Pin Descriptions

Terminal Name	Description	Electrical Characteristics
AGND	Analog Ground	Ground
AV _{DD}	Analog power	1.8 V nominal
CLK_INT	Clock input with a (10K-100K Ohm) pulldown resistor	Differential input
CLK_INC	Complementary clock input with a (10K-100K Ohm) pulldown resistor	Differential input
FB_INT	Feedback clock input	Differential input
FB_INC	Complementary feedback clock input	Differential input
FB_OUTT	Feedback clock output	Differential output
FB_OUTC	Complementary feedback clock output	Differential output
OE	Output Enable (Asynchronous)	LVC MOS input
OS	Output Select (tied to GND or V _{DDQ})	LVC MOS input
GND	Ground	Ground
V _{DDQ}	Logic and output power	1.8V nominal
CLKT[0:9]	Clock outputs	Differential outputs
CLKC[0:9]	Complementary clock outputs	Differential outputs
NB	No ball	

The PLL clock buffer, **ICS98ULPA877A**, is designed for a V_{DDQ} of 1.8 V, a AV_{DD} of 1.8 V and differential data input and output levels. Package options include a plastic 52-ball VFBGA and a 40-pin MLF.

ICS98ULPA877A is a zero delay buffer that distributes a differential clock input pair (CLK_INT, CLK_INC) to ten differential pair of clock outputs (CLKT[0:9], CLKC[0:9]) and one differential pair feedback clock outputs (FB_OUTT, FB_OUTC). The clock outputs are controlled by the input clocks (CLK_INT, CLK_INC), the feedback clocks (FB_INT, FB_INC), the LVC MOS program pins (OE, OS) and the Analog Power input (AV_{DD}). When OE is low, the outputs (except FB_OUTT/FB_OUTC) are disabled while the internal PLL continues to maintain its locked-in frequency. OS (Output Select) is a program pin that must be tied to GND or V_{DDQ}. When OS is high, OE will function as described above. When OS is low, OE has no effect on CLKT7/CLKC7 (they are free running in addition to FB_OUTT/FB_OUTC). When AV_{DD} is grounded, the PLL is turned off and bypassed for test purposes.

When both clock signals (CLK_INT, CLK_INC) are logic low, the device will enter a low power mode. An input logic detection circuit on the differential inputs, independent from the input buffers, will detect the logic low level and perform a low power state where all outputs, the feedback and the PLL are OFF. When the inputs transition from both being logic low to being differential signals, the PLL will be turned back on, the inputs and outputs will be enabled and the PLL will obtain phase lock between the feedback clock pair (FB_INT, FB_INC) and the input clock pair (CLK_INT, CLK_INC) within the specified stabilization time t_{STAB}.

The PLL in **ICS98ULPA877A** clock driver uses the input clocks (CLK_INT, CLK_INC) and the feedback clocks (FB_INT, FB_INC) to provide high-performance, low-skew, low-jitter output differential clocks (CLKT[0:9], CLKC[0:9]). **ICS98ULPA877A** is also able to track Spread Spectrum Clocking (SSC) for reduced EMI.

ICS98ULPA877A is available in Commercial Temperature Range (0°C to 70°C) and Industrial Temperature Range (-40°C to +85°C). See Ordering Information for details

*L(Z) means the outputs are disabled to a low stated meeting the I_{ODL} limit.

Absolute Maximum Ratings

Supply Voltage (VDDQ & AVDD)	-0.5V to 2.5V
Logic Inputs	GND - 0.5V to V _{DDQ} + 0.5V
Ambient Operating Temperature	-40°C to +85°C
Storage Temperature	-65°C to +150°C

Stresses above those listed under *Absolute Maximum Ratings* may cause permanent damage to the device. These ratings are stress specifications only and functional operation of the device at these or any other conditions above those listed in the operational sections of the specifications is not implied. Exposure to absolute maximum rating conditions for extended periods may affect product reliability.

Notes:

- Unused inputs must be held high or low to prevent them from floating.
- DC input signal voltage specifies the allowable DC execution of differential input.
- Differential inputs signal voltages specifies the differential voltage [VTR-VCP] required for switching, where VTR is the true input level and VCP is the complementary input level.
- Differential cross-point voltage is expected to track variations of V_{DDQ} and is the voltage at which the differential signal must be crossing.

Timing Requirements

Commercial: TA = 0°C - 70°C; Industrial: TA = -40°C - +85°C;

Supply Voltage AVDDQ, VDDQ = 1.8 V +/- 0.1V (unless otherwise stated)

PARAMETER	SYMBOL	CONDITIONS	MIN	MAX	UNITS
Max clock frequency	freq _{op}	1.8V±0.1V @ 25°C	95	410	MHz
Application Frequency Range	freq _{App}	1.8V±0.1V @ 25°C	160	410	MHz
Input clock duty cycle	d _{tin}		40	60	%
CLK stabilization	T _{STAB}			15	µs

NOTE: The PLL must be able to handle spread spectrum induced skew.

NOTE: Operating clock frequency indicates a range over which the PLL must be able to lock, but in which it is not required to meet the other timing parameters. (Used for low speed system debug.)

NOTE: Application clock frequency indicates a range over which the PLL must meet all timing parameters.

NOTE: Stabilization time is the time required for the integrated PLL circuit to obtain phase lock of its feedback signal to its reference signal, within the value specified by the Static Phase Offset (t_{ϕ}), after power-up. During normal operation, the stabilization time is also the time required for the integrated PLL circuit to obtain phase lock of its feedback signal to its reference signal when CK and CK# go to a logic low state, enter the power-down mode and later return to active operation. CK and CK# may be left floating after they have been driven low for one complete clock cycle.

- *Place the 2200pF capacitors close to the PLL.
- *Use wide traces for PLL Analog power and GND. Connect PLL and caps to AGND trace and connect trace to one GND via (farthest from PLL).
- *Recommended bead: Fair-rite P/N 2506036017Y0 or equivalent (0.8 DC max., 600 at 100MHz).
