CY7C131-25JC**

CY7C130/CY7C131 CY7C140/CY7C141

1K x 8 Dual-Port Static Ram

Features

- True Dual-Ported memory cells which allow simultaneous reads of the same memory location
- 1K x 8 organization
- 0.65-micron CMOS for optimum speed/power
- High-speed access: 15 ns
- Low operating power: I_{CC} = 90 mA (max.)
- Fully asynchronous operation
- Automatic power-down
- Master CY7C130/CY7C131 easily expands data bus width to 16 or more bits using slave CY7C140/CY7C141
- **BUSY** output flag on CY7C130/CY7C131; **BUSY** input on CY7C140/CY7C141
- **INT** flag for port-to-port communication
- Available in 48-pin DIP (CY7C130/140), 52-pin PLCC and 52-pin TQFP
- Pin-compatible and functionally equivalent to IDT7130/IDT7140

Functional Description

The CY7C130/CY7C131/CY7C140 and CY7C141 are high-speed CMOS 1K by 8 dual-port static RAMs. Two ports are provided permitting independent access to any location in memory. The CY7C130/ CY7C131 can be utilized as either a standalone 8-bit dual-port static RAM or as a master dual-port RAM in conjunction with the CY7C140/CY7C141 slave dual-port device in systems requiring 16-bit or greater word widths. It is the solution to applications requiring shared or buffered data, such as cache memory for DSP, bit-slice, or multiprocessor designs.

Each port has independent control pins; chip enable (\overline{CE}), write enable (R/\overline{W}), and output enable (\overline{OE}). Two flags are provided on each port, \overline{BUSY} and \overline{INT} . \overline{BUSY} signals that the port is trying to access the same location currently being accessed by the other port. \overline{INT} is an interrupt flag indicating that data has been placed in a unique location (3FF for the left port and 3FE for the right port). An automatic power-down feature is controlled independently on each port by the chip enable (\overline{CE}) pins.

The CY7C130 and CY7C140 are available in 48-pin DIP. The CY7C131 and CY7C141 are available in 52-pin PLCC and PQFP.

- Notes:**
1. CY7C130/CY7C131 (Master): \overline{BUSY} is open drain output and requires pull-up resistor
CY7C140/CY7C141 (Slave): \overline{BUSY} is input.
 2. Open drain outputs: pull-up resistor required

Notes:

- Test conditions assume signal transition times of 5 ns or less, timing reference levels of 1.5V, input pulse levels of 0 to 3.0V and output loading of the specified I_{OL}/I_{OH} and 30-pF load capacitance.
- AC Test Conditions use V_{OH} = 1.6V and V_{OL} = 1.4V.
- At any given temperature and voltage condition for any given device, t_{HZCE} is less than t_{LZCE} and t_{HZOE} is less than t_{LZOE}.
- t_{LZCE}, t_{LZWE}, t_{HZOE}, t_{LZOE}, t_{HZCE} and t_{HZWE} are tested with C_L = 5pF as in part (b) of AC Test Loads. Transition is measured ±500 mV from steady state voltage.
- The internal write time of the memory is defined by the overlap of CS LOW and R \overline{W} LOW. Both signals must be low to initiate a write and either signal can terminate a write by going high. The data input set-up and hold timing should be referenced to the rising edge of the signal that terminates the write

16. These parameters are measured from the input signal changing, until the output pin goes to a high-impedance state.
17. CY7C140/CY7C141 only.
18. A write operation on Port A, where Port A has priority, leaves the data on Port B's outputs undisturbed until one access time after one of the following:
 BUSY on Port B goes HIGH.
 Port B's address is toggled.
 CE for Port B is toggled.
 R/W for Port B is toggled during valid read.
