Digital video encoder

SAA7104E; SAA7105E

1 FEATURES

- Digital PAL/NTSC encoder with integrated high quality scaler and anti-flicker filter for TV output from a PC
- Supports Intel® Digital Video Out (DVO) low voltage interfacing to graphics controller
- 27 MHz crystal-stable subcarrier generation
- Maximum graphics pixel clock 85 MHz at double edged clocking, synthesized on-chip or from external source
- Programmable assignment of clock edge to bytes (in double edged mode)
- Synthesizable pixel clock (PIXCLK) with minimized output jitter, can be used as reference clock for the VGC, as well)
- PIXCLK output and bi-phase PIXCLK input (VGC clock loop-through possible)
- Hot-plug detection through dedicated interrupt pin
- Supported VGA resolutions for PAL or NTSC legacy video output up to 1280 × 1024 graphics data at 60 or 50 Hz frame rate
- Supported VGA resolutions for HDTV output up to 1920 × 1080 interlaced graphics data at 60 or 50 Hz frame rate
- Three Digital-to-Analog Converters (DACs) for CVBS (BLUE, C_B), VBS (GREEN, CVBS) and C (RED, C_R) at 27 MHz sample rate (signals in parenthesis are optionally), all at 10-bit resolution
- Non-interlaced C_B-Y-C_R or RGB input at maximum 4 : 4 : 4 sampling
- Downscaling and upscaling from 50 to 400%
- Optional interlaced C_B-Y-C_R input of Digital Versatile Disk (DVD) signals
- Optional non-interlaced RGB output to drive second VGA monitor (bypass mode, maximum 85 MHz)
- 3 × 256 bytes RGB Look-Up Table (LUT)
- Support for hardware cursor
- HDTV up to 1920 × 1080 interlaced and 1280 × 720 progressive, including 3-level sync pulses
- Programmable border colour of underscan area
- Programmable 5 line anti-flicker filter
- On-chip 27 MHz crystal oscillator (3rd-harmonic or fundamental 27 MHz crystal)
- Fast I²C-bus control port (400 kHz)
- Encoder can be master or slave
- Adjustable output levels for the DACs
- Programmable horizontal and vertical input synchronization phase
- Programmable horizontal sync output phase
- Internal Colour Bar Generator (CBG)
- Optional support of various Vertical Blanking Interval (VBI) data insertion
- Macrovision™⁽¹⁾ Pay-per-View copy protection system rev. 7.01, rev. 6.1 and rev. 1.03 (525p) as option; this applies to the SAA7104E only. The device is protected by USA patent numbers 4631603, 4577216 and 4819098 and other intellectual property rights. Use of the Macrovision anti-copy process in the device is licensed for non-commercial home use only. Reverse engineering or disassembly is prohibited. Please contact your nearest Philips Semiconductors sales office for more information.
- Optional cross-colour reduction for PAL and NTSC CVBS outputs
- Power-save modes
- Joint Test Action Group (JTAG) boundary scan test
- Monolithic CMOS 3.3 V device, 5 V tolerant I/Os.

(1) Macrovision™ is a trademark of the Macrovision Corporation.

Digital video encoder

SAA7104E; SAA7105E

2 GENERAL DESCRIPTION

The SAA7104E; SAA7105E is an advanced next-generation video encoder which converts PC graphics data at maximum 1280×1024 resolution (optionally 1920×1080 interlaced) to PAL (50 Hz) or NTSC (60 Hz) video signals. A programmable scaler and anti-flicker filter (maximum 5 lines) ensures properly sized and flicker-free TV display as CVBS or S-video output.

Alternatively, the three Digital-to-Analog Converters (DACs) can output RGB signals together with a TTL composite sync to feed SCART connectors.

When the scaler/interlacer is bypassed, a second VGA monitor can be connected to the RGB outputs and separate H and V-syncs as well, thereby serving as an auxiliary monitor at maximum 1280×1024 resolution/60 Hz (PIXCLK < 85 MHz). Alternatively this port can provide Y, P_B and P_R signals for HDTV monitors.

The device includes a sync/clock generator and on-chip DACs.

All inputs intended to interface to the host graphics controller are designed for low-voltage signals between down to 1.1 V and up to 3.6 V.

3 QUICK REFERENCE DATA

SYMBOL	PARAMETER	MIN.	TYP.	MAX.	UNIT
V _{DDA}	analog supply voltage	3.15	3.3	3.45	V

PD0	H3	I	MSB – 7 with C _B -Y-C _R 4 : 2 : 2; see Tables 9 to 14 for pin assignment

Notes

- Pin type: I = input, O = output, S = supply, pu = pull-up.
- In accordance with the "IEEE1149.1" standard the pins TDI, TMS, TCK and $\overline{\text{TRST}}$ are input pins with an internal pull-up resistor and TDO is a 3-state output pin.
- For board design without boundary scan implementation connect $\overline{\text{TRST}}$ to ground.
- This pin provides easy initialization of the Boundary Scan Test (BST) circuit. $\overline{\text{TRST}}$ can be used to force the Test Access Port (TAP) controller to the TEST_LOGIC_RESET state (normal operation) at once.
- The pins FSVG, VSVG, C_B, HSVGC and TTXRQ_XCLKO2 are used for bootstrapping; see Section 7.1.

Digital video encoder

SAA7104E; SAA7105E

7 FUNCTIONAL DESCRIPTION

The digital video encoder encodes digital luminance and colour difference signals (C_B-Y-C_R) or digital RGB signals into analog CVBS, S-video and, optionally, RGB or C_R-Y-C_B signals. NTSC M, PAL B/G and sub-standards are supported.

The SAA7104E; SAA7105E can be directly connected to a PC video graphics controller with a maximum resolution of 1280 × 1024 (progressive) or 1920 × 1080 (interlaced) at a 50 or 60 Hz frame rate. A programmable scaler scales the computer graphics picture so that it will fit into a standard TV screen with an adjustable underscan area. Non-interlaced-to-interlaced conversion is optimized with an adjustable anti-flicker filter for a flicker-free display at a very high sharpness.

Besides the most common 16-bit 4 : 2 : 2 C_B-Y-C_R input format (using 8 pins with double edge clocking), other C_B-Y-C_R and RGB formats are also supported; see Tables 9 to 14.

A complete 3 × 256 bytes Look-Up Table (LUT), which can be used, for example, as a separate gamma corrector, is located in the RGB domain; it can be loaded either through the video input port PD (Pixel Data) or via the I²C-bus.

The SAA7104E; SAA7105E supports a 32 × 32 × 2-bit hardware cursor, the pattern of which can also be loaded through the video input port or via the I²C-bus.

It is also possible to encode interlaced 4 : 2 : 2 video signals such as PC-DVD; for that the anti-flicker filter, and in most cases the scaler, will simply be bypassed.

Besides the applications for video output, the SAA7104E; SAA7105E can also be used for generating a kind of auxiliary VGA output, when the RGB non-interlaced input signal is fed to the DACs. This may be of interest for example, when the graphics controller provides a second graphics window at its video output port.

The basic encoder function consists of subcarrier generation, colour modulation and insertion of synchronization signals at a crystal-stable clock rate of 13.5 MHz (independent of the actual pixel clock used at the input side), corresponding to an internal 4 : 2 : 2 bandwidth in the luminance/colour difference domain. Luminance and chrominance signals are filtered in accordance with the standard requirements of "RS-170-A" and "ITU-R BT.470-3".

For ease of analog post filtering the signals are twice oversampled to 27 MHz before digital-to-analog conversion.

The total filter transfer characteristics (scaler and anti-flicker filter are not taken into account) are illustrated in Figs 4 to 9. All three DACs are realized with full 10-bit resolution. The C_R-Y-C_B to RGB dematrix can be bypassed (optionally) in order to provide the upsampled C_R-Y-C_B input signals.

Digital video encoder

SAA7104E; SAA7105E

The 8-bit multiplexed C_B - Y - C_R formats are "ITU-R BT.656" (D1 format) compatible, but the SAV and EAV codes can be decoded optionally, when the device is operated in slave mode. For assignment of the input data to the rising or falling clock edge see Tables 9 to 14.

In order to display interlaced RGB signals through a euro-connector TV set, a separate digital composite sync signal (pin HSM_CSYNCR) can be generated; it can be advanced up to 31 periods of the 27 MHz crystal clock in order to be adapted to the RGB processing of a TV set.

The SAA7104E; SAA7105E synthesizes all necessary internal signals, colour subcarrier frequency and synchronization signals from that clock.

Wide screen signalling data can be loaded via the I²C-bus and is inserted into line 23 for standards using a 50 Hz field rate.

VPS data for program dependent automatic start and stop of such featured VCRs is loadable via the I²C-bus.

The IC also contains Closed Caption and extended data services encoding (line 21), and supports teletext insertion for the appropriate bit stream format at a 27 MHz clock rate (see Fig.14). It is also possible to load data for the copy generation management system into line 20 of every field (525/60 line counting).

A number of possibilities are provided for setting different video parameters such as:

- Black and blanking level control
- Colour subcarrier frequency
- Variable burst amplitude etc.

7.1 Reset conditions

To activate the reset a pulse at least of 2 crystal clocks duration is required.

During reset ($\overline{RESET} = LOW$) plus an extra 32 crystal clock periods, FSVGC, VSVGC, CBO, HSVGC and TTX_SRES are set to input mode and HSM_CSYNCR and VSM are set to 3-state. A reset also forces the I²C-bus interface to abort any running bus transfer and sets it into receive condition.

After reset, the state of the I/Os and other functions is defined by the strapping pins until an I²C-bus access redefines the corresponding registers; see Table 2.

Table 2 Strapping pins

PIN	TIED	PRESET
FSVGC	LOW	NTSC M encoding, PIXCLK fits to 640 × 480 graphics input
	HIGH	PAL B/G encoding, PIXCLK fits to 640 × 480 graphics input
VSVGC	LOW	4 : 2 : 2 Y - C_B - C_R graphics input (format 0)
	HIGH	4 : 4 : 4 RGB graphics input (format 3)
CBO	LOW	input demultiplex phase: LSB = LOW
	HIGH	input demultiplex phase: LSB = HIGH
HSVGC	LOW	input demultiplex phase: MSB = LOW
	HIGH	input demultiplex phase: MSB = HIGH
TTXRQ_XCLKO2	LOW	slave (FSVGC, VSVGC and HSVGC are inputs, internal colour bar is active)
	HIGH	master (FSVGC, VSVGC and HSVGC are outputs)

7.2 Input formatter

The input formatter converts all accepted PD input data formats, either RGB or Y - C_B - C_R , to a common internal RGB or Y - C_B - C_R data stream.

When double-edge clocking is used, the data is internally split into portions PPD1 and PPD2. The clock edge assignment must be set according to the I²C-bus control bits SLOT and EDGE for correct operation.

If Y - C_B - C_R is being applied as a 27 Mbyte/s data stream, the output of the input formatter can be used directly to feed the video encoder block.

The horizontal upscaling is supported via the input formatter. According to the programming of the pixel clock dividers (see Section 7.10), it will sample up the data stream to 1 ×, 2 × or 4 × the input data rate. An optional interpolation filter is available. The clock domain transition is handled by a 4 entries wide FIFO which gets initialized every field or explicitly at request. A bypass for the FIFO is available, especially for high input data rates.

Digital video encoder

SAA7104E; SAA7105E

7.3 RGB LUT

The three 256 byte RAMs of this block can be addressed by three 8-bit wide signals, thus it can be used to build any transformation, e.g. a gamma correction for RGB signals. In the event that the indexed colour data is applied, the RAMs are addressed in parallel.

The LUTs can either be loaded by an I²C-bus write access or can be part of the pixel data input through the PD port. In the latter case, 256 × 3 bytes for the R, G and B LUT are expected at the beginning of the input video line, two lines before the line that has been defined as first active line, until the middle of the line immediately preceding the first active line. The first 3 bytes represent the first RGB LUT data, and so on.

7.4 Cursor insertion

A 32 × 32 dots cursor can be overlaid as an option; the bit map of the cursor can be uploaded by an I²C-bus write access to specific registers or in the pixel data input through the PD port. In the latter case, the 256 bytes defining the cursor bit map (2 bits per pixel) are expected immediately following the last RGB LUT data in the line preceding the first active line.

The cursor bit map is set up as follows: each pixel occupies 2 bits. The meaning of these bits depends on the CMODE I²C-bus register as described in Table 5. Transparent means that the input pixels are passed through, the 'cursor colours' can be programmed in separate registers.

The bit map is stored with 4 pixels per byte, aligned to the least significant bit. So the first pixel is in bits 0 and 1, the next pixel in bits 3 and 4 and so on. The first index is the column, followed by the row; index 0,0 is the upper left corner.

Table 3 Layout of a byte in the cursor bit map

D7	D6	D5	D4	D3	D2	D1	D0
pixel n + 3		pixel n + 2		pixel n + 1		pixel n	
D1	D0	D1	D0	D1	D0	D1	D0

For each direction, there are 2 registers controlling the position of the cursor, one controls the position of the 'hot spot', the other register controls the insertion position.

The hot spot is the 'tip' of the pointer arrow. It can have any position in the bit map. The actual position registers describe the co-ordinates of the hot spot. Again 0,0 is the upper left corner. While it is not possible to move the hot spot beyond the left respectively upper screen border this is perfectly legal for the right respectively lower border. It should be noted that the cursor position is described relative to the input resolution.

Table 4 Cursor bit map

BYTE	D7	D6	D5	D4	D3	D2	D1	D0
0	row 0 column 3		row 0 column 2		row 0 column 1		row 0 column 0

10	transparent	transparent
11	inverted input	auxiliary cursor colour

Digital video encoder

SAA7104E; SAA7105E

7.5 RGB Y-C_B-C_R matrix

RGB input signals to be encoded to PAL or NTSC are converted to the Y-C_B-C_R colour space in this block. The colour difference signals are fed through low-pass filters and formatted to a ITU-R BT.601 like 4 : 2 : 2 data stream for further processing.

A gain adjust option corrects the level swing of the graphics world (black-to-white as 0 to 255) to the required range of 16 to 235.

The matrix and formatting blocks can be bypassed for Y-C_B-C_R graphics input.

When the auxiliary VGA mode is selected, the output of the cursor insertion block is immediately directed to the triple DAC.

7.6 Horizontal scaler

The high quality horizontal scaler operates on the 4 : 2 : 2 data stream. Its control engines compensate the colour phase offset automatically.

The scaler starts processing after a programmable horizontal offset and continues with a number of input pixels. Each input pixel is a programmable fraction of the current output pixel (XINC/4096). A special case is XINC = 0, this sets the scaling factor to 1.

If the SAA7104E; SAA7105E input data is in accordance with "ITU-R BT.656", the scaler enters another mode. In this event, XINC needs to be set to 2048 for a scaling factor of 1. With higher values, upscaling will occur.

The phase resolution of the circuit is 12 bits, giving a maximum offset of 0.2 after 800 input pixels. Small FIFOs rearrange a 4 : 2 : 2 data stream at the scaler output.

7.7 Vertical scaler and anti-flicker filter

The functions scaling, Anti-Flicker Filter (AFF) and re-interlacing are implemented in the vertical scaler.

Besides the entire input frame, it receives the first and last lines of the border to allow anti-flicker filtering.

The circuit generates the interlaced output fields by scaling down the input frames with different offsets for odd and even fields. Increasing the YSKIP setting reduces the anti-flicker function. A YSKIP value of 4095 switches it off; see Table 86.

An additional, programmable vertical filter supports the anti-flicker function. This filter is not available at upscaling factors of more than 2.

The programming is similar to the horizontal scaler. For the re-interlacing, the resolutions of the offset registers are not sufficient, so the weighting factors for the first lines can also be adjusted. YINC = 0 sets the scaling factor to 1; YIWGTO and YIWGTE must not be 0.

Due to the re-interlacing, the circuit can perform upscaling by a maximum factor of 2. The maximum factor depends on the setting of the anti-flicker function and can be derived from the formulae given in Section 7.20.

An additional upscaling mode allows to increase the upscaling factor to maximum 4 as it is required for the old VGA modes like 320 × 240.

7.8 FIFO

The FIFO acts as a buffer to translate from the PIXCLK clock domain to the XTAL clock domain. The write clock is PIXCLK and the read clock is XTAL. An underflow or overflow condition can be detected via the I²C-bus read access.

In order to avoid underflows and overflows, it is essential that the frequency of the synthesized PIXCLK matches to the input graphics resolution and the desired scaling factor.

7.9 Border generator

When the graphics picture is to be displayed as interlaced PAL, NTSC, S-video or RGB on a TV screen, it is desired in many cases not to lose picture information due to the inherent overscanning of a TV set. The desired amount of underscan area, which is achieved through appropriate scaling in the vertical and horizontal direction, can be filled in the border generator with an arbitrary true colour tint.

7.10 Oscillator and Discrete Time Oscillator (DTO)

The master clock generation is realized as a 27 MHz crystal oscillator, which can operate with either a fundamental wave crystal or a 3rd-harmonic crystal.

The crystal clock supplies the DTO of the pixel clock synthesizer, the video encoder and the I²C-bus control block. It also usually supplies the triple DAC, with the exception of the auxiliary VGA or HDTV mode, where the triple DAC is clocked by the pixel clock (PIXCLK).

The DTO can be programmed to synthesize all relevant pixel clock frequencies between circa 40 and 85 MHz. Two programmable dividers provide the actual clock to be used externally and internally. The dividers can be programmed to factors of 1, 2, 4 and 8. For the internal pixel clock, a divider ratio of 8 makes no sense and is thus forbidden.

Digital video encoder

SAA7104E; SAA7105E

The internal clock can be switched completely to the pixel clock input. In this event, the input FIFO is useless and will be bypassed.

The entire pixel clock generation can be locked to the vertical frequency. Both pixel clock dividers get re-initialized every field. Optionally, the DTO can be cleared with each V-sync. At proper programming, this will make the pixel clock frequency a precise multiple of the vertical and horizontal frequencies. This is required for some graphic controllers.

7.11 Low-pass Clock Generation Circuit (CGC)

This block reduces the phase jitter of the synthesized pixel clock. It works as a tracking filter for all relevant synthesized pixel clock frequencies.

7.12 Encoder

7.12.1 VIDEO PATH

The encoder generates luminance and colour subcarrier output signals from the Y, C_B and C_R baseband signals, which are suitable for use as CVBS or separate Y and C signals.

Input to the encoder, at 27 MHz clock (e.g. DVD), is either originated from computer graphics at pixel clock, fed through the FIFO and border generator, or a ITU-R BT.656 style signal.

Luminance is modified in gain and in offset (the offset is programmable in a certain range to enable different black level set-ups). A blanking level can be set after insertion of a fixed synchronization pulse tip level, in accordance with standard composite synchronization schemes. Other manipulations used for the Macrovision anti-taping process, such as additional insertion of AGC super-white pulses (programmable in height), are supported by the SAA7104E only.

To enable easy analog post filtering, luminance is interpolated from a 13.5 MHz data rate to a 27 MHz data rate, thereby providing luminance in a 10-bit resolution. The transfer characteristics of the luminance interpolation filter are illustrated in Figs 6 and 7. Appropriate transients at start/end of active video and for synchronization pulses are ensured.

Chrominance is modified in gain (programmable separately for C_B and C_R), and a standard dependent burst is inserted, before baseband colour signals are interpolated from a 6.75 MHz data rate to a 27 MHz data rate. One of the interpolation stages can be bypassed, thus providing a higher colour bandwidth, which can be used for the Y and C output.

The transfer characteristics of the chrominance interpolation filter are illustrated in Figs 4 and 5.

The amplitude (beginning and ending) of the inserted burst, is programmable in a certain range that is suitable for standard signals and for special effects. After the succeeding quadrature modulator, colour is provided on the subcarrier in 10-bit resolution.

The numeric ratio between the Y and C outputs is in accordance with the standards.

7.12.2 TELETEXT INSERTION AND ENCODING (NOT SIMULTANEOUSLY WITH REAL-TIME CONTROL)

Pin TTX_SRES receives a WST or NABTS teletext bitstream sampled at the crystal clock. At each rising edge of the output signal (TTXRQ) a single teletext bit has to be provided after a programmable delay at input pin TTX_SRES.

Phase variant interpolation is achieved on this bitstream in the internal teletext encoder, providing sufficient small phase jitter on the output text lines.

TTXRQ_XCLKO2 provides a fully programmable request signal to the teletext source, indicating the insertion period of bitstream at lines which can be selected independently for both fields. The internal insertion window for text is set to 360 (PAL WST), 296 (NTSC WST) or 288 (NABTS) teletext bits including clock run-in bits. The protocol and timing are illustrated in Fig.14.

Alternatively, this pin can be provided with a buffered crystal clock (XCLK) of 13.5 MHz.

7.12.3 VIDEO PROGRAMMING SYSTEM (VPS) ENCODING

Five bytes of VPS information can be loaded via the I²C-bus and will be encoded in the appropriate format into line 16.

7.12.4 CLOSED CAPTION ENCODER

Using this circuit, data in accordance with the specification of Closed Caption or extended data service, delivered by the control interface, can be encoded (line 21). Two dedicated pairs of bytes (two bytes per field), each pair preceded by run-in clocks and framing code, are possible.

The actual line number in which data is to be encoded, can be modified in a certain range.

The data clock frequency is in accordance with the definition for NTSC M standard 32 times horizontal line frequency.

Digital video encoder

SAA7104E; SAA7105E

Data LOW at the output of the DACs corresponds to 0 IRE, data HIGH at the output of the DACs corresponds to approximately 50 IRE.

It is also possible to encode Closed Caption data for 50 Hz field frequencies at 32 times the horizontal line frequency.

7.12.5 ANTI-TAPING (SAA7104E ONLY)

For more information contact your nearest Philips Semiconductors sales office.

7.13 RGB processor

This block contains a dematrix in order to produce RED, GREEN and BLUE signals to be fed to a SCART plug.

Before Y, C_B and C_R signals are de-matrixed, individual gain adjustment for Y and colour difference signals and 2 times oversampling for luminance and 4 times oversampling for colour difference signals is performed. The transfer curves of luminance and colour difference components of RGB are illustrated in Figs 8 and 9.

7.14 Triple DAC

Both Y and C signals are converted from digital-to-analog in a 10-bit resolution at the output of the video encoder. Y and C signals are also combined into a 10-bit CVBS signal.

The CVBS output signal occurs with the same processing delay as the Y, C and optional RGB or C_R -Y- C_B outputs. Absolute amplitude at the input of the DAC for CVBS is reduced by $\frac{15}{16}$ with respect to Y and C DACs to make maximum use of the conversion ranges.

RED, GREEN and BLUE signals are also converted from digital-to-analog, each providing a 10-bit resolution.

The reference currents of all three DACs can be adjusted individually in order to adapt for different output signals. In addition, all reference currents can be adjusted commonly to compensate for small tolerances of the on-chip band gap reference voltage.

Alternatively, all currents can be switched off to reduce power dissipation.

All three outputs can be used to sense for an external load (usually 75 Ω) during a pre-defined output. A flag in the I²C-bus status byte reflects whether a load is applied or not. In addition, an automatic sense mode can be activated which indicates a 75 Ω load at any of the three outputs at the dedicated interrupt pin TVD.

If the SAA7104E; SAA7105E is required to drive a second (auxiliary) VGA monitor or an HDTV set, the DACs receive the signal coming from the HD data path. In this event, the DACs are clocked at the incoming PIXCLKI instead of the 27 MHz crystal clock used in the video encoder.

7.15 HD data path

This data path allows the SAA7104E; SAA7105E to be used with VGA or HDTV monitors. It receives its data directly from the cursor generator and supports RGB and Y- P_B - P_R output formats (RGB not with Y- P_B - P_R input formats). No scaling is done in this mode.

A gain adjustment either leads the full level swing to the digital-to-analog converters or reduces the amplitude by a factor of 0.69. This enables sync pulses to be added to the signal as it is required for display units expecting signals with sync pulses, either regular or 3-level syncs.

7.16 Timing generator

The synchronization of the SAA7104E; SAA7105E is able to operate in two modes; slave mode and master mode.

In slave mode, the circuit accepts sync pulses on the bidirectional FSVGC (frame sync), VSVGC (vertical sync) and HSVGC (horizontal sync) pins: the polarities of the signals can be programmed. The frame sync signal is only necessary when the input signal is interlaced, in other cases it may be omitted. If the frame sync signal is present, it is possible to derive the vertical and the horizontal phase from it by setting the HFS and VFS bits. HSVGC and VSVGC are not necessary in this case, so it is possible to switch the pins to output mode.

Alternatively, the device can be triggered by auxiliary codes in a ITU-R BT.656 data stream via PD7 to PD0.

Only vertical frequencies of 50 and 60 Hz are allowed with the SAA7104E; SAA7105E. In slave mode, it is not possible to lock the encoders colour carrier to the line frequency with the PHRES bits.

In the (more common) master mode, the time base of the circuit is continuously free-running. The IC can output a frame sync at pin FSVGC, a vertical sync at pin VSVGC, a horizontal sync at pin HSVGC and a composite blanking signal at pin CBO. All of these signals are defined in the PIXCLK domain. The duration of HSVGC and VSVGC are fixed, they are 64 clocks for HSVGC and 1 line for VSVGC. The leading slopes are in phase and the polarities can be programmed.

Digital video encoder

SAA7104E; SAA7105E

The input line length can be programmed. The field length is always derived from the field length of the encoder and the pixel clock frequency that is being used.

$\overline{\text{CBO}}$ acts as a data request signal. The circuit accepts input data at a programmable number of clocks after $\overline{\text{CBO}}$ goes active. This signal is programmable and it is possible to adjust the following (see Figs 12 and 13):

- The horizontal offset
- The length of the active part of the line
- The distance from active start to first expected data
- The vertical offset separately for odd and even fields
- The number of lines per input field.

In most cases, the vertical offsets for odd and even fields are equal. If they are not, then the even field will start later. The SAA7104E; SAA7105E will also request the first input lines in the even field, the total number of requested lines will increase by the difference of the offsets.

As stated above, the circuit can be programmed to accept the look-up and cursor data in the first 2 lines of each field. The timing generator provides normal data request pulses for these lines; the duration is the same as for regular lines. The additional request pulses will be suppressed with LUTL set to logic 0; see Table 109. The other vertical timings do not change in this case, so the first active line can be number 2, counted from 0.

7.17 Pattern generator for HD sync pulses

The pattern generator provides appropriate synchronization patterns for the video data path in auxiliary monitor or HDTV mode. It provides maximum flexibility in terms of raster generation for all interlaced and non-interlaced computer graphics or ATSC formats. The sync engine is capable of providing a combination of event-value pairs which can be used to insert certain values in the outgoing data stream at specified times. It can also be used to generate digital signals associated with time events. These can be used as digital horizontal and vertical synchronization signals on pins HSM_CSINC and VSM.

The picture position is adjustable through the programmable relationship between the sync pulses and the video contents.

The generation of embedded analog sync pulses is bound to a number of events which can be defined for a line. Several of these line timing definitions can exist in parallel. For the final sync raster composition a certain sequence of lines with different sync event properties has to be defined.

The sequence specifies a series of line types and the number of occurrences of this specific line type. Once the sequence has been completed, it restarts from the beginning. All pulse shapes are filtered internally in order to avoid ringing after analog post filters.

The sequence of the generated pulse stream must fit precisely to the incoming data stream in terms of the total number of pixels per line and lines per frame.

The sync engines flexibility is achieved by using a sequence of linked lists carrying the properties for the image, the lines as well as fractions of lines. Figure 3 illustrates the context between the various tables.

The first table serves as an array to hold the correct sequence of lines that compose the synchronization raster; it can contain up to 16 entries. Each entry holds a 4-bit index to the next table and a 10-bit counter value which specifies how often this particular line is invoked. If the necessary line count for a particular line exceeds the 10 bits, it has to use two table entries.

The 4-bit index in the line count array points to the line type array. It holds up to 15 entries (index 0 is not used), index 1 points to the first entry, index 2 to the second entry of the line type array etc.

Each entry of the line type array can hold up to 8 index pointers to another table. These indices point to portions of a line pulse pattern: A line could be split up e.g. into a sync, a blank, and an active portion followed by another blank portion, occupying four entries in one table line.

Each index of this table points to a particular line of the next table in the linked list. This table is called the line pattern array and each of the up to seven entries stores up to four pairs of a duration in pixel clock cycles and an index to a value table. The table entries are used to define portions of a line representing a certain value for a certain number of clock cycles.

The value specified in this table is actually another 3-bit index into a value array which can hold up to eight 8-bit values. If bit 4 (MSB) of the index is logic 1, the value is inserted into the G or Y signal, only; if bit 4 = 0, the associated value is inserted into all three signals.

Two additional bits of the entries in the value array (LSBs of the second byte) determine if the associated events appear as a digital pulse on the HSM_CSINC and/or VSM outputs.

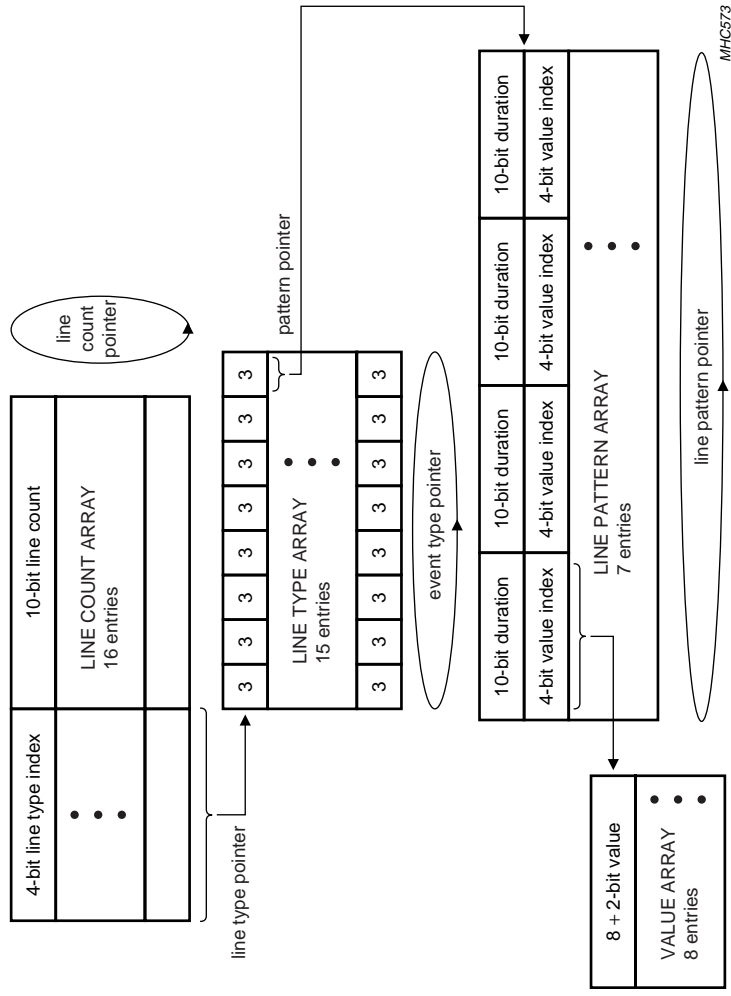

Fig.3 Context between the pattern generator tables for DH sync pulses.

Digital video encoder

SAA7104E; SAA7105E

To ease the trigger set-up for the sync generation module, a set of registers is provided to set up the screen raster which is defined as width and height. A trigger position can be specified as an x,y co-ordinate within the overall dimensions of the screen raster. If the x,y counter matches the specified co-ordinates, a trigger pulse is generated which pre-loads the tables with their initial values.

The listing in Table 6 outlines an example on how to set up the sync tables for a 1080i HD raster.

Important note:

Due to a problem in the programming interface, writing to the line pattern array (address D2) might destroy the data of the line type array (address D1). A work around is to write the line pattern array data before writing the line type array. Reading of the arrays is possible but all address pointers must be initialized before the next write operation.

Table 6 Example for set-up of the sync tables

SEQUENCE	COMMENT
Write to subaddress D0H	
00	points to first entry of line count array (index 0)
05 20	generate 5 lines of line type index 2 (this is the second entry of the line type array); will be the first vertical raster pulse
01 40	generate 1 line of line type index 4; will be sync-black-sync-black sequence after the first vertical pulse
0E 60	generate 14 lines of line type index 6; will be the following lines with sync-black sequence
1C 12	generate 540 lines of line type index 1; will be lines with sync and active video
02 60	generate 2 lines of line type index 6; will be the following lines with sync-black sequence
01 50	generate 1 line of line type index 5; will be the following line (line 563) with sync-black-sync-black-null sequence (null is equivalent to sync tip)
04 20	generate 4 lines of line type index 2; will be the second vertical raster pulse
01 30	generate 1 line of line type index 3; will be the following line with sync-null-sync-black sequence
0F 60	generate 15 lines of line type index 6; will be the following lines with sync-black sequence
1C 12	generate 540 lines of line type index 1; will be lines with sync and active video
02 60	generate 2 lines of line type index 6; will be the following lines with sync-black sequence; now, 1125 lines are defined
Write to subaddress D2H (insertion is done into all three analog output signals)	
00	points to first entry of line pattern array (index 1)
6F 33 2B 30 00 00 00 00	$880 \times \text{value}(3) + 44 \times \text{value}(3)$; (subtract 1 from real duration)
6F 43 2B 30 00 00 00 00	$880 \times \text{value}(4) + 44 \times \text{value}(3)$
3B 30 BF 03 BF 03 2B 30	$60 \times \text{value}(3) + 960 \times \text{value}(0) + 960 \times \text{value}(0) + 44 \times \text{value}(3)$
2B 10 2B 20 57 30 00 00	$44 \times \text{value}(1) + 44 \times \text{value}(2) + 88 \times \text{value}(3)$
3B 30 BF 33 BF 33 2B 30	$60 \times \text{value}(3) + 960 \times \text{value}(3) + 960 \times \text{value}(3) + 44 \times \text{value}(3)$
Write to subaddress D1H	
00	points to first entry of line type array (index 1)
34 00 00 00	use pattern entries 4 and 3 in this sequence (for sync and active video)
24 24 00 00	use pattern entries 4, 2, 4 and 2 in this sequence (for $2 \times$ sync-black-null-black)
24 14 00 00	use pattern entries 4, 2, 4 and 1 in this sequence (for sync-black-null-black-null)
14 14 00 00	use pattern entries 4, 1, 4 and 1 in this sequence (for sync-black-sync-black)

Digital video encoder

SAA7104E; SAA7105E

SEQUENCE	COMMENT
14 24 00 00	use pattern entries 4, 1, 4 and 2 in this sequence (for sync-black-sync-black-null)
54 00 00 00	use pattern entries 4 and 5 in this sequence (for sync-black)
Write to subaddress D3H (no signals are directed to pins HSM_CSsync and VSM)	
00	points to first entry of value array (index 0)
CC 00	black level, to be added during active video
80 00	sync level LOW (minimum output voltage)
0A 00	sync level HIGH (3-level sync)
CC 00	black level (needed elsewhere)
80 00	null (identical to sync level LOW)
Write to subaddress DCH	
0B	insertion is active, gain for signal is adapted accordingly

7.18 I²C-bus interface

The I²C-bus interface is a standard slave transceiver, supporting 7-bit slave addresses and 400 kbits/s guaranteed transfer rate. It uses 8-bit subaddressing with an auto-increment function. All registers are write and read, except two read only status bytes.

The register bit map consists of an RGB Look-Up Table (LUT), a cursor bit map and control registers. The LUT contains three banks of 256 bytes, where each RGB triplet is assigned to one address. Thus a write access needs the LUT address and three data bytes following subaddress FFH. For further write access auto-incrementing of the LUT address is performed. The cursor bit map access is similar to the LUT access but contains only a single byte per address.

The I²C-bus slave address is defined as 88H.

7.19 Power-down modes

In order to reduce the power consumption, the SAA7104E; SAA7105E supports 2 power-down modes, accessible via the I²C-bus. The analog power-down mode (DOWNNA = 1) turns off the digital-to-analog converters and the pixel clock synthesizer. The digital power-down mode turns off all internal clocks and sets the digital outputs to LOW except the I²C-bus interface. The IC keeps its programming and can still be accessed in this mode, however not all registers can be read or written to. Reading or writing to the look-up tables, the cursor and the HD sync generator require a valid pixel clock. The typical supply current in full power-down is approximately 5 mA.

Because the analog power-down mode turns off the pixel clock synthesizer, there are limitations in some applications. If there is no pixel clock, the IC is not able to set its outputs to LOW. So, in most cases, DOWNNA and DOWNND should be set to logic 1 simultaneously. If the EIDIV bit is logic 1, it should be set to logic 0 before power-down.

7.20 Programming the SAA7104E; SAA7105E

The SAA7104E; SAA7105E needs to provide a continuous data stream at its analog outputs as well as receive a continuous stream of data from its data source. Because there is no frame memory isolating the data streams, restrictions apply to the input frame timings.

Input and output processing of the SAA7104E; SAA7105E are only coupled through the vertical frequencies. In master mode, the encoder provides a vertical sync and an odd/even pulse to the input processing. In slave mode, the encoder receives them.

The parameters of the input field are mainly given by the memory capacity of the SAA7104E; SAA7105E. The rule is that the scaler and thus the input processing needs to provide the video data in the same time frames as the encoder reads them. Therefore, the vertical active video times (and the vertical frequencies) need to be the same.

The second rule is that there has to be data in the buffer FIFO when the encoder enters the active video area. Therefore, the vertical offset in the input path needs to be a bit shorter than the offset of the encoder.

Digital video encoder

SAA7104E; SAA7105E

The following Sections give the set of equations required to program the IC for the most common application: A post processor in master mode with non-interlaced video input data.

Some variables are defined below:

- InPix: the number of active pixels per input line
- InPpl: the length of the entire input line in pixel clocks
- InLin: the number of active lines per input field/frame
- TPclk: the pixel clock period
- RiePclk: the ratio of internal to external pixel clock
- OutPix: the number of active pixels per output line
- OutLin: the number of active lines per output field
- TXclk: the encoder clock period (37.037 ns).

7.20.1 TV DISPLAY WINDOW

At 60 Hz, the first visible pixel has the index 256, 710 pixels can be encoded; at 50 Hz, the index is 284, 702 pixels can be visible.

The output lines should be centred on the screen. It should be noted that the encoder has 2 clocks per pixel; see Table 59.

$$\begin{aligned} \text{ADWHS} &= 256 + 710 - \text{OutPix} \quad (60 \text{ Hz}); \\ \text{ADWHS} &= 284 + 702 - \text{OutPix} \quad (50 \text{ Hz}); \\ \text{ADWHE} &= \text{ADWHS} + \text{OutPix} \times 2 \quad (\text{all frequencies}) \end{aligned}$$

For vertical, the procedure is the same. At 60 Hz, the first line with video information is number 19, 240 lines can be active. For 50 Hz, the numbers are 23 and 287; see Table 65.

$$\text{FAL} = 19 + \frac{240 - \text{OutLin}}{2} \quad (60 \text{ Hz});$$

$$\text{FAL} = 23 + \frac{287 - \text{OutLin}}{2} \quad (50 \text{ Hz});$$

$$\text{LAL} = \text{FAL} + \text{OutLin} \quad (\text{all frequencies})$$

Most TV sets use overscan, and not all pixels respectively lines are visible. There is no standard for the factor, it is highly recommended to make the number of output pixels and lines adjustable. A reasonable underscan factor is 10%, giving approximately 640 output pixels per line.

7.20.2 INPUT FRAME AND PIXEL CLOCK

The total number of pixel clocks per line and the input horizontal offset need to be chosen next. The only constraint is that the horizontal blanking has at least 10 clock pulses.

The required pixel clock frequency can be determined in the following way: Due to the limited internal FIFO size, the input path has to provide all pixels in the same time frame as the encoders vertical active time. The scaler also has to process the first and last border lines for the anti-flicker function. Thus:

$$\text{TPclk} = \frac{262.5 \times 1716 \times \text{TXclk}}{\text{InPpl} \times \text{integer}\left(\frac{\text{InLin} + 2}{\text{OutLin}} \times 262.5\right)} \quad (60 \text{ Hz})$$

$$\text{TPclk} = \frac{312.5 \times 1728 \times \text{TXclk}}{\text{InPpl} \times \text{integer}\left(\frac{\text{InLin} + 2}{\text{OutLin}} \times 312.5\right)} \quad (50 \text{ Hz})$$

and for the pixel clock generator

$$\text{PCL} = \frac{\text{TXclk}}{\text{TPclk}} \times 2^{20 + \text{PCLE}} \quad (\text{all frequencies});$$

see Tables 68, 70 and 71. The divider PCLE should be set according to Table 70. PCLI may be set to a lower or the same value. Setting a lower value means that the internal pixel clock is higher and the data get sampled up. The difference may be 1 at 640 × 480 pixels resolution and 2 at resolutions with 320 pixels per line as a rule of thumb. This allows horizontal upscaling by a maximum factor of 2 respectively 4 (this is the parameter RiePclk).

$$\text{PCLI} = \text{PCLE} - \frac{\log \text{RiePclk}}{\log 2} \quad (\text{all frequencies})$$

The equations ensure that the last line of the field has the full number of clock cycles. Many graphic controllers require this. Note that the bit PCLSY needs to be set to ensure that there is not even a fraction of a clock left at the end of the field.

7.20.3 HORIZONTAL SCALER

XOFS can be chosen arbitrarily, the condition being that $\text{XOFS} + \text{XPIX} \leq \text{HLEN}$ is fulfilled. Values given by the VESA display timings are preferred.

$$\text{HLEN} = \text{InPpl} \times \text{RiePclk} - 1$$

$$\text{XPIX} = \frac{\text{InPix}}{2} \times \text{RiePclk}$$

$$\text{XINC} = \frac{\text{OutPix}}{\text{InPix}} \times \frac{4096}{\text{RiePclk}}$$

XINC needs to be rounded up, it needs to be set to 0 for a scaling factor of 1.

Digital video encoder

SAA7104E; SAA7105E

7.20.4 VERTICAL SCALER

The input vertical offset can be taken from the assumption that the scaler should just have finished writing the first line when the encoder starts reading it:

$$YOFS = \frac{FAL \times 1716 \times TXclk}{InPpl \times TPclk} - 2.5 \text{ (60 Hz)}$$

$$YOFS = \frac{FAL \times 1728 \times TXclk}{InPpl \times TPclk} - 2.5 \text{ (50 Hz)}$$

In most cases the vertical offsets will be the same for odd and even fields. The results should be rounded down.

$$YPIX = InLin$$

YSKIP defines the anti-flicker function. 0 means maximum flicker reduction but minimum vertical bandwidth, 4095 gives no flicker reduction and maximum bandwidth. Note that the maximum value for YINC is 4095. It might be necessary to reduce the value of YSKIP to fulfil this requirement.

$$YINC = \frac{OutLin}{InLin + 2} \times \left(1 + \frac{YSKIP}{4095}\right) \times 4096$$

$$YIWGTO = \frac{YINC}{2} + 2048$$

$$YIWGTE = \frac{YINC - YSKIP}{2}$$

When YINC = 0 it sets the scaler to scaling factor 1. The initial weighting factors must not be set to 0 in this case. YIWGTE may go negative. In this event, YINC should be added and YOFSE incremented. This can be repeated as often as necessary to make YIWGTE positive.

It should be noted that these equations assume that the input is non-interlaced but the output is interlaced. If the input is interlaced, the initial weighting factors need to be adapted to obtain the proper phase offsets in the output frame.

If vertical upscaling beyond the upper capabilities is required, the parameter YUPSC may be set to logic 1. This extends the maximum vertical scaling factor by a factor of 2. Only the parameter YINC is affected, it needs to be divided by two to get the same effect.

There are restrictions in this mode:

- The vertical filter YFILT is not available in this mode; the circuit will ignore this value
- The horizontal blanking needs to be long enough to transfer an output line between 2 memory locations. This is 710 internal pixel clocks.

Or the upscaling factor needs to be limited to 1.5 and the horizontal upscaling factor is also limited to less than ~1.5. In this case a normal blanking length is sufficient.

7.21 Input levels and formats

The SAA7104E; SAA7105E accepts digital Y, C_B, C_R or RGB data with levels (digital codes) in accordance with "ITU-R BT.601". An optional gain adjustment also allows to accept data with the full level swing of 0 to 255.

For C and CVBS outputs, deviating amplitudes of the colour difference signals can be compensated for by independent gain control setting, while gain for luminance is set to predefined values, distinguishable for 7.5 IRE set-up or without set-up.

The RGB, respectively C_R-Y-C_B path features an individual gain setting for luminance (GY) and colour difference signals (GCD). Reference levels are measured with a colour bar, 100% white, 100% amplitude and 100% saturation.

The SAA7104E; SAA7105E has special input cells for the VGC port. They operate at a wider supply voltage range and have a strict input threshold at 1/2V_{DD}. To achieve full speed of these cells, the EIDIV bit needs to be set to logic 1. Note that the impedance of these cells is approximately 6 kΩ. This may cause trouble with the bootstrapping pins of some graphic chips. So the power-on reset forces the bit to logic 0, the input impedance is regular in this mode.

Table 7 "ITU-R BT.601" signal component levels

COLOUR	SIGNALS ⁽¹⁾					
	Y	C _B	C _R	R	G	B
White	235	128	128	235	235	235
Yellow	210	16	146	235	235	16
Cyan	170	166	16	16	235	235
Green	145	54	34	16	235	16
Magenta	106	202	222	235	16	235
Red	81	90	240	235	16	16
Blue	41	240	110	16	16	235
Black	16	128	128	16	16	16

Note

1. Transformation:

- a) R = Y + 1.3707 × (C_R - 128)
- b) G = Y - 0.3365 × (C_B - 128) - 0.6982 × (C_R - 128)
- c) B = Y + 1.7324 × (C_B - 128).

Table 26 Subaddresses 17H to 19H

DATA BYTE	DESCRIPTION
RDACC	output level coarse adjustment for RED DAC; default after reset is 1BH for output of C signal 00000b \equiv 0.585 V to 11111b \equiv 1.240 V at 37.5 Ω nominal for full-scale conversion
GDACC	output level coarse adjustment for GREEN DAC; default after reset is 1BH for output of VBS signal 00000b \equiv 0.585 V to 11111b \equiv 1.240 V at 37.5 Ω nominal for full-scale conversion
BDACC	output level coarse adjustment for BLUE DAC; default after reset is 1FH for output of CVBS signal 00000b \equiv 0.585 V to 11111b \equiv 1.240 V at 37.5 Ω nominal for full-scale conversion

Table 27 Subaddress 1AH

DATA BYTE	DESCRIPTION
MSMT	monitor sense mode threshold for DAC output voltage, should be set to 70

Digital video encoder

SAA7104E; SAA7105E

Table 28 Subaddress 1BH

DATA BYTE	LOGIC LEVEL	DESCRIPTION
MSM	0	monitor sense mode off; RCOMP, GCOMP and BCOMP bits are not valid; default after reset
	1	monitor sense mode on
MSA	0	automatic monitor sense mode off; RCOMP, GCOMP and BCOMP bits are not valid; default after reset
	1	automatic monitor sense mode on if MSM = 0
MSOE	0	pin TVD is active
	1	pin TVD is 3-state; default after reset
RCOMP (read only)	0	check comparator at DAC on pin RED_CR_C_CVBS is active, output is loaded
	1	check comparator at DAC on pin RED_CR_C_CVBS is inactive, output is not loaded
GCOMP (read only)	0	check comparator at DAC on pin GREEN_VBS_CVBS is active, output is loaded
	1	check comparator at DAC on pin GREEN_VBS_CVBS is inactive, output is not loaded
BCOMP (read only)	0	check comparator at DAC on pin BLUE_CB_CVBS is active, output is loaded
	1	check comparator at DAC on pin BLUE_CB_CVBS is inactive, output is not loaded

Table 29 Subaddresses 26H and 27H

DATA BYTE	LOGIC LEVEL	DESCRIPTION
WSS	–	wide screen signalling bits 3 to 0 = aspect ratio 7 to 4 = enhanced services 10 to 8 = subtitles 13 to 11 = reserved
WSSON	0	wide screen signalling output is disabled; default after reset
	1	wide screen signalling output is enabled

Table 30 Subaddress 28H

DATA BYTE	LOGIC LEVEL	DESCRIPTION	REMARKS
BS	–	starting point of burst in clock cycles	PAL: BS = 33 (21H); default after reset if strapping pin FSVGC tied to HIGH
			NTSC: BS = 25 (19H); default after reset if strapping pin FSVGC tied to LOW

Digital video encoder

SAA7104E; SAA7105E

Table 31 Subaddress 29H

DATA BYTE	LOGIC LEVEL	DESCRIPTION	REMARKS
SRES	0	pin TTX_SRES accepts a teletext bit stream (TTX)	default after reset
	1	pin TTX_SRES accepts a sync reset input (SRES)	a HIGH impulse resets synchronization of the encoder (first field, first line)
BE	–	ending point of burst in clock cycles	PAL: BE = 29 (1DH); default after reset if strapping pin FSVGC tied to HIGH
			NTSC: BE = 29 (1DH); default after reset if strapping pin FSVGC tied to LOW

Table 32 Subaddresses 2AH to 2CH

DATA BYTE	LOGIC LEVEL	DESCRIPTION
CG	–	LSBs of the respective bytes are encoded immediately after run-in, the MSBs of the respective bytes have to carry the CRCC bits, in accordance with the definition of copy generation management system encoding format.
CGEN	0	copy generation data output is disabled; default after reset
	1	copy generation data output is enabled

Table 33 Subaddress 2DH

DATA BYTE	LOGIC LEVEL	DESCRIPTION
VBSEN	0	pin GREEN_VBS_CVBS provides a component GREEN signal (CVBS _{EN1} = 0) or CVBS signal (CVBS _{EN1} = 1)
	1	pin GREEN_VBS_CVBS provides a luminance (VBS) signal; default after reset
CVBS _{EN1}	0	pin GREEN_VBS_CVBS provides a component GREEN (G) or luminance (VBS) signal; default after reset
	1	pin GREEN_VBS_CVBS provides a CVBS signal
CVBS _{EN0}	0	pin BLUE_CB_CVBS provides a component BLUE (B) or colour difference BLUE (C _B) signal
	1	pin BLUE_CB_CVBS provides a CVBS signal; default after reset
CEN	0	pin RED_CR_C_CVBS provides a component RED (R) or colour difference RED (C _R) signal
	1	pin RED_CR_C_CVBS provides a chrominance signal (C) as modulated subcarrier for S-video; default after reset
ENCOFF	0	encoder is active; default after reset
	1	encoder bypass, DACs are provided with RGB signal after cursor insertion block
CLK2EN	0	pin TTXRQ_XCLKO2 provides a teletext request signal (TTXRQ)
	1	pin TTXRQ_XCLKO2 provides the buffered crystal clock divided by two (13.5 MHz); default after reset
CVBS _{EN2}	0	pin RED_CR_C_CVBS provides a signal according to CEN; default after reset
	1	pin RED_CR_C_CVBS provides a CVBS signal

Digital video encoder

SAA7104E; SAA7105E

Table 34 Subaddress 37H

DATA BYTE	LOGIC LEVEL	DESCRIPTION
YUPSC	0	normal operation of the vertical scaler; default after reset
	1	vertical upscaling is enabled
YFIL	–	controls the vertical interpolation filter, see Table 35; the filter is not available if YUPSC = 1
CZOOM	0	normal operation of the cursor generator; default after reset
	1	the cursor will be zoomed by a factor of 2 in both directions
IGAIN	0	expected input level swing is 16 to 235 (8-bit RGB); default after reset
	1	expected input level swing is 0 to 255 (8-bit RGB)
XINT	0	no horizontal interpolation filter; default after reset
	1	interpolation filter for horizontal upscaling is active

Table 35 Logic levels and function of YFIL

DATA BYTE		DESCRIPTION
YFIL1	YFILO	
0	0	no filter active; default after reset
0	1	filter is inserted before vertical scaling
1	0	filter is inserted after vertical scaling; YSKIP should be logic 0
1	1	reserved

Table 36 Subaddresses 38H and 39H

DATA BYTE	DESCRIPTION
GY4 to GY0	Gain luminance of RGB (C_R , Y and C_B) output, ranging from $(1 - 16/32)$ to $(1 + 15/32)$. Suggested nominal value = 0, depending on external application.
GCD4 to GCD0	Gain colour difference of RGB (C_R , Y and C_B) output, ranging from $(1 - 16/32)$ to $(1 + 15/32)$. Suggested nominal value = 0, depending on external application.

Digital video encoder

SAA7104E; SAA7105E

Table 37 Subaddress 3AH

DATA BYTE	LOGIC LEVEL	DESCRIPTION
CBENB	0	data from input ports is encoded
	1	colour bar with fixed colours is encoded
SYNTV	0	in slave mode, the encoder is only synchronized at the beginning of an odd field; default after reset
	1	in slave mode, the encoder receives a vertical sync signal
SYMP	0	horizontal and vertical trigger is taken from FSVGC or both VSVGC and HSVG; default after reset
	1	horizontal and vertical trigger is decoded out of "ITU-R BT.656" compatible data at PD port
DEMOFF	0	Y-C _B -C _R to RGB dematrix is active; default after reset
	1	Y-C _B -C _R to RGB dematrix is bypassed
CSYNC	0	pin HSM_CS _{SYNC} provides a horizontal sync for non-interlaced VGA components output (at PIXCLK)
	1	pin HSM_CS _{SYNC} provides a composite sync for interlaced components output (at XTAL clock)
Y2C	0	input luminance data is twos complement from PD input port
	1	input luminance data is straight binary from PD input port; default after reset
UV2C	0	input colour difference data is twos complement from PD input port
	1	input colour difference data is straight binary from PD input port; default after reset

Table 38 Subaddress 54H

DATA BYTE	LOGIC LEVEL	DESCRIPTION
VPSEN	0	video programming system data insertion is disabled; default after reset
	1	video programming system data insertion in line 16 is enabled
GPVAL	0	pin VSM provides a LOW level if GPEN = 1
	1	pin VSM provides a HIGH level if GPEN = 1
GPEN	0	pin VSM provides a vertical sync for a monitor; default after reset
	1	pin VSM provides a constant signal according to GPVAL
EDGE	0	input data is sampled with inverse clock edges
	1	input data is sampled with the clock edges specified in Tables 9 to 14; default after reset
SLOT	0	normal assignment of the input data to the clock edge; default after reset
	1	correct time misalignment due to inverted assignment of input data to the clock edge

Table 39 Subaddresses 55H to 59H

DATA BYTE	DESCRIPTION	REMARKS
VPS5	fifth byte of video programming system data	in line 16; LSB first; all other bytes are not relevant for VPS
VPS11	eleventh byte of video programming system data	
VPS12	twelfth byte of video programming system data	
VPS13	thirteenth byte of video programming system data	
VPS14	fourteenth byte of video programming system data	

Digital video encoder

SAA7104E; SAA7105E

Table 40 Subaddress 5AH; note 1

DATA BYTE	DESCRIPTION	VALUE	RESULT
CHPS	phase of encoded colour subcarrier (including burst) relative to horizontal sync; can be adjusted in steps of 360/256 degrees	6BH	PAL B/G and data from input ports in master mode
		16H	PAL B/G and data from look-up table
		25H	NTSC M and data from input ports in master mode
		46H	NTSC M and data from look-up table

Note

1. The default after reset is 00H.

Table 41 Subaddresses 5BH and 5DH

DATA BYTE	DESCRIPTION	CONDITIONS	REMARKS
GAINU	variable gain for C_B signal; input representation in accordance with "ITU-R BT.601"	white-to-black = 92.5 IRE	$GAINU = -2.17 \times \text{nominal} \text{ to } +2.16 \times \text{nominal}$
		GAINU = 0	output subcarrier of U contribution = 0
		GAINU = 118 (76H)	output subcarrier of U contribution = nominal
		white-to-black = 100 IRE	$GAINU = -2.05 \times \text{nominal} \text{ to } +2.04 \times \text{nominal}$
		GAINU = 0	output subcarrier of U contribution = 0
		GAINU = 125 (7DH)	output subcarrier of U contribution = nominal

Table 42 Subaddresses 5CH and 5EH

DATA BYTE	DESCRIPTION	CONDITIONS	REMARKS
GAINV	variable gain for C_R signal; input representation in accordance with "ITU-R BT.601"	white-to-black = 92.5 IRE	$GAINV = -1.55 \times \text{nominal} \text{ to } +1.55 \times \text{nominal}$
		GAINV = 0	output subcarrier of V contribution = 0
		GAINV = 165 (A5H)	output subcarrier of V contribution = nominal
		white-to-black = 100 IRE	$GAINV = -1.46 \times \text{nominal} \text{ to } +1.46 \times \text{nominal}$
		GAINV = 0	output subcarrier of V contribution = 0
		GAINV = 175 (AFH)	output subcarrier of V contribution = nominal

Table 43 Subaddress 5DH

DATA BYTE	DESCRIPTION	CONDITIONS	REMARKS
BLCKL	variable black level; input representation in accordance with "ITU-R BT.601"	white-to-sync = 140 IRE; note 1	recommended value: BLCKL = 58 (3AH)
		BLCKL = 0; note 1	output black level = 29 IRE
		BLCKL = 63 (3FH); note 1	output black level = 49 IRE
		white-to-sync = 143 IRE; note 2	recommended value: BLCKL = 51 (33H)
		BLCKL = 0; note 2	output black level = 27 IRE
		BLCKL = 63 (3FH); note 2	output black level = 47 IRE

Notes

1. Output black level/IRE = $BLCKL \times 2/6.29 + 28.9$.
2. Output black level/IRE = $BLCKL \times 2/6.18 + 26.5$.

Digital video encoder

SAA7104E; SAA7105E

Table 44 Subaddress 5EH

DATA BYTE	DESCRIPTION	CONDITIONS	REMARKS
BLNNL	variable blanking level	white-to-sync = 140 IRE; note 1	recommended value: BLNNL = 46 (2EH)
		BLNNL = 0; note 1	output blanking level = 25 IRE
		BLNNL = 63 (3FH); note 1	output blanking level = 45 IRE
		white-to-sync = 143 IRE; note 2	recommended value: BLNNL = 53 (35H)
		BLNNL = 0; note 2	output blanking level = 26 IRE
		BLNNL = 63 (3FH); note 2	output blanking level = 46 IRE

Notes

- Output black level/IRE = $BLNNL \times 2/6.29 + 25.4$.
- Output black level/IRE = $BLNNL \times 2/6.18 + 25.9$; default after reset: 35H.

Table 45 Subaddress 5FH

DATA BYTE	DESCRIPTION
CCRS	select cross-colour reduction filter in luminance; see Table 46
BLNVB	variable blanking level during vertical blanking interval is typically identical to value of BLNNL

Table 46 Logic levels and function of CCRS

CCRS1	CCRS0	DESCRIPTION
0	0	no cross-colour reduction; for overall transfer characteristic of luminance see Fig.6
0	1	cross-colour reduction #1 active; for overall transfer characteristic see Fig.6
1	0	cross-colour reduction #2 active; for overall transfer characteristic see Fig.6
1	1	cross-colour reduction #3 active; for overall transfer characteristic see Fig.6

Digital video encoder

SAA7104E; SAA7105E

Table 47 Subaddress 61H

DATA BYTE	LOGIC LEVEL	DESCRIPTION
DOWND	0	digital core in normal operational mode; default after reset
	1	digital core in sleep mode and is reactivated with an I ² C-bus address
DOWNA	0	DACs in normal operational mode; default after reset
	1	DACs in power-down mode
INPI	0	PAL switch phase is nominal; default after reset
	1	PAL switch is inverted compared to nominal if RTCE = 1
YGS	0	luminance gain for white – black 100 IRE
	1	luminance gain for white – black 92.5 IRE including 7.5 IRE set-up of black
SCBW	0	enlarged bandwidth for chrominance encoding (for overall transfer characteristic of chrominance in baseband representation see Figs 4 and 5)
	1	standard bandwidth for chrominance encoding (for overall transfer characteristic of chrominance in baseband representation see Figs 4 and 5); default after reset
PAL	0	NTSC encoding (non-alternating V component)
	1	PAL encoding (alternating V component)
FISE	0	864 total pixel clocks per line
	1	858 total pixel clocks per line

Table 48 Subaddress 62H

DATA BYTE	LOGIC LEVEL	DESCRIPTION	CONDITIONS	REMARKS
RTCE	0	no real-time control of generated subcarrier frequency; default after reset		
	1	real-time control of generated subcarrier frequency through a Philips video decoder; for a specification of the RTC protocol see document "RTC Functional Description", available on request		
BSTA	–	amplitude of colour burst; input representation in accordance with "ITU-R BT.601"	white-to-black = 92.5 IRE; burst = 40 IRE; NTSC encoding BSTA = 0 to 2.02 × nominal	recommended value: BSTA = 63 (3FH)
			white-to-black = 92.5 IRE; burst = 40 IRE; PAL encoding BSTA = 0 to 2.82 × nominal	recommended value: BSTA = 45 (2DH)
			white-to-black = 100 IRE; burst = 43 IRE; NTSC encoding BSTA = 0 to 1.90 × nominal	recommended value: BSTA = 67 (43H)
			white-to-black = 100 IRE; burst = 43 IRE; PAL encoding BSTA = 0 to 3.02 × nominal	recommended value: BSTA = 47 (2FH); default after reset

Digital video encoder

SAA7104E; SAA7105E

Table 49 Subaddresses 63H to 66H (four bytes to program subcarrier frequency)

DATA BYTE	DESCRIPTION	CONDITIONS	REMARKS
FSC0 to FSC3	f_{fsc} = subcarrier frequency (in multiples of line frequency); f_{llc} = clock frequency (in multiples of line frequency)	$FSC = \text{round}\left(\frac{f_{fsc}}{f_{llc}} \times 2^{32}\right)$; note 1	FSC3 = most significant byte; FSC0 = least significant byte

Note

1. Examples:

- a) NTSC M: $f_{fsc} = 227.5$, $f_{llc} = 1716 \rightarrow FSC = 569408543$ (21F07C1FH).
b) PAL B/G: $f_{fsc} = 283.7516$, $f_{llc} = 1728 \rightarrow FSC = 705268427$ (2A098ACBH).

Table 50 Subaddresses 67H to 6AH

DATA BYTE	DESCRIPTION	REMARKS
L21O0	first byte of captioning data, odd field	LSBs of the respective bytes are encoded immediately after run-in and framing code, the MSBs of the respective bytes have to carry the parity bit, in accordance with the definition of line 21 encoding format.
L21O1	second byte of captioning data, odd field	
L21E0	first byte of extended data, even field	
L21E1	second byte of extended data, even field	

Table 51 Subaddresses 6CH and 6DH

DATA BYTE	DESCRIPTION
HTRIG	sets the horizontal trigger phase related to chip-internal horizontal input values above 1715 (FISE = 1) or 1727 (FISE = 0) are not allowed; increasing HTRIG decreases delays of all internally generated timing signals; the default value is 0

Table 52 Subaddress 6DH

DATA BYTE	DESCRIPTION
VTRIG	sets the vertical trigger phase related to chip-internal vertical input increasing VTRIG decreases delays of all internally generated timing signals, measured in half lines; variation range of VTRIG = 0 to 31 (1FH); the default value is 0

Table 53 Subaddress 6EH

DATA BYTE	LOGIC LEVEL	DESCRIPTION
NVTRIG	0	values of the VTRIG register are positive
	1	values of the VTRIG register are negative
BLCKON	0	encoder in normal operation mode; default after reset
	1	output signal is forced to blanking level
PHRES	–	selects the phase reset mode of the colour subcarrier generator; see Table 54
LDEL	–	selects the delay on luminance path with reference to chrominance path; see Table 55
FLC	–	field length control; see Table 56

Digital video encoder

SAA7104E; SAA7105E

Table 54 Logic levels and function of PHRES

DATA BYTE		DESCRIPTION
PHRES1	PHRES0	
0	0	no subcarrier reset
0	1	subcarrier reset every two lines
1	0	subcarrier reset every eight fields
1	1	subcarrier reset every four fields

Table 55 Logic levels and function of LDEL

DATA BYTE		DESCRIPTION
LDEL1	LDEL0	
0	0	no luminance delay; default after reset
0	1	1 LLC luminance delay
1	0	2 LLC luminance delay
1	1	3 LLC luminance delay

Table 56 Logic levels and function of FLC

DATA BYTE		DESCRIPTION
FLC1	FLC0	
0	0	interlaced 312.5 lines/field at 50 Hz, 262.5 lines/field at 60 Hz; default after reset
0	1	non-interlaced 312 lines/field at 50 Hz, 262 lines/field at 60 Hz
1	0	non-interlaced 313 lines/field at 50 Hz, 263 lines/field at 60 Hz
1	1	non-interlaced 313 lines/field at 50 Hz, 263 lines/field at 60 Hz

Table 57 Subaddress 6FH

DATA BYTE	LOGIC LEVEL	DESCRIPTION
CCEN	–	enables individual line 21 encoding; see Table 58
TTXEN	0	disables teletext insertion; default after reset
	1	enables teletext insertion
SCCLN	–	selects the actual line, where Closed Caption or extended data are encoded; line = (SCCLN + 4) for M-systems; line = (SCCLN + 1) for other systems

Table 58 Logic levels and function of CCEN

DATA BYTE		DESCRIPTION
CCEN1	CCEN0	
0	0	line 21 encoding off; default after reset
0	1	enables encoding in field 1 (odd)
1	0	enables encoding in field 2 (even)
1	1	enables encoding in both fields

Digital video encoder

SAA7104E; SAA7105E

Table 59 Subaddresses 70H to 72H

DATA BYTE	DESCRIPTION
ADWHS	active display window horizontal start; defines the start of the active TV display portion after the border colour values above 1715 (FISE = 1) or 1727 (FISE = 0) are not allowed
ADWHE	active display window horizontal end; defines the end of the active TV display portion before the border colour values above 1715 (FISE = 1) or 1727 (FISE = 0) are not allowed

Table 60 Subaddress 73H

DATA BYTE	DESCRIPTION	REMARKS
TTXHS	start of signal TTXRQ on pin TTXRQ_XCLKO2 (CLK2EN = 0); see Fig.14	TTXHS = 42H; is default after reset if strapped to PAL TTXHS = 54H; is default after reset if strapped to NTSC

Table 61 Subaddress 74H

DATA BYTE	DESCRIPTION	REMARKS
TTXHD	indicates the delay in clock cycles between rising edge of TTXRQ output signal on pin TTXRQ_XCLKO2 (CLK2EN = 0) and valid data at pin TTX_SRES	minimum value: TTXHD = 2; is default after reset

Table 62 Subaddress 75H

DATA BYTE	DESCRIPTION
CSYNCA	advanced composite sync against RGB output from 0 XTAL clocks to 31 XTAL clocks

Table 63 Subaddresses 76H, 77H and 7CH

DATA BYTE	DESCRIPTION	REMARKS
TTXOVS	first line of occurrence of signal TTXRQ on pin TTXRQ_XCLKO2 (CLK2EN = 0) in odd field line = (TTXOVS + 4) for M-systems line = (TTXOVS + 1) for other systems	TTXOVS = 05H; is default after reset if strapped to PAL TTXOVS = 06H; is default after reset if strapped to NTSC
TTXOVE	last line of occurrence of signal TTXRQ on pin TTXRQ_XCLKO2 (CLK2EN = 0) in odd field line = (TTXOVE + 3) for M-systems line = TTXOVE for other systems	TTXOVE = 16H; is default after reset if strapped to PAL TTXOVE = 10H; is default after reset if strapped to NTSC

Digital video encoder

SAA7104E; SAA7105E

Table 64 Subaddresses 78H, 79H and 7CH

DATA BYTE	DESCRIPTION	REMARKS
TTXEVS	first line of occurrence of signal TTXRQ on pin TTXRQ_XCLKO2 (CLK2EN = 0) in even field line = (TTXEVS + 4) for M-systems line = (TTXEVS + 1) for other systems	TTXEVS = 04H; is default after reset if strapped to PAL TTXEVS = 05H; is default after reset if strapped to NTSC
TTXEVE	last line of occurrence of signal TTXRQ on pin TTXRQ_XCLKO2 (CLK2EN = 0) in even field line = (TTXEVE + 3) for M-systems line = TTXEVE for other systems	TTXEVE = 16H; is default after reset if strapped to PAL TTXEVE = 10H; is default after reset if strapped to NTSC

Table 65 Subaddresses 7AH to 7CH

DATA BYTE	DESCRIPTION
FAL	first active line = FAL + 4 for M-systems and FAL + 1 for other systems, measured in lines FAL = 0 coincides with the first field synchronization pulse
LAL	last active line = LAL + 3 for M-systems and LAL for other system, measured in lines LAL = 0 coincides with the first field synchronization pulse

Table 66 Subaddress 7CH

DATA BYTE	LOGIC LEVEL	DESCRIPTION
TTX60	0	enables NABTS (FISE = 1) or European TTX (FISE = 0); default after reset
	1	enables world standard teletext 60 Hz (FISE = 1)
TTXO	0	new teletext protocol selected; at each rising edge of TTXRQ a single teletext bit is requested (see Fig.14); default after reset
	1	old teletext protocol selected; the encoder provides a window of TTXRQ going HIGH; the length of the window depends on the chosen teletext standard (see Fig.14)

Table 67 Subaddresses 7EH and 7FH

DATA BYTE	DESCRIPTION
LINE	individual lines in both fields (PAL counting) can be disabled for insertion of teletext by the respective bits, disabled line = LINE _{xx} (50 Hz field rate) this bit mask is effective only if the lines are enabled by TTXOVS/TTXOVE and TTXEVS/TTXEVE

Table 68 Subaddresses 81H to 83H

DATA BYTE	DESCRIPTION
PCL	defines the frequency of the synthesized pixel clock PIXCLKO; $f_{\text{PIXCLK}} = \left(\frac{\text{PCL}}{2^{24}} \times f_{\text{XTAL}} \right) \times 8$; $f_{\text{XTAL}} = 27 \text{ MHz nominal}$, e.g. 640 × 480 to NTSC M: PCL = 20F63BH; 640 × 480 to PAL B/G: PCL = 1B5A73H (as by strapping pins)

Digital video encoder

SAA7104E; SAA7105E

Table 69 Subaddress 84H

DATA BYTE	LOGIC LEVEL	DESCRIPTION
DCLK	–	set to logic 1 (default after reset is logic 0)
PCLSY	0	pixel clock generator runs free; default after reset
	1	pixel clock generator gets synchronized with the vertical sync
IFRA	0	input FIFO gets reset explicitly at falling edge
	1	input FIFO gets reset every field; default after reset
IFBP	0	input FIFO is active
	1	input FIFO is bypassed; default after reset
PCLE	–	controls the divider for the external pixel clock; see Table 70
PCLI	–	controls the divider for the internal pixel clock; see Table 71

Table 70 Logic levels and function of PCLE

DATA BYTE		DESCRIPTION
PCLE1	PCLE0	
0	0	divider ratio for PIXCLK output is 1
0	1	divider ratio for PIXCLK output is 2; default after reset
1	0	divider ratio for PIXCLK output is 4
1	1	divider ratio for PIXCLK output is 8

Table 71 Logic levels and function of PCLI

DATA BYTE		DESCRIPTION
PCLI1	PCLI0	
0	0	divider ratio for internal PIXCLK is 1
0	1	divider ratio for internal PIXCLK is 2; default after reset
1	0	divider ratio for internal PIXCLK is 4
1	1	not allowed

Table 72 Subaddress 85H

DATA BYTE	LOGIC LEVEL	DESCRIPTION
EIDIV	0	set to logic 0 if DVO compliant signals are applied; default after reset
	1	set to logic 1 if non-DVO compliant signals are applied
FILI	–	threshold for FIFO internal transfers; nominal value is 8; default after reset

Table 73 Subaddresses 90H and 94H

DATA BYTE	DESCRIPTION
XOFS	horizontal offset; defines the number of PIXCLKs from horizontal sync (HSVGC) output to composite blanking (CBO) output

Digital video encoder

SAA7104E; SAA7105E

Table 74 Subaddresses 91H and 94H

DATA BYTE	DESCRIPTION
XPIX	pixel in X direction; defines half the number of active pixels per input line (identical to the length of $\overline{\text{CBO}}$ pulses)

Table 75 Subaddresses 92H and 94H

DATA BYTE	DESCRIPTION
YOFSO	vertical offset in odd field; defines (in the odd field) the number of lines from VSVG to first line with active $\overline{\text{CBO}}$; if no LUT data is requested, the first active $\overline{\text{CBO}}$ will be output at YOFSO + 2; usually, YOFSO = YOFSE with the exception of extreme vertical downscaling and interlacing

Table 76 Subaddresses 93H and 94H

DATA BYTE	DESCRIPTION
YOFSE	vertical offset in even field; defines (in the even field) the number of lines from VSVG to first line with active $\overline{\text{CBO}}$; if no LUT data is requested, the first active $\overline{\text{CBO}}$ will be output at YOFSE + 2; usually, YOFSE = YOFSO with the exception of extreme vertical downscaling and interlacing

Table 77 Subaddresses 95H and 96H

DATA BYTE	DESCRIPTION
YPIX	defines the number of requested input lines from the feeding device; number of requested lines = YPIX + YOFSE – YOFSO

Table 78 Subaddress 96H

DATA BYTE	LOGIC LEVEL	DESCRIPTION
EFS	0	frame sync signal at pin FSVG ignored in slave mode
	1	frame sync signal at pin FSVG accepted in slave mode
PCBN	0	normal polarity of $\overline{\text{CBO}}$ signal (HIGH during active video)
	1	inverted polarity of $\overline{\text{CBO}}$ signal (LOW during active video)
SLAVE	0	the SAA7104E; SAA7105E is timing master to the graphics controller
	1	the SAA7104E; SAA7105E is timing slave to the graphics controller
ILC	0	if hardware cursor insertion is active, set LOW for non-interlaced input signals
	1	if hardware cursor insertion is active, set HIGH for interlaced input signals
YFIL	0	luminance sharpness booster disabled
	1	luminance sharpness booster enabled

Digital video encoder

SAA7104E; SAA7105E

Table 79 Subaddress 97H

DATA BYTE	LOGIC LEVEL	DESCRIPTION
HFS	0	horizontal sync is directly derived from input signal (slave mode) at pin HSVGC
	1	horizontal sync is derived from a frame sync signal (slave mode) at pin FSVGC (only if EFS is set HIGH)
VFS	0	vertical sync (field sync) is directly derived from input signal (slave mode) at pin VSVGC
	1	vertical sync (field sync) is derived from a frame sync signal (slave mode) at pin FSVGC (only if EFS is set HIGH)
OFS	0	pin FSVGC is switched to input
	1	pin FSVGC is switched to active output
PFS	0	polarity of signal at pin FSVGC in output mode (master mode) is active HIGH; rising edge of the input signal is used in slave mode
	1	polarity of signal at pin FSVGC in output mode (master mode) is active LOW; falling edge of the input signal is used in slave mode
OVS	0	pin VSVGC is switched to input
	1	pin VSVGC is switched to active output
PVS	0	polarity of signal at pin VSVGC in output mode (master mode) is active HIGH; rising edge of the input signal is used in slave mode
	1	polarity of signal at pin VSVGC in output mode (master mode) is active LOW; falling edge of the input signal is used in slave mode
OHS	0	pin HSVGC is switched to input
	1	pin HSVGC is switched to active output
PHS	0	polarity of signal at pin HSVGC in output mode (master mode) is active HIGH; rising edge of the input signal is used in slave mode
	1	polarity of signal at pin HSVGC in output mode (master mode) is active LOW; falling edge of the input signal is used in slave mode

Table 80 Subaddresses 98H and 99H

DATA BYTE	DESCRIPTION
HLEN	horizontal length; $HLEN = \frac{\text{number of PIXCLKs}}{\text{line}} - 1$

Table 81 Subaddress 99H

DATA BYTE	DESCRIPTION
IDEL	input delay; defines the distance in PIXCLKs between the active edge of \overline{CBO} and the first received valid pixel

Digital video encoder

SAA7104E; SAA7105E

Table 82 Subaddresses 9AH and 9CH

DATA BYTE	DESCRIPTION
XINC	incremental fraction of the horizontal scaling engine; $XINC = \frac{\text{number of output pixels}}{\text{line}} \times \frac{\text{number of input pixels}}{\text{line}} \times 4096$

Table 83 Subaddresses 9BH and 9CH

DATA BYTE	DESCRIPTION
YINC	incremental fraction of the vertical scaling engine; $YINC = \frac{\text{number of active output lines}}{\text{number of active input lines}} \times 4096$

Table 84 Subaddresses 9DH and 9FH

DATA BYTE	DESCRIPTION
YIWGTO	weighting factor for the first line of the odd field; $YIWGTO = \frac{YINC}{2} + 2048$

Table 85 Subaddresses 9EH and 9FH

DATA BYTE	DESCRIPTION
YIWGTE	weighting factor for the first line of the even field; $YIWGTE = \frac{YINC - YSKIP}{2}$

Table 86 Subaddresses A0H and A1H

DATA BYTE	DESCRIPTION
YSKIP	vertical line skip; defines the effectiveness of the anti-flicker filter; YSKIP = 0: most effective; YSKIP = 4095: anti-flicker filter switched off

Table 87 Subaddress A1H

DATA BYTE	LOGIC LEVEL	DESCRIPTION
BLEN	0	no internal blanking for non-interlaced graphics in bypass mode; default after reset
	1	forced internal blanking for non-interlaced graphics in bypass mode

Table 88 Subaddresses A2H to A4H

DATA BYTE	DESCRIPTION
BCY, BCU and BCV	luminance and colour difference portion of border colour in underscan area

Digital video encoder

SAA7104E; SAA7105E

Table 89 Subaddress D0H

DATA BYTE	DESCRIPTION
HLCA	RAM start address for the HD sync line count array; the byte following subaddress D0 points to the first cell to be loaded with the next transmitted byte; succeeding cells are loaded by auto-incrementing until stop condition. Each line count array entry consists of 2 bytes; see Table 90. The array has 15 entries.
HLC	HD line counter. The system will repeat the pattern described in 'HLT' HLC times and then start with the next entry in line count array.
HLT	HD line type pointer. If not 0, the value points into the line type array, index HLT – 1 with the description of the current line. 0 means the entry is not used.

Table 90 Layout of the data bytes in the line count array

BYTE	DESCRIPTION							
0	HLC7	HLC6	HLC5	HLC4	HLC3	HLC2	HLC1	HLC0
1	HLT3	HLT2	HLT1	HLT0	0	0	HLC9	HLC8

Table 91 Subaddress D1H

DATA BYTE	DESCRIPTION
HLTA	RAM start address for the HD sync line type array; the byte following subaddress D1 points to the first cell to be loaded with the next transmitted byte; succeeding cells are loaded by auto-incrementing until stop condition. Each line type array entry consists of 4 bytes; see Table 92. The array has 15 entries.
HLP	HD line type; if not 0, the value points into the line pattern array. The index used is HLP – 1. It consists of value-duration pairs. Each entry consists of 8 pointers, used from index 0 to 7. The value 0 means that the entry is not used.

Table 92 Layout of the data bytes in the line type array

BYTE	DESCRIPTION							
0	0	HLP12	HLP11	HLP10	0	HLP02	HLP01	HLP00
1	0	HLP32	HLP31	HLP30	0	HLP22	HLP21	HLP20

3	0	HLP72	HLP71	HLP70	0	HLP62	HLP61	HLP60

Table 93 Subaddress D2H

DATA BYTE	DESCRIPTION
HLP A	RAM start address for the HD sync line pattern array; the byte following subaddress D2 points to the first cell to be loaded with the next transmitted byte; succeeding cells are loaded by auto-incrementing until stop condition. Each line pattern array entry consists of 4 value-duration pairs occupying 2 bytes; see Table 94. The array has 7 entries.
HPD	HD pattern duration. The value defines the time in pixel clocks (HPD + 1) the corresponding value HPV is added to the HD output signal. If 0, this entry will be skipped.
HPV	HD pattern value pointer. This gives the index in the HD value array containing the level to be inserted into the HD output path. If the MSB of HPV is logic 1, the value will only be inserted into the Y/GREEN channel of the HD data path, the other channels remain unchanged.

8 BOUNDARY SCAN TEST

The SAA7104E; SAA7105E has built-in logic and 5 dedicated pins to support boundary scan testing which allows board testing without special hardware (nails). The SAA7104E; SAA7105E follows the "IEEE Std. 1149.1 - Standard Test Access Port and Boundary-Scan Architecture" set by the Joint Test Action Group (JTAG) chaired by Philips.

The 5 special pins are Test Mode Select (TMS), Test Clock (TCK), Test Reset ($\overline{\text{TRST}}$), Test Data Input (TDI) and Test Data Output (TDO).

The Boundary Scan Test (BST) functions BYPASS, EXTEST, INTEST, SAMPLE, CLAMP and IDCODE are all supported; see Table 116. Details about the JTAG BST-TEST can be found in the specification "IEEE Std. 1149.1". A file containing the detailed Boundary Scan Description Language (BSDL) of the SAA7104E; SAA7105E is available on request.

Table 116 BST instructions supported by the SAA7104E; SAA7105E

INSTRUCTION	DESCRIPTION
BYPASS	This mandatory instruction provides a minimum length serial path (1 bit) between TDI and TDO when no test operation of the component is required.
EXTEST	This mandatory instruction allows testing of off-chip circuitry and board level interconnections.
SAMPLE	This mandatory instruction can be used to take a sample of the inputs during normal operation of the component. It can also be used to preload data values into the latched outputs of the boundary scan register.
CLAMP	This optional instruction is useful for testing when not all ICs have BST. This instruction addresses the bypass register while the boundary scan register is in external test mode.
IDCODE	This optional instruction will provide information on the components manufacturer, part number and version number.
INTEST	This optional instruction allows testing of the internal logic (no support for customer available).
USER1	This private instruction allows testing by the manufacturer (no support for customer available).

8.1 Initialization of boundary scan circuit

The Test Access Port (TAP) controller of an IC should be in the reset state (TEST_LOGIC_RESET) when the IC is in functional mode. This reset state also forces the instruction register into a functional instruction such as IDCODE or BYPASS.

To solve the power-up reset, the standard specifies that the TAP controller will be forced asynchronously to the TEST_LOGIC_RESET state by setting the $\overline{\text{TRST}}$ pin LOW.

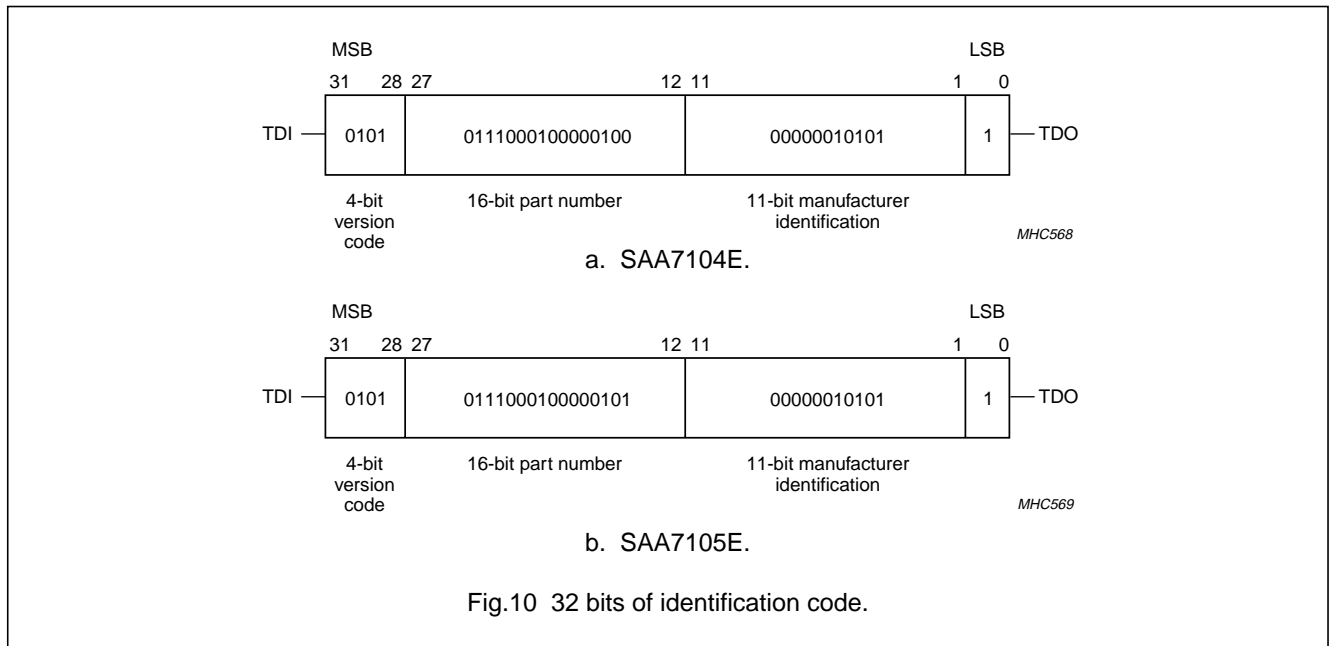

8.2 Device identification codes

A device identification register is specified in "IEEE Std. 1149.1b-1994". It is a 32-bit register which contains fields for the specification of the IC manufacturer, the IC part number and the IC version number. Its biggest advantage is the possibility to check for the correct ICs mounted after production and to determine the version number of the ICs during field service.

When the IDCODE instruction is loaded into the BST instruction register, the identification register will be connected between TDI and TDO of the IC. The identification register will load a component specific code during the CAPTURE_DATA_REGISTER state of the TAP controller, this code can subsequently be shifted out. At board level this code can be used to verify component manufacturer, type and version number. The device identification register contains 32 bits, numbered 31 to 0, where bit 31 is the most significant bit (nearest to TDI) and bit 0 is the least significant bit (nearest to TDO); see Fig.10.

Digital video encoder

SAA7104E; SAA7105E

9 LIMITING VALUES

In accordance with the Absolute Maximum Rating System (IEC 60134); all ground pins connected together and grounded (0 V); all supply pins connected together.

SYMBOL	PARAMETER	CONDITIONS	MIN.	MAX.	UNIT
V_{DDD}	digital supply voltage		-0.5	+4.6	V
V_{DDA}	analog supply voltage		-0.5	+4.6	V
$V_{i(A)}$	input voltage at analog inputs		-0.5	+4.6	V
$V_{i(n)}$	input voltage at pins XTALI, SDA and SCL		-0.5	$V_{DDD} + 0.5$	V
$V_{i(D)}$	input voltage at digital inputs or I/O pins	outputs in 3-state	-0.5	+4.6	V
		outputs in 3-state; note 1	-0.5	+5.5	V
ΔV_{SS}	voltage difference between $V_{SSA(n)}$ and $V_{SSD(n)}$		-	100	mV
T_{stg}	storage temperature		-65	+150	°C
T_{amb}	ambient temperature		0	70	°C
V_{esd}	electrostatic discharge voltage	human body model; note 2	-	± 2000	V
		machine model; note 3	-	± 200	V

Notes

- Condition for maximum voltage at digital inputs or I/O pins: $3.0\text{ V} < V_{DDD} < 3.6\text{ V}$.
- Class 2 according to EIA/JESD22-114-B.
- Class B according to EIA/JESD22-115-A.

Digital video encoder

SAA7104E; SAA7105E

10 THERMAL CHARACTERISTICS

SYMBOL	PARAMETER	CONDITIONS	VALUE	UNIT
$R_{th(j-a)}$	thermal resistance from junction to ambient	in free air	38 ⁽¹⁾	K/W

Note

- The overall $R_{th(j-a)}$ value can vary depending on the board layout. To minimize the effective $R_{th(j-a)}$ all power and ground pins must be connected to the power and ground layers directly. An ample copper area direct under the SAA7104E; SAA7105E with a number of through-hole plating, which connect to the ground layer (four-layer board: second layer), can also reduce the effective $R_{th(j-a)}$. Please do not use any solder-stop varnish under the chip. In addition the usage of soldering glue with a high thermal conductance after curing is recommended.

11 CHARACTERISTICS

$T_{amb} = 0$ to 70 °C (typical values excluded); unless otherwise specified.

SYMBOL	PARAMETER	CONDITIONS	MIN.	TYP.	MAX.	UNIT
Supplies

Notes

1. Minimum value for I²C-bus bit DOWNA = 1.
2. Minimum value for I²C-bus bit DOWND = 1.
3. Levels refer to pins PD11 to PD0, FSVGC, PIXCLKI, VSVGC, PIXCLKO, $\overline{\text{CBO}}$, TVD, and HSVG, being inputs or outputs directly connected to a graphics controller.
Input sensitivity is $\frac{1}{2}V_{\text{DD}2} + 100 \text{ mV}$ for HIGH and $\frac{1}{2}V_{\text{DD}2} - 100 \text{ mV}$ for LOW.
The reference voltage $\frac{1}{2}V_{\text{DD}2}$ is generated on chip.
4. The data is for both input and output direction.
5. This parameter is arbitrary, if PIXCLKI is looped through the VGC.
6. Tested with programming IFBP = 1.
7. If an internal oscillator is used, crystal deviation of nominal frequency is directly proportional to the deviation of subcarrier frequency and line/field frequency.
8. $B_{-3 \text{ dB}} = \frac{1}{2\pi R_L (C_{\text{ext}} + 5 \text{ pF})}$ with $R_L = 37.5 \Omega$ and $C_{\text{ext}} = 20 \text{ pF}$ (typical).

11.1 Teletext timing

Time t_{FD} is the time needed to interpolate input data TTX and insert it into the CVBS and VBS output signal, such that it appears at $t_{TTX} = 9.78 \mu s$ (PAL) or $t_{TTX} = 10.5 \mu s$ (NTSC) after the leading edge of the horizontal synchronization pulse.

Time t_{PD} is the pipeline delay time introduced by the source that is gated by TTXRQ_XCLKO2 in order to deliver TTX data. This delay is programmable by register TTXHD. For every active HIGH state at output pin TTXRQ_XCLKO2, a new teletext bit must be provided by the source.

Since the beginning of the pulses representing the TTXRQ signal and the delay between the rising edge of TTXRQ and valid teletext input data are fully programmable (TTXHS and TTXHD), the TTX data is always inserted at the correct position after the leading edge of the outgoing horizontal synchronization pulse.

Time $t_{i(TTXW)}$ is the internally used insertion window for TTX data; it has a constant length that allows insertion of 360 teletext bits at a text data rate of 6.9375 Mbits/s (PAL), 296 teletext bits at a text data rate of 5.7272 Mbits/s (world standard TTX) or 288 teletext bits at a text data rate of 5.7272 Mbits/s (NABTS). The insertion window is not opened if the control bit TTXEN is zero.

Using appropriate programming, all suitable lines of the odd field (TTXOVS and TTXOVE) plus all suitable lines of the even field (TTXEVS and TTXEVE) can be used for teletext insertion.

It is essential to note that the two pins used for teletext insertion must be configured for this purpose by the correct I²C-bus register settings.

(1a) With 3rd-harmonic quartz.
Crystal load = 8 pF.

(1b) With fundamental quartz.
Crystal load = 20 pF.

(2a) With direct clock.

(2b) With fundamental quartz and restricted drive level. When P_{drive} of the internal oscillator is too high, a resistance R_s can be placed in series with the oscillator output XTALO.
Note: The decreased crystal amplitude results in a lower drive level but on the other hand the jitter performance will decrease.

Fig.17 Oscillator application.

Digital video encoder

SAA7104E; SAA7105E

12.1 Reconstruction filter

Figure 16 shows a possible reconstruction filter for the digital-to-analog converters. Due to its cut-off frequency of ~6 MHz, it is not suitable for HDTV applications.

12.2 Analog output voltages

The analog output voltages are dependent on the total load (typical value 37.5 Ω), the digital gain parameters and the I²C-bus settings of the DAC reference currents (analog settings).

The digital output signals in front of the DACs under nominal (nominal here stands for the settings given in

Tables 41 to 48 for example a standard PAL or NTSC signal) conditions occupy different conversion ranges, as indicated in Table 117 for a 100/100 colour bar signal.

By setting the reference currents of the DACs as shown in Table 117, standard compliant amplitudes can be achieved for all signal combinations; it is assumed that in subaddress 16H, parameter DACF = 0000b, that means the fine adjustment for all DACs in common is set to 0%.

If S-video output is desired, the adjustment for the C (chrominance subcarrier) output should be identical to the one for VBS (luminance plus sync) output.

Table 117 Digital output signals conversion range

SET/OUT	CVBS, SYNC TIP-TO-WHITE	VBS, SYNC TIP-TO-WHITE	RGB, BLACK-TO-WHITE
Digital settings	see Tables 41 to 48	see Tables 41 to 48	see Table 36
Digital output	1014	881	876
Analog settings	e.g. B DAC = 1FH	e.g. G DAC = 1BH	e.g. R DAC = G DAC = B DAC = 0BH
Analog output	1.23 V (p-p)	1.00 V (p-p)	0.70 V (p-p)

12.3 Suggestions for a board layout

Use separate ground planes for analog and digital ground. Connect these planes only at one point directly under the device, by using a 0 Ω resistor directly at the supply stage. Use separate supply lines for analog and digital supply. Place the supply decoupling capacitors close to the supply pins.

Use L_{bead} (ferrite coil) in each digital supply line close to the decoupling capacitors to minimize radiation energy (EMC).

Place the analog coupling (clamp) capacitors close to the analog input pins. Place the analog termination resistors close to the coupling capacitors.

Be careful of hidden layout capacitors around the crystal application.

Use serial resistors in clock, sync and data lines, to avoid clock or data reflection effects and to soften data energy.

14 SOLDERING

14.1 Introduction to soldering surface mount packages

This text gives a very brief insight to a complex technology. A more in-depth account of soldering ICs can be found in our *"Data Handbook IC26; Integrated Circuit Packages"* (document order number 9398 652 90011).

There is no soldering method that is ideal for all surface mount IC packages. Wave soldering can still be used for certain surface mount ICs, but it is not suitable for fine pitch SMDs. In these situations reflow soldering is recommended.

14.2 Reflow soldering

Reflow soldering requires solder paste (a suspension of fine solder particles, flux and binding agent) to be applied to the printed-circuit board by screen printing, stencilling or pressure-syringe dispensing before package placement. Driven by legislation and environmental forces the worldwide use of lead-free solder pastes is increasing.

Several methods exist for reflowing; for example, convection or convection/infrared heating in a conveyor type oven. Throughput times (preheating, soldering and cooling) vary between 100 and 200 seconds depending on heating method.

Typical reflow peak temperatures range from 215 to 270 °C depending on solder paste material. The top-surface temperature of the packages should preferably be kept:

- below 225 °C (SnPb process) or below 245 °C (Pb-free process)
 - for all BGA, HTSSON-T and SSOP-T packages
 - for packages with a thickness ≥ 2.5 mm
 - for packages with a thickness < 2.5 mm and a volume ≥ 350 mm³ so called thick/large packages.
- below 240 °C (SnPb process) or below 260 °C (Pb-free process) for packages with a thickness < 2.5 mm and a volume < 350 mm³ so called small/thin packages.

Moisture sensitivity precautions, as indicated on packing, must be respected at all times.

14.3 Wave soldering

Conventional single wave soldering is not recommended for surface mount devices (SMDs) or printed-circuit boards with a high component density, as solder bridging and non-wetting can present major problems.

To overcome these problems the double-wave soldering method was specifically developed.

If wave soldering is used the following conditions must be observed for optimal results:

- Use a double-wave soldering method comprising a turbulent wave with high upward pressure followed by a smooth laminar wave.
- For packages with leads on two sides and a pitch (e):
 - larger than or equal to 1.27 mm, the footprint longitudinal axis is **preferred** to be parallel to the transport direction of the printed-circuit board;
 - smaller than 1.27 mm, the footprint longitudinal axis **must** be parallel to the transport direction of the printed-circuit board.

The footprint must incorporate solder thieves at the downstream end.

- For packages with leads on four sides, the footprint must be placed at a 45° angle to the transport direction of the printed-circuit board. The footprint must incorporate solder thieves downstream and at the side corners.

During placement and before soldering, the package must be fixed with a droplet of adhesive. The adhesive can be applied by screen printing, pin transfer or syringe dispensing. The package can be soldered after the adhesive is cured.

Typical dwell time of the leads in the wave ranges from 3 to 4 seconds at 250 °C or 265 °C, depending on solder material applied, SnPb or Pb-free respectively.

A mildly-activated flux will eliminate the need for removal of corrosive residues in most applications.

14.4 Manual soldering

Fix the component by first soldering two diagonally-opposite end leads. Use a low voltage (24 V or less) soldering iron applied to the flat part of the lead. Contact time must be limited to 10 seconds at up to 300 °C.

When using a dedicated tool, all other leads can be soldered in one operation within 2 to 5 seconds between 270 and 320 °C.

14.5 Suitability of surface mount IC packages for wave and reflow soldering methods

PACKAGE ⁽¹⁾	SOLDERING METHOD	
	WAVE	REFLOW ⁽²⁾
BGA, HTSSON..T ⁽³⁾ , LBGA, LFBGA, SQFP, SSOP..T ⁽³⁾ , TFBGA, USON, VFBGA	not suitable	suitable
DHVQFN, HBCC, HBGA, HLQFP, HSO, HSOP, HSQFP, HSSON, HTQFP, HTSSOP, HVQFN, HVSON, SMS	not suitable ⁽⁴⁾	suitable
PLCC ⁽⁵⁾ , SO, SOJ	suitable	suitable
LQFP, QFP, TQFP	not recommended ⁽⁵⁾⁽⁶⁾	suitable
SSOP, TSSOP, VSO, VSSOP	not recommended ⁽⁷⁾	suitable
CWQCCN..L ⁽⁸⁾ , PMFP ⁽⁹⁾ , WQCCN..L ⁽⁸⁾	not suitable	not suitable

Notes

- For more detailed information on the BGA packages refer to the “(LF)BGA Application Note” (AN01026); order a copy from your Philips Semiconductors sales office.
- All surface mount (SMD) packages are moisture sensitive. Depending upon the moisture content, the maximum temperature (with respect to time) and body size of the package, there is a risk that internal or external package cracks may occur due to vaporization of the moisture in them (the so called popcorn effect). For details, refer to the Drypack information in the “Data Handbook IC26; Integrated Circuit Packages; Section: Packing Methods”.
- These transparent plastic packages are extremely sensitive to reflow soldering conditions and must on no account be processed through more than one soldering cycle or subjected to infrared reflow soldering with peak temperature exceeding $217\text{ °C} \pm 10\text{ °C}$ measured in the atmosphere of the reflow oven. The package body peak temperature must be kept as low as possible.
- These packages are not suitable for wave soldering. On versions with the heatsink on the bottom side, the solder cannot penetrate between the printed-circuit board and the heatsink. On versions with the heatsink on the top side, the solder might be deposited on the heatsink surface.
- If wave soldering is considered, then the package must be placed at a 45° angle to the solder wave direction. The package footprint must incorporate solder thieves downstream and at the side corners.
- Wave soldering is suitable for LQFP, TQFP and QFP packages with a pitch (e) larger than 0.8 mm; it is definitely not suitable for packages with a pitch (e) equal to or smaller than 0.65 mm.
- Wave soldering is suitable for SSOP, TSSOP, VSO and VSSOP packages with a pitch (e) equal to or larger than 0.65 mm; it is definitely not suitable for packages with a pitch (e) equal to or smaller than 0.5 mm.
- Image sensor packages in principle should not be soldered. They are mounted in sockets or delivered pre-mounted on flex foil. However, the image sensor package can be mounted by the client on a flex foil by using a hot bar soldering process. The appropriate soldering profile can be provided on request.
- Hot bar or manual soldering is suitable for PMFP packages.

15 DATA SHEET STATUS

LEVEL	DATA SHEET STATUS ⁽¹⁾	PRODUCT STATUS ⁽²⁾⁽³⁾	DEFINITION
I	Objective data	Development	This data sheet contains data from the objective specification for product development. Philips Semiconductors reserves the right to change the specification in any manner without notice.
II	Preliminary data	Qualification	This data sheet contains data from the preliminary specification. Supplementary data will be published at a later date. Philips Semiconductors reserves the right to change the specification without notice, in order to improve the design and supply the best possible product.
III	Product data	Production	This data sheet contains data from the product specification. Philips Semiconductors reserves the right to make changes at any time in order to improve the design, manufacturing and supply. Relevant changes will be communicated via a Customer Product/Process Change Notification (CPCN).

Notes

1. Please consult the most recently issued data sheet before initiating or completing a design.
2. The product status of the device(s) described in this data sheet may have changed since this data sheet was published. The latest information is available on the Internet at URL <http://www.semiconductors.philips.com>.
3. For data sheets describing multiple type numbers, the highest-level product status determines the data sheet status.

16 DEFINITIONS

Short-form specification — The data in a short-form specification is extracted from a full data sheet with the same type number and title. For detailed information see the relevant data sheet or data handbook.

Limiting values definition — Limiting values given are in accordance with the Absolute Maximum Rating System (IEC 60134). Stress above one or more of the limiting values may cause permanent damage to the device. These are stress ratings only and operation of the device at these or at any other conditions above those given in the Characteristics sections of the specification is not implied. Exposure to limiting values for extended periods may affect device reliability.

Application information — Applications that are described herein for any of these products are for illustrative purposes only. Philips Semiconductors make no representation or warranty that such applications will be suitable for the specified use without further testing or modification.

17 DISCLAIMERS

Life support applications — These products are not designed for use in life support appliances, devices, or systems where malfunction of these products can reasonably be expected to result in personal injury. Philips Semiconductors customers using or selling these products for use in such applications do so at their own risk and agree to fully indemnify Philips Semiconductors for any damages resulting from such application.

Right to make changes — Philips Semiconductors reserves the right to make changes in the products - including circuits, standard cells, and/or software - described or contained herein in order to improve design and/or performance. When the product is in full production (status 'Production'), relevant changes will be communicated via a Customer Product/Process Change Notification (CPCN). Philips Semiconductors assumes no responsibility or liability for the use of any of these products, conveys no licence or title under any patent, copyright, or mask work right to these products, and makes no representations or warranties that these products are free from patent, copyright, or mask work right infringement, unless otherwise specified.
