, HOSTPRIV, and can be either user or supervisor.

Table 5-2. Available Memory Page Protection Scheme with Privilege ID

PRIVID MODULE	CORRESPONDING FIELD IN MEMORY PROTECTION PAGE ATTRIBUTE REGISTERS	PRIVILEGE MODE	DESCRIPTION
0 (Core 0)	AID0	Inherited from CPU(1)	C64x+ Megamodule Core 0
0 (not SRIO or HPI or Core 0)	AID0	User	All peripheral masters except SRIO and HPI
0 (SRIO or HPI)	AID0	User/Supervisor (configured in HOSTPRIV)	SRIO and HPI
1	AID1	Inherited from CPU(1)	C64x+ Megamodule Core 1
2	AID2	Inherited from CPU(1)	C64x+ Megamodule Core 2
3	AID3	Inherited from CPU(1)	C64x+ Megamodule Core 3

(1) Also applies to EDMA transfers that are programmed by the CPU.

Table 5-2. Available Memory Page Protection Scheme with Privilege ID (continued)

PRIVID MODULE	CORRESPONDING FIELD IN MEMORY PROTECTION PAGE ATTRIBUTE REGISTERS	PRIVILEGE MODE	DESCRIPTION
4	AID4	Inherited from CPU(1)	C64x+ Megamodule Core 4
5	AID5	Inherited from CPU(1)	C64x+ Megamodule Core 5
≥6	AIDX	Reserved	Reserved

Table 5-3. Available Memory Page Protection Scheme with AIDx and Local Bits

PRIVID MODULE	LOCAL BIT	DESCRIPTION
0	0	No access to memory page is permitted.
0	1	Only direct access by CPU is permitted.
1	0	Only accesses by system masters and IDMA are permitted (includes EDMA and IDMA accesses initiated by the CPU).
1	1	All accesses permitted

Faults are handled by software in an interrupt (or exception, programmable within each C64x+ Megamodule interrupt controller) service routine. A CPU or DMA access to a page without the proper permissions will:

- Block the access - reads return zero, writes are voided.
- Capture the initiator in a status register - ID, address, and access type are stored.
- Signal event to CPU interrupt controller.

The software is responsible for taking corrective action to respond to the event and resetting the error status in the memory controller.

For more information on memory protection for L1D, L1P, and L2, see the *TMS320C64x+ DSP Megamodule Reference Guide* (literature number SPRU871).

5.3 Bandwidth Management

When multiple requestors contend for a single C64x+ Megamodule resource, the conflict is solved by granting access to the highest priority requestor. The following four resources are managed by the Bandwidth Management control hardware:

- Level 1 Program (L1P) SRAM/Cache
- Level 1 Data (L1D) SRAM/Cache
- Level 2 (L2) SRAM/Cache
- Memory-mapped registers configuration bus

The priority level for operations initiated within the C64x+ Megamodule; e.g., CPU-initiated transfers, user-programmed cache coherency operations, and IDMA-initiated transfers, are declared through registers in the C64x+ Megamodule. The priority level for operations initiated outside the C64x+ Megamodule by system peripherals is declared through the Priority Allocation Register (PRI_ALLOC), see Figure 4-2. System peripherals with no fields in PRI_ALLOC have their own registers to program their priorities.

More information on the bandwidth management features of the C64x+ Megamodule can be found in the *TMS320C64x+ DSP Megamodule Reference Guide* (literature number SPRU871).

PRODUCT PREVIEW

5.4 Power-Down Control

The C64x+ Megamodule supports the ability to power-down various parts of the C64x+ Megamodule. The power-down controller (PDC) of the C64x+ Megamodule can be used to power down L1P, the cache control hardware, the CPU, and the entire C64x+ Megamodule. These power-down features can be used to design systems for lower overall system power requirements.

NOTE

The C6472 does not support power-down modes for the L2 memory at this time.

More information on the power-down features of the C64x+ Megamodule can be found in the *TMS320C64x+ DSP Megamodule Reference Guide* (literature number SPRU871).

5.5 Megamodule Resets

Table 5-4 shows the reset types supported on the C6472 device and they affect the resetting of the Megamodule, either both globally or just locally.

Table 5-4. Megamodule Reset (Global or Local)

RESET TYPE	GLOBAL MEGAMODULE RESET	LOCAL MEGAMODULE RESET
Power-On Reset	Y	Y
Warm Reset	Y	Y
System Reset	Y	Y
CPU Reset	N	Y

For more detailed information on the global and local Megamodule resets, see the *TMS320C64x+ DSP Megamodule Reference Guide* (literature number SPRU871). For more detailed information on device resets, see Section 7.7, *Reset Controller*.

5.6 Megamodule Revision

The version and revision of the C64x+ Megamodule can be read from the Megamodule Revision ID Register (MM_REVID) located at address 0181 2000h. The MM_REVID register is shown in Figure 5-5 and described in Table 5-5. The C64x+ Megamodule revision is dependant on the silicon revision being used. For more information, see the *TMS320C6472 Digital Signal Processor Silicon Errata* (literature number SPRZ300).

31	16	15	0
VERSION		REVISION(A)	
R-1h		R-n	

LEGEND: R = Read only; -*n* = value after reset

A. The C64x+ Megamodule revision is dependant on the silicon revision being used. For more information, see the *TMS320C6472 Digital Signal Processor Silicon Errata* (literature number SPRZ300).

Figure 5-5. Megamodule Revision ID Register (MM_REVID) [Hex Address: 0181 2000h]

Table 5-5. Megamodule Revision ID Register (MM_REVID) Field Descriptions

Bit	Field	Value	Description
31:16	VERSION	1h	Version of the C64x+ Megamodule implemented on the device. This field is always read as 1h.
15:0	REVISION		Revision of the C64x+ Megamodule version implemented on the device. The C64x+ Megamodule revision is dependant on the silicon revision being used. For more information, see the *TMS320C6472 Digital Signal Processor Silicon Errata* (literature number SPRZ300).

Table 5-6. Megamodule Interrupt Registers

HEX ADDRESS RANGE	ACRONYM	REGISTER NAME
0180 0000	EVTFLAG0	Event Flag Register 0 (Events [31:0])
0180 0004	EVTFLAG1	Event Flag Register 1
0180 0008	EVTFLAG2	Event Flag Register 2
0180 000C	EVTFLAG3	Event Flag Register 3
0180 0010 - 0180 001C	-	Reserved
0180 0020	EVTSET0	Event Set Register 0 (Events [31:0])
0180 0024	EVTSET1	Event Set Register 1
0180 0028	EVTSET2	Event Set Register 2
0180 002C	EVTSET3	Event Set Register 3
0180 0030 - 0180 003C	-	Reserved
0180 0040	EVTCLR0	Event Clear Register 0 (Events [31:0])
0180 0044	EVTCLR1	Event Clear Register 1
0180 0048	EVTCLR2	Event Clear Register 2
0180 004C	EVTCLR3	Event Clear Register 3
0180 0050 - 0180 007C	-	Reserved
0180 0080	EVTMASK0	Event Mask Register 0 (Events [31:0])
0180 0084	EVTMASK1	Event Mask Register 1
0180 0088	EVTMASK2	Event Mask Register 2
0180 008C	EVTMASK3	Event Mask Register 3
0180 0090 - 0180 009C	-	Reserved
0180 00A0	MEVTFLAG0	Masked Event Flag Status Register 0 (Events [31:0])
0180 00A4	MEVTFLAG1	Masked Event Flag Status Register 1
0180 00A8	MEVTFLAG2	Masked Event Flag Status Register 2
0180 00AC	MEVTFLAG3	Masked Event Flag Status Register 3
0180 00B0 - 0180 00BC	-	Reserved
0180 00C0	EXPMASK0	Exception Mask Register 0 (Events [31:0])
0180 00C4	EXPMASK1	Exception Mask Register 1
0180 00C8	EXPMASK2	Exception Mask Register 2
0180 00CC	EXPMASK3	Exception Mask Register 3
0180 00D0 - 0180 00DC	-	Reserved
0180 00E0	MEXPFLAG0	Masked Exception Flag Register 0
0180 00E4	MEXPFLAG1	Masked Exception Flag Register 1
0180 00E8	MEXPFLAG2	Masked Exception Flag Register 2
0180 00EC	MEXPFLAG3	Masked Exception Flag Register 3
0180 00F0 - 0180 00FC	-	Reserved
0180 0100	-	Reserved
0180 0104	INTMUX1	Interrupt Multiplexor Register 1
0180 0108	INTMUX2	Interrupt Multiplexor Register 2
0180 010C	INTMUX3	Interrupt Multiplexor Register 3
0180 0110 - 0180 013C	-	Reserved
0180 0140	AEGMUX0	Advanced Event Generator Mux Register 0
0180 0144	AEGMUX1	Advanced Event Generator Mux Register 1
0180 0148 - 0180 017C	-	Reserved
0180 0180	INTXSTAT	Interrupt Exception Status Register
0180 0184	INTXCLR	Interrupt Exception Clear Register

Table 5-6. Megamodule Interrupt Registers (continued)

PRODUCT PREVIEW

5.8 CPU Revision ID

Each 64x+ Megamodule contains a 64x+ CPU processing core. This 64x+ CPU processing core also contains an additional CPU ID and Revision ID independent from the Megamodule Revision ID. It is contained in the control status resister (CSR) which is part of the control register file within the CPU core. The CPU ID field (bits 31:24) identifies the CPU core as 64x+ by returning the value 10h when read. The REVISION ID field (bits 23:16) returns the value 00h when read. For more CPU Revision ID related information, see the *TMS320C6472 Digital Signal Processor Silicon Errata* (literature number SPRZ300). For more CPU CSR related information, see the *TMS320C64x/C64x+ DSP CPU and Instruction Set Reference Guide* (literature number SPRU732).

6 Device Operating Conditions

6.1 Absolute Maximum Ratings Over Operating Case Temperature Range (Unless Otherwise Noted)(1)(2)(3)

Supply voltage range:	CV_{DD}	-0.5 V to 1.5 V
	CV_{DD2}	-0.5 V to 1.5 V
	DV_{DD33}	-0.5 V to 4.2 V
	DV_{DD18}, AV_{DDA3}, AV_{DDA4}	-0.5 V to 2.5 V
	AV_{DDA1}, AV_{DDA2}	-0.5 V to 2.5 V
	DV_{DD15}	-0.5 V to 2.5 V
	DV_{DDR}	-0.5 V to 2.5 V
	CV_{DD1}	-0.5 V to 1.5 V
	AV_{DDA}, DV_{DDD}, AV_{DDT}	-0.5 V to 1.5 V
Input voltage (V_I) range:	3.3-V pins	-0.5 V to DV_{DD33} + 0.5 V
	RGMII pins	-0.3 V to DV_{DD15} + 0.3 V
	DDR2 memory controller pins	-0.3 V to DV_{DD18} + 0.3 V
	RIO pins	0 V to 1.32 V
Output voltage (V_O) range:	3.3-V pins	-0.5 V to DV_{DD33} + 0.5 V
	RGMII pins	-0.3 V to DV_{DD15} + 0.3 V
	DDR2 memory controller pins	-0.3 V to DV_{DD18} + 0.3 V
	RIO pins	0 V to 1.32 V
Operating case temperature range, T_C:	Standard	0°C to 85°C
	A version(4)	-40°C to 100°C
Storage temperature range, T_{stg}		-65°C to 150°C

(1) Stresses beyond those listed under "absolute maximum ratings" may cause permanent damage to the device. These are stress ratings only, and functional operation of the device at these or any other conditions beyond those indicated under "recommended operating conditions" is not implied. Exposure to absolute-maximum-rated conditions for extended periods may affect device reliability.
(2) All voltage values are with respect to V_{SS}.
(3) Overshoot and undershoot transients due to impedance mismatch on 3.3-V pins can be up to 30% of the supply voltage for up to 30% of the signal period without significantly impacting reliability. For RGMII and DDR2 pins, limit overshoot/undershoot to 20% of supply voltage for up to 20% of the duty cycle. These period limits assume continuous operation.
(4) Extended temperature (A version) range is available only on 500-MHz and 625-MHz devices.

PRODUCT PREVIEW

6.2 Recommended Operating Conditions[1]

PARAMETER			MIN	NOM	MAX	UNIT
CV_{DD}	Supply voltage, Core	500 MHz	0.95	1.0	1.05	V
		625 MHz	1.05	1.1	1.16	
		700 MHz	1.14	1.2	1.26	
CV_{DD2}	Supply voltage, SRIO Core	500 MHz	0.95	1.0	1.05	V
		625 MHz	1.05	1.1	1.16	
		700 MHz	1.14	1.2	1.26	
CV_{DD1}	Supply volttage, 1.2-V DDR Core		1.14	1.2	1.26	V
DV_{DD33}	Supply voltage, 3.3-V I/O		3.135	3.3	3.465	V
DV_{DD18}	Supply voltage, 1.8-V I/O (DDR)		1.71	1.8	1.89	V
DV_{DD15}	Supply voltage, 1.8-V/1.5-V I/O (RGMII)		1.4		1.9	V
$V_{REFHSTL}$ ($0.5 * DV_{DD15}$)	Reference voltage, RGMII I/O		0.7		0.95	V
$V_{REFSSTL}$ ($0.5 * DV_{DD18}$)	Reference voltage, DDR2 I/O		0.855	0.9	0.945	V
AV_{DDA1}	Analog supply voltage, PLL1 (System PLL)		1.71	1.8	1.89	V
AV_{DDA2}	Analog supply voltage, PLL2 (EMAC PLL)		1.71	1.8	1.89	V
AV_{DDA3}	Analog supply voltage, PLL3 (DDR PLL)		1.71	1.8	1.89	V
AV_{DDA4}	Analog supply voltage, DDR		1.71	1.8	1.89	V
DV_{DDD}	SRIO Digital supply voltage		1.14	1.2	1.26	V
AV_{DDA}	SRIO Analog supply voltage		1.14	1.2	1.26	V
AV_{DDT}	SRIO Termination voltage		1.14	1.2	1.26	V
DV_{DDR}	SRIO Regulator supply voltage		1.35	1.5/1.8	1.98	V
V_{IH}	High-level input voltage	3.3-V pins (except I2C pins)	2.0		DV_{DD33} + 0.5	V
		I2C pins	$0.7 * DV_{DD33}$		DV_{DD33} + 0.5	
		RGMII pins	$V_{REFHSTL}$ + 0.10		DV_{DD15} + 0.3	
		DDR2 memory controller pins	$V_{REFSSTL}$ + 0.125		DV_{DD18} + 0.3	
V_{IL}	Low-level input voltage	3.3-V pins (except I2C pins)	-0.5		0.8	V
		I2C pins	-0.5		$0.3 * DV_{DD33}$	
		RGMII pins	-0.3		$V_{REFHSTL}$ - 0.1	
		DDR2 memory controller pins	-0.3		$V_{REFSSTL}$ - 0.125	
P_{CDD}	Core supply power[2]	CV_{DD} = CV_{DD2} = 1.0 V, CPU frequency = 500 MHz		2.38		W
		CV_{DD} = CV_{DD2} = 1.1 V, CPU frequency = 625 MHz		3.76		
		CV_{DD} = CV_{DD2} = 1.2 V, CPU frequency = 700 MHz		5.42		

(1) Operating conditions are at 500 MHz, 625 MHz, or 700 MHz.
(2) Assumes the following conditions: CPU utilization 30% DSP/60% control; DDR2 at 30% utilization (266 MHz), 35% writes, 32 bits, 15% bit switching; TSIP0, TSIP1, and TSIP2 at 20% utilization, 15% switching; UTOPIA 50 MHz, 16-bit at 50% utilization, 15% switching EMAC0, 1000 Mbps, RGMII, 50% utilization, 50% switching; EMAC1 disabled; SRIO both lanes disabled; all timers active; HPI disabled; I2C enabled at 10% utilization; room temperature (25°C). The actual power consumption is application-dependent. For more details on core and I/O activity, see the *TMS320C6472/TMS320TCI6486 Power Consumption Summary* (literature number SPRAAS4).

Recommended Operating Conditions *(continued)*

PARAMETER			MIN	NOM	MAX	UNIT
P_{DDD}	I/O supply power(2)	3.3-V Supply (DV_{DD33})		0.2		W
		1.8-V Supplies, including PLLs (DV_{DD18}, AV_{DDA1}, AV_{DDA2}, AV_{DDA3}, AV_{DDA4}		0.26		
		1.5-V Supplies (DV_{DD15}, DV_{DDR})		0.05		
		1.2-V Supplies (CV_{DD1}, AV_{DDA}, DV_{DDD}, AV_{DDT})		0.28		

PRODUCT PREVIEW

6.3 Electrical Characteristics Over Recommended Ranges of Supply Voltage and Operating Case Temperature (Unless Otherwise Noted)

PARAMETER			TEST CONDITIONS(1)	MIN	TYP	MAX	UNIT
V_{OH}	High-level ouput voltage	3.3 V pins (except I2C pins)	DV_{DD33} = MIN, I_{OH} = MAX	0.8 * DV_{DD33}			V
		I2C pins	DV_{DD33} = MIN, I_{OH} = MAX	0.8 * DV_{DD33}			V
		RGMII pins		DV_{DD15} - 0.4			V
		DDR2 memory controller pins		DV_{DD18} - 0.4			V
V_{OL}	Low-level ouput voltage	3.3-V pins (except I2C pins)	DV_{DD33} = MIN, I_{OL} = MAX			0.4	V
		I2C pins	Pulled up to 3.3 V, 3 mA sink current			0.4	V
		RGMII pins				0.4	V
		DDR2 memory controller pins				0.4	V
I_I	Input current (DC)	3.3-V pins (except I2C pins)	V_I = V_{SS} to DV_{DD33}, pins without internal pull-up or pull-down resistor	-1		1	uA
			V_I = V_{SS} to DV_{DD33}, pins with internal pull-up resistor	50	100	400	uA
			V_I = V_{SS} to DV_{DD33}, pins with internal pull-down resistor	-400	-100	-50	uA
		I2C pins	0.1 * DV_{DD33} ≤ V_I ≤ 0.9 * DV_{DD33}	-10		10	uA
		RGMII pins		-1		1	uA
		DDR2 memory controller pins		-1		1	uA
I_{OH}	High-level output current	E Class Buffers - EMU[18:0] and all 3.3-V Ethernet, except MCRS0_RMCRSDV0, MCOL0, GMDIO, and GMDCLK				-7	mA
		D Class Buffers - GPIO[15:0], TDO, HOUT, and SYSCLKOUT				-3	mA
		C Class Buffers - HPI, TSIP, UTOPIA, BOOTACTIVE, WDOUT, RESETSTAT, TIMO2, MCRS0_RMCRSDV0, MCOL0, GMDIO, and GMDCLK				-3	mA
		RGMII pins				-8	mA
		DDR pins				-13.4	mA

(1) For test conditions shown as MIN, MAX, or NOM, use the appropriate value specified in the recommended operating conditions table.

Electrical Characteristics Over Recommended Ranges of Supply Voltage and Operating Case Temperature (Unless Otherwise Noted) *(continued)*

PARAMETER			TEST CONDITIONS(1)	MIN	TYP	MAX	UNIT
I_{OL}	Low-level output current	E Class Buffers - EMU[18:0] and all 3.3-V Ethernet, except MCRS0_RMCRSDV0, MCOL0, GMDIO, and GMDCLK				7	mA

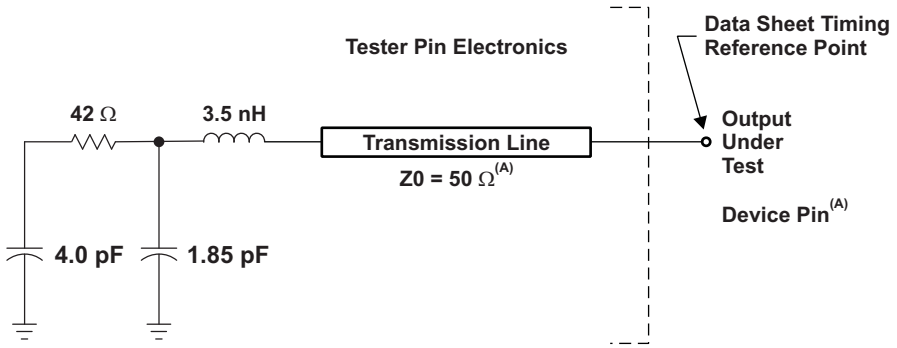
		extended temperature(2)		-40		100	

(2) Extended temperature (A) range is available only on 500-MHz and 625-MHz devices.

PRODUCT PREVIEW

7 C64x+ Peripheral Information and Electrical Specifications

7.1 Parameter Information



A. The data sheet provides timing at the device pin. For output timing analysis, the tester pin electronics and its transmission line effects must be taken into account. A transmission line with a delay of 2 ns or longer can be used to produce the desired transmission line effect. The transmission line is intended as a load only. It is not necessary to add or subtract the transmission line delay (2 ns or longer) from the data sheet timings. Input requirements in this data sheet are tested with an input slew rate of ≤ 4 Volts per nanosecond (V/ns) at the device pin.

Figure 7-1. Test Load Circuit for AC Timing Measurements

The load capacitance value stated is only for characterization and measurement of AC timing signals. This load capacitance value does not indicate the maximum load the device is capable of driving.

7.1.1 3.3-V Signal Transition Levels

All input and output timing parameters are referenced to 1.5 V for both "0" and "1" logic levels.

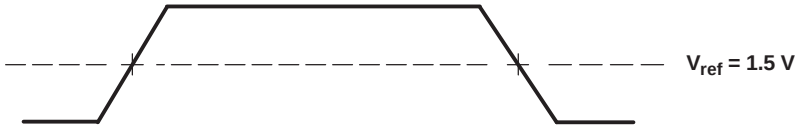


Figure 7-2. Input and Output Voltage Reference Levels for AC Timing Measurements

All rise and fall transition timing parameters are referenced to V_{IL} MAX and V_{IH} MIN for input clocks, V_{OL}MAX and V_{OH} MIN for output clocks.

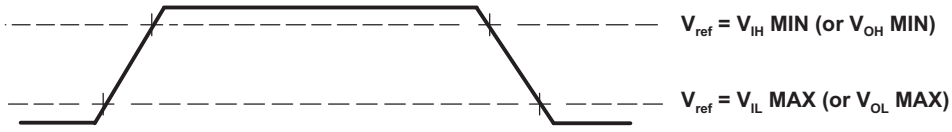

Figure 7-3. Rise and Fall Transition Time Voltage Reference Levels

7.1.2 3.3-V Signal Transition Rates

All timings are tested with an input edge rate of ≤4 Volts per nanosecond (V/ns).

7.1.3 Timing Parameters and Board Routing Analysis

The timing parameter values specified in this data sheet do *not* include delays by board routings. As a good board design practice, such delays must *always* be taken into account. Timing values may be

PRODUCT PREVIEW

adjusted by increasing/decreasing such delays. TI recommends utilizing the available I/O buffer information specification (IBIS) models to analyze the timing characteristics correctly. To properly use IBIS models to attain accurate timing analysis for a given system, see the *Using IBIS Models for Timing Analysis* application report (literature number SPRA839). If needed, external logic hardware such as buffers may be used to compensate any timing differences.

7.2 Recommended Clock and Control Signal Transition Behavior

All clocks and control signals ***must*** transition between V_{IH} and V_{IL} (or between V_{IL} and V_{IH}) in a monotonic manner.

7.3 Power Supplies

7.3.1 Power-Supply Sequencing

TI recommends the power-supply sequence options shown in Figure 7-4 and Figure 7-5. For Option 2, after the DV_{DD33} supply is stable, the remaining power supplies can be powered up at the same time as CV_{DD} as long as their supply voltage never exceeds the CV_{DD} voltage until CV_{DD} is stable. Note that the word *stable* means voltages that have reached a valid level as described in Section 6.2. Some TI power-supply devices include an "auto-track" feature that can be used to ensure multiple supply outputs ramp at the same time to prevent one being higher than another during startup. In all of these sequencing requirements, the intent is to prevent a subsequent power supply voltage from exceeding a previous power supply until the previous supply has reached a stable value.

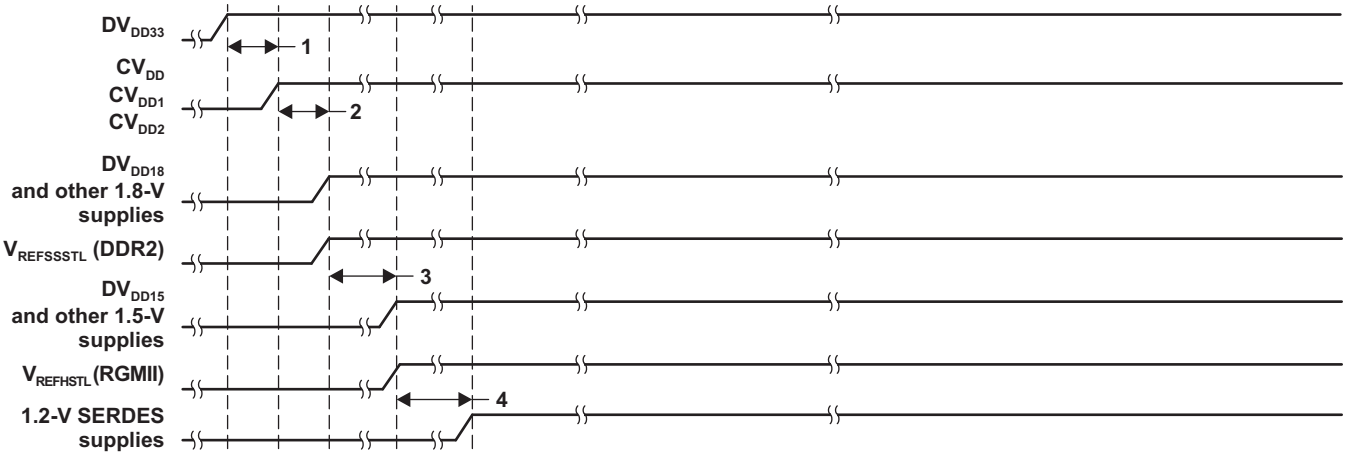

Figure 7-4. Power-Supply Sequence (Option 1)

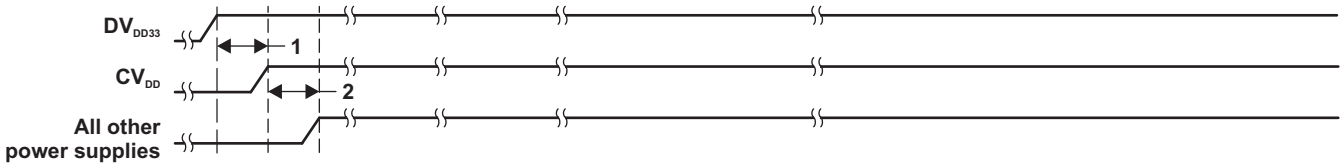

Figure 7-5. Power-Supply Sequence (Option 2)

PRODUCT PREVIEW

Table 7-1. Timing Requirements for Power-Supply Sequence (Option 1)(1)

NO.			500/625/700		UNIT
			MIN	MAX	
1	$t_{su(DVDD33-CVDD)}$	Setup time, DV_{DD33} supply stable before CV_{DD} supply stable	0.5	200	ms
2	$t_{su(CVDD-DVDD18)}$	Setup time, CV_{DD} supply stable before DV_{DD18} supply and $V_{REFSSTL}$ reference voltage stable	0	200	ms
3	$t_{su(DVDD18-DVDD15)}$	Setup time, DV_{DD18} supply and $V_{REFSSTL}$ reference voltage stable before DV_{DD15} supply and $V_{REFHSTL}$ reference voltage stable	0	200	ms
4	$t_{su(DVDD15-DVDD)}$	Setup time, DV_{DD15} supply and $V_{REFHSTL}$ reference voltage stable before DV_{DD} supply stable	0	200	ms

(1) **Note:** The word *stable* means voltages that have reached a valid level as described in Section 6.2.

Table 7-2. Timing Requirements for Power-Supply Sequence (Option 2)(1)

NO.			500/625/700		UNIT
			MIN	MAX	
1	$t_{su(DVDD33-CVDD)}$	Setup time, DV_{DD33} supply stable before CV_{DD} supply stable	0.5	200	ms
2	$t_{su(CVDD-ALLSUP)}$	Setup time, CV_{DD} supply stable before all other supplies stable	0	200	ms

(1) **Note:** The word *stable* means voltages that have reached a valid level as described in Section 6.2.

For detailed information, see the *TMS320C6472/TMS320TCI6486 Hardware Design Guide* (literature number SPRAAQ4).

7.3.2 Power-Supply Decoupling

In order to properly decouple the supply planes from system noise, place as many capacitors (caps) as possible close to the DSP. These caps need to be close to the DSP, no more than 1.25 cm maximum distance to be effective. Physically smaller caps are better, such as 0402, but need to be evaluated from a yield/manufacturing point-of-view. Parasitic inductance limits the effectiveness of the decoupling capacitors, therefore physically smaller capacitors should be used while maintaining the largest available capacitance value. As with the selection of any component, verification of capacitor availability over the product's production lifetime should be considered.

7.3.3 Preserving Boundary-Scan Functionality on DDR2, RGMII, and RapidIO Interface Pins

When the DDR2 Memory Controller is not used, the DV_{DD18}, $DV_{DD18MON}$, $V_{REFSSTL}$, AV_{DDA3}, AV_{DDA4}, CV_{DD1}, PTV18P, and PTV18N pins can be NC or connected directly to ground (V_{SS}) to save power. However, this prevents boundary scan from functioning on the DDR2 Memory Controller pins. To preserve boundary-scan functionality on the DDR2 Memory Controller pins DV_{DD18}, $DV_{DD18MON}$, $V_{REFSSTL}$, AV_{DDA3}, AV_{DDA4}, CV_{DD1}, PTV18P, and PTV18N should be connected as follows:

- DV_{DD18}, $DV_{DD18MON}$, AV_{DDA3}, and AV_{DDA4} - connect these pins to the 1.8-V supply.
- CV_{DD1} - connect these pins to the 1.2-V supply.
- $V_{REFSSTL}$ - connect this pin to a voltage of 0.9 V. This voltage can be generated directly from the 1.8-V supply using two 1-kΩ resistors to form a resistor-divider circuit.
- PTV18P - connect this pin to ground (V_{SS}) via a 200-Ω resistor.
- PTV18N - connect this pin to the 1.8-V supply via a 200-Ω resistor.

When the RGMII mode of the EMAC is not used, the DV_{DD15}, $DV_{DD15MON}$, $V_{REFHSTL}$, PTV15P, and PTV15N pins can be NC or connected directly to ground (V_{SS}) to save power. However, this prevents boundary scan from functioning on the RGMII pins of the EMAC. To preserve boundary-scan functionality on the RGMII pins DV_{DD15}, $DV_{DD15MON}$, $V_{REFHSTL}$, PTV15P, and PTV15N should be connected as follows:

- DV_{DD15} and $DV_{DD15MON}$ - connect these pins to the 1.8-V supply.
- $V_{REFHSTL}$ - connect to a voltage of 0.9 V. This voltage can be generated directly from the 1.8-V supply using two 1-kΩ resistors to form a resistor-divider circuit.
- PTV15P - connect this pin to ground (V_{SS}) via a 200-Ω resistor.

PRODUCT PREVIEW

- PTV15N - connect this pin to the 1.8-V supply via a 200-Ω resistor.

When the RapidIO interface is not used, the CV_{DD2}, AV_{DDA}, DV_{DDD}, DV_{DDR}, and AV_{DDT} pins can be NC or connected directly to ground (V_{SS}) to reduce power use. However, this prevents boundary-scan from functioning on the RapidIO pins. To preserve boundary-scan functionality on the RapidIO pins CV_{DD2}, AV_{DDA}, DV_{DDD}, DV_{DDR}, and AV_{DDT} should be connected as follows:

- CV_{DD2} - connect these pins to the 1.0/1.1-V core supply.
- AV_{DDA}, DV_{DDD}, and AV_{DDT} - connect these pins to the 1.2-V supply.
- DV_{DDR} - connect these pins to the 1.8-V supply.

7.4 Power and Sleep Controller (PSC)

The Power and Sleep Controller (PSC) controls TMS320C6472 device power by gating off clocks to individual peripherals/modules. The PSC consists of a Global PSC (GPSC) and a set of Local PSCs (LPSCs). The GPSC contains memory mapped registers, power domain control, PSC interrupt control, and a state machine for each peripheral/module. An LPSC is associated with each peripheral/module and provides clock and reset control. The GPSC controls all of the TMS320C6472 LPSCs.

Figure 7-6 shows the PSC components and the power and clock domains they control. For more details on the PSC, see the *TMS320C6472/TMS320TCI6486 PSC User's Guide* (literature number SPRUEG3).

7.5 Enhanced Direct Memory Access (EDMA3) Controller

The primary purpose of the EDMA3 is to service user-programmed data transfers between two memory-mapped slave endpoints on the device. The EDMA3 services software-driven paging transfers (e.g., data movement between external memory and internal memory), performs sorting or subframe extraction of various data structures and offloads data transfers from the device CPU.

The EDMA3 includes the following features:

- Fully orthogonal transfer description
  - 3 transfer dimensions: array (multiple bytes), frame (multiple arrays), and block (multiple frames)
  - Single event can trigger transfer of array, frame, or entire block
  - Independent indexes on source and destination
- Flexible transfer definition:
  - Increment or FIFO transfer addressing modes
  - Linking mechanism allows for ping-pong buffering, circular buffering, and repetitive/continuous transfers, all with no CPU intervention
  - Chaining allows multiple transfers to execute with one event
- 256 PaRAM entries
  - Used to define transfer context for channels
  - Each PaRAM entry can be used as a DMA entry, QDMA entry, or link entry
- 64 DMA channels
  - Manually triggered (CPU writes to channel controller register), external event triggered, and chain triggered (completion of one transfer triggers another)
- 4 Quick DMA (QDMA) channels
  - Used for software-driven transfers
  - Triggered upon writing to a single PaRAM set entry
- 4 transfer controllers/event queues with programmable system-level priority
- Interrupt generation for transfer completion and error conditions
- Debug visibility
  - Queue watermarking/threshold allows detection of maximum usage of event queues
  - Error and status recording to facilitate debug

Each of the transfer controllers has a direct connection to the switched central resource (SCR). lists the peripherals that can be accessed by the transfer controllers.

7.5.1 EDMA3 Channel Synchronization Events

The C64x+ EDMA3 supports up to 64 EDMA channels which service peripheral devices and external memory. Table 7-4 lists the source of C64x+ EDMA3 synchronization events associated with each of the programmable EDMA channels. For the C6472 device, the association of an event to a channel is fixed; each of the EDMA channels has one specific event associated with it. These specific events are captured in the EDMA event registers (ERL, ERH) even if the events are disabled by the EDMA event enable registers (EERL, EERH). The priority of each event can be specified independently in the transfer parameters stored in the EDMA parameter RAM. For more detailed information on the EDMA module and how EDMA events are enabled, captured, processed, linked, chained, and cleared, etc., see the *TMS320C6472/TMS320TCI648x DSP Enhanced DMA (EDMA3) Controller User's Guide* (literature number SPRU727).

Table 7-4. C6472 EDMA3 Channel Synchronization Events(1)

EDMA CHANNEL	BINARY	EVENT NAME	EVENT DESCRIPTION
0	0000000	GPINT0	GPIO 0 Event
1	0000001	GPINT1	GPIO 1 Event

7.6 Interrupts

7.6.1 Interrupt Sources and Interrupt Controller

The CPU interrupts on the C6472 device are configured through the C64x+ megamodule interrupt controller. The interrupt controller allows for up to 128 system events to be programmed to any of the twelve CPU interrupt inputs, the CPU exception input, or the advanced emulation logic. Table 8-4 shows the mapping of system events to the interrupt controller inputs. Event numbers 0-31 correspond to the default interrupt mapping of the device. The remaining events must be mapped using software.

For more information on the Interrupt Controller, see the *TMS320C64x+ DSP Megamodule Reference Guide* (literature number SPRU871).

Table 7-10. C6472 DSP Interrupts

EVENT NUMBER	INTERRUPT EVENT	INTERRUPT SOURCE
0(1)	EVT0	Event Combiner 0 Output
1(1)	EVT1	Event Combiner 1 Output
2(1)	EVT2	Event Combiner 2 Output
3(1)	EVT3	Event Combiner 3 Output
4(2)	RIOINT_LOCAL	RapidIO Individual Interrupt
5	MACRXINT0	Ethernet MAC0 Receive Interrupt
6	MACTXINT0	Ethernet MAC0 Transmit Interrupt
7	MACRXINT1	Ethernet MAC1 Receive Interrupt
8	MACTXINT1	Ethernet MAC1 Transmit Interrupt
9(1)	EMU_D	ECM Interrupt for: • Host scan access • DTDMA transfer complete • AET interrupt
10	Reserved	
11(1)	EMU_RTDXRX	RTDX Receive Complete
12(1)	EMU_RTDXTX	RTDX Transmit Complete
13(1)	IDMA0	IDMA Channel 0 Interrupt
14(1)	IDMA1	IDMA Channel 1 Interrupt
15(3)	EDMA3CCINT_LOCAL	EDMA3CC Individual Completion Interrupt
16	TINTL	Local Timer Interrupt Low
17	TINTH	Local Timer Interrupt High
18	TINT6L	Timer 6 Interrupt Low
19	TINT6H	Timer 6 Interrupt High
20	TINT7L	Timer 7 Interrupt Low
21	TINT7H	Timer 7 Interrupt High

(5) This system event is generated from within the C64x+ megamodule.

PRODUCT PREVIEW

7.6.2 NMI Pin-Generated Interrupts

An NMI interrupt may be asserted to individual C64x+ megamodules from the device pins. The NMI interrupt is initiated by asserting the NMI input (low), selecting the intended C64x+ megamodule(s) with the CORESEL[2:0] inputs, and then latching it with the rising LRESETNMIEN input. The NMI interrupt input must be removed (or de-asserted) from the C64x+ megamodule. This is done by the NMI pin being latched high by the rising LRESETNMIEN input while selecting the intended C64x+ megamodule with the CORESEL[2:0] inputs. Therefore, to assert and de-assert NMI, two LRESETNMIEN pulses are required where the first latches NMI low and the second latches NMI high. Timing requirements for NMI can be found in Table 7-16 and Figure 7-12.

7.6.3 GPIO Pin-Generated Interrupts

The C6472 device has 16 GPIOs. All GPIOs can be configured to generate interrupts. GPIO0-5 provide interrupts that are assigned one per core. Interrupts from GPIO6-15 are available to all cores. GPIO0-7 are also provided as event inputs to the EDMA. Timing for the GPIO interrupts can be found in Table 7-152 and Figure 7-65.

7.6.4 Host and Inter-DSP Interrupts

The C64x+ megamodules can assert an event to a host processor using HOUT. Table 7-11 provides the timing for the HOUT pulses. The external host or any of the six C64x+ megamodules can generate interrupts to other C64x+ megamodules. For more details, see Section 3.7.

Table 7-11. Switching Characteristics Over Recommended Operating Conditions for HOUT External Event(1)

(see Figure 7-7)

NO.			500/625/700			UNIT
			MIN	TYP	MAX	
1	$t_{w(HOUTH)}$	HOUT pulse duration high		24P		ns
2	$t_{w(HOUTL)}$	HOUT pulse duration low	24P			ns

(1) P = 1/CPU clock frequency in nanoseconds (ns).

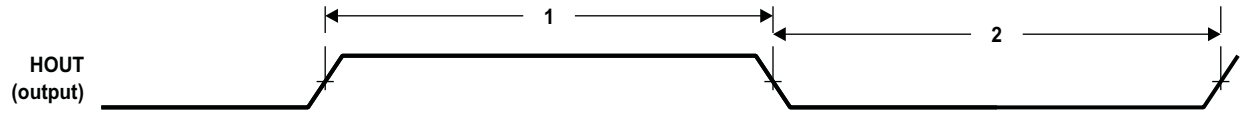

Figure 7-7. HOUT External Event

PRODUCT PREVIEW

7.7 Reset Controller

The reset controller detects the different type of resets supported on the C6472 device and manages the distribution of those resets throughout the device.

The C6472 device has several types of resets: power-on reset, system reset, warm reset, CPU local reset, and module reset. Table 7-12 explains further the types of reset, the reset initiator, and the effects of each reset on the chip. See Section 7.7.8, *Reset Electrical Data/Timing*, for more information on the effects of each reset on the PLL controllers and their clocks.

Table 7-12. Reset Types

TYPE	INITIATOR	EFFECT(s)
Power-on Reset	$\overline{\text{POR}}$ pin	Resets the entire chip including the emulation logic. Device configuration inputs are latched. Memory contents are not preserved. Device reset status output ($\overline{\text{RESETSTAT}}$) pin asserted (low).
Warm Reset	$\overline{\text{RESET}}$ pin	Reset on all chip components, except for emulation and PLL3. Device configuration inputs are latched. Memory contents are not preserved. Device reset status output ($\overline{\text{RESETSTAT}}$) pin asserted (low).
System Reset	Emulator Watchdog timer timeout	A system reset maintains memory contents and does not reset the emulation logic. The device configuration pins are not re-latched and the state of the peripherals (enabled/disabled) is not affected. This is a software-initiated reset that has the effect of a warm reset. Device reset status output ($\overline{\text{RESETSTAT}}$) pin asserted (low).
C64x+ Megamodule Local Reset	$\overline{\text{LRESET}}$ pin PSC Watchdog timer timeout	Provides a local reset of the C64x+ megamodule only. Memory contents are maintained. The device configuration pins are not re-latched. C64x+ megamodule slave DMA port remains alive when the C64x+ megamodule is in local reset.
Module Reset	Software (PSC MMR bit)	Only the module controlled by the LPSC gets reset

7.7.1 Power-on Reset

Power-on Reset is initiated by the $\overline{\text{POR}}$ pin and is used to reset the entire chip, including the emulation logic. Power-on Reset is also referred to as a cold reset since the device usually goes through a power-up cycle. During power-up, the $\overline{\text{POR}}$ pin must be asserted (driven low) until the power supplies have reached their normal operating conditions. Note that a device power-up cycle is not required to initiate a Power-on Reset.

The following sequence must be followed during a Power-on Reset:

1. Wait for all power supplies to reach normal operating conditions while keeping the $\overline{\text{POR}}$ pin asserted (driven low). While $\overline{\text{POR}}$ is asserted, all output buffers are set to high-impedance and the internal pull-up and pull-down resistors, on those buffers that have them, are enabled (except for those disabled by the six multiplexed GPIO pins). All peripherals, except those selected for boot purposes, are disabled after a power-on reset and must be enabled through the device state control registers; for more details, see Section 3.3, *Peripheral Selection After Device Reset*.
2. Once all the power supplies are within valid operating conditions, the $\overline{\text{POR}}$ pin must remain asserted (low) for a minimum of 256 CLKIN cycles; where CLKIN is the slowest of the active inputs CLKIN1, CLKIN2, and CLKIN3. The PLL1 controller input clock (CLKIN1), the PLL2 controller input clock (CLKIN2), and the PLL3 controller input clock (CLKIN3) must be valid during this time, if they are used. If the DDR2 memory controller is not needed, CLKIN3 can be tied low. Similarly, if the EMAC peripheral is not needed, CLKIN2 can be tied low. If both CLKIN2 and CLKIN3 are tied low, the $\overline{\text{POR}}$ pin must remain asserted (low) for a minimum of 256 CLKIN1 cycles after all power supplies have reached valid operating conditions.

Within the low period of the $\overline{\text{POR}}$ pin, the following happens:

- The reset signals flow to the entire chip (including the emulation logic), resetting modules that use reset asynchronously.
- The PLL1 controller clocks are started at the frequency of the system reference clock. The clocks are propagated throughout the chip to reset modules that use reset synchronously. By default, PLL1 is in reset and unlocked.
- The PLL2 controller clocks are started at the frequency of the EMAC reference clock. The clocks are propagated throughout the chip to reset modules that use reset synchronously. By default, PLL2 is in reset and unlocked.
- The PLL3 controller clocks are started at the frequency of the DDR2 reference clock. PLL3 is held in reset. Since the PLL3 controller always operates in PLL mode, the system reference clock and all the DDR2 clocks are invalid at this point.
- The $\overline{\text{RESETSTAT}}$ pin stays asserted (low), indicating the device is in reset.

3. The $\overline{\text{POR}}$ pin may now be deasserted (driven high) after the appropriate delay. When the $\overline{\text{POR}}$ pin is deasserted, the configuration pin values are latched and the PLL controllers change their system clocks to their default divide-down values. PLL3 is taken out of reset and automatically starts its locking sequence. Other device initialization is also started. PLL1 and PLL2 are held in reset.
4. After device initialization is complete, the $\overline{\text{RESETSTAT}}$ pin is deasserted (driven high). By this time, PLL3 has already completed its locking sequence and is outputting a valid clock.
5. The device is now out of reset, device execution begins as dictated by the selected boot mode (see Section 2.4, *Boot Mode Sequence*).

NOTE

To most of the device, reset is de-asserted only when the $\overline{\text{POR}}$ and $\overline{\text{RESET}}$ pins are both de-asserted (driven high). Therefore, in the sequence described above, if the $\overline{\text{RESET}}$ pin is held low past the low period of the $\overline{\text{POR}}$ pin, most of the device will remain in reset. The only exception being that PLL3 is taken out of reset as soon as $\overline{\text{POR}}$ is de-asserted (driven high), regardless of the state of the $\overline{\text{RESET}}$ pin. The $\overline{\text{RESET}}$ pin should not be tied together with the $\overline{\text{POR}}$ pin.

7.7.2 Warm Reset ($\overline{\text{RESET}}$ Pin)

A Warm Reset has the same effects as a Power-on Reset, except that in this case, the emulation logic and PLL3 are not reset.

The following sequence must be followed during a Warm Reset:

1. Hold the $\overline{\text{RESET}}$ pin low for a minimum of 24 CLKIN1 cycles. Within the low period of the $\overline{\text{RESET}}$ pin, the following happens:
   - All output buffers are set to high impedance and the internal pull-up and pull-down resistors, on those buffers that have them, are enabled (except for those disabled by the six multiplexed GPIO pins).
   - The reset signals flow to the entire chip (excluding the emulation logic), resetting modules that use reset asynchronously.
   - The PLL1 controller is reset, thereby switching back to bypass mode and resetting all its registers to their default values. PLL1 is placed in reset and loses lock. The PLL1 controller clocks start running at the frequency of the system reference clock. The clocks are propagated throughout the chip to reset modules that use reset synchronously.
   - The PLL2 controller is reset thereby switching back to bypass mode and resetting all its registers to their default values. PLL2 is placed in reset and loses lock. The PLL2 controller clocks start running at the frequency of the system reference clock. The clocks are propagated throughout the chip to reset modules that use reset synchronously.
   - The PLL3 controller is reset, thereby resetting all its registers to their default values. The PLL3 controller clocks start running at the frequency of the DDR2 reference clock. PLL3 is not reset, therefore it remains locked.

– The RESETSTAT pin becomes active (low), indicating the device is in reset.

2. The RESET pin may now be released (driven inactive high). When the RESET pin is released, the configuration pin values are latched and the PLL controllers immediately change their system clocks to their default divide-down values. Other device initialization is also started.
3. After device initialization is complete, the RESETSTAT pin goes inactive (high).
4. The device is now out of reset, device execution begins as dictated by the selected boot mode (see Section 2.4, *Boot Mode Sequence*).

NOTE

The POR pin should be held inactive (high) throughout the Warm Reset sequence. Otherwise, if POR is activated (brought low), the minimum POR pulse width must be met. The RESET pin should not be tied together with the POR pin.

7.7.3 System Reset

System Reset is initiated by:

- The emulator
- The local watchdog timeout (when Reset mux is configured to route this as System Reset)

A System Reset maintains memory contents and does not reset the clock logic or the emulation circuitry. The device configuration pins are also not re-latched and the state of the peripherals (enabled/disabled) is also not affected. A System Reset is initiated by the emulator or watchdog timer. For information on how to configure the action corresponding to a watchdog timeout, see Section 3.8.2, *Reset Mux Registers*.

During a System Reset, the following happens:

1. The reset is allowed to propagate through the system. Internal system clocks are not affected.
2. The PLL controllers retain their configuration. The PLLs also remain locked.
3. The RESETSTAT pin goes low to indicate an internal reset is being generated.
4. The boot sequence is started after the system clocks are re-aligned. Since the configuration pins (including the BOOTMODE[3:0] pins) are not latched with a System Reset, the previous values, as shown in the DEVSTAT register, are used to select the boot mode.

NOTE

A System Reset should not be used if the peripheral used for boot loading was disabled following boot.

7.7.4 Local Reset

The Local Reset provides a local reset to the C64x+ megamodule, without destroying clock alignment or memory contents. It does not affect any chip components. Local reset is initiated by asserting the LRESET input (low), selecting the intended C64x+ megamodule(s) with the CORESEL[2:0] inputs, and then latching it with the rising LRESETNMIEN input. The C64x+ megamodule(s) are held in reset until LRESET input is latched high by the rising LRESETNMIEN input while selecting the intended C64x+ megamodule with the CORESEL[2:0] inputs. Therefore, to assert and de-assert LRESET, two LRESETNMIEN pulses are required where the first latches LRESET low and the second latches LRESET high. Timing requirements for Local Reset can be found in Table 7-16 and Figure 7-12.

The external system is not notified of this reset. Once LRESET is deasserted, C64x+ megamodule goes through a local boot sequence. In certain cases, a watchdog timeout may also cause a local reset of an individual C64x+ megamodule. For information on how to configure the action corresponding to a watchdog timeout, see Section 3.8.2, *Reset Mux Registers*.

PRODUCT PREVIEW

7.7.5 Module Reset

Module reset is initiated by LPSC and only resets the module controlled by that LPSC. To prevent stalls, care must be taken when using this reset.

7.7.6 Reset Priority

If any of the above reset sources occur simultaneously, the PLLCTRL only processes the highest priority reset request. The rest request priorities are as follows (high to low):

- Power-on Reset
- Warm Reset
- System Reset
- Local Reset

7.7.7 Reset Controller Register

The reset type status (RSTYPE) register (029A 00E4) is the only register for the reset controller. This register falls in the same memory range as the PLL1 controller registers [029A 0000 - 029A 01FF].

7.7.7.1 Reset Type Status Register Description

The rest type status (RSTYPE) register latches the cause of the last reset. If multiple reset sources occur simultaneously, this register latches the highest priority reset source. The reset type status register is shown in Figure 7-8 and described in Table 7-13.

31															16
Reserved															
R-0															

15												4	3	2	1	0
Reserved													SRST	Rsvd	WRST	POR
R-0													R-x	R-0	R-x	R-x

LEGEND: R/W = Read/Write; R = Read only; *-n* = value after reset

Figure 7-8. Reset Type Status Register (RSTYPE) [Hex Address: 029A 00E4]

Table 7-13. Reset Type Status Register (RSTYPE) Field Descriptions

Bit	Field	Value	Description
31:4	Reserved		Reserved. The reserved bit location is always read as 0. A value written to this field has no effect.
3	SRST		System reset.
		0	System Reset was not the last reset to occur.
		1	System Reset was the last reset to occur.
2	Reserved		Reserved. The reserved bit location is always read as 0. A value written to this field has no effect.
1	WRST		Warm reset.
		0	Warm Reset was not the last reset to occur.
		1	Warm Reset was the last reset to occur.
0	POR		Power-on reset.
		0	Power-on Reset was not the last reset to occur.
		1	Power-on Reset was the last reset to occur.

7.7.8 Reset Electrical Data/Timing

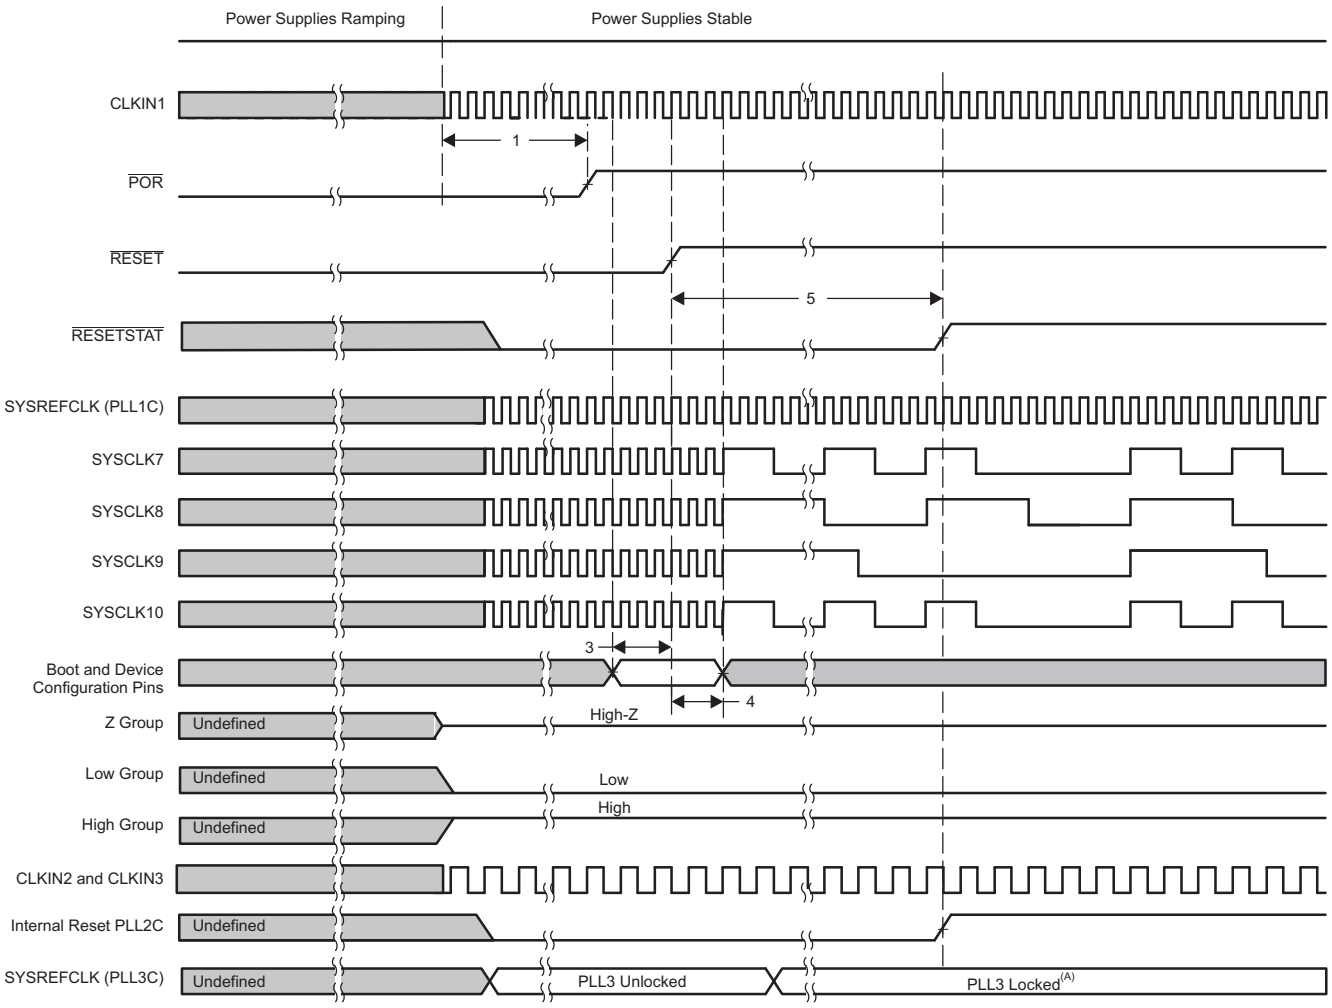
NOTE

If a configuration pin must be routed out from the device, the internal pullup/pulldown (IPU/IPD) resistor should not be relied upon; TI recommends the use of an external pullup/pulldown resistor.

For Figure 7-9, note the following:

- Low group pins consist of all 3.3-V I/O/Z and O/Z pins that have active internal pull-down (IPD) resistors. These pins become low as soon as the DV_{DD33} power supply has reached normal operating conditions. (These pins are high impedance prior to DV_{DD33} reaching a valid level.) These pins remain low until configured otherwise by their respective peripheral. For a list of pins containing IPD resistors, see Table 2-5, *Terminal Functions*.
- High group pins consist of all 3.3-V I/O/Z and O/Z pins that have active internal pull-up (IPU) resistors. These pins become high as soon as the DV_{DD33} power supply has reached normal operating conditions. (These pins are high impedance prior to DV_{DD33} reaching a valid level.) These pins remain high until configured otherwise by their respective peripheral. For a list of pins containing IPU resistors, see Table 2-5, *Terminal Functions*.
- Z group pins consist of all I/O/Z and O/Z pins associated with I2C, RGMII, DDR2 and RapidIO, as well as 3.3-V pins that have IPU/IPD functionality disabled by one of the six multiplexed GPIO pins. These pins are high impedance prior to power supply ramp and remain that way when their respective power supply has reached normal operating conditions. These pins remain in high impedance until configured otherwise by their respective peripheral.
- Each peripheral must be enabled through software to use it following a Power-on Reset; for more details, see Section 7.7.1, *Power-on Reset*, of this document.
- For power-supply sequence requirements, see Section 7.3.1, *Power-Supply Sequencing*.

PRODUCT PREVIEW



A. SYSREFCLK of the PLL2 controller and PLL3 controller runs at CLKIN2 ×20 and CLKIN3 ×20, respectively.

B. Power supplies, CLKIN1, CLKIN2 and CLKIN3 (if used) must be stable before the start of $t_{w(POR)}$.

7.8 PLL1 and PLL1 Controller

The C6472 device includes a PLL1 and a software-programmable PLL1 controller. The PLL1 controller is able to generate different clocks for different parts of the system (i.e., megamodule, DSP core, Peripheral Data Bus, and other peripherals). There is no hardware CLKMODE selection on the C6472 device. The PLL multiply factor is set in software after reset.

NOTE

The PLL controller module as described in the *TMS320C6472/TMS320TCI648x DSP Software-Programmable Phase-Locked Loop (PLL) Controller User's Guide* (literature number SPRU806) includes a superset of features, some of which are not supported on the C6472 DSP. The following sections describe the features that are supported; it should be assumed that any feature not included in these sections is not supported by the C6472 DSP.

7.8.1 PLL1 Controller Device-Specific Information

7.8.1.1 Internal Clocks and Maximum Operating Frequencies

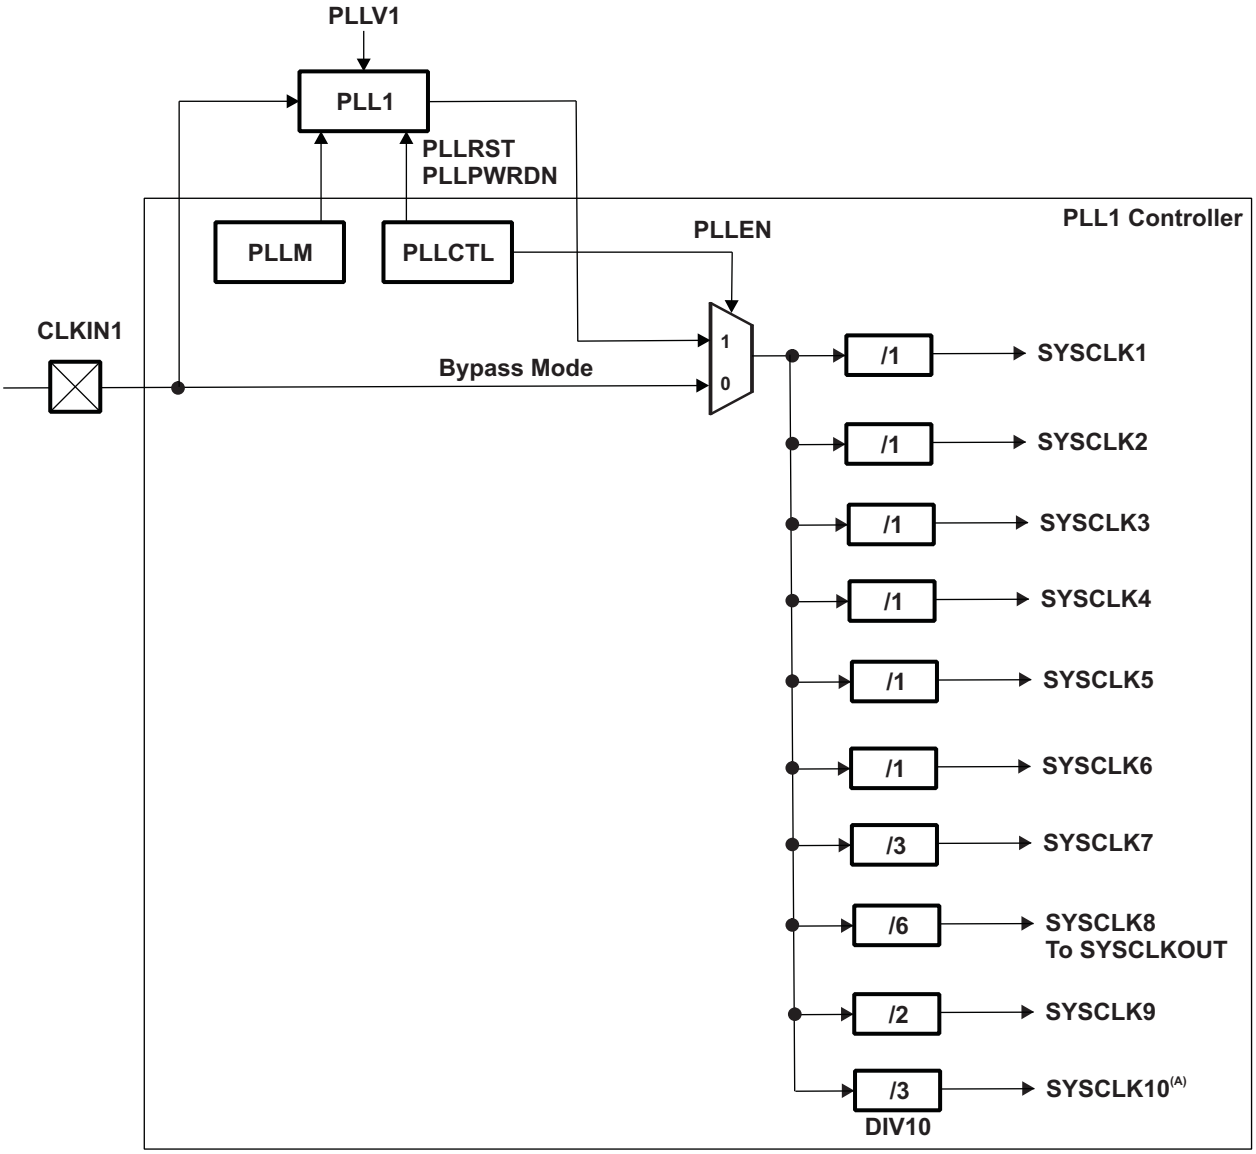
As shown in Figure 7-14, the PLL1 controller generates several internal clocks including the system clock output (SYSCLKOUT) and the system clocks (SYSCLK1 through SYSCLK10). SYSCLK10 has a programmable divider. All other SYSCLK*n* clocks have a fixed relationship to the CPU clock.

- SYSCLK1 through SYSCLK6 are used to clock C64x+ Megamodule0 through C64x+ Megamodule5.
- SYSCLK7 is used for EDMA3CC, EDMA3TC, DMA SCR, Config SCR, boot controller, bridges, and some peripherals.
- SYSCLK8 is used for PSC, some peripherals, and SYSCLKOUT external pin.
- SYSCLK9 is used for shared memory controller and memory.
- SYSCLK10 is used for C64x+ megamodule trace logic.

NOTE

There is a minimum and maximum operating frequency for CLKIN1 and SYSCLK*n*. The clock generator must not be configured to exceed any of these constraints (certain combinations of external clock input, internal dividers, and PLL multiply ratios might not be supported). See Table 7-18 for the PLL clocks input and output frequency ranges.

PRODUCT PREVIEW



A. SYSCLK10 is programmable.

Figure 7-14. PLL1 and PLL1 Controller

Table 7-18. PLL1 Clock Frequency Ranges

CLOCK SIGNAL	REQUIRED FREQUENCY FOR 500-MHz OPERATION	REQUIRED FREQUENCY FOR 625-MHz OPERATION	REQUIRED FREQUENCY FOR 700-MHz OPERATION	UNIT
CLKIN1	15.625 - 50.0	19.531 - 50.0	21.875 - 50.0	MHz
SYSCLK1	500.0	625.0	700.0	MHz
SYSCLK2	500.0	625.0	700.0	MHz
SYSCLK3	500.0	625.0	700.0	MHz
SYSCLK4	500.0	625.0	700.0	MHz
SYSCLK5	500.0	625.0	700.0	MHz
SYSCLK6	500.0	625.0	700.0	MHz
SYSCLK7	166.7	208.4	233.3	MHz
SYSCLK8	83.3	104.1	116.7	MHz
SYSCLK9	250.0	312.5	350.0	MHz
SYSCLK10	166.7(1)	208.4(1)	233.3(1)	MHz

(1) This frequency may be changed by reprogramming SYSCLK10.

7.8.1.2 PLL1 Controller Operating Modes

The PLL1 controller has two modes of operation: bypass mode and PLL mode. The mode of operation is determined by the PLLEN bit of the PLL control register (PLLCTL). In PLL mode, SYSREFCLK is generated from the device input clock, CLKIN1, using the the PLL multiplier, PLLM. In bypass mode, CLKIN1 is fed directly to SYSREFCLK. All hosts (HPI, etc.) must hold off accesses to the DSP while the frequency of its internal clocks is changing. A mechanism must be in place such that the DSP notifies the host when the PLL configuration has completed.

The PLL3 controller provides the control to reset PLL3. It is also capable of placing it in a power-down condition for systems where DDR2 EMIF is not being used.

7.8.1.3 PLL1 Stabilization, Lock, and Reset Times

The PLL stabilization time is the amount of time that must be allotted for the internal PLL regulators to become stable after device powerup. The PLL output should not be used until this stabilization time has expired. The PLL reset time is the amount of wait time needed when resetting the PLL (writing PLLRST = 1), in order for the PLL to properly reset, before bringing the PLL out of reset (writing PLLRST = 0). For the PLL1 reset time value, see Table 7-19.The PLL lock time is the amount of time needed from when the PLL is taken out of reset (PLLRST = 1 with PLLEN = 0) to when the PLL controller can be switched to PLL mode (PLLEN=1). The PLL1 lock time is given in Table 7-19.

Table 7-19. PLL1 Stabilization, Lock, and Reset Times

	MIN	TYP	MAX	UNIT
PLL1 stabilization time	50			µs
PLL1 lock time			2000 * C(1)	ns
PLL1 reset time	256 * C(1)			ns

(1) C = CLKIN1 cycle time in ns. For example, when CLKIN1 frequency is 50 MHz, use C = 20 ns.

PRODUCT PREVIEW

7.8.2 PLL1 Controller Peripheral Register Descriptions

The memory map of the PLL1 controller is shown in Table 7-20. Note that only registers documented here are accessible on the C6472. Other addresses in the PLL1 controller memory map are reserved and should not be modified.

Table 7-20. PLL1 Controller Registers

HEX ADDRESS RANGE	ACRONYM	REGISTER NAME
029A 0000	PID	Peripheral Identification Register [value: 0001 0802h]
029A 0004 - 029A 00E0	-	Reserved
029A 00E4	RSTYPE	Reset Type Status Register
029A 00E8 - 029A 00FC	-	Reserved

029A 017C - 029A 03FC	-	Reserved

7.8.3 PLL1 Controller Registers

This section provides a description of the PLL1 controller registers. For details on the operation of the PLL controller module, see the *TMS320C6472/TMS320TCI648x DSP Software-Programmable Phase-Locked Loop (PLL) Controller User's Guide* (literature number SPRU806).

NOTE

Not all of the registers documented in the *TMS320C6472/TMS320TCI648x DSP Software-Programmable Phase-Locked Loop (PLL) Controller User's Guide* (literature number SPRU806) are supported on the C6472. Only those registers documented in this section are supported. Furthermore, only the bits within the registers described here are supported. Users should not write to any reserved memory location or change the value of reserved bits.

7.8.3.1 PLL1 Peripheral ID Register (PID)

The peripheral identification register (PID) is a constant register that contains the ID and ID revision number for that module. The PID stores version information used to identify the module. All bits within this register are read-only (writes have no effect).

31 – 24	23 – 16	15 – 8	7 – 0
Reserved	TYPE	CLASS	REV
R-0	R-01	R-08	R-0D

LEGEND: R/W = Read/Write; R = Read only; -*n* = value after reset

Figure 7-15. Peripheral ID Register (PID)

Table 7-21. Peripheral ID Register (PID) Field Descriptions

Bit	Field	Value	Description
31:24	Reserved		Reserved
23:16	TYPE	01h	Peripheral Type
15:8	CLASS	08h	Peripheral Class
7:0	REV	0Dh	Peripheral Revision. Identifies the revision level of the specific instance of the peripheral.

7.8.3.2 Reset Type Status Register (RSTYPE)

The reset type status register (RSTYPE) is described in Section 7.7.7.1.

PRODUCT PREVIEW

7.8.3.3 PLL1 PLL Control Register (PLLCTL)

The PLL control register (PLLCTL) is shown in Figure 7-16 and described in Table 7-22.

31								16
Reserved								
R-00 0001h								

15	8	7	6	5	4	3	2	1	0

R-00 0001h		R/W-0	R-1	R/W-10		R/W-1	R-0	R/W-0	R/W-0

LEGEND: R/W = Read/Write; R = Read only; -*n* = value after reset

Figure 7-16. PLL Control Register (PLLCTL)

Table 7-22. PLL Control Register (PLLCTL) Field Descriptions(1)

Bit	Field	Value	Description
31:8	Reserved		Reserved. The reserved bit location is always read as 00 0001h. A value written to this field has no effect.
7	Reserved		Reserved. Writes to this register must keep this bit as 0.
6	Reserved		Reserved. The reserved bit location is always read as 1. A value written to this field has no effect.
5:4	Reserved		Reserved. Writes to this register must always program these bits as 00.
3	PLLRST		PLL reset bit
		0	PLL reset is released
		1	PLL reset is asserted
2	Reserved		Reserved. The reserved bit location is always read as 0. A value written to this field has no effect.
1	PLLPWRDN		PLL power-down mode select bit
		0	PLL is operational
		1	PLL is placed in power-down state, i.e., all analog circuitry in the PLL is turned-off
0	PLLEN		PLL enable bit
		0	Bypass mode. PLL is bypassed. All the system clocks (SYSCLK*n*) are divided down directly from input reference clock (CLKIN1).
		1	PLL mode. PLL is not bypassed. PLL output path is enabled. All the system clocks (SYSCLK*n*) are divided down from PLL output.

(1) The value of this register is changed by the ROM bootloader.

PRODUCT PREVIEW

7.8.3.4 PLL1 PLL Multiply Control Register (PLLM)

The PLL multiplier control register (PLLM) defines the input reference clock frequency multiplier. The multiplier should be chosen such that the output frequency should not exceed device frequency; i.e., no more than 700 MHz for the 700-MHz device. The PLLM register is shown in Figure 7-16 and described in Table 7-23.

31	5	4	0
Reserved		PLLM	
R-0		R/W-13h

Bit	Field	Value	Description
31:16	Reserved	0	Reserved. The reserved bit location is always read as 0. A value written to this field has no effect.
15	D*n*EN		Divider D*n* enable bit.
		0	Divider *n* is disabled. No clock output.
		1	Divider *n* is enabled.
14:5	Reserved	0	Reserved. The reserved bit location is always read as 0. A value written to this field has no effect.
4:0	RATIO	0-1Fh	Divider ratio bits.
		0	Reserved
		1h	Reserved
		2h-1Fh	÷3 to ÷32. Divide frequency by 3 to divide frequency by 32.

PRODUCT PREVIEW

7.8.3.6 PLL1 PLL Controller Command Register (PLLCMD)

The PLL controller command register (PLLCMD) controls the SYSCLK rate change and phase alignment. The PLLCMD register is shown in Figure 7-19 and described in Table 7-25.

31	16
Reserved	
R-0	

15	2	1	0
Reserved		Rsvd	GOSET
R-0		R/W-0	R/W-0

LEGEND: R/W = Read/Write; R = Read only; -*n* = value after reset

Figure 7-19. PLL Controller Command Register (PLLCMD)

Table 7-25. PLL Controller Command Register (PLLCMD) Field Descriptions

Bit	Field	Value	Description
31:1	Reserved	0	Reserved. The reserved bit location is always read as 0. A value written to this field has no effect.
0	GOSET		GO operation command for SYSCLK rate change and phase alignment. Before setting this bit to 1 to initiate a GO operation, check the GOSTAT bit in the PLLSTAT register to ensure all previous GO operations have completed.
		0	No effect. Write of 0 clears bit to 0.
		1	Initiates GO operation. Write of 1 initiates GO operation. Once set, GOSET remains set but further writes of 1 can initiate the GO operation.

PRODUCT PREVIEW

7.8.3.7 PLL1 PLL Controller Status Register (PLLSTAT)

The PLL controller status register (PLLSTAT) shows the PLL controller status. PLLSTAT is shown in Figure 7-20 and described in Table 7-26.

31	16
Reserved	
R-0000 0000 0000 0000 0000 0000 0000 001	

15	1	0

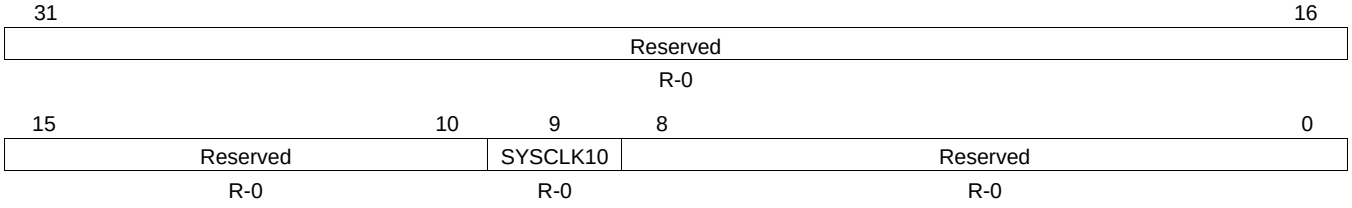
Bit	Field	Value	Description
31:1	Reserved	0000 0000 0000 0000 0000 0000 0000 001	Reserved. A value written to this field has no effect.
0	GOSTAT		GO operation status.
		0	GO operation is not in progress. SYSCLK divide ratios are not being changed.
		1	GO operation is in progress. SYSCLK divide ratios are being changed.

PRODUCT PREVIEW

7.8.3.8 PLL1 PLLDIV Ratio Change Status Register (DCHANGE)

Whenever a different ratio is written to the PLLDIV10 register, the PLLCTRL flags the change in the PLLDIV ratio change status register (DCHANGE). During the GO operation, the PLL controller will only change the divide ratio of the SYSCLK with the bit set in DCHANGE. Note that changed clocks will be automatically aligned to other clocks if the corresponding ALN bit is set. The PLLDIV divider ratio change status register is shown in Figure 7-21 and described in Table 7-27.



LEGEND: R/W = Read/Write; R = Read only; -*n* = value after reset

Figure 7-21. PLLDIV Divider Ratio Change Status Register (DCHANGE)

Table 7-27. PLLDIV Divider Ratio Change Status Register (DCHANGE) Field Descriptions

Bit	Field	Value	Description
31:10	Reserved	0	Reserved. The reserved bit location is always read as 0. A value written to these fields has no effect.
9	SYSCLK10		Identifies when the SYSCLK10 divide ratio has been modified.
		0	SYSCLK10 ratio has not been modified. When GOSET is set, SYSCLK10 will not be affected.
		1	SYSCLK10 ratio has been modified. When GOSET is set, SYSCLK10 will change to the new ratio.
8:0	Reserved	0	Reserved. The reserved bit location is always read as 0. A value written to these fields has no effect.

7.8.3.9 PLL1 SYSCLK Status Register (SYSTAT)

The SYSCLK status register (SYSTAT) shows the status of the system clocks (SYSCLK*n*). SYSTAT is shown in Figure 7-22 and described in Table 7-28.

31							16

3	$t_{w(CLKL)}$	Pulse duration, SYSCLKOUT low	3P	ns

(1) The reference points for the rise and fall transitions are measured at 3.3 V V_{OL} MAX and V_{OH} MIN.
(2) P = 1/CPU clock frequency in nanoseconds (ns).

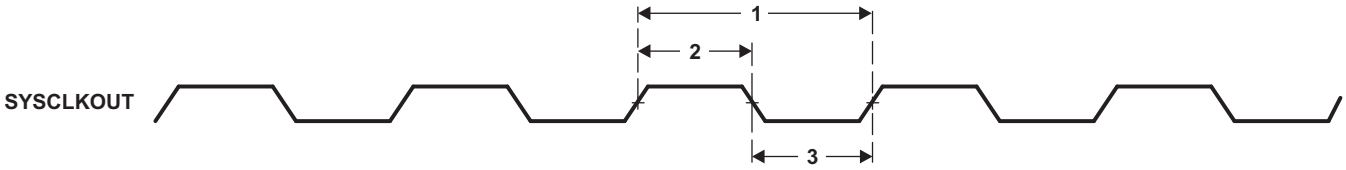

Figure 7-24. SYSCLKOUT Timing

7.9 PLL2 and PLL2 Controller

The C6472 device includes a PLL2 and a software-programmable PLL2 controller. The PLL2 controller generates different clocks required for Gigabit Ethernet. The PLL multiply factor is set to x20 for PLL2.

NOTE

The PLL controller module as described in the *TMS320C6472/TMS320TCI648x DSP Software-Programmable Phase-Locked Loop (PLL) Controller User's Guide* (literature number SPRU806) includes a superset of features, some of which are not supported on the C6472 DSP. The following sections describe the features that are supported; it should be assumed that any feature not included in these sections is not supported by the C6472 DSP.

7.9.1 PLL2 Controller Device-Specific Information

7.9.1.1 Internal Clocks and Maximum Operating Frequencies

As shown in Figure 7-25, the PLL2 controller generates EMAC reference clocks.

- SYSCLK13 is used by RGMII0 (1000Mbps mode)
- SYSCLK14 is used by RGMII0 (100Mbps mode) and GMII (1000Mbps mode)
- SYSCLK15 is used by RGMII0 (10Mbps mode)
- SYSCLK16 is used by RGMII1 (1000Mbps mode)
- SYSCLK17 is used by RGMII1 (100Mbps mode)
- SYSCLK18 is used by RGMII1 (10Mbps mode)

NOTE

There is a fixed operating frequency for CLKIN2 and SYSCLK13-18. The clock generator must not be configured to exceed any of these constraints (certain combinations of external clock input, internal dividers, and PLL multiply ratios might not be supported). For the PLL clocks input and output frequencies, see Table 7-31.

PRODUCT PREVIEW

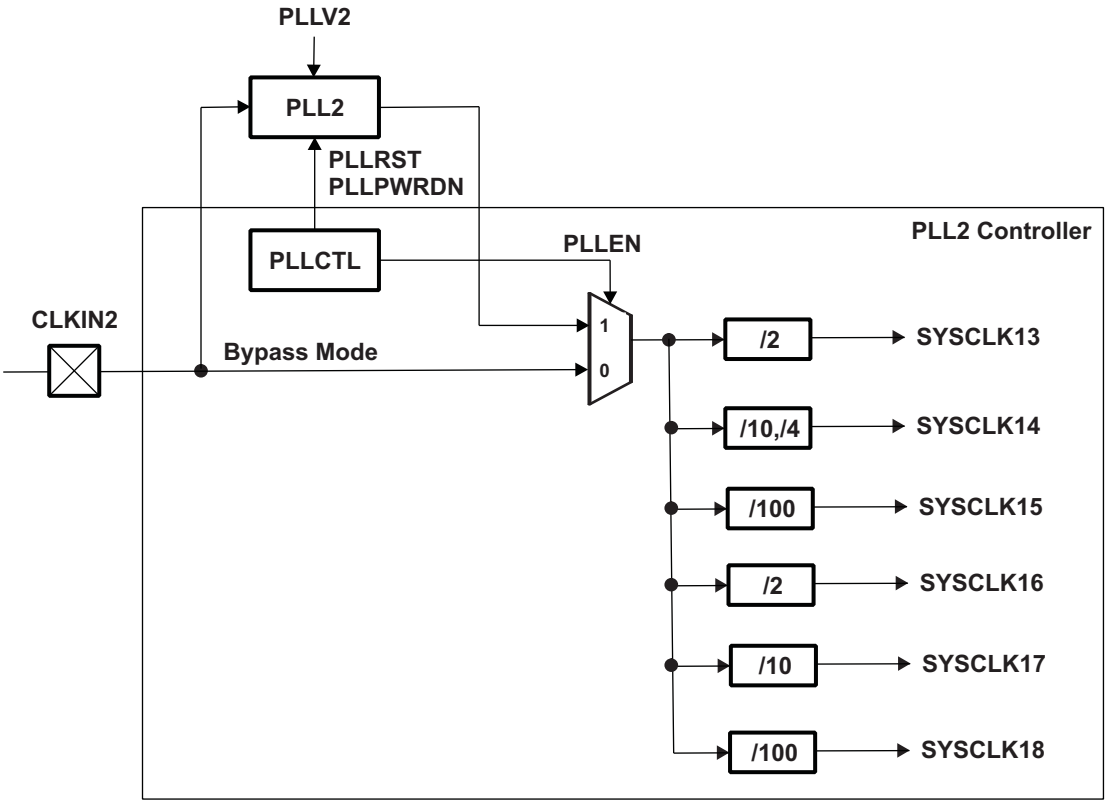

Figure 7-25. PLL2 and PLL2 Controller

Table 7-31. PLL2 Clock Frequency Ranges

CLOCK SIGNAL	REQUIRED FREQUENCY	UNIT
CLKIN2	25	MHz
SYSCLK13	250	MHz
SYSCLK14	50 or 125	MHz
SYSCLK15	5	MHz
SYSCLK16	250	MHz
SYSCLK17	50	MHz
SYSCLK18	5	MHz

7.9.1.2 PLL2 Controller

The PLL2 controller provides the control to reset PLL2. It is also capable of placing it in a power-down condition for systems where Ethernet is not being used.

7.9.1.3 PLL2 Stabilization, Lock, and Reset Times

The PLL stabilization time is the amount of time that must be allotted for the internal PLL regulators to become stable after device powerup. The PLL should not be operated until this stabilization time has expired. The PLL reset time is the amount of wait time needed when resetting the PLL (writing PLLRST = 1), in order for the PLL to properly reset, before bringing the PLL out of reset (writing PLLRST = 0). For the PLL2 reset time value, see Table 7-32. The PLL lock time is the amount of time needed from when the PLL is taken out of reset (PLLRST = 1 with PLLEN = 0) to when the PLL controller can be switched to PLL mode (PLLEN=1). The PLL2 lock time is given in Table 7-32.

Table 7-32. PLL2 Stabilization, Lock, and Reset Times

	MIN	TYP	MAX	UNIT
PLL2 stabilization time	500			µs
PLL2 lock time			2000 * C(1)	ns
PLL2 reset time	128 * C(1)			ns

(1) C = CLKIN2 cycle time in ns. For example, when CLKIN2 frequency is 25 MHz, use C = 40 ns.

7.9.2 PLL2 Controller Peripheral Register Descriptions

The memory map of the PLL2 controller is shown in Table 7-33. Note that only registers documented here are accessible on the C6472. Other addresses in the PLL2 controller memory map should not be modified.

Table 7-33. PLL2 Controller Registers

HEX ADDRESS RANGE	ACRONYM	REGISTER NAME
029C 0000	PID	Constant Peripheral Identification Register

7.9.3 PLL2 Controller Registers

This section provides a description of the PLL2 controller registers. For details on the operation of the PLL controller module, see the *TMS320C6472/TMS320TCI648x DSP Software-Programmable Phase-Locked Loop (PLL) Controller User's Guide* (literature number SPRU806).

NOTE

Not all of the registers documented in the *TMS320C6472/TMS320TCI648x DSP Software-Programmable Phase-Locked Loop (PLL) Controller User's Guide* (literature number SPRU806) are supported on the C6472. Only those registers documented in this section are supported. Furthermore, only the bits within the registers described here are supported. You should not write to any reserved memory location or change the value of reserved bits.

7.9.3.1 PLL2 Peripheral ID Register (PID)

The peripheral identification register (PID) is a constant register that contains the ID and ID revision number for that module. The PID stores version information used to identify the module. All bits within this register are read-only (writes have no effect).

31 – 24	23 – 16	15 – 8	7 – 0

7.9.3.4 PLL2 PLL Controller Command Register (PLLCMD)

The PLL controller command register (PLLCMD) contains the command bit for GO operation. PLLCMD is shown in Figure 7-29 and described in Table 7-38.

31	16
Reserved	
R-0	

15	2	1	0
Reserved		Rsvd	GOSET
R-0		R/W-0	R/W-0

LEGEND: R/W = Read/Write; R = Read only; -*n* = value after reset

Figure 7-29. PLL Controller Command Register (PLLCMD)

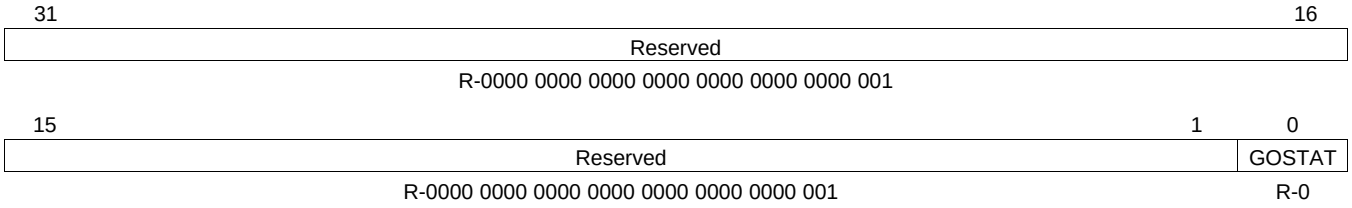
Table 7-38. PLL Controller Command Register (PLLCMD) Field Descriptions

Bit	Field	Value	Description
31:2	Reserved	0	Reserved. The reserved bit location is always read as 0. A value written to this field has no effect.
1	Reserved		Reserved. The reserved bit location is always read as 0. A value written to this field has no effect.
0	GOSET		GO operation command for SYSCLK rate change and phase alignment. Before setting this bit to 1 to initiate a GO operation, check the GOSTAT bit in the PLLSTAT register to ensure all previous GO operations have completed.
		0	No effect. Write of 0 clears bit to 0.
		1	Initiates GO operation. Write of 1 initiates GO operation. Once set, GOSET remains set but further writes of 1 can initiate the GO operation.

PRODUCT PREVIEW

7.9.3.5 PLL2 PLL Controller Status Register (PLLSTAT)

The PLL controller status register (PLLSTAT) shows the PLL controller status. PLLSTAT is shown in Figure 7-30 and described in Table 7-39.



LEGEND: R/W = Read/Write; R = Read only; -*n* = value after reset

Figure 7-30. PLL Controller Status Register (PLLSTAT)

Table 7-39. PLL Controller Status Register (PLLSTAT) Field Descriptions

Bit	Field	Value	Description

0	GOSTAT		GO operation status.
		0	GO operation is not in progress. SYSCLK divide ratios are not being changed.
		1	GO operation is in progress. SYSCLK divide ratios are being changed.

PRODUCT PREVIEW

7.9.3.6 PLL2 PLLDIV Ratio Change Status Register (DCHANGE)

Whenever a different ratio is written to the PLLDIV*n* registers, the PLLCTRL flags the change in the PLLDIV ratio change status registers (DCHANGE). During the GO operation, the PLL controller will only change the divide ratio of the SYSCLKs with the bit set in DCHANGE. Note that changed clocks will be automatically aligned to other clocks. The PLLDIV divider ratio change status register is shown in Figure 7-31 and described in Table 7-40.

PRODUCT PREVIEW

7.10 PLL3 and PLL3 Controller

The C6472 device includes a PLL3 and a software-programmable PLL3 controller. The PLL3 controller generates the clock. The PLL multiply factor is set to x20 for PLL3.

NOTE

The PLL controller module as described in the *TMS320C6472/TMS320TCI648x DSP Software-Programmable Phase-Locked Loop (PLL) Controller User's Guide* (literature number SPRU806) includes a superset of features, some of which are not supported on the C6472 DSP. The following sections describe the features that are supported; it should be assumed that any feature not included in these sections is not supported by the C6472 DSP.

7.10.1 PLL3 Controller Device-Specific Information

7.10.1.1 Internal Clocks and Maximum Operating Frequencies

As shown in Figure 7-34, the PLL3 controller generates only one clock which is used for DDR2.

NOTE

There is a minimum and maximum operating frequency for CLKIN3 and DDR2 clock (the multiplier is fixed). The clock generator must not be configured to exceed any of these constraints. For the PLL clocks input and output frequencies, see Table 7-43.

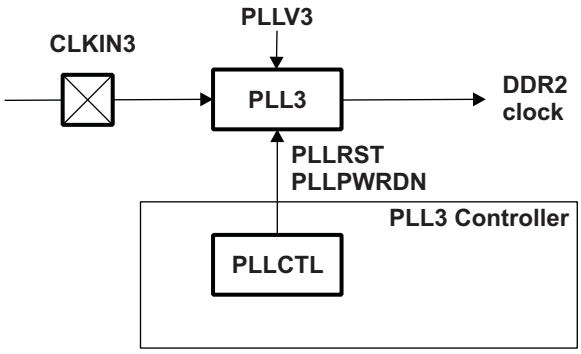

Figure 7-34. PLL3 and PLL3 Controller

Table 7-43. PLL3 Clock Frequency Ranges

CLOCK SIGNAL	REQUIRED FREQUENCY	UNIT
CLKIN3	20 - 26.66	MHz
PLLOUT (DDR2 clock)	400 - 533.33	MHz

7.10.1.2 PLL3 Controller

The PLL3 controller provides the control to reset PLL3. It is also capable of placing it in a power-down condition for systems where DDR2 EMIF is not being used.

7.10.1.3 PLL3 Stabilization, Lock, and Reset Times

The PLL stabilization time is the amount of time that must be allotted for the internal PLL regulators to become stable after device powerup. The PLL should not be operated until this stabilization time has

expired. The PLL reset time is the amount of wait time needed when resetting the PLL (writing PLLRST = 1), in order for the PLL to properly reset, before bringing the PLL out of reset (writing PLLRST = 0). For the PLL3 reset time value, see Table 7-44. The PLL lock time is the amount of time needed from when the PLL is taken out of reset to when the output clock is ready for use. The PLL3 lock time is given in Table 7-44.

Table 7-44. PLL3 Stabilization, Lock, and Reset Times

	MIN	TYP	MAX	UNIT
PLL3 stabilization time	150			µs
PLL3 lock time			2000 * C(1)	ns
PLL3 reset time	128 * C(1)			ns

(1) C = CLKIN3 cycle time in ns. For example, when CLKIN3 frequency is 25 MHz, use C = 40 ns.

7.10.2 PLL3 Controller Peripheral Register Descriptions

The memory map of the PLL3 controller is shown in Table 7-45. Note that only registers documented here are accessible on the C6472. Other addresses in the PLL3 controller memory map should not be modified.

Table 7-45. PLL3 Controller Registers

HEX ADDRESS RANGE	ACRONYM	REGISTER NAME
029C 0400	PID	Constant Peripheral Identification Register
029C 0404 - 029C 04FC	-	Reserved
029C 0500	PLLCTL	PLL Control Register
029C 0504 - 029C 07FC	-	Reserved

7.10.3 PLL3 Controller Registers

This section provides a description of the PLL3 controller registers. For details on the operation of the PLL controller module, see the *TMS320C6472/TMS320TCI648x DSP Software-Programmable Phase-Locked Loop (PLL) Controller User's Guide* (literature number SPRU806).

NOTE

The PLL3 controller registers can only be accessed using the CPU or the emulator. Not all of the registers documented in the *TMS320C6472/TMS320TCI648x DSP Software-Programmable Phase-Locked Loop (PLL) Controller User's Guide* (literature number SPRU806) are supported on the C6472. Only those registers documented in this section are supported. Furthermore, only the bits within the registers described here are supported. You should not write to any reserved memory location or change the value of reserved bits.

PRODUCT PREVIEW

7.10.3.1 PLL3 Peripheral ID Register

The peripheral identification register (PID) is a constant register that contains the ID and ID revision number for that module. The PID stores version information used to identify the module. All bits within this register are read-only (writes have no effect).

31 – 24	23 – 16	15 – 8	7 – 0
Reserved	TYPE	CLASS	REV
R-0	R-01	R-08	R-0D

LEGEND: R/W = Read/Write; R = Read only; *-n* = value after reset

PRODUCT PREVIEW

7.11 DDR2 Memory Controller

The 32-bit DDR2 Memory Controller bus of the C6472 is used to interface to JEDEC DDR2 SDRAM devices. The DDR2 bus is designed to sustain a throughput of up to 2.13 GBps at a 533-MHz data rate (267-MHz clock rate) as long as data requests are pending in the DDR2 Memory Controller. The DDR2 external bus only interfaces to DDR2 devices; it does not share the bus with any other types of peripherals.

7.11.1 DDR2 Memory Controller Device-Specific Information

The approach to specifying interface timing for the DDR2 memory bus is different than on other interfaces such as HPI and TSIP. For these other interfaces, the device timing was specified in terms of data manual specifications and I/O buffer information specification (IBIS) models. For the C6472 DDR2 memory bus, the approach is to specify compatible DDR2 devices and provide the printed circuit board (PCB) solution and guidelines directly to the user. Texas Instruments (TI) has performed the simulation and system characterization to ensure all DDR2 interface timings in this solution are met. The complete DDR2 system solution is documented in the *TMS320C6472/TMS320TCI6486 DDR2 Implementation Guidelines* application report (literature number SPRAAT7).

TI *only* supports designs that follow the board design guidelines outlined in the SPRAAT7 application report.

The DDR2 Memory Controller pins must be enabled by setting the DDREN configuration pin high during device reset. The DDREN pin must remain high at all times if the DDR2 Memory Controller is enabled. If DDREN is low, all data accessed destined for the DDR2 will be NULL terminated at the SCR. For more details, see Section 3.1, *Device Configuration at Device Reset*. The DDR2 Memory Controller on the TMS320C6472 device supports the following memory topologies:

- A 32-bit wide configuration interfacing to two 16-bit wide DDR2 SDRAM devices.
- A 16-bit wide configuration interfacing to a single 16-bit wide DDR2 SDRAM device.

7.11.2 DDR2 Memory Controller Peripheral Register Descriptions

Table 7-49. DDR2 Memory Controller Registers

HEX ADDRESS RANGE	ACRONYM	REGISTER NAME
7800 0000	MIDR	DDR2 Memory Controller Module and Revision Register

7800 00E8 - 7FFF FFC	-	Reserved

PRODUCT PREVIEW

7.11.3 DDR2 Memory Controller Electrical Data/Timing

The *TMS320C6472/TMS320TCI6486 DDR2 Implementation Guidelines* application report (literature number SPRAAT7) specifies a complete DDR2 interface solution for the C6472 device as well as a list of compatible DDR2 devices. TI has performed the simulation and system characterization to ensure all DDR2 interface timings in this solution are met; therefore, no electrical data/timing information is supplied here for this interface.

TI *only* supports designs that follow the board design guidelines outlined in the SPRAAT7 application report.

7.12 I2C Peripheral

The inter-integrated circuit (I2C) module provides an interface between a C64x+ DSP and other devices compliant with Philips Semiconductors Inter-IC bus™ (I2C bus) specification version 2.1 and connected by way of an I2C-bus. External components attached to this 2-wire serial bus can transmit/receive up to 8-bit data to/from the DSP through the I2C module.

7.12.1 I2C Device-Specific Information

The C6472 device includes an I2C peripheral module (I2C). NOTE: when using the I2C module, ensure there are external pullup resistors on the SDA and SCL pins.

The I2C modules on the C6472 device may be used by the DSP to control local peripherals ICs (DACs, ADCs, etc.) or may be used to communicate with other controllers in a system or to implement a user interface.

The I2C port supports:

- Compatible with Philips I2C Specification Revision 2.1 (January 2000)
- Fast Mode up to 400 Kbps (no fail-safe I/O buffers)
- Glitch filter to suppress glitches 50 ns or shorter
- 7- and 10-Bit Device Addressing Modes
- Multi-Master (Transmit/Receive) and Slave (Transmit/Receive) Functionality
- Events: DMA, Interrupt, or Polling
- Slew-Rate Limited Open-Drain Output Buffers

Figure 7-38 is a block diagram of the I2C module.

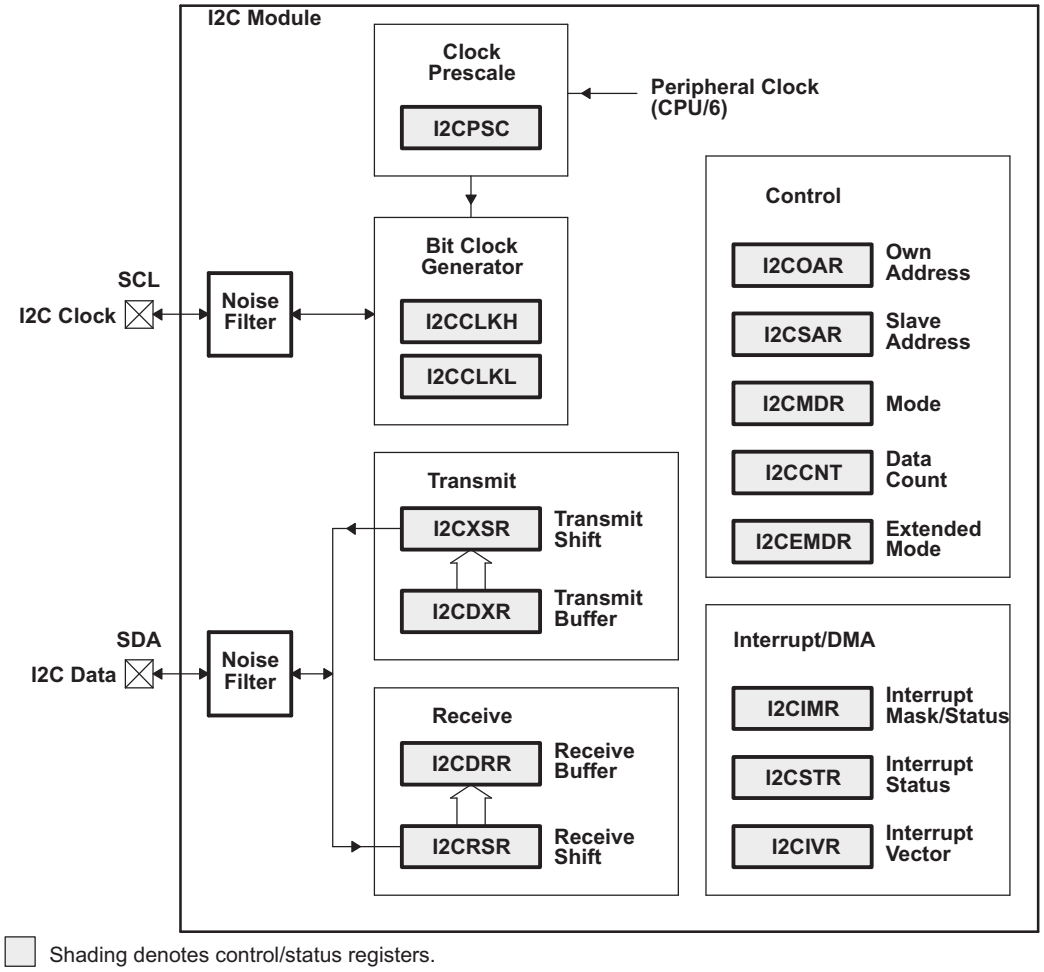

Figure 7-38. I2C Module Block Diagram

7.12.3 I2C Electrical Data/Timing

Table 7-51. Timing Requirements for I2C Input(1)

(see Figure 7-39)

NO.			500/625/700				UNIT
			STANDARD MODE		FAST MODE		
			MIN	MAX	MIN	MAX	
1	$t_{c(SCL)}$	Cycle time, SCL	10		2.5		µs
2	$t_{su(SCLH-SDAL)}$	Setup time, SCL high before SDA low (for a repeated START condition)	4.7		0.6		µs
3	$t_{h(SCLL-SDAL)}$	Hold time, SCL low after SDA low (for a START and a repeated START condition)	4		0.6		µs
4	$t_{w(SCLL)}$	Pulse duration, SCL low	4.7		1.3		µs
5	$t_{w(SCLH)}$	Pulse duration, SCL high	4		0.6		µs
6	$t_{su(SDAV-SDLH)}$	Setup time, SDA valid before SCL high	250		100(2)		ns
7	$t_{h(SDA-SDLL)}$	Hold time, SDA valid after SCL low (For I2C bus™ devices)	0(3)		0(3)	0.9(4)	µs
8	$t_{w(SDAH)}$	Pulse duration, SDA high between STOP and START conditions	4.7		1.3		µs
9	$t_{r(SDA)}$	Rise time, SDA		1000	20 + 0.1C_b (5)	300	ns
10	$t_{r(SCL)}$	Rise time, SCL		1000	20 + 0.1C_b (5)	300	ns
11	$t_{f(SDA)}$	Fall time, SDA		300	20 + 0.1C_b (5)	300	ns
12	$t_{f(SCL)}$	Fall time, SCL		300	20 + 0.1C_b (5)	300	ns
13	$t_{su(SCLH-SDAH)}$	Setup time, SCL high before SDA high (for STOP condition)	4		0.6		µs
14	$t_{w(SP)}$	Pulse duration, spike (must be suppressed)			0	50	ns
15	C_b (5)	Capacitive load for each bus line		400		400	pF

(1) The I2C pins SDA and SCL do not feature fail-safe I/O buffers. These pins could potentially draw current when the device is powered down.
(2) A Fast-mode I2C-bus™ device can be used in a Standard-mode I2C-bus™ system, but the requirement $t_{su(SDA-SCLH)}$ ≥250 ns must then be met. This will automatically be the case if the device does not stretch the LOW period of the SCL signal. If such a device does stretch the LOW period of the SCL signal, it must output the next data bit to the SDA line t_r max + $t_{su(SDA-SCLH)}$ = 1000 + 250 = 1250 ns (according to the Standard-mode I2C-Bus Specification) before the SCL line is released.
(3) A device must internally provide a hold time of at least 300 ns for the SDA signal (referred to the V_{IHmin} of the SCL signal) to bridge the undefined region of the falling edge of SCL.
(4) The maximum $t_{h(SDA-SCLL)}$ has only to be met if the device does not stretch the low period [$t_{w(SCLL)}$] of the SCL signal.
(5) C_b = total capacitance of one bus line in pF. If mixed with HS-mode devices, faster fall-times are allowed.

7.13 Host-Port Interface (HPI) Peripheral

7.13.1 HPI Device-Specific Information

The C6472 device includes a user-configurable 16-bit host-port interface (HPI16).

A host processor uses HPI to access internal registers and C6472 memory or external memory through the C6472 DDR2 EMIF. This accessibility may be useful for initializing the device in connection with the host boot mode and reading internal memory in connection with a software failure. Software handshaking, via the HRDY bit of the HPI control register (HPIC), is not supported on the C6472 device. For details about the HPI registers and their modes, see the *TMS320C6472/TMS320TCI6486 DSP Host Port Interface (HPI) User's Guide* (literature number SPRUEG1).

7.13.2 HPI Peripheral Register Descriptions

Table 7-53 discusses access to the HPI registers from the C6472 C64x+ megamodules.

Table 7-53. HPI Control Registers

HEX ADDRESS RANGE	ACRONYM	REGISTER NAME	COMMENTS
0288 0000	HPIPID	HPI Peripheral ID Register	
0288 0004	PWREMU_MGMT	HPI Power and Emulation Management Register	PWREMU_MGMT has both Host/CPU read/write access.
0288 0008 - 0288 002C	-	Reserved	
0288 0030	HPIC	HPI Control Register	The Host has read/write access to the HPIC register. The CPU has primarily read access to the HPIC register.(1)
0288 0034	HPID	Data register	The Host has read/write access to the HPIA registers. The CPU has only read access to the HPIA registers.
0288 0038	HPIAR/HPIAW(2)	HPI Address Registers	
0288 003C - 0289 FFFC	-	Reserved	

(1) The CPU can write 1 to the HINT bit to generate an interrupt to the host and it can write 1 to the DSPINT bit to clear/acknowledge an interrupt from the host.
(2) There are two 32-bit HPIA registers: HPIAR for read operations and HPIAW for write operations. The HPI can be configured such that HPIAR and HPIAW act as a single 32-bit HPIA (single-HPIA mode) or as two separate 32-bit HPIAs (dual-HPIA mode) from the perspective of the host. The CPU can access HPIAW and HPIAR independently. For details about the HPIA registers and their modes, see the *TMS320C6472/TMS320TCI6486 DSP Host Port Interface (HPI) User's Guide* (literature number SPRUEG1).

7.13.3 Host Access to HPI

The host-port interface pins comprise a multiplexed access to the HPI module that contains the registers described in Table 7-53. This external interface can only directly access the HPIC, HPID, and the two HPIA registers. The select lines, HCNTL[1:0], are used to determine which of these registers is being accessed. The remaining control lines, HR/W and HHWIL, qualify the external accesses and the strobes, HCS, HDS1, and HDS2, latch data into the HPI registers. Optionally, HAS can be used to latch the select and control inputs.

Write and read accesses to these HPI registers initiate DMA-like transfers within the DSP. The HRDY (host ready) output from the HPI must be monitored to determine when a requested access is complete before initiating the next access. Since the HPI module operates on the CPU/6 clock, these access cycles are slow when PLL1 is in bypass mode; i.e., at the beginning of host boot mode. HPI accesses are used to configure PLL1 to shorten these cycles.

7.13.4 HPI Electrical Data/Timing

Table 7-54. Timing Requirements for Host-Port Interface Cycles(1)(2)

(see Figure 7-41 through Figure 7-44)

NO.			500/625/700		UNIT
			MIN	MAX	
9	$t_{su(HASL-HSTBL)}$	Setup time, $\overline{HAS}$ low before $\overline{HSTROBE}$ low	5		ns
10	$t_{h(HSTBL-HASL)}$	Hold time, $\overline{HAS}$ low after $\overline{HSTROBE}$ low	2		ns
11	$t_{su(SELV-HASL)}$	Setup time, select signals(3) valid before $\overline{HAS}$ low	5		ns
12	$t_{h(HASL-SELV)}$	Hold time, select signals(3) valid after $\overline{HAS}$ low	5		ns
13	$t_{w(HSTBL)}$	Pulse duration, $\overline{HSTROBE}$ low	2M		ns
14	$t_{w(HSTBH)}$	Pulse duration, $\overline{HSTROBE}$ high between consecutive accesses	2M		ns
15	$t_{su(SELV-HSTBL)}$	Setup time, select signals(3) valid before $\overline{HSTROBE}$ low	5		ns
16	$t_{h(HSTBL-SELV)}$	Hold time, select signals(3) valid after $\overline{HSTROBE}$ low	5		ns
17	$t_{su(HDV-HSTBH)}$	Setup time, host data valid before $\overline{HSTROBE}$ high	6		ns
18	$t_{h(HSTBH-HDV)}$	Hold time, host data valid after $\overline{HSTROBE}$ high	0		ns
37	$t_{su(HCSL-HSTBL)}$	Setup time, $\overline{HCS}$ low before $\overline{HSTROBE}$ low	0		ns
38	$t_{h(HRDYL-HSTBL)}$	Hold time, $\overline{HSTROBE}$ low after $\overline{HRDY}$ low. $\overline{HSTROBE}$ should not be inactivated until $\overline{HRDY}$ is active (low); otherwise, HPI writes will not complete properly.	0		ns

(1) $\overline{HSTROBE}$ refers to the following logical operation on $\overline{HCS}$, $\overline{HDS1}$, and $\overline{HDS2}$: [NOT($\overline{HDS1}$ XOR $\overline{HDS2}$)] OR $\overline{HCS}$.
(2) M = HPI module clock period = 6 * CPU clock period or 12 ns at 500 MHz. (This duration will be much longer when PLL1 is in bypass mode.)
(3) Select signals (SELV) include: HCNTL[1:0] and HR/$\overline{W}$ and HHWIL.

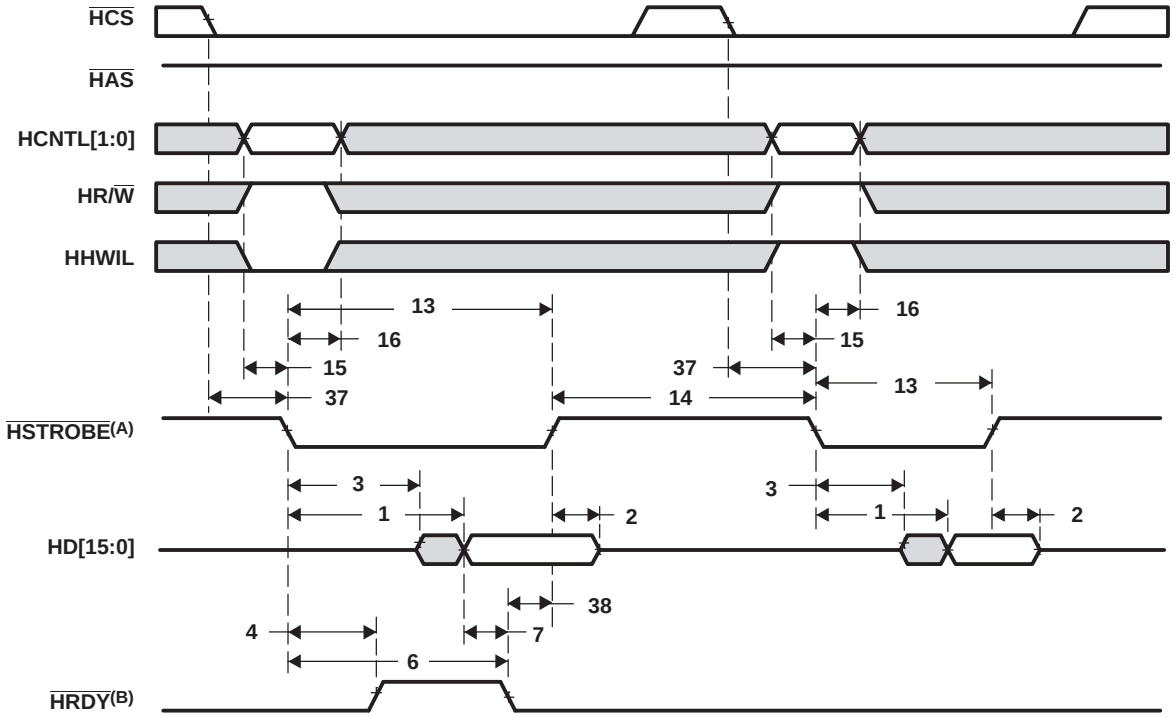
Table 7-55. Switching Characteristics Over Recommended Operating Conditions for Host-Port Interface Cycles(1)(2)(3)

(see Figure 7-41 through Figure 7-44)

NO.	PARAMETER			500/625/700		UNIT
				MIN	MAX	
1	$t_{d(HSTBL-HDV)}$	Delay time, HSTROBE low to DSP data valid	Case 1. HPIC or HPIA read	3	20	ns
			Case 2. HPID read with no auto-increment		17 * M + 20	
			Case 3. HPID read with auto-increment and read FIFO initially empty		16 * M + 20	
			Case 4. HPID read with auto-increment and data previously prefetched into the read FIFO	3	20	
2	$t_{dis(HSTBH-HDV)}$	Disable time, HD high-impedance from HSTROBE high		1	12	ns
3	$t_{en(HSTBL-HD)}$	Enable time, HD driven from HSTROBE low		2	20	ns
4	$t_{d(HSTBL-HRDYH)}$	Delay time, HSTROBE low to HRDY high			20	ns
5	$t_{d(HSTBH-HRDYH)}$	Delay time, HSTROBE high to HRDY high			20	ns
6	$t_{d(HSTBL-HRDYL)}$	Delay time, HSTROBE low to HRDY low	Case 1. HPID read with no auto-increment		18 * M + 20	ns
			Case 2. HPID read with auto-increment and read FIFO initially empty		17 * M + 20	
7	$t_{d(HDV-HRDYL)}$	Delay time, HD valid to HRDY low		0		ns
34	$t_{d(DSH-HRDYL)}$	Delay time, HSTROBE high to HRDY low	Case 1. HPIA write		5 * M + 20	ns
			Case 2. HPID write with no auto-increment		5 * M + 20	
35	$t_{d(HSTBL-HRDYL)}$	Delay time, HSTROBE low to HRDY low for HPIA write and FIFO not empty			40 * M + 20	ns
36	$t_{d(HASL-HRDYH)}$	Delay time, HAS low to HRDY high			20	ns

(1) M = HPI module clock period = 6 * CPU clock period or 12 ns at 500 MHz. (This duration will be much longer when PLL1 is in bypass mode.)
(2) HSTROBE refers to the following logical operation on HCS, HDS1, and HDS2: [NOT(HDS1 XOR HDS2)] OR HCS.
(3) Maximum delays for 1 (cases 2 and 3), 6, 34, and 35 assume no conflict with SCR. The true maximum delay during application execution is dependent on internal congestion delays. HRDY must be used to guarantee valid cycle completion.

PRODUCT PREVIEW



A. HSTROBE refers to the following logical operation on HCS, HDS1, and HDS2: [NOT(HDS1 XOR HDS2)] OR HCS.

B. Depending on the type of write or read operation (HPID without auto-incrementing; HPIA, HPIC, or HPID with auto-incrementing) and the state of the FIFO, transitions on HRDY may or may not occur. For more detailed information on the HPI peripheral, see the *TMS320C6472/TMS320TCI6486 DSP Host Port Interface (HPI) User's Guide* (literature number SPRUEG1).

PRODUCT PREVIEW

7.14 TSIP

The TSIP is a multi-link serial interface consisting of a maximum of eight transmit data signals (or links), eight receive data signals (or links), two frame sync input signals, and two serial clock inputs. The TSIP module offers support for a maximum of 1024 timeslots for transmit and receive. Typically, 672 timeslots (DS3) for transmit and receive are utilized on these links. The TSIP module can be configured to use the frame sync signals and the serial clocks as redundant sources for all transmit and receive data signals or one frame sync and serial clock for transmit and the second frame sync and clock for receive. The standard serial data rate for each TSIP transmit and receive data signal is 8.192 Mbps. The standard frame sync is a one- (or more) bit wide pulse that occurs once every 125 μs or a minimum of one serial clock period every 1024 serial clocks. At the standard rate and default configuration there are 8 transmit and 8 receive links that are active. Each serial interface link supports up to 128 8-bit timeslots. This corresponds to an HMVIP or H.110 serial data rate interface. The serial interface clock frequency may be either 16.384 MHz (default) or 8.192 MHz. (The clock can be either 1x or 2x the data-bit rate.) Typical timeslot occupation is 96 timeslots (DS2) for each serial interface link. Seven transmit data links and seven receive data links are utilized to support the DS3 timeslot requirement. The eighth transmit and receive links are available to support common channel signaling (CCS). The data rate for the serial interface links can also be set to 16.384 Mbps or 32.768 Mbps. The maximum number of active serial links is reduced to four and two, respectively, in these configurations. The serial interface clock frequency may be either 32.768 MHz or 16.384 MHz for 16.384 Mbps serial links and either 65.536 MHz or 32.768 MHz for 32.768 Mbps serial links.

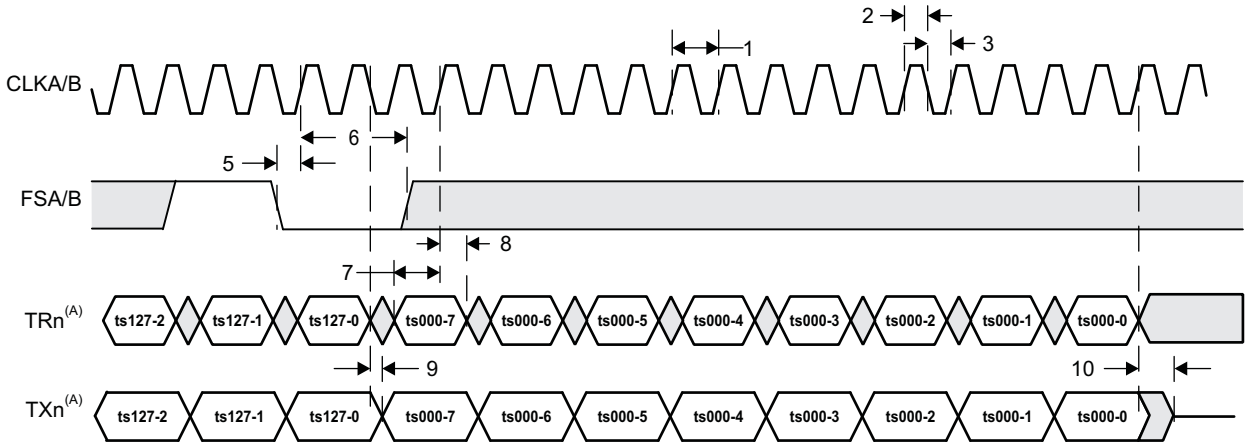
7.14.4 TSIP Electrical Data/Timing

Table 7-98. Timing Requirements for TSIP 2X Mode(1)

(see Figure 7-45)

NO.			500/625/700		UNIT
			MIN	MAX	
1	$t_{c(CLK)}$	Cycle time, CLK rising edge to next CLK rising edge	61(2)		ns
2	$t_{w(CLKL)}$	Pulse duration, CLK low	0.4 $t_{c(clk)}$		ns
3	$t_{w(CLKH)}$	Pulse duration, CLK high	0.4 $t_{c(clk)}$		ns
4	$t_{t(CLK)}$	Transition time, CLK high to low or CLK low to high		2	ns
5	$t_{su(FS-CLK)}$	Setup time, f_s valid before rising CLK	5		ns
6	$t_{h(CLK-FS)}$	Hold time, f_s valid after rising CLK	5		ns
7	$t_{su(TR-CLK)}$	Setup time, t_r valid before rising CLK	5		ns
8	$t_{h(CLK-TR)}$	Hold time, t_r valid before rising CLK	5		ns
9	$t_{d(CLKL-TX)}$	Delay time, CLK low to TX valid	1	12	ns
10	$t_{dis(CLKH-TXZ)}$	Disable time, CLK low to TX tristate	2	10	ns

(1) Polarities of XMTFSYNCP = 0b, XMTFCLKP = 0, XMTDCLKP = 1b, RCVFSYNCP = 0, RCVFCLKP = 0, RCVDCLKP = 0. If the polarity of any of the signals is inverted, then the timing references of that signal are also inverted.
(2) Timing shown is for 8.192 Mbps links. Timing for 16.384 Mbps and 32.768 Mbps links is 30.5 ns and 15.2 ns, respectively.



A. Example timeslot numbering shown is for 8.192 Mbps links; 16.384 Mbps links have timeslots numbered 0 through 255 and 32.768 Mbps links have timeslots numbered 0 through 511. The data timing shown relative to the clock and frame sync signals would require a RCVDATD=1 and a XMTDATD=1.

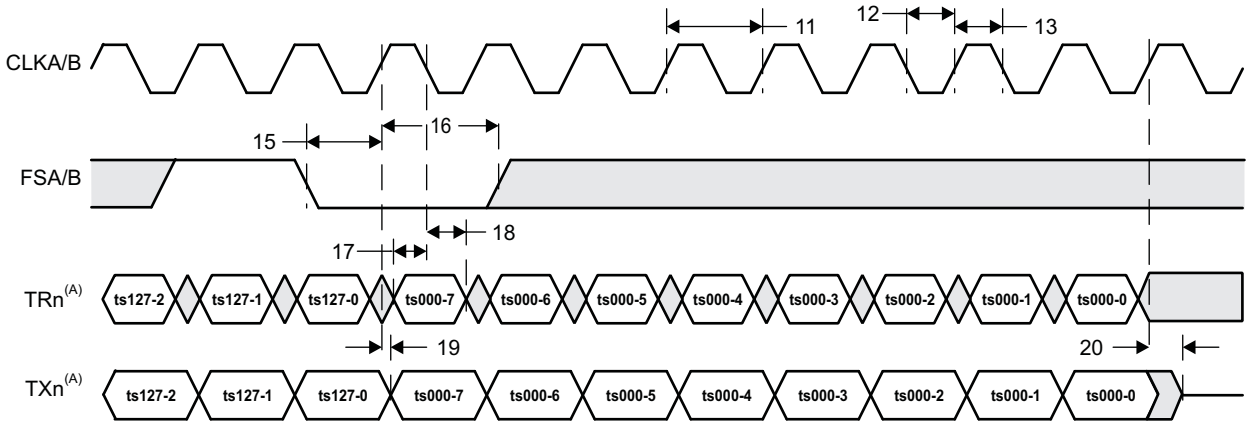
Figure 7-45. TSIP 2x Timing Diagram

Table 7-99. Timing Requirements for TSIP 1X Mode(1)

(see Figure 7-46)

NO.			500/625/700		UNIT
			MIN	MAX	
11	$t_{c(CLK)}$	Cycle time, CLK rising edge to next CLK rising edge	122.1(2)		ns
12	$t_{w(CLKL)}$	Pulse duration, CLK low	0.4 $t_{c(clk)}$		ns
13	$t_{w(CLKH)}$	Pulse duration, CLK high	0.4 $t_{c(clk)}$		ns
14	$t_{t(CLK)}$	Transition time, CLK high to low or CLK low to high		2	ns
15	$t_{su(FS-CLK)}$	Setup time, f_s valid before rising CLK	5		ns
16	$t_{h(CLK-FS)}$	Hold time, f_s valid after rising CLK	5		ns
17	$t_{su(TR-CLK)}$	Setup time, t_r valid before falling CLK	5		ns
18	$t_{h(CLK-TR)}$	Hold time, t_r valid before falling CLK	5		ns
19	$t_{d(CLKH-TX)}$	Delay time, CLK high to TX valid (1024(2) clock cycles plus)	1	12	ns
20	$t_{dis(CLKH-TXZ)}$	Disable time, CLK high to TX tristate	1	12	ns

(1) Polarities of XMTFSYNCP = 0b, XMTFCLKP = 0, XMTDCLKP = 0b, RCVFSYNCP = 0, RCVFCLKP = 0, RCVDCLKP = 1. If the polarity of any of the signals is inverted, then the timing references of that signal are also inverted.
(2) Timing shown is for 8.192 Mbps links. Timing for 16.384 Mbps and 32.768 Mbps links is 61 ns and 30.5 ns, respectively.



A. Example timeslot numbering shown is for 8.192 Mbps links; 16.384 Mbps links have timeslots numbered 0 through 255 and 32.768 Mbps links have timeslots numbered 0 through 511. The data timing shown relative to the clock and frame sync signals would require a RCVDATD=1023 and a XMTDATD=1023.

Figure 7-46. TSIP 1x Timing Diagram

PRODUCT PREVIEW

7.15 Ethernet MAC (EMAC)

The C6472 device contains two Ethernet Media Access Controller (EMAC) interfaces. Each EMAC module provides an efficient interface between the C6472 DSP core processor and the networked community. The EMAC supports 10Base-T (10 Mbits/second [Mbps]), and 100BaseTX (100 Mbps), in either half- or full-duplex mode, and 1000BaseT (1000 Mbps) in full-duplex mode, with hardware flow control and quality-of-service (QOS) support.

The EMAC module conforms to the IEEE 802.3-2002 standard, describing the “Carrier Sense Multiple Access with Collision Detection (CSMA/CD) Access Method and Physical Layer” specifications. The IEEE 802.3 standard has also been adopted by ISO/IEC and re-designated as ISO/IEC 8802-3:2000(E).

One deviation from this standard, the EMAC module does not use the Transmit Coding Error signal MTXER. Instead of driving the error pin when an underflow condition occurs on a transmitted frame, the EMAC will intentionally generate an incorrect checksum by inverting the frame CRC, so that the transmitted frame will be detected as an error by the network.

The EMAC control module is the main interface between the device core processor, the MDIO module, and the EMAC module. The relationship between these three components is shown in Figure 7-47. The EMAC control module contains the necessary components to allow the EMAC to make efficient use of device memory, plus it controls device interrupts. The EMAC control module incorporates 8K-bytes of internal RAM to hold EMAC buffer descriptors.

For more detailed information on the EMAC/MDIO, see the *TMS320C6472/TMS320TCI6486 DSP Ethernet Media Access Controller (EMAC)/Management Data Input/Output (MDIO) Module User's Guide* (literature number SPRUEF8).

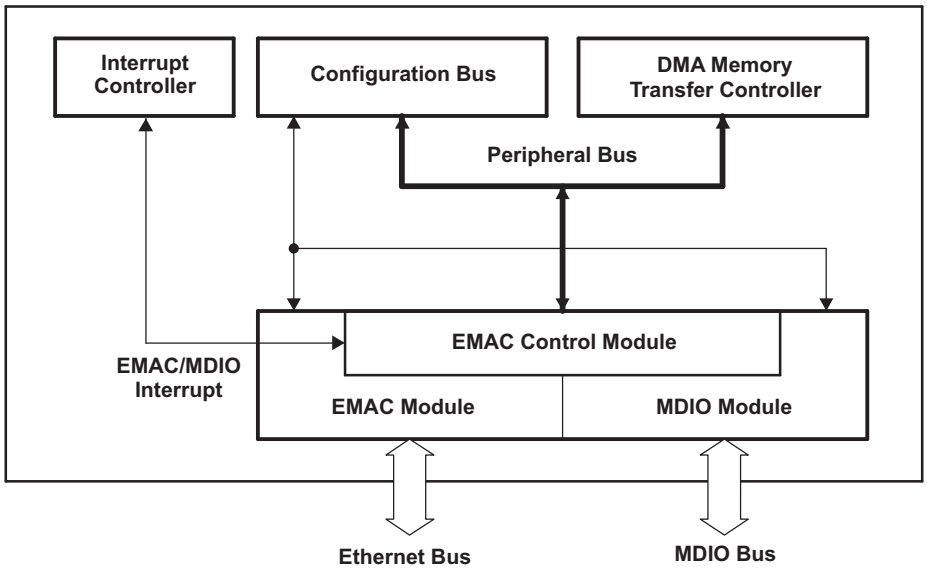


Figure 7-47. EMAC, MDIO, and EMAC Control Modules

7.15.1 EMAC Device-Specific Information

Interface Modes

The EMAC module on the TMS320C6472 device supports five interface modes: Media Independent Interface (MII), Reduced Media Independent Interface (RMII), Source Synchronous Serial Media Independent Interface (S3MII), Gigabit Media Independent Interface (GMII), and Reduced Gigabit Media Independent Interface (RGMII). The MII and GMII interface modes are defined in the IEEE 802.3-2002 standard.

The RGMII mode of the EMAC conforms to the Reduced Gigabit Media Independent Interface (RGMII) Specification (version 2.0). The RGMII mode implements the same functionality as the GMII mode, but with a reduced number of pins. Data and control information is transmitted and received using both edges of the transmit and receive clocks (TXC and RXC).

Note: The EMAC internally delays the transmit clock (TXC) with respect to the transmit data and control pins. Therefore, the EMAC conforms to the RGMII-ID operation of the RGMII specification. However, the EMAC does not delay the receive clock (RXC); this signal must be delayed with respect to the receive data and control pins outside of the DSP.

The RMII mode of the EMAC conforms to the RMII Specification (revision 1.2), as written by the RMII Consortium, except for the half-duplex mode, which is not supported. As the name implies, the Reduced Media Independent Interface (RMII) mode is a reduced pin count version of the MII mode.

The S3MII mode of the EMAC conforms to the Serial-MII Specification (revision 2.1).

Interface Mode Select

The EMAC uses the same pins for the (G)MII, RMII, and S3MII modes. Standalone pins are included for the RGMII mode, due to specific voltage requirements. Only one mode can be used at a time for each EMAC port. The mode used is selected at device reset based on the MACSEL0[2:0] and MACSEL1[1:0] configuration pins (for more detailed information, see Section 3, *Device Configuration*, of this document). Table 7-100 shows all the multiplexed pins used in the (G)MII, RMII, and S3MII modes on EMAC. For a detailed description of these pin functions, see Section 2.7, *Terminal Functions*.

Table 7-100. EMAC/MDIO Multiplexed Pins (MII, GMII0, RMII, and S3MII Modes)

PIN NUMBER	SIGNAL NAME	MII0	GMII0	RMII0	RMII1	S3MII0	S3MII1
AH11	MRXD00/RMRXD00/SRXD0	MRXD00	MRXD00	RMRXD00		SRXD0

7.15.5 Management Data Input/Output (MDIO)

The Management Data Input/Output (MDIO) module implements the 802.3 serial management interface to interrogate and controls up to 32 Ethernet PHY(s) connected to the device, using a shared two-wire bus. Application software uses the MDIO module to configure the negotiation parameters of each PHY attached to the EMAC, retrieve the negotiation results, and configure required parameters in the EMAC module for correct operation. The module is designed to allow almost transparent operation of the MDIO interface, with very little maintenance from the core processor.

The EMAC control module is the main interface between the device core processor, the MDIO module, and the EMAC module. The relationship between these three components is shown in Figure 7-47.

The MDIO uses the same pins for the MII, GMII, S3MII, and RMII modes. Standalone pins are included for the RGMII mode due to specific voltage requirements. Only one mode can be used at a time. The mode used is selected at device reset based on the MACSEL0[2:0] configuration pins (for more detailed information, see Section 3, *Device Configuration* section of this document).

For more detailed information on the EMAC/MDIO, see the *TMS320C6472/TMS320TCI6486 DSP Ethernet Media Access Controller (EMAC)/Management Data Input/Output (MDIO) Module User's Guide* (literature number SPRUEF8).

7.15.5.1 MDIO Device-Specific Information

Clocking Information

The on-chip PLL2 and PLL2 Controller generate all the clocks to the MDIO module. When enabled, the input clock to the PLL2 Controller (CLKIN2) must have a 25-MHz frequency. For more information, see Section 7.9, *PLL2 and PLL2 Controller* of this document.

7.15.5.2 MDIO Peripheral Register Descriptions

Table 7-124. MDIO Registers

7.16 Timers

The timers can be used to: time events, count events, generate pulses, interrupt the CPU, and send synchronization events to the EDMA. The localized timers (Timer 0 - Timer 5) can also be used as watchdog timers.

7.16.1 Timer Device-Specific Information

The C6472 device has six localized timers (Timer 0 - Timer 5) and six shared timers (Timer 6 - Timer 11). Each of the localized timers can be configured as a general-purpose timer or a watchdog timer. Each of the shared timers is a general-purpose timer. When configured as a general-purpose timer, each timer can be programmed as a 64-bit timer or as two separate 32-bit timers. The localized timers are clocked with an internal clock with a CPU/6 frequency. The shared timers can also be clocked with the same internal clock frequency or with an external signal provided on TIMI0 or TIMI1.

Each timer is made up of two 32-bit counters: a high counter and a low counter. The TIMI0 pin is connected to the low counter of each of the shared timers and the TIMI1 pin is connected to the high counter of each of the shared timers. The output of one of the shared timers, either the high counter or the low counter, can be selected to be output on the timer output pin (TIMO2).

When Timer 0 - Timer 5 are configured as watchdog timers, each core should maintain its own watchdog. Each core should also configure the corresponding RSTMUX0-5 register (see Section 3.8.2) to define the action that will be taken if a watchdog timeout occurs. In addition to the internally defined actions, a watchdog timeout results in the assertion of the WDOUT pin. WDOUT is a logically-combined signal from the six individual watchdog timers. A host can determine which of the six cores experienced the watchdog timeout by reading the RSTMUX registers or having the contents of those registers reported by one of the cores.

7.17 UTOPIA

7.17.1 UTOPIA Device-Specific Information

The Universal Test and Operations PHY Interface for ATM (UTOPIA) peripheral is a 50 MHz, 8-/16-Bit Slave-only interface. The UTOPIA peripheral contains two, two-cell FIFOs, one for transmit and one for receive, to buffer data sent/received at the interface. There is a transmit and a receive indication to the PDMA to enable servicing.

For more detailed information on the UTOPIA peripheral, see the *TMS320C6472/TMS320TCI6486 DSP Universal Test & Operations PHY Interface for ATM 2 (UTOPIA2) User's Guide* (literature number SPRUEG2).

PRODUCT PREVIEW

7.18 Serial RapidIO (SRIO) Port

The SRIO ports on the C6472 device are high-performance, low-pin-count interconnects aimed for embedded markets. The use of the RapidIO interconnect in a system board design can create a homogeneous interconnect environment providing simple, high-throughput connectivity and control among the devices. RapidIO is based on the memory and device addressing concepts of processor buses where the transaction processing is managed completely by hardware. This enables the RapidIO interconnect to lower the system cost by providing low latency, reduced overhead, packet data processing and high system bandwidth. The RapidIO interconnect offers very-low-pin count interfaces with scalable system bandwidth. The C6472 device contains two independent 1x lanes. The lanes can operate at 1.25, 2.5, or 3.135 Gbps.

The PHY part of the SRIO consists of the physical layer and includes the input and output buffers (each serial link consists of a differential pair), the 8-bit/10-bit encoder/decoder, the PLL clock recovery, and the parallel-to-serial/serial-to-parallel converters (SERDES).

The transmitter supports programmable output levels and de-emphasis settings. The receiver has equalization that can be converged automatically or programmed statically.

7.18.1 Serial RapidIO Device-Specific Information

The approach to specifying interface timing for the SRIO Port is different than on other interfaces such as HPI. For these other interfaces the device timing was specified in terms of data manual specifications and I/O buffer information specification (IBIS) models.

For the C6472 SRIO Port, Texas Instruments (TI) provides a printed circuit board (PCB) solution showing two DSPs connected via a 1x SRIO link directly to the user. TI has performed the simulation and system characterization to ensure all SRIO interface timings in this solution are met. The complete SRIO system solution is documented in the *TMS320C6472/TMS320TCI6486 Serial RapidIO Implementation Guidelines* application report (literature number SPRAAT9).

TI *only* supports designs that follow the board design guidelines outlined in the SPRAAT9 application report.

The Serial RapidIO peripheral is a master peripheral in the C6472 DSP. It conforms to the *RapidIO™ Interconnect Specification, Part VI: Physical Layer 1x/4x LP-Serial Specification, Revision 1.2*. For more information from an application perspective, see the *TMS320C6472/TMS320TCI648x Serial RapidIO (SRIO) User's Guide* (literature number SPRUE13).

7.18.2 SRIO Peripheral Register Descriptions

Table 7-150. RapidIO Control Registers

HEX ADDRESS RANGE	ACRONYM	REGISTER NAME
02D0 0000	PID	Peripheral Identification Register
02D0 0004	PCR	Peripheral Control Register
02D0 0008 - 02D0 001C	-	Reserved
02D0 0020	PER_SET_CNTL	Peripheral Settings Control Register
02D0 0024 - 02D0 002C	-	Reserved
02D0 0030	GBL_EN	Peripheral Global Enable Register
02D0 0034	GBL_EN_STAT	Peripheral Global Enable Status
02D0 0038	BLK0_EN	Block Enable 0
02D0 003C	BLK0_EN_STAT	Block Enable Status 0
02D0 0040	BLK1_EN	Block Enable 1
02D0 0044	BLK1_EN_STAT	Block Enable Status 1
02D0 0048	BLK2_EN	Block Enable 2
02D0 004C	BLK2_EN_STAT	Block Enable Status 2

7.19 General-Purpose Input/Output (GPIO)

7.19.1 GPIO Device-Specific Information

On the C6472 device, the GPIO peripheral pins are muxed with configuration inputs that are captured at device reset. For more detailed information on device/peripheral configuration and the C6472 device pin muxing, see Section 3, *Device Configuration*.

7.19.2 GPIO Peripheral Register Descriptions

Table 7-151. GPIO Registers

PRODUCT PREVIEW

7.20 Emulation Features and Capability

7.20.1 Advanced Event Triggering (AET)

The C6472 device supports Advanced Event Triggering (AET). This capability can be used to debug complex problems as well as understand performance characteristics of user applications. AET provides the following capabilities:

- **Hardware Program Breakpoints:** specify addresses or address ranges that can generate events such as halting the processor or triggering the trace capture.
- **Data Watchpoints:** specify data variable addresses, address ranges, or data values that can generate events such as halting the processor or triggering the trace capture.
- **Counters:** count the occurrence of an event or cycles for performance monitoring.
- **State Sequencing:** allows combinations of hardware program breakpoints and data watchpoints to precisely generate events for complex sequences.

For more information on AET, see the following documents:

Using Advanced Event Triggering to Find and Fix Intermittent Real-Time Bugs application report (literature number SPRA753)

Using Advanced Event Triggering to Debug Real-Time Problems in High Speed Embedded Microprocessor Systems application report (literature number SPRA387)

7.20.2 Trace

The C6472 device supports Trace. Trace is a debug technology that provides a detailed, historical account of application code execution, timing, and data accesses. Trace collects, compresses, and exports debug information for analysis. Trace works in real-time and does not impact the execution of the system.

For more information on board design guidelines for Trace Advanced Emulation, see the *Emulation and Trace Headers Technical Reference Manual* (literature number SPRU655).

Table 7-154. Timing Requirements for Trace

(see Figure 7-67)

NO.			500/625/700		UNIT
			MIN	MAX	
1	$t_{w(EMUnH)}$	Pulse duration, EMUn high	3 - 0.6(1)		ns
	$t_{w(EMUnH)}$ 90%	Pulse duration, EMUn high detected at 90% V_{OH}	1.5		
2	$t_{w(EMUnL)}$	Pulse duration, EMUn low	3 - 0.6(1)		
	$t_{w(EMUnL)}$ 10%	Pulse duration, EMUn low detected at 10% V_{OH}	1.5		
3	$t_{sko(EMUn)}$	Output Skew time, time delay difference between EMU pins configured as trace.	390 ps	1.8 ns	

(1) This parameter applies to the maximum trace export frequency operating in a 40/60 duty cycle.

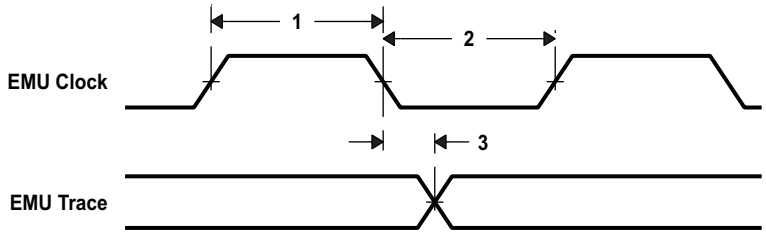

Figure 7-67. Trace Timing

PRODUCT PREVIEW

7.20.3 IEEE 1149.1 JTAG

The JTAG interface is used to support boundary scan testing and emulation of the C6472 device. The JTAG interface provides an asynchronous TRST and only the four primary JTAG signals (TCK, TDI, TMS, and TDO) are required for boundary scan. The pins EMU0 and EMU1 have no effect on the operation of the JTAG interface on the C6472 device. Most interfaces on the device follow the Boundary Scan Test Specification (IEEE1149.1), while the SerDes (RapidIO) supports the AC coupled net test defined in AC Coupled Net Test Specification (IEEE1149.6).

It is expected that all compliant devices are connected through the same JTAG interface, in daisy-chain fashion, as per the specification.

7.20.3.1 IEEE 1149.1 JTAG Compatibility Statement

For maximum reliability, the C6472 DSP includes an internal pulldown (IPD) on the TRST pin to ensure that TRST will always be asserted upon power up and the DSP's internal emulation logic will always be properly initialized when this pin is not routed out. JTAG controllers from Texas Instruments actively drive TRST high. However, some third-party JTAG controllers may not drive TRST high but expect the use of an external pullup resistor on TRST. When using this type of JTAG controller, assert TRST to initialize the DSP after powerup and externally drive TRST high before attempting any emulation or boundary scan operations.

7.20.3.2 Boundary Scan Operation

The C6472 device supports boundary scan testing through the IEEE 1149.1 JTAG interface. The *TMS320C6472 BSDL Model* (literature number SPRM384) is available to support boundary scan test vector development. The BSDL model files list POR and RESET as *compliance pins* and define their required state to be a 1. These pins must be pulled high prior to any boundary scan test sequence initialization and they must remain steady at a high level throughout the boundary scan testing to attain valid results. POR and RESET are the only pins (other than power and ground pins) that must remain at a fixed state during the boundary scan testing.

The JTAG ID is commonly read by boundary scan test tools. Note that the VARIANT field in the JTAG ID (see Section 3.10) may not be valid during boundary scan testing unless sufficient CLKIN1 clock cycles have been received (see Section 7.7 and Figure 7-9).

In an ideal system designed for boundary scan test, all of the ICs would have their own JTAG interface and all of the input and output pins would be controlled through the internal boundary scan cells. Since many of the devices on boards, like clock buffers, do not contain boundary scan cells or a JTAG interface, the outputs from these devices should be tristated during boundary scan testing. This allows all of the nets attached to the C6472 device to be tested. Additionally, if testing is desired for SRIO, DDR, or RGMII pins that may be powered down in some configurations, see the notes in Section 7.3.3. Additional BSDL files are available for designs that have one or more of these three interfaces disabled.

7.20.3.3 JTAG Electrical Data/Timing

Table 7-155. Timing Requirements for JTAG

(see Figure 7-68)

NO.			500/625/700		UNIT
			MIN	MAX	
1	$t_{c(TCLK)}$	Cycle time, TCLK	23.255	(1)	ns
3	$t_{su(TDIV-TCLKH)}$	Setup time, TDI/TMS/$\overline{TRST}$ valid before TCLK high	3		ns
4	$t_{h(TCLKH-TDIV)}$	Hold time, TDI/TMS/$\overline{TRST}$ valid after TCLK high	6 (2)		ns

(1) Fully-synchronous design removes maximum clock period limitations.
(2) Hold time measured from rising edge.

Table 7-156. Switching Characteristics Over Recommended Operating Conditions for JTAG

(see Figure 7-68)

NO.			500/625/700		UNIT
			MIN	MAX	
2	$t_{d(TCLKL-TDOV)}$	Delay time, TCLK low to TDO valid	0	12	ns

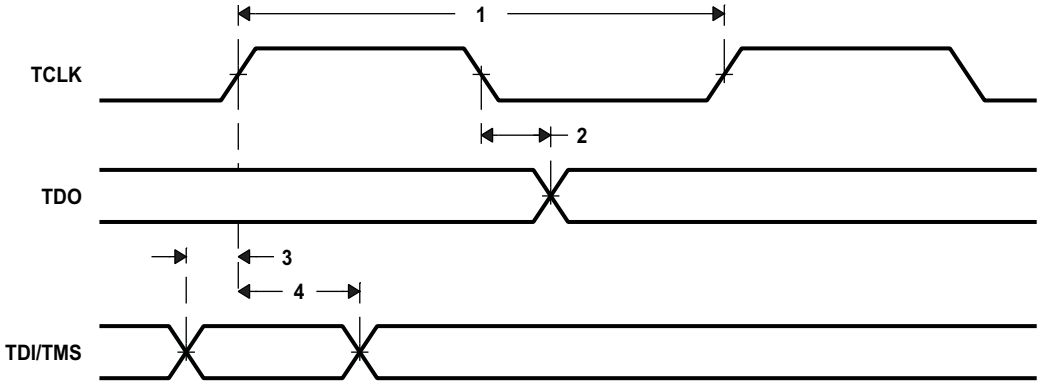

Figure 7-68. JTAG Timing

Table 7-157. Timing Requirements for HS-RTDX

(see Figure 7-69)

NO.			500/625/700		UNIT
			MIN	MAX	
1	$t_{c(TCLK)}$	Cycle time, TCLK	10	20	ns
2	$t_{su(TCLKH-EMUn)}$	Setup time, EMUn input valid before TCLK high	1.5		ns
3	$t_{h(TCLKH-EMUn)}$	Hold time, EMUn input valid after TCLK high	3.0		ns
4	$t_{d(TCLKH-EMUn)}$	Delay time, TCLK high to EMUn output valid	3.0	$t_{c(TCLK)}$ - 3.5	ns

8 Mechanical Data

8.1 Thermal Data

Table 8-1 shows the thermal resistance characteristics for the PBGA - ZTZ mechanical package.

Table 8-1. Thermal Resistance Characteristics (S-PBGA Package) [ZTZ]

NO.			°C/W	AIR FLOW (lfm)(1)
1	$R\Theta_{JC}$	Junction-to-case	0.56	N/A
2	$R\Theta_{JB}$	Junction-to-board	5.1	N/A
3	$R\Theta_{JA}$	Junction-to-free air	12.9	0
4			9.9	150
5			8.5	250
6			7.3	500
7	Psi_{JT}	Junction-to-package top	0.027	0
			0.028	150
			0.028	250
			0.029	500

(1) lfm = linear feet per minute.

8.2 Packaging Information

The following packaging information reflects the most current released data available for the designated device. This data is subject to change without notice and without revision of this document.

PRODUCT PREVIEW

PACKAGING INFORMATION

Orderable Device	Status (1)	Package Type	Package Drawing	Pins	Package Qty	Eco Plan (2)	Lead/ Ball Finish	MSL Peak Temp (3)	Samples (Requires Login)

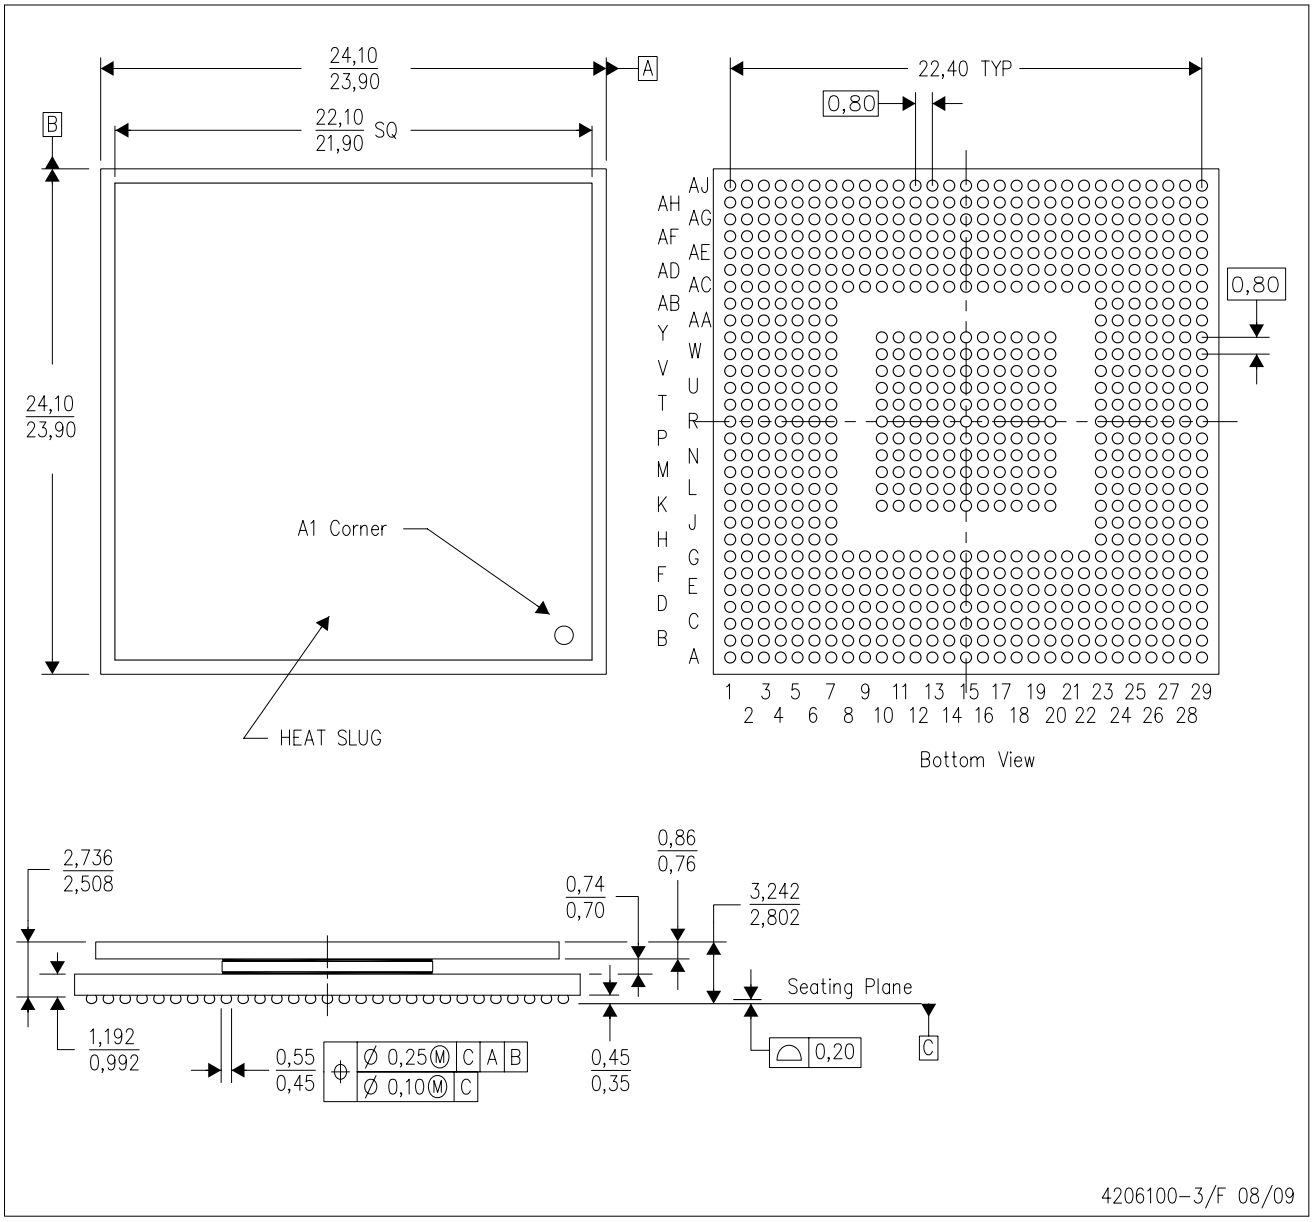
(1) The marketing status values are defined as follows:
ACTIVE: Product device recommended for new designs.
LIFEBUY: TI has announced that the device will be discontinued, and a lifetime-buy period is in effect.
NRND: Not recommended for new designs. Device is in production to support existing customers, but TI does not recommend using this part in a new design.
PREVIEW: Device has been announced but is not in production. Samples may or may not be available.
OBSOLETE: TI has discontinued the production of the device.

(2) Eco Plan - The planned eco-friendly classification: Pb-Free (RoHS), Pb-Free (RoHS Exempt), or Green (RoHS & no Sb/Br) - please check http://www.ti.com/productcontent for the latest availability information and additional product content details.
TBD: The Pb-Free/Green conversion plan has not been defined.
Pb-Free (RoHS): TI's terms "Lead-Free" or "Pb-Free" mean semiconductor products that are compatible with the current RoHS requirements for all 6 substances, including the requirement that lead not exceed 0.1% by weight in homogeneous materials. Where designed to be soldered at high temperatures, TI Pb-Free products are suitable for use in specified lead-free processes.
Pb-Free (RoHS Exempt): This component has a RoHS exemption for either 1) lead-based flip-chip solder bumps used between the die and package, or 2) lead-based die adhesive used between the die and leadframe. The component is otherwise considered Pb-Free (RoHS compatible) as defined above.
Green (RoHS & no Sb/Br): TI defines "Green" to mean Pb-Free (RoHS compatible), and free of Bromine (Br) and Antimony (Sb) based flame retardants (Br or Sb do not exceed 0.1% by weight in homogeneous material)

(3) MSL, Peak Temp. -- The Moisture Sensitivity Level rating according to the JEDEC industry standard classifications, and peak solder temperature.

In no event shall TI's liability arising out of such information exceed the total purchase price of the TI part(s) at issue in this document sold by TI to Customer on an annual basis.

ZTZ (S–PBGA–N737) PLASTIC BALL GRID ARRAY



NOTES:
A. All linear dimensions are in millimeters.
B. This drawing is subject to change without notice.
C. Thermally enhanced plastic package with heat slug (HSL).
D. Flip chip application only.
E. This is a Pb–free solder ball design.

IMPORTANT NOTICE

Texas Instruments Incorporated and its subsidiaries (TI) reserve the right to make corrections, modifications, enhancements, improvements, and other changes to its products and services at any time and to discontinue any product or service without notice. Customers should obtain the latest relevant information before placing orders and should verify that such information is current and complete. All products are sold subject to TI's terms and conditions of sale supplied at the time of order acknowledgment.

TI warrants performance of its hardware products to the specifications applicable at the time of sale in accordance with TI's standard warranty. Testing and other quality control techniques are used to the extent TI deems necessary to support this warranty. Except where mandated by government requirements, testing of all parameters of each product is not necessarily performed.

TI assumes no liability for applications assistance or customer product design. Customers are responsible for their products and applications using TI components. To minimize the risks associated with customer products and applications, customers should provide adequate design and operating safeguards.

TI does not warrant or represent that any license, either express or implied, is granted under any TI patent right, copyright, mask work right, or other TI intellectual property right relating to any combination, machine, or process in which TI products or services are used. Information published by TI regarding third-party products or services does not constitute a license from TI to use such products or services or a warranty or endorsement thereof. Use of such information may require a license from a third party under the patents or other intellectual property of the third party, or a license from TI under the patents or other intellectual property of TI.

Reproduction of TI information in TI data books or data sheets is permissible only if reproduction is without alteration and is accompanied by all associated warranties, conditions, limitations, and notices. Reproduction of this information with alteration is an unfair and deceptive business practice. TI is not responsible or liable for such altered documentation. Information of third parties may be subject to additional restrictions.

Resale of TI products or services with statements different from or beyond the parameters stated by TI for that product or service voids all express and any implied warranties for the associated TI product or service and is an unfair and deceptive business practice. TI is not responsible or liable for any such statements.

TI products are not authorized for use in safety-critical applications (such as life support) where a failure of the TI product would reasonably be expected to cause severe personal injury or death, unless officers of the parties have executed an agreement specifically governing such use. Buyers represent that they have all necessary expertise in the safety and regulatory ramifications of their applications, and acknowledge and agree that they are solely responsible for all legal, regulatory and safety-related requirements concerning their products and any use of TI products in such safety-critical applications, notwithstanding any applications-related information or support that may be provided by TI. Further, Buyers must fully indemnify TI and its representatives against any damages arising out of the use of TI products in such safety-critical applications.

TI products are neither designed nor intended for use in military/aerospace applications or environments unless the TI products are specifically designated by TI as military-grade or "enhanced plastic." Only products designated by TI as military-grade meet military specifications. Buyers acknowledge and agree that any such use of TI products which TI has not designated as military-grade is solely at the Buyer's risk, and that they are solely responsible for compliance with all legal and regulatory requirements in connection with such use.

TI products are neither designed nor intended for use in automotive applications or environments unless the specific TI products are designated by TI as compliant with ISO/TS 16949 requirements. Buyers acknowledge and agree that, if they use any non-designated products in automotive applications, TI will not be responsible for any failure to meet such requirements.
