THE DATASHEET OF

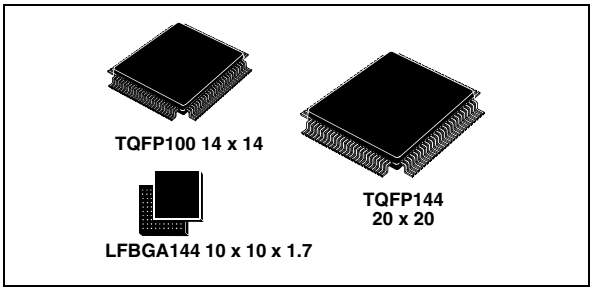
STR730FZ1H7

STR73xFxx

ARM7TDMI™ 32-bit MCU with Flash, 3x CAN, 4 UARTs, 20 timers, ADC, 12 comm. interfaces

Features

- **Core**
  - ARM7TDMI 32-bit RISC CPU
  - 32 MIPS @ 36 MHz
- **Memories**
  - Up to 256 Kbytes Flash program memory (10,000 cycles endurance, data retention 20 years @ 85° C)
  - 16 Kbytes RAM
- **Clock, reset and supply management**
  - 4.5 - 5.5 V application supply and I/Os
  - Embedded 1.8 V regulator for core supply
  - Embedded oscillator running from external 4-8 MHz crystal or ceramic resonator
  - Up to 36 MHz CPU frequency with internal PLL
  - 32 kHz or 2 MHz internal RC oscillator, software configurable for fast startup and backup clock
  - Real-time clock for clock-calendar function
  - Wake-up timer driven by internal RC for wake-up from STOP mode
  - 5 power saving modes: SLOW, WFI, LPWFI, STOP and HALT modes
- **Nested interrupt controller**
  - Fast interrupt handling with multiple vectors
  - 64 maskable IRQs with 64 vectors and 16 priority levels
  - 2 maskable FIQ sources
  - 16 external interrupts, up to 32 wake-up lines
- **Up to 112 I/O ports**
  - 72/112 multifunctional bidirectional I/Os



- **DMA**
  - 4 DMA controllers with 4 channels each
- **Timers**
  - 16-bit watchdog timer (WDG)
  - 6/10 16-bit timers (TIM) each with: 2 input captures, 2 output compares, PWM and pulse counter modes
  - 6 16-bit PWM modules (PWM)
  - 3 16-bit timebase timers with 8-bit prescalers
- **12 communications interfaces**
  - 2 I^2C interfaces
  - 4 UART asynchronous serial interfaces
  - 3 BSPI synchronous serial interfaces
  - Up to 3 CAN interfaces (2.0B Active)
- **10-bit A/D converter**
  - 12/16 channels
  - Conversion time: min. 3 µs, range: 0 to 5V
- **Development tools support**
  - JTAG interface

Contents

1 Scope

This datasheet provides the STR73x ordering information, mechanical and electrical device characteristics.

For complete information on the STR73xF microcontroller memory, registers and peripherals. please refer to the STR73x reference manual.

For information on programming, erasing and protection of the internal Flash memory please refer to the STR7 Flash programming reference manual.

For information on the ARM7TDMI core please refer to the ARM7TDMI technical reference manual.

1.1 Description

ARM core with embedded Flash & RAM

STR73xF family combines the high performance ARM7TDMI™ CPU with an extensive range of peripheral functions and enhanced I/O capabilities. All devices have on-chip high-speed single voltage Flash memory and high-speed RAM. The STR73xF family has an embedded ARM core and is therefore compatible with all ARM tools and software.

Extensive tools support

STMicroelectronics' 32-bit, ARM core-based microcontrollers are supported by a complete range of high-end and low-cost development tools to meet the needs of application developers. This extensive line of hardware/software tools includes starter kits and complete development packages all tailored for ST's ARM core-based MCUs.

The range of development packages includes third-party solutions that come complete with a graphical development environment and an in-circuit emulator/programmer featuring a JTAG application interface. These support a range of embedded operating systems (OS), while several royalty-free OSs are also available.

For more information, please refer to ST MCU site http://www.st.com/mcu

Figure 1 shows the general block diagram of the device family.

2 Overview

Table 2. Product overview

Features	STR730FZx		STR735FZx		STR731FVx			STR736FVx		
Flash memory - bytes	128K	256K	128K	256K	64K	128K	256K	64K	128K	256K
RAM - bytes	16 K				16 K					
Peripheral functions	10 TIM timers, 112 I/Os, 32 wake-up lines, 16 ADC				6 TIM timers, 72 I/Os, 18 wake-up lines, 12 ADC channels					
CAN peripherals	3		0		3			0		
Operating voltage	4.5 to 5.5 V									
Operating temperature	-40 to +85°C/-40 to +105° C									
Packages	**T**=TQFP144 20 x 20 **H**=LFBGA144 10 x10				**T**=TQFP100 14x14					

Package choice: reduced pin-count TQFP100 or feature-rich 144-pin TQFP or LFBGA

The STR73xF family is available in 3 packages. The TQFP144 and LFBGA144 versions have the full set of all features. The 100-pin version has fewer timers, I/Os and ADC channels. Refer to the Device Summary on Page 1 for a comparison of the I/Os available on each package.

The family includes versions with and without CAN.

High speed Flash memory

The Flash program memory is organized in 32-bit wide memory cells which can be used for storing both code and data constants. It is accessed by CPU with zero wait states @ 36 MHz.

The STR7 embedded Flash memory can be programmed using in-circuit programming or in-application programming.

The Flash memory endurance is 10K write/erase cycles and the data retention is 20 years @ 85° C.

IAP (in-application programming): IAP is the ability to re-program the Flash memory of a microcontroller while the user program is running.

ICP (in-circuit programming): ICP is the ability to program the Flash memory of a microcontroller using JTAG protocol while the device is mounted on the user application board.

The Flash memory can be protected against different types of unwanted access (read/write/erase). There are two types of protection:

- Sector write protection
- Flash debug protection (locks JTAG access)

Flexible power management

To minimize power consumption, you can program the STR73xF to switch to SLOW, WFI LPWFI, STOP or HALT modes depending on the current system activity in the application.

Flexible clock control

Two clock sources are used to drive the microcontroller, a main clock driven by an external crystal or ceramic resonator and an internal backup RC oscillator that operates at 2 MHz or 32 kHz. The embedded PLL can be configured to generate an internal system clock of up to 36 MHz. The PLL output frequency can be programmed using a wide selection of multipliers and dividers.

Voltage regulators

The STR73xF requires an external 4.5 to 5.5 V power supply. There are two internal Voltage Regulators for generating the 1.8 V power supply needed by the core and peripherals. The main VR is switched off and the Low Power VR switched on when the application puts the STR73xF in Low Power Wait for Interrupt (LPWFI) mode.

Low voltage detectors

The voltage regulator and Flash modules each have an embedded LVD that monitors the internal 1.8 V supply. If the voltage drops below a certain threshold, the LVD will reset the STR73xF.

Note: An external power-on reset must be provided ensure the microcontroller starts-up correctly.

2.1 On-chip peripherals

CAN interfaces

The three CAN modules are compliant with the CAN specification V2.0 part B (active). The bit rate can be programmed up to 1 MBaud. These are not available in the STR735 and STR736.

DMA

4 DMA controllers, each with 4 data streams manage memory to memory, peripheral to peripheral, peripheral to memory and memory to peripheral transfers. The DMA requests are connected to TIM timers, BSPI0, BSPI1, BSPI2 and ADC. One of the streams can be configured to be triggered by a software request, independently from any peripheral activity.

16-bit timers (TIM)

Each of the ten timers (six in 100-pin devices) have a 16-bit free-running counter with 7-bit prescaler, up to two input capture/output compare functions, a pulse counter function, and a PWM channel with selectable frequency. This provides a total of 16 independent PWMs (12 in 100-pin devices) when added with the PWM modules (see next paragraph).

PWM modules (PWM)

The six 16-bit PWM modules have independently programmable periods and duty-cycles, with 5+3 bit prescaler factor.

Timebase timers (TB)

The three 16-bit timebase timers with 8-bit prescaler for general purpose time triggering operations.

Real-time clock (RTC)

The RTC provides a set of continuously running counters driven by separate clock signal derived from the main oscillator. The RTC can be used as a general timebase or

clock/calendar/alarm function. When the STR73xF is in LPWFI mode the RTC keeps running, powered by the low power voltage regulator.

UARTs

The 4 UARTs allow full duplex, asynchronous, communications with external devices with independently programmable TX and RX baud rates up to 625 Kbaud.

Buffered serial peripheral interfaces (BSPI)

Each of the three BSPIs allow full duplex, synchronous communications with external devices, master or slave communication at up to 6 Mb/s in master mode and up to 4.5 Mb/s in slave mode (@36 MHz system clock).

I^2C interfaces

The two I^2C Interfaces provide multi-master and slave functions, support normal and fast I^2C mode (400 kHz) and 7 or 10-bit addressing modes.

A/D converter

The 10-bit analog to digital converter, converts up to 16 channels in single-shot or continuous conversion modes (12 channels in 100-pin devices). The minimum conversion time is 3 µs.

Watchdog

The 16-bit watchdog timer protects the application against hardware or software failures and ensures recovery by generating a reset.

I/O ports

Up to 112 I/O ports (72 in 100-pin devices) are programmable as general purpose input/output or alternate function.

External interrupts and wake-up lines

16 external interrupts lines are available for application use. In addition, up to 32 external Wake-up lines (18 in 100-pin devices) can be used as general purpose interrupts or to wake-up the application from STOP mode.

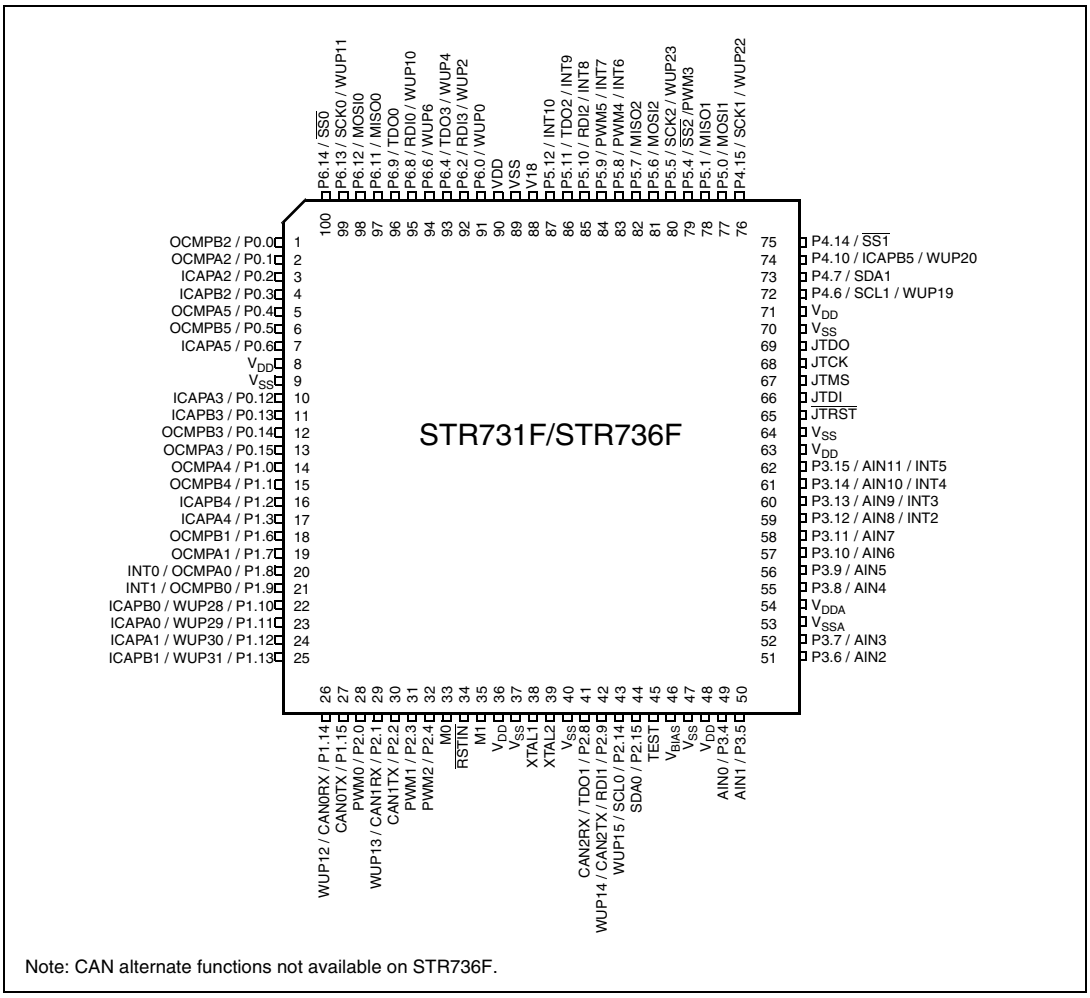
3.2.3 STR731F/STR736F (TQFP100)

Figure 4. STR731F/STR736F pin configuration (top view)



Note: CAN alternate functions not available on STR736F.

Legend / Abbreviations for *Table 4*:

Type: I = input, O = output, S = supply, HiZ= high impedance,

In/Output level: T_T= TTL 0.8 V / 2 V with input trigger
C_T= CMOS $0.3V_{DD}/0.7V_{DD}$ with input trigger

Port and control configuration:

Input: pu/pd = with internal 100 kΩ weak pull-up or pull down

Output: OD = open drain (logic level)
PP = push-pull

Interrupts:

INTx = external interrupt line

WUPx = wake-up interrupt line

The reset state (during and just after the reset) of the I/O ports is input floating (Input tristate TTL mode). To avoid excess power consumption, unused I/O ports must be tied to ground.

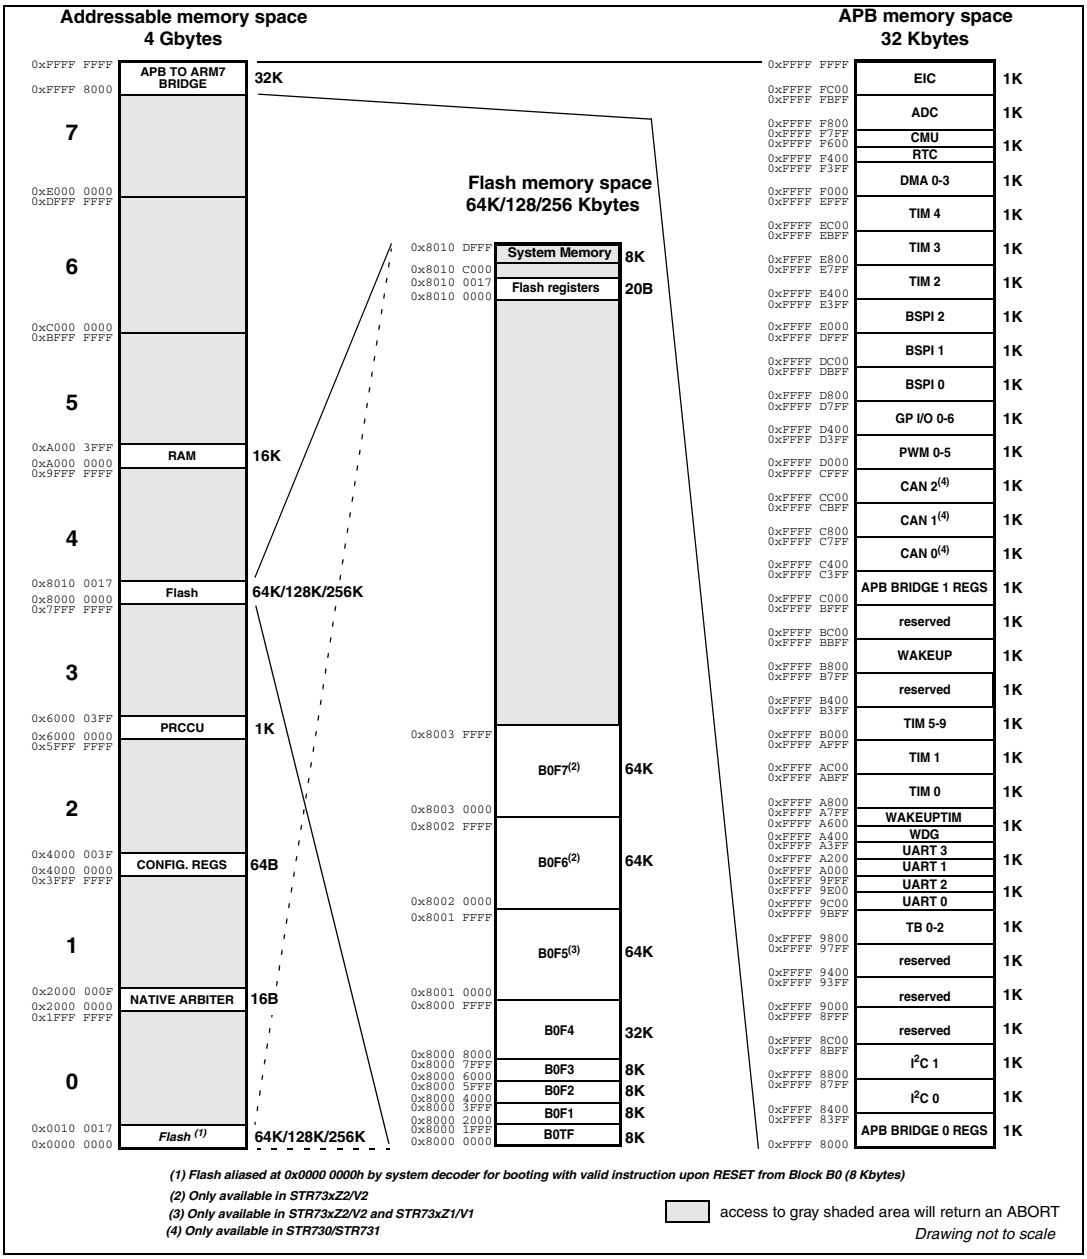
3.3 Memory mapping

Figure 5 shows the various memory configurations of the STR73xF system. The system memory map (from 0x0000_0000 to 0xFFFF_FFFF) is shown on the left part of the figure, the right part shows maps of the Flash and APB areas. For flexibility the Flash or RAM addresses can be aliased to Block 0 addresses using the remapping feature

Most reserved memory spaces (gray shaded areas in *Figure 5*) are protected from access by the user code. When an access this memory space is attempted, an ABORT signal is generated. Depending on the type of access, the ARM processor will enter “prefetch abort” state (Exception vector 0x0000_000C) or “data abort” state (Exception vector 0x0000_0010). It is up to the application software to manage these abort exceptions.

Figure 5. Memory map



4 Electrical parameters

4.1 Parameter conditions

Unless otherwise specified, all voltages are referred to V_{SS}.

4.1.1 Minimum and maximum values

Unless otherwise specified the minimum and maximum values are guaranteed in the worst conditions of ambient temperature, supply voltage and frequencies by tests in production on 100% of the devices with an ambient temperature at T_A=25° C and T_A=T_{Amax} (given by the selected temperature range).

Data based on characterization results, design simulation and/or technology characteristics are indicated in the table footnotes and are not tested in production. Based on characterization, the minimum and maximum values refer to sample tests and represent the mean value plus or minus three times the standard deviation (mean±3Σ).

4.1.2 Typical values

Unless otherwise specified, typical data are based on T_A=25° C and V_{DD}=5 V. They are given only as design guidelines and are not tested.

Typical ADC accuracy values are determined by characterization of a batch of samples from a standard diffusion lot over the full temperature range, where 95% of the devices have an error less than or equal to the value indicated (mean±2Σ).

4.1.3 Typical curves

Unless otherwise specified, all typical curves are given only as design guidelines and are not tested.

4.1.4 Loading capacitor

The loading conditions used for pin parameter measurement are shown in *Figure 6*.

4.1.5 Pin input voltage

The input voltage measurement on a pin of the device is described in *Figure 7*.

Figure 6. Pin loading conditions

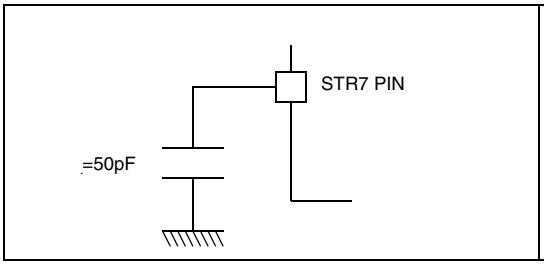


Figure 7. Pin input voltage

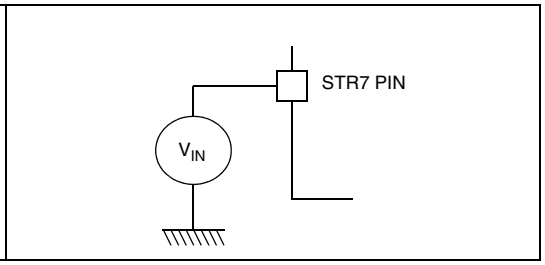

4.2 Absolute maximum ratings

Stresses above those listed as “absolute maximum ratings” may cause permanent damage to the device. This is a stress rating only and functional operation of the device under these conditions is not implied. Exposure to maximum rating conditions for extended periods may affect device reliability.

Table 5. Voltage characteristics

Symbol	Ratings	Min	Max	Unit
V_{DD} - V_{SS}	External 5 V Supply voltage	-0.3	6.0	V
V_{SSA}	Reference ground for A/D converter	V_{SS}	V_{SS}	V
V_{DDA}- V_{SSA}	Reference voltage for A/D converter	-0.3	V_{DD}+0.3	V
V_{IN}	Input voltage on any pin	-0.3	V_{DD}+0.3	
$\lvert\Delta V_{DDx}\rvert$	Variations between different 5 V power pins	-	0.3	mV
$\lvert V_{SSX}$ - $V_{SS}\rvert$	Variations between all the different ground pins	-	0.3	
$V_{ESD(HBM)}$	Electrostatic discharge voltage (Human Body Model)	see *: Absolute maximum ratings (electrical sensitivity) on page 36*		
$V_{ESD(MM)}$	Electrostatic discharge voltage (Machine Model)			

Table 6. Current characteristics

Symbol	Ratings	Max.	Unit
I_{VDD}	Total current into V_{DD} power lines (source) 1)	100	mA
I_{VSS}	Total current out of V_{SS} ground lines (sink) 1)	100	
I_{IO}	Output current sunk by any I/O and control pin	10	
	Output current source by any I/O and control pin	10	
$I_{INJ(PIN)}$ 2) & 3)	Injected current on any other pin 4) &5)	±10	
$\Sigma I_{INJ(PIN)}$ 2)	Total injected current (sum of all I/O and control pins) 4)	±75	

1. All 5 V power (V_{DD}, V_{DDA}) and ground (V_{SS}, V_{SSA}) pins must always be connected to the external 5 V supply
2. $I_{INJ(PIN)}$ must never be exceeded. This is implicitly insured if V_{IN} maximum is respected. If V_{IN} maximum cannot be respected, the injection current must be limited externally to the $I_{INJ(PIN)}$ value. A positive injection is induced by $V_{IN}>V_{DD}$ while a negative injection is induced by $V_{IN}<V_{SS}$.
3. Negative injection disturbs the analog performance of the device. See note in *Section 4.3.6: 10-bit ADC characteristics on page 43*.
4. When several inputs are submitted to a current injection, the maximum $\Sigma I_{INJ(PIN)}$ is the absolute sum of the positive and negative injected currents (instantaneous values). These results are based on characterization with $\Sigma I_{INJ(PIN)}$ maximum current injection on four I/O port pins of the device.

5.) In 144-pin devices, only +10 mA on P0.3, P1.13, P3.6 and P4.13 pins (negative injection not allowed).

Table 7. Thermal characteristics

Symbol	Ratings	Value	Unit
T_{STG}	Storage temperature range	-55 to +150	°C
T_J	Maximum junction temperature (see *Section 5.2: Thermal characteristics on page 48*)		

4.3 Operating conditions

Subject to general operating conditions for V_{DD}, and T_A.

Table 8. General operating conditions

Symbol	Parameter	Conditions	Min	Max	Unit
f_{MCLK}	Internal CPU and system clock frequency	Accessing SRAM or Flash (zero wait state Flash access up to 36 MHz)	0	36	MHz
V_{DD}	Standard Operating Voltage		4.5	5.5	V
V_{DDA}	Operating analog reference voltage with respect to ground		4.5	V_{DD}+0.1	V
T_A	Ambient temperature range	6 partnumber suffix 7 partnumber suffix	-40 -40	85 105	°C

Table 9. Operating conditions at power-up / power-down

Symbol	Parameter	Conditions	Min	Typ	Max	Unit
t_{VDD}	V_{DD} rise time rate	Subject to general operating conditions for T_A.	-	20	-	ms/V

4.3.1 Supply current characteristics

The current consumption is measured as described in *Figure 6* and *Figure 7*.

Total current consumption

The MCU is placed under the following conditions:

- All I/O pins in input mode with a static value at V_{DD} or V_{SS} (no load)
- All peripherals are disabled except if explicitly mentioned.

Subject to general operating conditions for V_{DD}, and T_A.

Table 10. Total current consumption

Symbol	Parameter	Conditions	Typ [1]	Max [2]	Unit
I_{DD}	RUN mode[3]	Formula, f_{MCLK} in MHz, RAM execution	7 + 1.9 f_{MCLK}		mA
		f_{MCLK} = 36 MHz, RAM execution	76		mA
		f_{MCLK} = 36 MHz, Flash execution	86		mA
	WFI mode	f_{OSC} = 4 MHz, f_{MCLK}= f_{OSC}/16 = 250 kHz Main voltage regulator ON, LP voltage regulator = 2 mA, RTC and WDG on, other modules off.	6.7	8	mA
	LPWFI mode	f_{RC} = high frequency (CMU_RCCTL= 0x8), f_{MCLK}= f_{RC} /16, LP voltage regulator = 2 mA, other modules off.	220	350	µA
	STOP mode	f_{OSC} = 4 MHz, RC oscillator on f_{RC} = high frequency (CMU_RCCTL= 0x0) LP voltage regulator = 6 mA, RTC and WUT ON, other modules off. Internal wake-up possible.	500	700	µA
		f_{RC} = high frequency (CMU_RCCTL= 0xF), LP voltage regulator = 2mA. WUT ON, other modules off. Internal wake-up possible.	150	220	
		LP voltage regulator = 2 mA, WIU on, Other modules off, external wake-up.	50	140	
	HALT mode	LP voltage regulator = 2 mA.	50	140	µA

1. Typical data are based on T_A=25° C, V_{DD}=5 V
2. Data based on characterization results, tested in production at V_{DD} max. and T_A = 25° C.
3. I/O in static configuration (not toggling). RUN mode is almost **independent of temperature**. On the contrary RUN mode current is **highly dependent on the application**. The I_{DDRUN} value can be significantly reduced by the application in the following ways: switch-off unused peripherals (default), reduce peripheral frequency through internal prescaler, fetch the most frequently-used functions from RAM and use low power mode when possible.

Figure 8. STOP I_{DD} vs. VDD

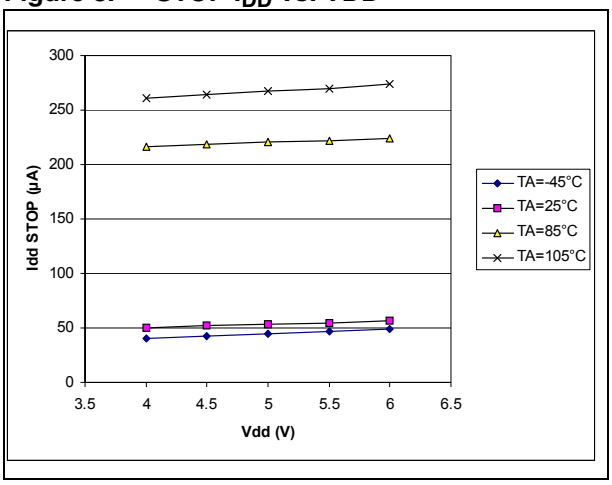

Figure 9. HALT I_{DD} vs. V_{DD}

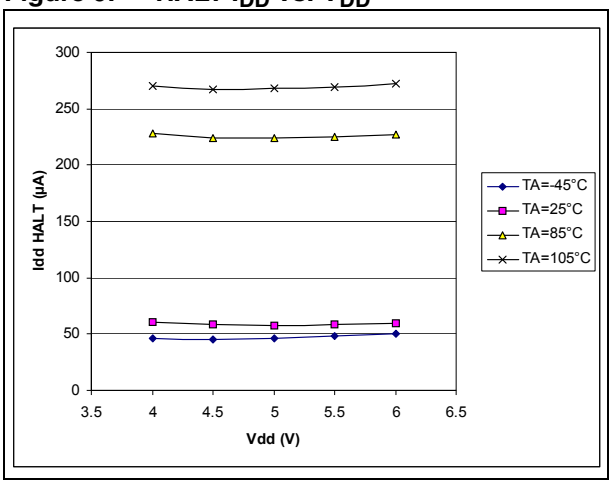

Figure 10. WFI I_{DD} vs. V_{DD}

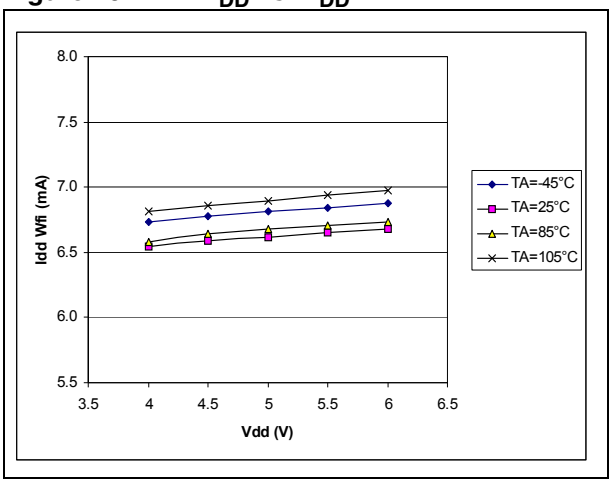

Figure 11. LPWFI I_{DD} vs. V_{DD}

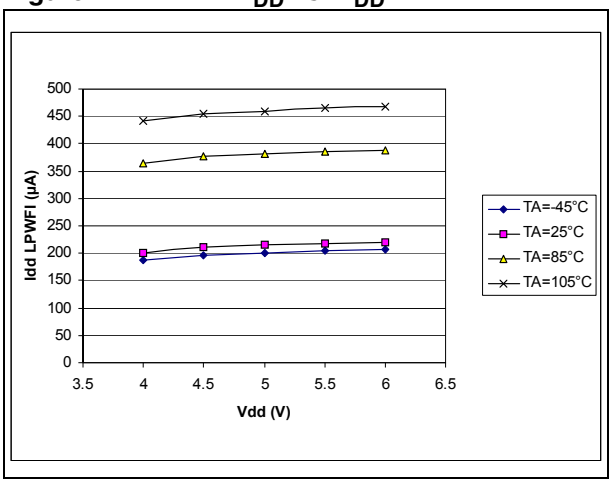


Typical application current consumption

Table 11. Typical consumption in Run mode at 25°C and 85°C

Conditions		f_{MCLK} (MHz)	f_{ADC} (MHz)	Typical I_{DD} (mA)
V_{DD}= 5.5 V, RC oscillator off, PLL on, RTC enabled, 1 Timer (TIM) running, and ADC running in scan mode.	Code executing in RAM	10	10	20
		20		29
		36	9	42
	Code executing in Flash	10	10	22
		20		32
		36	9	48

Table 12. Typical consumption in Run and low power modes at 25°C

Mode	Conditions	f_{MCLK}	Typical I_{DD}
RUN	All peripherals on, RAM execution	36 MHz	76 mA
		24 MHz	56 mA
WFI	Main voltage regulator on, Flash on, EIC on, WIU on, GPIOs on.	36 MHz	33 mA
		24 MHz	31 mA
SLOW	PLL off, main voltage regulator on	4 MHz	11 mA
	CLOCK2/16, main voltage regulator on	250 kHz	8 mA
	CLOCK2/16, main voltage regulator off	250 kHz	3 mA
	RC oscillator running in low frequency, main crystal oscillator off, main voltage regulator off	29 kHz	2.5 mA
LPWFI	CLOCK2/16, main voltage regulator off, LP voltage regulator = 2 mA, Flash in power down mode.	250 kHz	528 µA
STOP	Main voltage regulator off, RTC on, RC oscillator off, LP voltage regulator = 6 mA	-	378 µA
	Main voltage regulator off, RTC off, RC oscillator off, LP voltage regulator = 6 mA	-	83 µA
	Main voltage regulator off, RTC off, RC oscillator off, LP voltage regulator = 4 mA	-	64 µA
	Main voltage regulator off, RTC off, RC oscillator off, LP voltage regulator = 2 mA	-	44 µA
HALT	RTC off, LP voltage regulator = 2 mA	-	44 µA

On-chip peripherals

Table 13. Peripheral current consumption at T_A= 25°C

Symbol	Parameter	Conditions	Typ	Unit
$I_{DD(RC)}$	RC (backup oscillator) supply current	High frequency	120	µA
		Low frequency	60	µA
$I_{DD(TIM)}$	TIM timer supply current [1]	f_{MCLK}=36 MHz	350	µA
$I_{DD(BSPI)}$	BSPI supply current [1]		1.1	mA
$I_{DD(UART)}$	UART supply current [1]		850	µA
$I_{DD(I2C)}$	I2C supply current [1]		430	µA
$I_{DD(ADC)}$	ADC supply current when converting [2]		5	mA
$I_{DD(EIC)}$	EIC supply current		2.88	mA
$I_{DD(CAN)}$	CAN supply current [1]		2.95	mA
$I_{DD(GPIO)}$	GPIO supply current		150	µA
$I_{DD(TB)}$	TB supply current		250	µA
$I_{DD(PWM)}$	PWM supply current		240	µA
$I_{DD(RTC)}$	RTC supply current		370	µA
$I_{DD(DMA)}$	DMA supply current		2.5	mA
$I_{DD(ARB)}$	Native arbiter supply current		180	µA
$I_{DD(AHB)}$	AHB arbiter supply current		570	µA
$I_{DD(WUT)}$	WUT supply current		300	µA
$I_{DD(WIU)}$	WIU supply current		460	µA

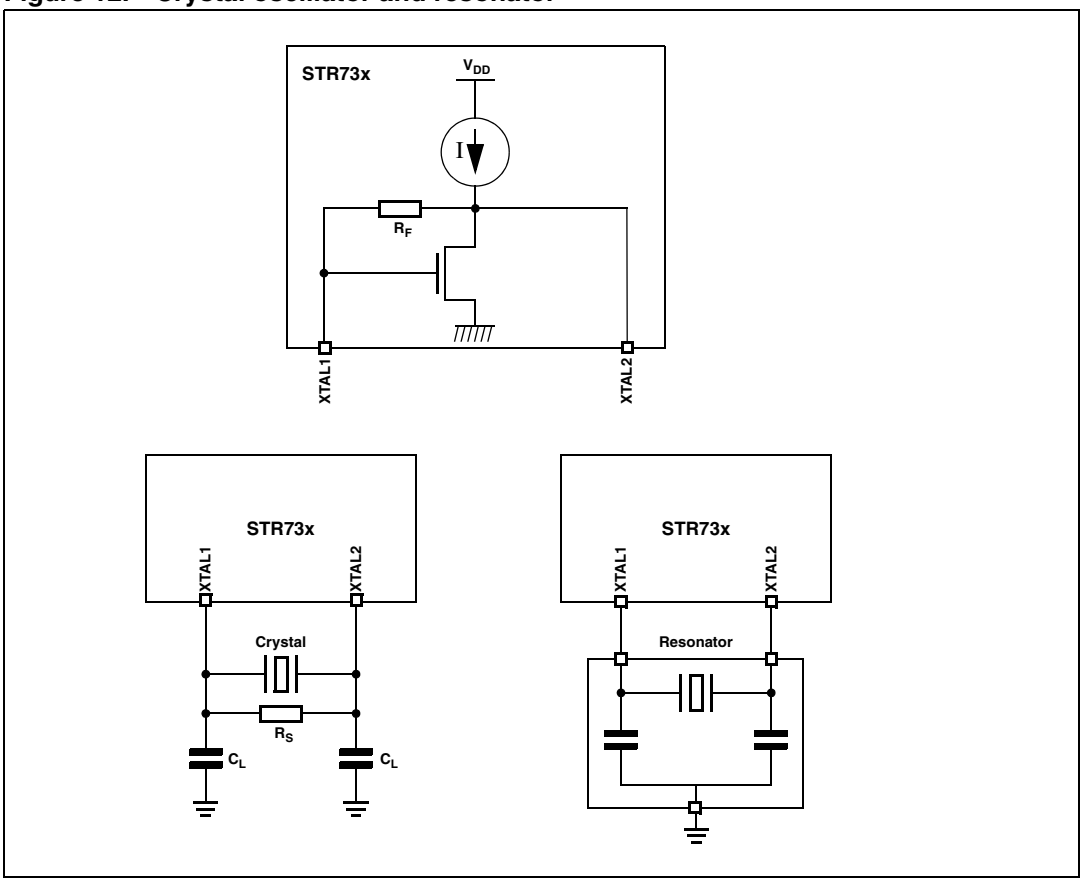
1. Data based on a differential I_{DD} measurement between the on-chip peripheral when kept under reset, not clocked and the on-chip peripheral when clocked and not kept under reset. This measurement does not include the pad toggling consumption.
2. Data based on a differential I_{DD} measurement between reset configuration and continuous A/D conversions.

4.3.2 Clock and timing characteristics

Crystal / ceramic resonator oscillator

The STR73xF can operate with a crystal oscillator or resonator clock source. *Figure 12* describes a simple model of the internal oscillator driver as well as example of connection for an oscillator or a resonator.

Figure 12. Crystal oscillator and resonator



Note: 1 XTAL2 must not be used to directly drive external circuits.

2 For test or boot purpose, XTAL2 can be used as an high impedance input pin to provide an external clock to the device. XTAL1 should be grounded, and XTAL2 connected to a wave signal generator providing a 0 to VDD signal. Directly driving XTAL2 may results in deteriorated jitter and duty cycle.

Main oscillator characteristics

V_{DD} = 5 V ± 10%, T_A = -40° C to T_{Amax}, unless otherwise specified.

Table 14. Main oscillator characteristics

Symbol	Parameter	Conditions	Value			Unit
			Min	Typ	Max	
f_{OSC}	Oscillator frequency		4		8	MHz
g_m	Oscillator transconductance		1.5		4.2	mA/V
V_{OSC} 1)	Oscillation amplitude	f_{OSC} = 4 MHz, T_A= 25° C	-	2.4	-	V
		f_{OSC} = 8 MHz, T_A= 25° C		1.-		
V_{AV} 1)	Oscillator operating point	Sine wave middle, T_A= 25° C	-	0.77	-	v

			$C_1 = C_2$ = 40 pF	135	315	-	
		f_{OSC} = 8 MHz Cp = 10 pF	$C_1 = C_2$ = 10 pF	155	340	-	
			$C_1 = C_2$ = 20 pF	210	435	-	
			$C_1 = C_2$ = 30 pF	145	335	-	
			$C_1 = C_2$ = 40 pF	100	245	-	

1. Min and max values are guaranteed by characterization, not tested in production.
2. C_P represents the total capacitance between XTAL1 and XTAL2, including the shunt capacitance of the external quartz crystal as well as the total board parasitic cross-capacitance between XTAL1 track and XTAL2 track.
3. C_1 represents the total capacitance between XTAL1 and ground, including the external capacitance tied to XTAL1 pin (C_L) as well as the total parasitic capacitance between XTAL1 track and ground (this includes application board track capacitance to ground and device pin capacitance).
4. C_2 represents the total capacitance between XTAL2 and ground, including the external capacitance tied to XTAL1 pin (C_L) as well as the total parasitic capacitance between XTAL2 track and ground (this includes application board track capacitance to ground and device pin capacitance).

RC/backup oscillator characteristics

V_{DD} = 5V ± 10%, T_A = -40°C to T_{Amax}, unless otherwise specified.

Table 15. RC oscillator characteristics

Symbol	Parameter	Conditions	Value			Unit
			Min	Typ	Max	
f_{RC}	RC frequency	High frequency mode [1]		2.35		MHz
		Low frequency mode[1]		29		kHz
f_{RCHF}	RC high frequency	CMU_RCCTL = 0x0	3			MHz
		CMU_RCCTL = 0xF			2.3	MHz
f_{RCLF}	RC low frequency	CMU_RCCTL = 0x0	35			kHz
		CMU_RCCTL = 0xF			30	kHz
f_{RCHFS}[2]	RC high frequency stability	Fixed CMU_RCCTL			10	%
f_{RCLFS}[2]	RC low frequency stability	Fixed CMU_RCCTL			23	%
t_{RCSTUP}	RC start-up time	Stable V_{DD}, f_{RC} = 2.35 MHz, T_A = 25°C		2.35		µs

1) CMU_RCCTL = 0x8

2) RC frequency shift versus average value (%)

PLL electrical characteristics

V_{DD} = 5 V ± 10%, T_A = -40° C to T_{Amax}, unless otherwise specified

Table 16. PLL characteristics

Symbol	Parameter	Conditions	Value			Unit
			Min	Typ	Max	
f_{PLLIN} (1)	PLL reference clock	FREF_RANGE = '0' FREF_RANGE = '1'	1.5 3.0		3.0 5.0	MHz
f_{PLLOUT}	PLL output clock	MX = "00" MX = "01" MX = "10" MX = "11"	20 x f_{PLLIN} 12 x f_{PLLIN} 28 x f_{PLLIN} 16 x f_{PLLIN}			MHz
f_{MCLK}	System clock	DX = 1..7	f_{PLLOUT}/DX		36	MHz
f_{FREE} (2)	PLL free running frequency	FREF_RANGE = '0', MX0 = '1' FREF_RANGE = '0', MX0 = '0' FREF_RANGE = '1', MX0 = '1' FREF_RANGE = '1', MX0 = '0'		120 240 240 480		kHz
t_{LOCK} (3)	PLL lock time	Stable oscillator (f_{PLLIN} = 4 MHz), stable V_{DD}		100	300	µs
Δt_{PKJIT}	PLL jitter (pk to pk)	f_{PLLIN} = 4 MHz (pulse generator)			1.5	ns

1. f_{PLLIN} is obtained from f_{OSC} directly or through an optional divider by 2.
2. Typical data are based on T_A=25°C, V_{DD}=5V
3. Max value is guaranteed by characterization, not tested in production.

Table 17. Low-power mode wake-up timing

Symbol	Parameter	Conditions	Typ	Unit
t_{WUHALT}	Wake-up from HALT mode		200	µs
t_{WUSTOP}	Wake-up from STOP mode	RC high frequency in STOP mode	180	µs
		RC low frequency in STOP mode	234	µs
$t_{WULPWFI}$ 1)	Wake-up from LPWFI mode	Main voltage regulator on RC oscillator off f_{OSC} = 4 MHz, f_{MCLK}= f_{OSC}/16 RAM or FLASH execution	27	µs
		Main voltage regulator on RC oscillator = high frequency Flash execution	46	µs
		Main voltage regulator on RC oscillator = low frequency Flash execution	3.6	ms

1. Flash memory programmed to enter Power Down mode during LPWFI.

4.3.3 Memory characteristics

Flash memory

Table 18. Flash memory characteristics

Symbol	Parameter	Test Conditions	Value			Unit
			Min	Typ	Max[1)]	
t_{WP}	Word program (32-bit)			35	80	µs
t_{DWP}	Double word program(64-bit)			64	150	µs
t_{BP64}	Bank program (64 K)	Double word program		0.5	1.25	s
t_{BP128}	Bank program (128 K)	Double word program		1	2.5	s
t_{BP256}	Bank program (256 K)	Double word program		2	4.9	s

t_{PSL}[3)]	Program suspend latency				10	µs
t_{ESL}[3)]	Erase suspend latency				30	µs
t_{ESR}[3)]	Erase suspend rate	Min. time from erase resume to next erase suspend		20	20	ms
t_{SP}[3)]	Set protection			40	170	µs
t_{FPW}[3)]	First word program			1		ms
N_{END}	Endurance		10			kcycles
t_{RET}	Data retention	T_A = 85° C	20			Years

1. T_A = -45° C after 0 cycles, Guaranteed by characterization, not tested in production.
2. All bits programmed to 0.
3. Guaranteed by design, not tested in production.

4.3.4 EMC characteristics

Susceptibility tests are performed on a sample basis during product characterization.

Functional EMS (electromagnetic susceptibility)

Based on a simple running application on the product (toggling 2 LEDs through I/O ports), the product is stressed by two electromagnetic events until a failure occurs (indicated by the LEDs).

- **ESD**: Electrostatic discharge (positive and negative) is applied on all pins of the device until a functional disturbance occurs. This test conforms with the IEC 1000-4-2 standard.
- **FTB**: A burst of fast transient voltage (positive and negative) is applied to V_{DD} and V_{SS} through a 100 pF capacitor, until a functional disturbance occurs. This test conforms with the IEC 1000-4-4 standard.

A device reset allows normal operations to be resumed. The test results are given in the table below based on the EMS levels and classes defined in application note AN1709.

Designing hardened software to avoid noise problems

EMC characterization and optimization are performed at component level with a typical application environment and simplified MCU software. It should be noted that good EMC performance is highly dependent on the user application and the software in particular.

Therefore it is recommended that the user applies EMC software optimization and prequalification tests in relation with the EMC level requested for his application.

Software recommendations:

The software flowchart must include the management of runaway conditions such as:

- Corrupted program counter
- Unexpected reset
- Critical data corruption (control registers...)

Prequalification trials:

Most of the common failures (unexpected reset and program counter corruption) can be reproduced by manually forcing a low state on the RESET pin or the oscillator pins for 1 second.

To complete these trials, ESD stress can be applied directly on the device, over the range of specification values. When unexpected behavior is detected, the software can be hardened to prevent unrecoverable errors occurring (see application note AN1015).

Table 19. EMS data

Symbol	Parameter	Conditions	Level/ Class
V_{FESD}	Voltage limits to be applied on any I/O pin to induce a functional disturbance	V_{DD}=5 V, T_A=+25° C, f_{MCLK}=36 MHz conforms to IEC 1000-4-2	4A
V_{EFTB}	Fast transient voltage burst limits to be applied through 100 pF on V_{DD} and V_{SS} pins to induce a functional disturbance	V_{DD}=5 V, T_A=+25° C, f_{MCLK}=36 MHz conforms to IEC 1000-4-4	4A

Electromagnetic interference (EMI)

Based on a simple application running on the product (toggling 2 LEDs through the I/O ports), the product is monitored in terms of emission. This emission test is in line with the norm SAE J 1752/3 which specifies the board and the loading of each pin.

Table 20. EMI data

Symbol	Parameter	Conditions	Monitored frequency band	Max vs. [f_{OSC4M}/f_{MCLK}]		Unit
				6/36 MHz	8/8 MHz	
S_{EMI}	Peak level	V_{DD}=5.0V, T_A=+25°C, All packages	0.1 MHz to 30 MHz	23	30	dBµV
			30 MHz to 130 MHz	37	34	
			130 MHz to 1 GHz	20	7	
			SAE EMI Level	4	3.5	-

Absolute maximum ratings (electrical sensitivity)

Based on three different tests (ESD, LU and DLU) using specific measurement methods, the product is stressed in order to determine its performance in terms of electrical sensitivity. For more details, refer to the application note AN1181.

Electrostatic discharge (ESD)

Electrostatic discharges (a positive then a negative pulse separated by 1 second) are applied to the pins of each sample according to each pin combination. The sample size depends on the number of supply pins in the device (3 parts*(n+1) supply pin). Two models can be simulated: human body model and machine model. This test conforms to the JESD22-A114A/A115A standard.

Table 21. ESD Absolute Maximum ratings

Symbol	Ratings	Conditions	Maximum value [1]	Unit
$V_{ESD(HBM)}$	Electrostatic discharge voltage (human body model)	T_A=+25° C	2000	V
$V_{ESD(MM)}$	Electrostatic discharge voltage (machine model)		200	
$V_{ESD(CDM)}$	Electrostatic discharge voltage (charge device model)		750 on corner pins, 500 on others	

Notes:

1. Data based on characterization results, not tested in production.

Static and dynamic latch-up

- **LU**: 3 complementary static tests are required on 10 parts to assess the latch-up performance. A supply overvoltage (applied to each power supply pin) and a current injection (applied to each input, output and configurable I/O pin) are performed on each

sample. This test conforms to the EIA/JESD 78 IC latch-up standard. For more details, refer to the application note AN1181.

- **DLU**: Electrostatic discharges (one positive then one negative test) are applied to each pin of 3 samples when the micro is running to assess the latch-up performance in dynamic mode. Power supplies are set to the typical values, the oscillator is connected as near as possible to the pins of the micro and the component is put in reset mode. This test conforms to the IEC1000-4-2 and SAEJ1752/3 standards. For more details, refer to the application note AN1181.

Table 22. Electrical sensitivities

Symbol	Parameter	Conditions	Class [1]
LU	Static latch-up class	T_A=+25°C T_A=+85°C T_A=+105°C	A A A
DLU	Dynamic latch-up class	V_{DD}= 5.5 V, f_{OSC4M} = 4 MHz, f_{MCLK} = 32 MHz, T_A = +25° C	A

1. Class description: A Class is an STMicroelectronics internal specification. All its limits are higher than the JEDEC specifications, that means when a device belongs to Class A it exceeds the JEDEC standard. B Class strictly covers all the JEDEC criteria (international standard).

4.3.5 I/O port pin characteristics

General characteristics

Subject to general operating conditions for V_{DD} and T_A unless otherwise specified.

Table 23. I/O static characteristics

Symbol	Parameter	Conditions	Min	Typ	Max	Unit
V_{IL}	Input low level voltage [1]	TTL ports			0.8	V
V_{IH}	Input high level voltage [1]		2.0			
$I_{INJ(PIN)}$	Injected current on any I/O pin				±10	mA
$\Sigma I_{INJ(PIN)}$ [2]	Total injected current (sum of all I/O and control pins)				±75	mA
I_{lkg}	Input leakage current [3]	$V_{SS} \leq V_{IN} \leq V_{DD}$			±1	µA
I_S	Static current consumption [4]	Floating input mode		200		µA
R_{PU}	Weak pull-up equivalent resistor[5]	$V_{IN}=V_{SS}$	55	120	220	kΩ
R_{PD}	Weak pull-down equivalent resistor[5]	$V_{IN}=V_{DD}$	55	120	220	kΩ
C_{IO}	I/O pin capacitance			5		pF

1. Data based on characterization results, not tested in production.
2. When the current limitation is not possible, the V_{IN} absolute maximum rating must be respected, otherwise refer to $I_{INJ(PIN)}$ specification. A positive injection is induced by $V_{IN}>V_{33}$ while a negative injection is induced by $V_{IN}<V_{SS}$. Refer to *Section 4.2 on page 22* for more details.
3. Leakage could be higher than max. if negative current is injected on adjacent pins.
4. Configuration not recommended, all unused pins must be kept at a fixed voltage: using the output mode of the I/O for example or an external pull-up or pull-down resistor. Data based on design simulation and/or technology characteristics, not tested in production.
6. The R_{PU} pull-up and R_{PD} pull-down equivalent resistor are based on a resistive transistor (corresponding I_{PU} and I_{PD} current characteristics described in *Figure 19*).

Output driving current

Subject to general operating conditions for V_{DD} and T_A unless otherwise specified.

Table 24. Output driving current

I/O Type	Symbol	Parameter	Conditions	Min	Max	Unit
Standard	V_{OL} 1)	Output low level voltage for an I/O pin when 8 pins are sunk at same time	I_{IO}=+2 mA		0.4	V
	V_{OH} 2)	Output high level voltage for an I/O pin when 4 pins are sourced at same time	I_{IO}=-2 mA	V_{DD}-0.8		
Med. Current (JTDO)	V_{OL} 1)	Output low level voltage for an I/O pin	I_{IO}=+6 mA		0.4	
	V_{OH} 2)	Output high level voltage for an I/O pin	I_{IO}=-6 mA	V_{DD}-0.8		
High Current P6.0	V_{OL} 1)	Output low level voltage for an I/O pin	I_{IO}=+8 mA		0.4	
	V_{OH} 2)	Output high level voltage for an I/O pin	I_{IO}=-8 mA	V_{DD}-0.8		

1. The I_{IO} current sunk must always respect the absolute maximum rating specified in *Table 6* and the sum of I_{IO} (I/O ports and control pins) must not exceed I_{VSS}.
2. The I_{IO} current sourced must always respect the absolute maximum rating specified in *Table 6* and the sum of I_{IO} (I/O ports and control pins) must not exceed IV_{DD}.

Figure 13. V_{OH} standard ports vs I_{OH} @ V_{DD} 5V T_A -45° C

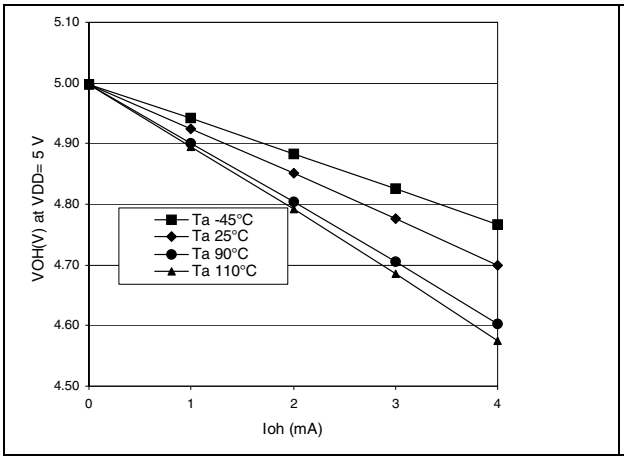

Figure 14. V_{OL} standard ports vs I_{OL} @ V_{DD} 5 V

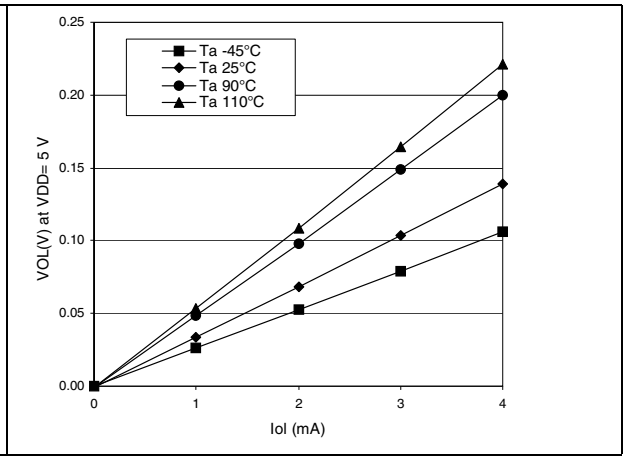

Figure 15. V_{OH} JTDO pin vs I_{OL} @ V_{DD} 5 V

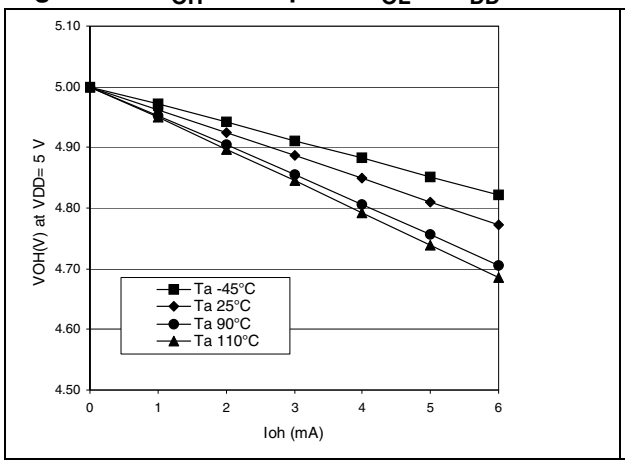

Figure 16. V_{OL} JTDO pin vs I_{OL} @ V_{DD} 5 V

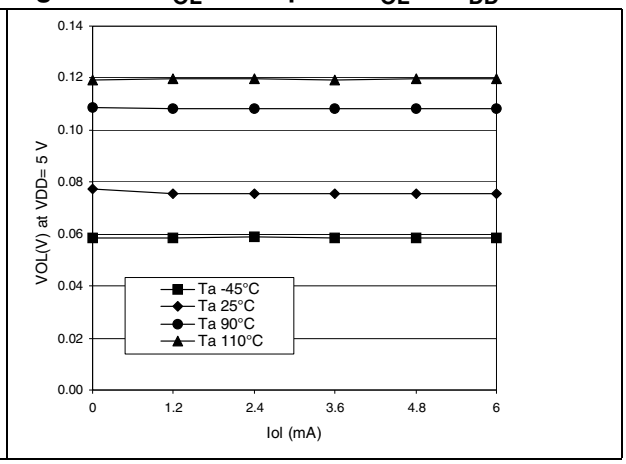

Figure 17. V_{OH} P6.0 pin vs I_{OL} @ V_{DD} 5 V

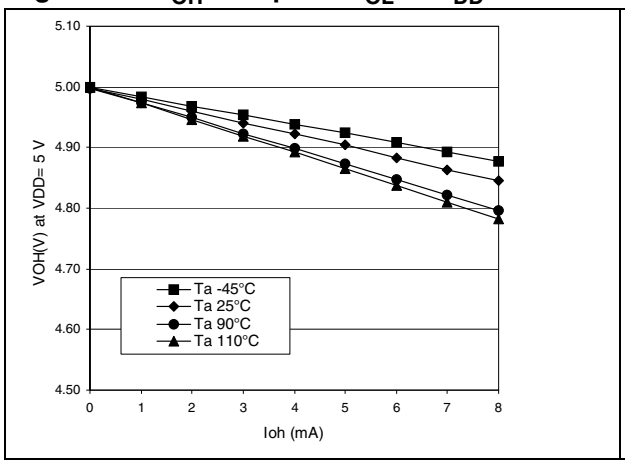

Figure 18. V_{OL} P6.0 pin vs I_{OL} @ V_{DD} 5 V

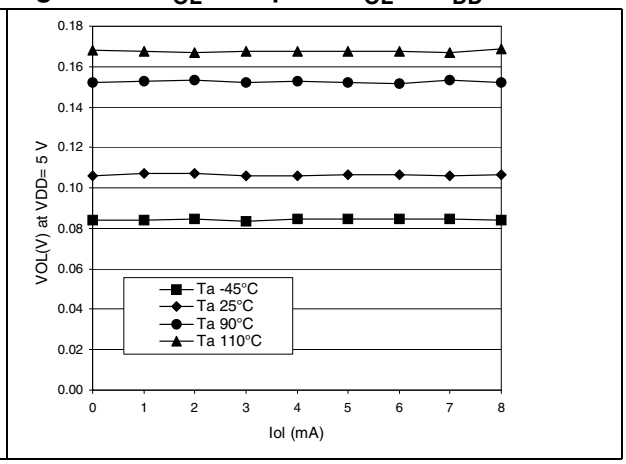


NRSTIN pin

The NRSTIN pin input driver is CMOS. A permanent pull-up is present which is the same as R_{PU} (see *: General characteristics on page 38*)

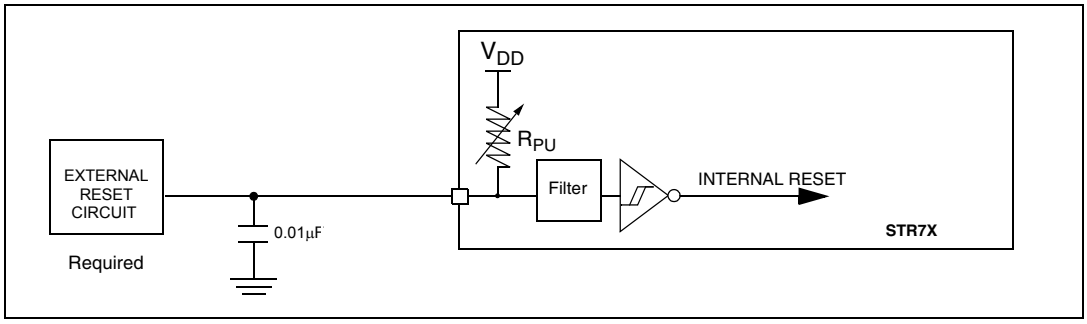
Subject to general operating conditions for V_{DD} and T_A unless otherwise specified.

Table 25. Reset pin characteristics

Symbol	Parameter	Conditions	Min	Typ [1]	Max	Unit
$V_{IL(NRSTIN)}$	NRSTIN Input low level voltage [1]				0.3 V_{DD}	V
$V_{IH(NRSTIN)}$	NRSTIN Input high level voltage [1]		0.7 V_{DD}			
$V_{hys(NRSTIN)}$	NRSTIN Schmitt trigger voltage hysteresis [2]			800		mV
$V_{F(RSTINn)}$	NRSTIN Input filtered pulse[3]				500	ns
$V_{NF(RSTINn)}$	NRSTIN Input not filtered pulse[3]		2			µs
$V_{RP(RSTINn)}$	NRSTIN removal after Power-up[3]		100			µs

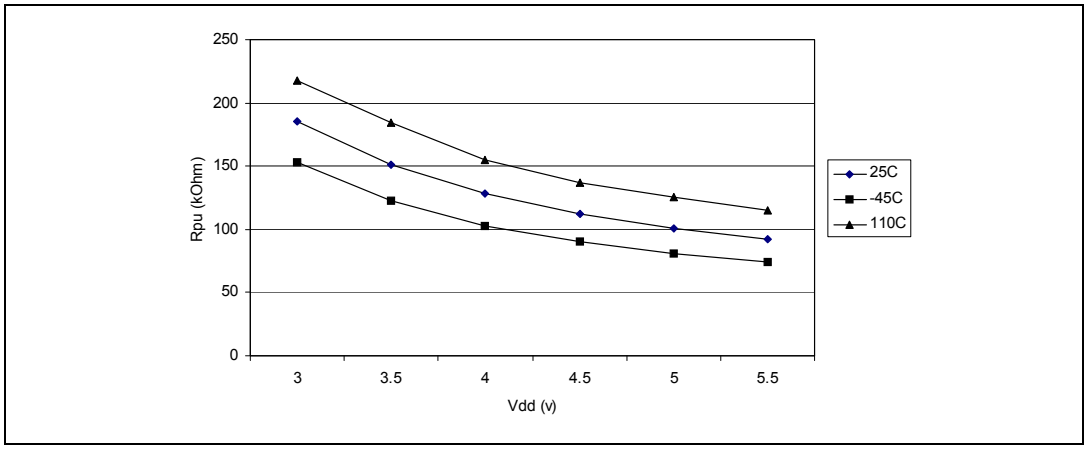
1. Data based on characterization results, not tested in production.
2. Hysteresis voltage between Schmitt trigger switching levels.
3. Data guaranteed by design, not tested in production.

Figure 19. Recommended NRSTIN pin protection[1]



1. The R_{PU} pull-up equivalent resistor is based on a resistive transistor.
2. The reset network protects the device against parasitic resets.
3. The user must ensure that the level on the NRSTIN pin can go below the $V_{IL(NRSTIN)}$ max. level specified in *Table 25*. Otherwise the reset will not be taken into account internally.

Figure 20. NRSTIN R_{PU} vs. V_{DD}



4.3.6 10-bit ADC characteristics

Subject to general operating conditions for V_{DDA}, f_{MCLK}, and T_A unless otherwise specified.

Table 26. ADC characteristics

Symbol	Parameter	Conditions	Min	Typ [1]	Max	Unit
f_{ADC}			0.4		10	MHz
V_{AIN}	Conversion voltage range [2]		V_{SSA}		V_{DDA}	V
I_{lkg}	Negative input leakage current on analog pins	$V_{IN}<V_{SS,}$ | I_{IN} |< 400 µA on adjacent analog pin		5	6	µA
C_{ADC}	Internal sample and hold capacitor				3.5	pF
t_{CAL} [2]	Calibration time	f_{ADC} = 10 MHz	580.2			µs
			5802			$1/f_{ADC}$
t_S [3]	Sampling time	f_{ADC} = 10 MHz	1		14	µs
t_{CONV}	Total conversion time (including sampling time)	f_{ADC} = 10 MHz	3			µs
			30 (10 for sampling +20 for successive approximation)			$1/f_{ADC}$
I_{ADC}	Running mode	Normal mode			5	mA
	Power-down mode				1	µA

1. Unless otherwise specified, typical data are based on T_A=25°C and V_{DDA}-V_{SS}=5.0V. They are given only as design guidelines and are not tested.
2. Calibration is recommended once after each power-up.
3. During the sample time the input capacitance C_{AIN} (6.8 max) can be charged/discharged by the external source. The internal resistance of the analog source must allow the capacitance to reach its final voltage level within t_S. After the end of the sample time t_S, changes of the analog input voltage have no effect on the conversion result. Values for the sample clock t_S depend on programming.

Table 27. ADC accuracy with f_{MCLK} = 20 MHz, f_{ADC}=10 MHz, R_{AIN} < 10 kΩ RAIN, V_{DDA}=5 V. This assumes that the ADC is calibrated[2)]

Symbol	Parameter	Conditions	Typ	Max	Unit
$\|E_T\|$	Total unadjusted error [1)]		1.0	2.0	LSB
$\|E_O\|$	Offset error [1)]		0.15	1.0	
$\|E_G\|$	Gain error [1)]		0.97	1.1	
$\|E_D\|$	Differential linearity error[1)]		0.7	1.0	
$\|E_L\|$	Integral linearity error [1)]		0.76	1.5	

1. ADC accuracy vs. negative injection current: Injecting negative current on any of the standard (non-robust) analog input pins should be avoided as this significantly reduces the accuracy of the conversion being performed on another analog input. It is recommended to add a Schottky diode (pin to ground) to standard analog pins which may potentially inject negative current. The effect of negative injection current on robust pins is specified in *Section 4.3.5*.
   Any positive injection current within the limits specified for $I_{INJ(PIN)}$ and $\Sigma I_{INJ(PIN)}$ in *Section 4.3.5* does not affect the ADC accuracy.
2. Calibration is needed once after each power-up.

Figure 21. ADC accuracy characteristics

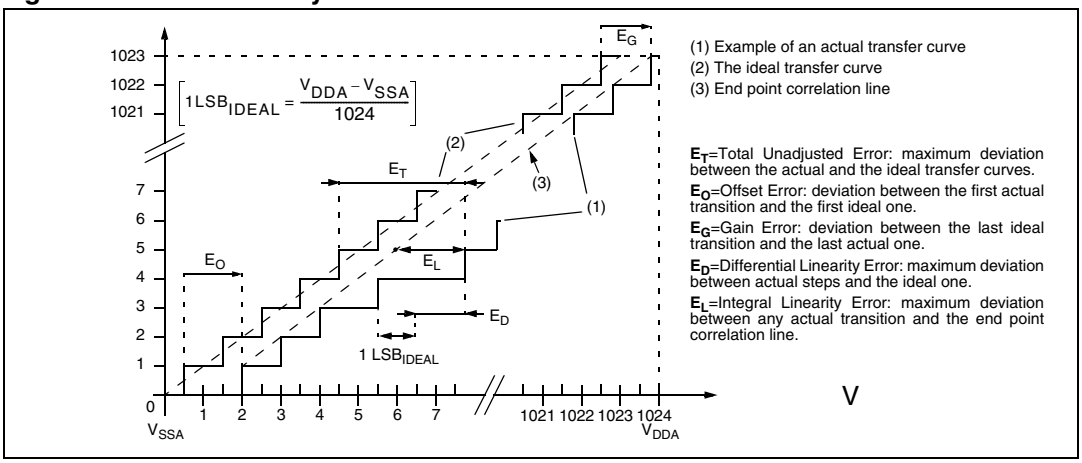


Figure 22. Typical application with ADC

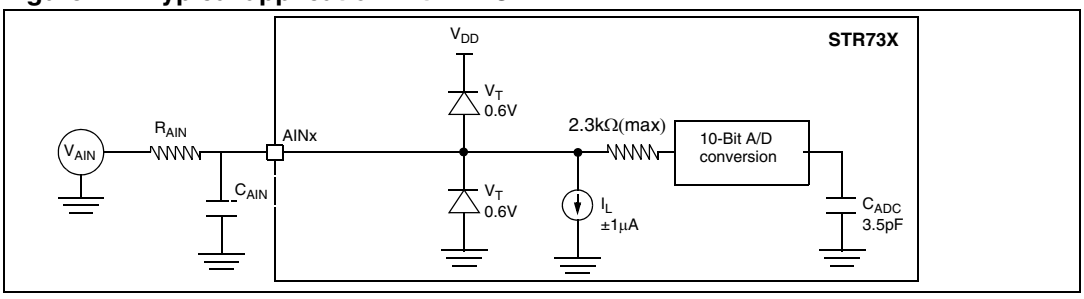

Analog power supply and reference pins

The V_{DDA} and V_{SSA} pins are the analog power supply of the A/D converter cell. They act as the high and low reference voltages for the conversion.

Separation of the digital and analog power pins allow board designers to improve A/D performance. Conversion accuracy can be impacted by voltage drops and noise in the event of heavily loaded or badly decoupled power supply lines (see*: General PCB design guidelines*).

General PCB design guidelines

To obtain best results, some general design and layout rules should be followed when designing the application PCB to shield the noise-sensitive, analog physical interface from noise-generating CMOS logic signals.

- Use separate digital and analog planes. The analog ground plane should be connected to the digital ground plane via a single point on the PCB.
- Filter power to the analog power planes. It is recommended to connect capacitors, with good high frequency characteristics, between the power and ground lines, placing 0.1 µF and optionally, if needed 10 pF capacitors as close as possible to the STR7 power supply pins and a 1 to 10 µF capacitor close to the power source (see *Figure 23*).
- The analog and digital power supplies should be connected in a star network. Do not use a resistor, as V_{DDA} is used as a reference voltage by the A/D converter and any resistance would cause a voltage drop and a loss of accuracy.
- Properly place components and route the signal traces on the PCB to shield the analog inputs. Analog signals paths should run over the analog ground plane and be as short as possible. Isolate analog signals from digital signals that may switch while the analog inputs are being sampled by the A/D converter. Do not toggle digital outputs near the A/D input being converted.

Software filtering of spurious conversion results

For EMC performance reasons, it is recommended to filter A/D conversion outliers using software filtering techniques.

Figure 23. Power supply filtering

5.2 Thermal characteristics

The average chip-junction temperature, T_J, in degrees Celsius, may be calculated using the following equation:

$$T_J = T_A + (P_D \times \Theta_{JA}) \quad (1)$$

Where:

- T_A is the ambient temperature in °C,
- Θ_{JA} is the package junction-to-ambient thermal resistance, in °C/W,
- P_D is the sum of P_{INT} and $P_{I/O}$ ($P_D = P_{INT} + P_{I/O}$),
- P_{INT} is the product of I_{DD} and V_{DD}, expressed in Watts. This is the chip internal power,
- $P_{I/O}$ represents the power dissipation on input and output pins; user determined.

Most of the time for the applications $P_{I/O} < P_{INT}$ and may be neglected. On the other hand, $P_{I/O}$ may be significant if the device is configured to drive continuously external modules and/or memories.

An approximate relationship between P_D and T_J (if $P_{I/O}$ is neglected) is given by:

$$P_D = K / (T_J + 273°C) \quad (2)$$

Therefore (solving equations 1 and 2):

$$K = P_D \times (T_A + 273°C) + \Theta_{JA} \times P_D^2 \quad (3)$$

Where:

- K is a constant for the particular part, which may be determined from equation (3) by measuring P_D (at equilibrium) for a known T_A. Using this value of K, the values of P_D and T_J may be obtained by solving equations (1) and (2) iteratively for any value of T_A

Table 28. Thermal characteristics

7 Known limitations

7.1 Low power wait for interrupt mode

When the STR73x device is put in Low Power Wait For Interrupt mode (LPWFI), the Flash goes into low power mode or power down mode, depending on the setting of the PWD bit in the Flash Control Register 0 (default is '0', Low Power mode). This default mode can create excessive voltage conditions on the transistor gates and may affect the long term behavior of the Low Power mode circuitry.

Workaround

There is no workaround. If Low Power Wait For Interrupt mode is used, it is strongly suggested to configure the Flash to enter power down mode (bit PWD = '1').

7.2 PLL free running mode at high temperature

When the STR73x device is operated and an ambient temperature (T_A) of more than 55° C and the main system clock (f_{MCLK}) is sourced by the PLL in free running mode, the device may not work properly.

Workaround

At high temperature (more than 55° C), it is recommended to use the internal RC oscillator as a backup clock source rather than the PLL free running mode.

8 Revision history

Table 30. Document revision history

Date	Revision	Description of changes
19-Sep-2005	1	First release
02-Nov-2005	2	Removed Table 8 power consumption in LP modes Updated PLL frequency in *Section 1.1* and *Table 12*
08-Mar-2006	3	*Section 3.4: Preliminary power consumption data* updated *Section 3.5: DC electrical characteristics* updated *Section 7: Known limitations* added
04-Jun-2006	4	*Section 4: Electrical parameters* updated *Section 7: Known limitations* updated Added temperature range -40°C to 85°C in *Section 6: Order codes*
19-Jun-2006	5	Changed Flash data retention to 20 years at 85°C in *Table 18 on page 34*.
08-Sep-2006	6	Changed *Table 24: Output driving current on page 39* Added *Figure 14: VOL standard ports vs IOL @ VDD 5 V* thru *Figure 18: VOL P6.0 pin vs IOL @ VDD 5 V on page 40*. Added *Figure 20: NRSTIN RPU vs. VDD*
08-Jun-2008	7	Inch values rounded to 4 decimal digits in *Section 5.1: Package mechanical data* Modified BSPI speed in *Section 2.1: On-chip peripherals*
