Functional Description

The CY2310ANZ is a 3.3V buffer designed to distribute high-speed clocks in mobile PC applications. The part has 10 outputs, 8 of which can be used to drive up to four SDRAM SO-DIMMs, and the remaining can be used for external feedback to a PLL. The device operates at 3.3V and outputs can run up to 100 MHz, thus making it compatible with Pentium II® processors. The CY2310ANZ can be used in conjunction with the CY2281 or similar clock synthesizer for a full Pentium II motherboard solution.

The CY2310ANZ also includes a serial interface which can enable or disable each output clock. On power-up, all output clocks are enabled. A separate Output Enable pin facilitates testing on ATE.

Application Information

Clock traces must be terminated with either series or parallel termination, as is normally done.

Cd = DECOUPLING CAPACITOR

Ct = OPTIONAL EMI-REDUCING CAPACITORS

Rs = SERIES TERMINATING RESISTORS

Summary

- Surface mount, low-ESR, ceramic capacitors should be used for filtering. Typically, these capacitors have a value of 0.1 μ F. In some cases, smaller value capacitors may be required.
- The value of the series terminating resistor satisfies the following equation, where R_{trace} is the loaded characteristic impedance of the trace, R_{out} is the output impedance of the buffer (typically 25 Ω), and R_{series} is the series terminating resistor.

$$R_{series} > R_{trace} - R_{out}$$
- Footprints must be laid out for optional EMI-reducing capacitors, which should be placed as close to the terminating resistor as is physically possible. Typical values of these capacitors range from 4.7 pF to 22 pF.
- A Ferrite Bead **may** be used to isolate the Board V_{DD} from the clock generator V_{DD} island. Ensure that the Ferrite Bead offers greater than 50 Ω impedance at the clock frequency, under loaded DC conditions. Please refer to the application note "Layout and Termination Techniques for Cypress Clock Generators" for more details.
- If a Ferrite Bead is used, a 10 μ F–22 μ F tantalum bypass capacitor should be placed close to the Ferrite Bead. This capacitor prevents power supply droop during current surges.
