

**THE DATASHEET OF  
CY7C68000-56LFXC**

**TX2™ USB 2.0 UTMI Transceiver**

**1.0 EZ-USB TX2™ Features**

The Cypress EZ-USB TX2™ is a Universal Serial Bus (USB) specification revision 2.0 transceiver, serial/deserializer, to a parallel interface of either 16 bits at 30 MHz or eight bits at 60 MHz. The TX2 provides a high-speed physical layer interface that operates at the maximum allowable USB 2.0 bandwidth. This allows the system designer to keep the complex high-speed analog USB components external to the digital ASIC which decreases development time and associated risk. A standard interface is provided that is USB 2.0-certified and is compliant with Transceiver Macrocell Interface (UTMI) specification version 1.05 dated 3/29/01.

Two packages are defined for the family: 56-pin SSOP and 56-pin QFN.

The function block diagram is shown in *Figure 1-1*. The features of the EX-USB TX2 are:

- **UTMI-compliant/USB-2.0-certified for device operation**
- **Operates in both USB 2.0 high speed (HS), 480 Mbits/second, and full speed (FS), 12 Mbits/second**
- **Serial-to-parallel and parallel-to-serial conversions**
- **8-bit unidirectional, 8-bit bidirectional, or 16-bit bidirectional external data interface**
- **Synchronous field and EOP detection on receive packets**
- **Synchronous field and EOP generation on transmit packets**
- **Data and clock recovery from the USB serial stream**
- **Bit stuffing/unstuffing; bit stuff error detection**
- **Staging register to manage data rate variation due to bit stuffing/unstuffing**
- **16-bit 30-MHz, and 8-bit 60-MHz parallel interface**
- **Ability to switch between FS and HS terminations and signaling**
- **Supports detection of USB reset, suspend, and resume**
- **Supports HS identification and detection as defined by the USB 2.0 Specification**
- **Supports transmission of resume signaling**
- **3.3 V operation**
- **Two package options—56-pin QFN, and 56-pin SSOP**
- **All required terminations, including 1.5K-ohm pull up on DPLUS, are internal to the chip**
- **Supports USB 2.0 test modes**

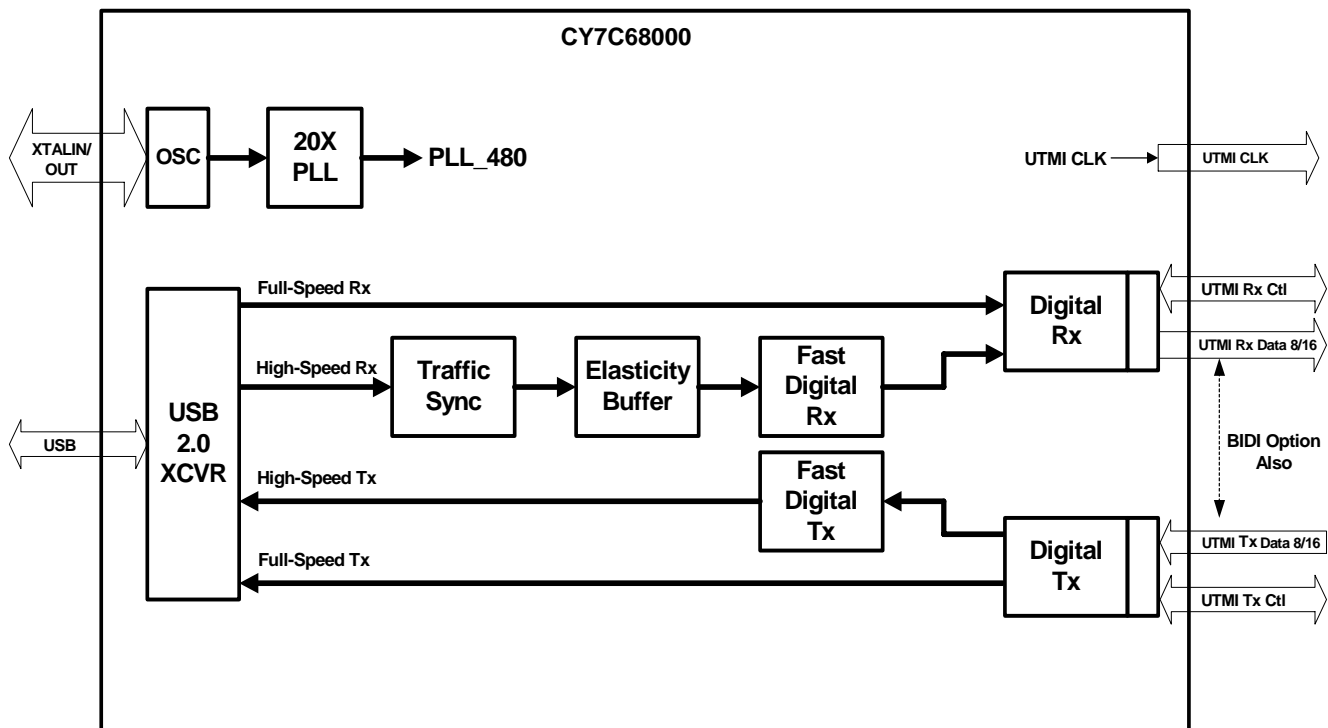

Figure 1-1. Block Diagram

## 2.0 Applications

- DSL modems
- ATA interface
- Memory card readers
- Legacy conversion devices
- Cameras
- Scanners
- Home PNA
- Wireless LAN
- MP3 players
- Networking

## 3.0 Functional Overview

### 3.1 USB Signaling Speed

TX2 operates at two of the rates defined in the USB Specification 2.0, dated April 27, 2000:

- Full speed, with a signaling bit rate of 12 Mbps
- High speed, with a signaling bit rate of 480 Mbps

TX2 does not support the low-speed (LS) signaling rate of 1.5 Mbps.

### 3.2 Transceiver Clock Frequency

TX2 has an on-chip oscillator circuit that uses an external 24-MHz ( $\pm 100$ -ppm) crystal with the following characteristics:

- Parallel resonant
- Fundamental mode
- 500- $\mu$ W drive level
- 27–33 pF (5% tolerance) load capacitors

An on-chip phase-locked loop (PLL) multiplies the 24-MHz oscillator up to 30/60 MHz, as required by the transceiver parallel data bus. The default UTMI interface clock (CLK) frequency is determined by the DataBus16\_8 pin.

### 3.3 Buses

The two packages allow for 8/16-bit bidirectional data bus for data transfers to a controlling unit.

### 3.4 Reset Pin

An input pin (Reset) resets the chip. This pin has hysteresis and is active HIGH according to the UTMI specification. The internal PLL stabilizes approximately 200  $\mu$ s after  $V_{CC}$  has reached 3.3V.

### 3.5 Line State

The Line State output pins LineState[1:0] are driven by combinational logic and may be toggling between the J and the K states. They are synchronized to the CLK signal for a valid

signal. On the CLK edge the state of these lines reflect the state of the USB data lines. Upon the clock edge the 0-bit of the LineState pins is the state of the DPLUS line and the one bit of LineState is the DMINUS line. When synchronized, the set up and hold timing of the LineState is identical to the parallel data bus.

### 3.6 Full-speed vs. High-speed Select

The FS vs. HS is done through the use of both XcvrSelect and the TermSelect input signals. The TermSelect signal enables the 1.5 K ohm pull up on to the DPLUS pin. When TermSelect is driven LOW, a SE0 is asserted on the USB providing the HS termination and generating the HS Idle state on the bus. The XcvrSelect signal is the control which selects either the FS transceivers or the HS transceivers. To select the HS transceivers, set this pin to '0'. To select the FS transceivers, set this pin to '1'.

### 3.7 Operational Modes

The operational modes are controlled by the OpMode signals. The **OpMode** signals are capable of inhibiting normal operation of the transceiver and evoking special test modes. These modes take effect immediately and take precedence over any pending data operations. The transmission data rate when in **OpMode** depends on the state of the **XcvrSelect** input.

OpMode[1:0]	Mode	Description
00	0	Normal operation
01	1	Non-driving
10	2	Disable Bit Stuffing and NRZI encoding
11	3	Reserved

Mode 0 allows the transceiver to operate with normal USB data decoding and encoding.

Mode 1 allows the transceiver logic to support a soft disconnect feature which three-states both the HS and FS transmitters, and removes any termination from the USB, making it appear to an upstream port that the device has been disconnected from the bus.

Mode 2 disables Bit Stuff and NRZI encoding logic so 1s loaded from the data bus becomes Js on the **DPLUS/DMINUS** lines and 0s become Ks.

### 4.0 DPLUS/DMINUS Impedance Termination

The CY7C68000 does not require external resistors for USB data line impedance termination or an external pull up resistor on the DPLUS line. These resistors are incorporated into the part. They are factory trimmed to meet the requirements of USB 2.0. Incorporating these resistors also reduces the pin count on the part.

**5.0 Pin Assignments**

The following pages illustrate the individual pin diagrams that are available in the 56-pin QFN and 56-pin SSOP packages. The packages offered use either an 8-bit (60-MHz) or 16-bit (30-MHz) bus interface.

5.1 CY7C68000 Pin Descriptions

Table 5-1. Pin Descriptions [1]

SSOP	QFN	Name	Type	Default	Description
11	4	AVCC	Power	N/A	<b>Analog V<sub>CC</sub>.</b> This signal provides power to the analog section of the chip.
15	8	AVCC	Power	N/A	<b>Analog V<sub>CC</sub>.</b> This signal provides power to the analog section of the chip.
14	7	AGND	Power	N/A	<b>Analog Ground.</b> Connect to ground with as short a path as possible.
18	11	AGND	Power	N/A	<b>Analog Ground.</b> Connect to ground with as short a path as possible.
16	9	DPLUS	I/O/Z	Z	<b>USB DPLUS Signal.</b> Connect to the USB DPLUS signal.
17	10	DMINUS	I/O/Z	Z	<b>USB DMINUS Signal.</b> Connect to the USB DMINUS signal.

Note:

- Unused inputs should not be left floating. Tie either HIGH or LOW as appropriate. Outputs that are three-statable should only be pulled up or down to ensure signals at power-up and in standby.

Table 5-1. Pin Descriptions (continued)<sup>[1]</sup>

SSOP	QFN	Name	Type	Default	Description
56	49	D0	I/O		<b>Bidirectional Data Bus.</b> This bidirectional bus is used as the entire data bus in the 8-bit bidirectional mode or the least significant eight bits in the 16-bit mode or under the 8-bit unidirectional mode these bits are used as inputs for data, selected by the RxValid signal.
55	48	D1	I/O		
53	46	D2	I/O		
51	44	D3	I/O		
50	43	D4	I/O		
48	41	D5	I/O		
46	39	D6	I/O		
45	38	D7	I/O		
44	37	D8	I/O		<b>Bidirectional Data Bus.</b> This bidirectional bus is used as the upper eight bits of the data bus when in the 16-bit mode, and not used when in the 8-bit bidirectional mode. Under the 8-bit unidirectional mode these bits are used as outputs for data, selected by the TxValid signal.
43	36	D9	I/O		
41	34	D10	I/O		
40	33	D11	I/O		
38	31	D12	I/O		
36	29	D13	I/O		
34	27	D14	I/O		
33	26	D15	I/O		
1	50	CLK	Output		<b>Clock.</b> This output is used for clocking the receive and transmit parallel data on the D[15:0] bus.
10	3	Reset	Input	N/A	<b>Active HIGH Reset.</b> Resets the entire chip. This pin can be tied to V <sub>CC</sub> through a 0.1 μF capacitor and to GND through a 100 K resistor for a 10 msec RC time constant.
19	12	XcvrSelect	Input	N/A	<b>Transceiver Select.</b> This signal selects between the Full Speed (FS) and the High Speed (HS) transceivers: 0: HS transceiver enabled 1: FS transceiver enabled
20	13	TermSelect	Input	N/A	<b>Termination Select.</b> This signal selects between the between the Full Speed (FS) and the High Speed (HS) terminations: 0: HS termination 1: FS termination
9	2	Suspend	Input	N/A	<b>Suspend.</b> Places the CY7C68000 in a mode that draws minimal power from supplies. Shuts down all blocks not necessary for Suspend/Resume operations. While suspended, <b>TermSelect</b> must always be in FS mode to ensure that the 1.5 K ohm pull-up on DPLUS remains powered. 0: CY7C68000 circuitry drawing suspend current 1: CY7C68000 circuitry drawing normal current
26	19	LineState1	Output		<b>Line State.</b> These signals reflect the current state of the single-ended receivers. They are combinatorial until a “usable” CLK is available then they are synchronized to CLK. They directly reflect the current state of the DPLUS (LineState0) and DMINUS (LineState1). D- D+ Description 0 0 0: SE0 0 1 1: ‘J’ State 1 0 2: ‘K’ State 1 1 3: SE1
25	18	LineState0	Output		<b>Line State.</b> These signals reflect the current state of the single-ended receivers. They are combinatorial until a ‘usable’ CLK is available then they are synchronized to CLK. They directly reflect the current state of the DPLUS (LineState0) and DMINUS (LineState1). D- D+ Description 00-0: SE0 01-1: ‘J’ State 10-2: ‘K’ State 11-3: SE1.

Table 5-1. Pin Descriptions (continued)<sup>[1]</sup>

SSOP	QFN	Name	Type	Default	Description
22	15	OpMode1	Input		<b>Operational Mode.</b> These signals select among various operational modes: 10 Description 00–0: Normal Operation 01–1: Non-driving 10–2: Disable Bit Stuffing and NRZI encoding 11–3: Reserved.
21	14	OpMode0	Input		<b>Operational Mode.</b> These signals select among various operational modes: 10 Description 00–0: Normal Operation 01–1: Non-driving 10–2: Disable Bit Stuffing and NRZI encoding 11–3: Reserved.
5	54	TXValid	Input		<b>Transmit Valid.</b> Indicates that the data bus is valid. The assertion of Transmit Valid initiates SYNC on the USB. The negation of Transmit Valid initiates EOP on the USB. The start of SYNC must be initiated on the USB no less than one or no more that two CLKs after the assertion of TXValid.  In HS (XcvrSelect = 0) mode, the SYNC pattern must be asserted on the USB between 8- and 16-bit times after the assertion of TXValid is detected by the Transmit State Machine.  In FS (Xcvr = 1), the SYNC pattern must be asserted on the USB no less than one or more than two CLKs after the assertion of TXValid is detected by the Transmit State Machine.
8	1	TXReady	Output		<b>Transmit Data Ready.</b> If TXValid is asserted, the SIE must always have data available for clocking in to the TX Holding Register on the rising edge of CLK. If TXValid is TRUE and TXReady is asserted at the rising edge of CLK, the CY7C68000 will load the data on the data bus into the TX Holding Register on the next rising edge of CLK. At that time, the SIE should immediately present the data for the next transfer on the data bus.
28	21	RXValid	Output		<b>Receive Data Valid.</b> Indicates that the <b>DataOut</b> bus has valid data. The Receive Data Holding Register is full and ready to be unloaded. The SIE is expected to latch the <b>DataOut</b> bus on the clock edge.
29	22	RXActive	Output		<b>Receive Active.</b> Indicates that the receive state machine has detected SYNC and is active.  RXActive is negated after a bit stuff error or an EOP is detected.
30	23	RXError	Output		<b>Receive Error.</b> 0 Indicates no error. 1 Indicates that a receive error has been detected.
7	56	ValidH	I/O		<b>ValidH.</b> This signal indicates that the high-order eight bits of a 16-bit data word presented on the <b>Data</b> bus are valid. When <b>DataBus16_8</b> = 1 and <b>TXValid</b> = 0, <b>ValidH</b> is an output, indicating that the high-order receive data byte on the <b>Data</b> bus is valid. When <b>DataBus16_8</b> = 1 and <b>TXValid</b> = 1, <b>ValidH</b> is an input and indicates that the high-order transmit data byte, presented on the <b>Data</b> bus by the transceiver, is valid. When <b>DataBus16_8</b> = 0, <b>ValidH</b> is undefined. The status of the receive low-order data byte is determined by <b>RXValid</b> and are present on D0–D7.
2	51	DataBus16_8	Input		<b>Data Bus 16_8.</b> Selects between 8- and 16-bit data transfers. 1–16-bit data path operation enabled. CLK = 30 MHz. 0–8-bit data path operation enabled. When Uni_Bidi = 0, D[8:15] are undefined. When Uni_Bidi = 1, D[0:7] are valid on RxValid and D[8:15] are valid on TxValid. CLK = 60 MHz  Note: <b>DataBus16_8</b> is static after Power-on Reset (POR) and is only sampled at the end of Reset.

**Table 5-1. Pin Descriptions** (continued)<sup>[1]</sup>

SSOP	QFN	Name	Type	Default	Description
13	6	XTALIN	Input	N/A	<b>Crystal Input.</b> Connect this signal to a 24-MHz parallel-resonant, fundamental mode crystal and 20-pF capacitor to GND. It is also correct to drive XTALIN with an external 24-MHz square wave derived from another clock source.
12	5	XTALOUT	Output	N/A	<b>Crystal Output.</b> Connect this signal to a 24-MHz parallel-resonant, fundamental mode crystal and 30-pF (nominal) capacitor to GND. If an external clock is used to drive XTALIN, leave this pin open.
3	52	Uni_Bidi	Input		<b>Driving this pin HIGH enables the unidirectional mode when the 8-bit interface is selected.</b> Uni_Bidi is static after power on reset (POR).
6	55	V <sub>CC</sub>	Power		V <sub>CC</sub> . Connect to 3.3V power source.

12.0 PCB Layout Recommendations<sup>[3]</sup>

The following recommendations should be followed to ensure reliable high-performance operation.

- At least a four-layer impedance controlled boards are required to maintain signal quality.
- Specify impedance targets (ask your board vendor what they can achieve).
- To control impedance, maintain trace widths and trace spacing to within specifications.
- Minimize stubs to minimize reflected signals.
- Connections between the USB connector shell and signal ground must be done near the USB connector.
- Bypass/flyback capacitors on VBus, near the connector, are recommended.
- DPLUS and DMINUS trace lengths should be kept to within 2 mm of each other in length, with preferred length of 20–30 mm.
- Maintain a solid ground plane under the DPLUS and DMINUS traces. Do not allow the plane to be split under these traces.
- If possible, do not place any vias on the DPLUS or DMINUS trace routing.
- Isolate the DPLUS and DMINUS traces from all other signal traces by no less than 10 mm.

Note:

3. Source for recommendations: *EZ-USB FX2™ PCB Design Recommendations*, [http://www.cypress.com/cfuploads/support/app\\_notes/FX2\\_PCB.pdf](http://www.cypress.com/cfuploads/support/app_notes/FX2_PCB.pdf) *High-Speed USB Platform Design Guidelines*, [http://www.usb.org/developers/docs/hs\\_usb\\_pdg\\_r1\\_0.pdf](http://www.usb.org/developers/docs/hs_usb_pdg_r1_0.pdf).

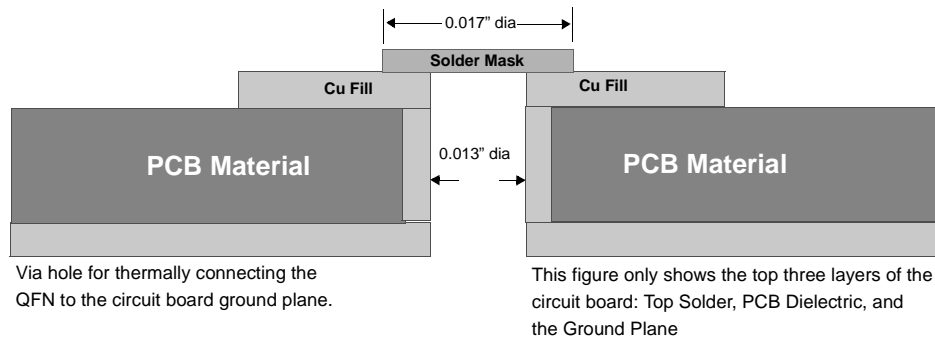

**13.0 Quad Flat Package No Leads (QFN) Package Design Notes**

Electrical contact of the part to the Printed Circuit Board (PCB) is made by soldering the leads on the bottom surface of the package to the PCB. Hence, special attention is required to the heat transfer area below the package to provide a good thermal bond to the circuit board. A Copper (Cu) fill is to be designed into the PCB as a thermal pad under the package. Heat is transferred from the TX2 through the device's metal paddle on the bottom side of the package. Heat from here, is conducted to the PCB at the thermal pad. It is then conducted from the thermal pad to the PCB inner ground plane by an array of via. A via is a plated through hole in the PCB with a finished diameter of 13 mil. The QFN's metal die paddle must be soldered to the PCB's thermal pad. Solder mask is placed on the board top side over each via to resist solder flow into the via. The

mask on the top side also minimizes outgassing during the solder reflow process.

For further information on this package design please refer to the application note "Surface Mount Assembly of AMKOR's MicroLeadFrame (MLF) Technology." This application note can be downloaded from AMKOR's web site from the following URL [http://www.amkor.com/products/notes\\_papers/MLFApp Note.pdf](http://www.amkor.com/products/notes_papers/MLFApp Note.pdf). The application note provides detailed information on board mounting guidelines, soldering flow, rework process, etc.

Figure 13-1 below displays a cross-sectional area underneath the package. The cross section is of only one via. The solder paste template needs to be designed to allow at least 50% solder coverage. The thickness of the solder paste template should be 5 mil. Cypress recommends that 'No Clean', type 3 solder paste is used for mounting the part. Nitrogen purge is recommended during reflow.

**Figure 13-1. Crosssection of the Area Underneath the QFN Package**

Figure 13-2 is a plot of the solder mask pattern image of the assembly (darker areas indicate solder).

**Figure 13-2. Plot of the Solder Mask (White Area)**
