CY28RS480

# Clock Generator for ATI<sup>®</sup> RS480 Chipset

## Features

- Supports AMD<sup>®</sup> CPU
- 200-MHz differential CPU clock pairs
- 100-MHz differential SRC clocks
- 48-MHz USB clock
- 33-MHz PCI clock
- 66-MHz HyperTransport<sup>™</sup> clock
- I<sup>2</sup>C support with readback capabilities
- Ideal Lexmark Spread Spectrum profile for maximum electromagnetic interference (EMI) reduction
- 3.3V power supply
- 56-pin SSOP and TSSOP packages

**Pin Description**

Pin No.	Name	Type	Description
41,40,45,44	CPU/C	O, DIF	<b>Differential CPU clock outputs.</b> AMD K8 buffer (200 Mhz).
50	PCI0	O	<b>33-MHz clock output.</b>
37	IREF	I	A precision resistor attached to this pin is connected to the internal current reference.
52, 53, 54	REF[2:0]	O, SE	<b>14.318-MHz REF clock output.</b> Intel® Type-5 buffer.
7	SCLK	I,PU	<b>SMBus-compatible SCLOCK.</b> This pin has an internal pull-up, but is tri-stated in power-down.
8	SDATA	I/O,PU	<b>SMBus-compatible SDATA.</b> This pin has an internal pull-up, but is tri-stated in power-down.
27, 28, 30, 29	SRCST/C[1:0]	O, DIF	<b>Differentials Selectable serial reference clock.</b> Intel Type-X buffer. Includes overclock support through SMBUS
12, 13, 16, 17, 18, 19, 22, 23, 24, 25, 34, 33	SRCT/C[5:0]	O, DIF	<b>100-MHz differential serial reference clock.</b> Intel Type-X buffer.
10,11	CLKREQ#[0:1]	I, SE, PD	<b>Output Enable control for SRCT/C.</b> Output enable control required by Minicard specification. This pin has an internal pull-down. 0 = Selected SRC outputs are enabled, 1 = Selected SRC outputs are disabled
4	USB_48	O, SE	<b>48-MHz clock output.</b> Intel Type-3A buffer.
47	HTT66	O, SE	<b>66-MHz clock output.</b> Intel Type-5 buffer.
3	VDD_48	PWR	3.3V power supply for USB outputs
43	VDD_CPU	PWR	3.3V power supply for CPU outputs
51	VDD_PCI	PWR	3.3V power supply for PCI outputs
56	VDD_REF	PWR	3.3V power supply for REF outputs
48	VDD_HTT	PWR	3.3V power supply for Hyper Transport outputs
14, 21	VDD_SRC	PWR	3.3V power supply for SRC outputs
35	VDD_SRC1	PWR	3.3V power supply for SRC outputs
32	VDD_SRCS	PWR	3.3V power supply for SRCS outputs
39	VDDA	PWR	3.3V Analog Power for PLLs
5	VSS_48	GND	Ground for USB outputs
42	VSS_CPU	GND	Ground for CPU outputs
49	VSS_PCI	GND	Ground for PCI outputs
55	VSS_REF	GND	Ground for REF outputs

## Serial Data Interface

To enhance the flexibility and function of the clock synthesizer, a two-signal serial interface is provided. Through the Serial Data Interface, various device functions, such as individual clock output buffers, can be individually enabled or disabled. The registers associated with the Serial Data Interface initialize to their default setting upon power-up, and therefore use of this interface is optional. Clock device register changes are normally made upon system initialization, if any are required. The interface cannot be used during system operation for power management functions.

## Data Protocol

The clock driver serial protocol accepts byte write, byte read, block write, and block read operations from the controller. For block write/read operation, the bytes must be accessed in sequential order from lowest to highest byte (most significant bit first) with the ability to stop after any complete byte has been transferred. For byte write and byte read operations, the system controller can access individually indexed bytes. The offset of the indexed byte is encoded in the command code, as described in *Table 1*.

The block write and block read protocol is outlined in *Table 2* while *Table 3* outlines the corresponding byte write and byte read protocol. The slave receiver address is 11010010 (D2h).

**Table 1. Command Code Definition**

**Table 4. Crystal Recommendations**

Frequency (Fund)	Cut	Loading	Load Cap	Drive (max.)	Shunt Cap (max.)	Motional (max.)	Tolerance (max.)	Stability (max.)	Aging (max.)
14.31818 MHz	AT	Parallel	20 pF	0.1 mW	5 pF	0.016 pF	35 ppm	30 ppm	5 ppm

**Crystal Recommendations**

The CY28RS480 requires a Parallel Resonance Crystal. Substituting a series resonance crystal will cause the CY28RS480 to operate at the wrong frequency and violate the ppm specification. For most applications there is a 300-ppm frequency shift between series and parallel crystals due to incorrect loading.

**Crystal Loading**

Crystal loading plays a critical role in achieving low ppm performance. To realize low ppm performance, the total capacitance the crystal will see must be considered to calculate the appropriate capacitive loading (CL).

Figure 1 shows a typical crystal configuration using the two trim capacitors. An important clarification for the following discussion is that the trim capacitors are in series with the crystal not parallel. It's a common misconception that load capacitors are in parallel with the crystal and should be approximately equal to the load capacitance of the crystal. This is not true.

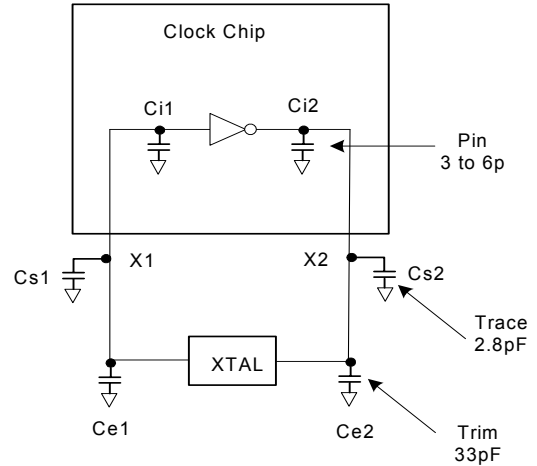

**Figure 1. Crystal Capacitive Clarification**

**Calculating Load Capacitors**

In addition to the standard external trim capacitors, trace capacitance and pin capacitance must also be considered to correctly calculate crystal loading. As mentioned previously, the capacitance on each side of the crystal is in series with the crystal. This means the total capacitance on each side of the crystal must be twice the specified crystal load capacitance (CL). While the capacitance on each side of the crystal is in

series with the crystal, trim capacitors (Ce1,Ce2) should be calculated to provide equal capacitive loading on both sides.

**Figure 2. Crystal Loading Example**

As mentioned previously, the capacitance on each side of the crystal is in series with the crystal. This means the total capacitance on each side of the crystal must be twice the specified load capacitance (CL). While the capacitance on each side of the crystal is in series with the crystal, trim capacitors (Ce1,Ce2) should be calculated to provide equal capacitance loading on both sides.

Use the following formulas to calculate the trim capacitor values for Ce1 and Ce2.

**Load Capacitance (each side)**

$$C_e = 2 * CL - (C_s + C_i)$$

**Total Capacitance (as seen by the crystal)**

$$CL_e = \frac{1}{\left(\frac{1}{C_{e1} + C_{s1} + C_{i1}} + \frac{1}{C_{e2} + C_{s2} + C_{i2}}\right)}$$

- CL .....Crystal load capacitance
- CL<sub>e</sub> ..... Actual loading seen by crystal using standard value trim capacitors
- C<sub>e</sub> ..... External trim capacitors
- C<sub>s</sub> ..... Stray capacitance (terraced)
- C<sub>i</sub> ..... Internal capacitance (lead frame, bond wires etc.)
- CL .....Crystal load capacitance
- CL<sub>e</sub> ..... Actual loading seen by crystal using standard value trim capacitors
- C<sub>e</sub> ..... External trim capacitors
- C<sub>s</sub> ..... Stray capacitance (terraced)
- C<sub>i</sub> ..... Internal capacitance (lead frame, bond wires etc.)

**CLK\_REQ[0:1]# Description**

The CLKREQ#[1:0] signals are active low input used for clean stopping and starting selected SRC outputs. The outputs controlled by CLKREQ#[1:0] are determined by the settings in register bytes 4 and 5. The CLKREQ# signal is a debounced signal in that its state must remain unchanged during two consecutive rising edges of DIFC to be recognized as a valid assertion or deassertion. (The assertion and deassertion of this signal is absolutely asynchronous.)

**CLK\_REQ[0:1]# Deassertion [Low to High Transition]**

The impact of deasserting the CLKREQ#[1:0] pins is all DIF outputs that are set in the control registers to stoppable via assertion of CLKREQ#[1:0] are to be stopped after their next transition. When the control register CLKREQ# drive mode bit is programmed to '0', the final state of all stopped SRC signals

is SRCT clock = High and SRCC = Low. There is to be no change to the output drive current values, SRCT will be driven high with a current value equal  $6 \times I_{ref}$ . When the control register CLKREQ# drive mode bit is programmed to '1', the final state of all stopped DIF signals is low, both SRCT clock and SRCC clock outputs will not be driven.

**CLK\_REQ[0:1]# Assertion [High to Low Transition]**

All differential outputs that were stopped are to resume normal operation in a glitch free manner. The maximum latency from the Assertion to active outputs is between 2–6 SRC clock periods (2 clocks are shown) with all SRC outputs resuming simultaneously. If the CLKREQ# drive mode bit is programmed to '1' (three-state), the all stopped SRC outputs must be driven high within 10 ns of CLKREQ#[1:0] Assertion to a voltage greater than 200 mV.

## Test and Measurement Set-up

### For PCI Single-ended Signals and Reference

The following diagram shows the test load configurations for the single-ended PCI, USB, and REF output signals.

**Figure 4. Single-ended Load Configuration**

### For Differential CPU and SRC Output Signals

The following diagram shows the test load configuration for the differential SRC outputs.

**Ordering Information**

Part Number	Package Type	Product Flow
<b>Lead-free</b>		
CY28RS480OXC	56-pin SSOP	Commercial, 0° to 70°C
CY28RS480OXCT	56-pin SSOP – Tape and Reel	Commercial, 0° to 70°C
CY28RS480ZXC	56-pin TSSOP	Commercial, 0° to 70°C
CY28RS480ZXCT	56-pin TSSOP – Tape and Reel	Commercial, 0° to 70°C
