Clock Generator for Intel® Eaglelake Chipset

Features

- Compliant to Intel® CK505
- Low power push-pull type differential output buffers
- Integrated voltage regulator
- Integrated resistors on differential clocks
- Scalable low voltage VDD_IO (3.3V to 1.05V)
- Differential CPU clocks with selectable frequency
- 100 MHz Differential SRC clocks
- 96 MHz Differential DOT clock
- 48 MHz USB clocks
- 33 MHz PCI clock
- 25MHz Free run for WOL
- Selectable 25MHz/24.576MHz output
- Buffered Reference Clock 14.318 MHz
- Low-voltage frequency select input
- I^2C support with readback capabilities
- Triangular Spread Spectrum profile for maximum electromagnetic interference (EMI) reduction
- 3.3V Power supply
- 56-pin TSSOP packages

56-TSSOP Pin Definitions

Pin No.	Name	Type	Description
1	PCI_0/ CR#_A	I/O, SE	33 MHz clock/3.3V CR# Input mappable via I2C to control either SRC 0 or SRC 2. Default PCI_0
2	VDD_PCI	PWR	3.3V Power supply for PCI PLL.
3	PCI_1/ CR#_B	I/O, SE	33 MHz clock/3.3V CR# Input mappable via I2C to control either SRC 1 or SRC 4. Default PCI_1.
4	PCI_2	O, SE	33 MHz clock.
5	PCI_3	O, SE,	33 MHz clock.
6	PCI4 /SRC5_EN	I/O, SE	33 MHz clock output/3.3V-tolerant input for SRC enable (Sampled on CKPWRGD assertion) 1 = SRC5, 0 =CPU_STOP#/PCI_STOP#
7	PCIF_0/ITP_EN	I/O, SE	3.3V LVTTL input to enable SRC8 or CPU2_ITP/33 MHz clock output. (sampled on the CK_PWRGD assertion) 1 = CPU2_ITP, 0 = SRC8
8	VSS_PCI	GND	Ground for outputs.
9	VDD_48	PWR	3.3V Power supply for outputs and PLL.
10	USB_48/FSA	I/O	3.3V tolerant input for CPU frequency selection/fixed 48 MHz clock output. *Refer to DC Electrical Specifications table for Vil_FS and Vih_FS specifications.*
11	VSS_48	GND	Ground for outputs.
12	VDD_IO	PWR	3.3V-1.05V Power supply for outputs.
13	SRC0/DOT96T	O, DIF	100 MHz Differential serial reference clocks/Fixed 96 MHz clock output. Selected via I2C default is SRC0.
14	SRC0#/DOT96#	O, DIF	100 MHz Differential serial reference clocks/Fixed 96 MHz clock output. Selected via I2C default is SRC0.
15	VSS_IO	GND	Ground for PLL2.
16	VDD_PLL3	PWR	3.3V Power supply for PLL3
17	SRC1/25M0_F	O, SE	100 MHz Differential serial reference clocks/ Free run 25MHz clock output
18	SRC1#/25M1_24.576M	O, SE	100 MHz Differential serial reference clocks/ 25MHz clock output/24.576MHz clock output
19	VSS_PLL3	GND	Ground for PLL3.
20	VDD_PLL3_IO	PWR	3.3V-1.05V power supply for PLL3
21	SRC2_SATA	O, DIF	100 MHz Differential serial reference clocks.
22	SRC2#_SATA#	O, DIF	100 MHz Differential serial reference clocks.
23	VSS_SRC	GND	Ground for outputs.
24	SRC3/ CR#_C	I/O, Dif	100-MHz Differential serial reference clocks / 3.3V CR#_C, input, mappable via I2C to control either SRC 0 or SRC 2. Default SRC3
25	SRC3#/ CR#_D	I/O, Dif	100-MHz Differential serial reference clocks / 3.3V CR#_D input, mappable via I2C to control either SRC 1 or SRC 4. Default SRC3
26	VDD_SRC_IO	PWR	3.3V-1.05V power supply for SRC outputs.
27	SRC4	O, DIF	100 MHz Differential serial reference clocks.
28	SRC4#	O, DIF	100 MHz Differential serial reference clocks.
29	CPU_STOP#/SRC5#	I/O, Dif	3.3V tolerant input for stopping CPU outputs./100 MHz Differential serial reference clocks. The option is selected by SRC5_EN
30	PCI_STOP#/SRC5	I/O, Dif	3.3V tolerant input for stopping PCI and SRC outputs./100 MHz Differential serial reference clocks.The option is selected by SRC5_EN
31	VDD_SRC	PWR	3.3V Power supply for SRC PLL.

56-TSSOP Pin Definitions

Pin No.	Name	Type	Description
32	SRC6#	O, DIF	100 MHz Differential serial reference clocks.
33	SRC6	O, DIF	100 MHz Differential serial reference clocks.
34	VSS_SRC	GND	Ground for outputs.
35	SRC7#/ CR#_E	I/O, Dif	100 MHz Differential serial reference clocks/3.3V CR#_E Input controlling SRC6. Default SRC7.
36	SRC7/ CR#_F	I/O, Dif	100 MHz Differential serial reference clocks/3.3V OE#8 Input controlling SRC8. Default SRC7.
37	VDD_SRC_IO	PWR	3.3V-1.05V power supply for SRC outputs.
38	SRC8#/CPUC2_ITP#	O, DIF	Selectable differential CPU or SRC clock output. ITP_EN = 0 @ CK_PWRGD assertion = SRC8 ITP_EN = 1 @ CK_PWRGD assertion = CPU2 *Note: CPU2 is an iAMT clock in iAMT mode depending on the configuration set in Byte 11 Bit3:2.*
39	SRC8/CPUT2_ITP	O, DIF	Selectable differential CPU or SRC clock output. ITP_EN = 0 @ CK_PWRGD assertion = SRC8 ITP_EN = 1 @ CK_PWRGD assertion = CPU2 *Note: CPU2 is an iAMT clock in iAMT mode depending on the configuration set in Byte 11 Bit3:2.*
40	SEL_24.576M	I, PD	Select 25M1_24.576M output and SRC1 0 = 25M1, M= SRC1, 1 = 24.576M
41	VDD_CPU_IO	PWR	3.3V-1.05V power supply for CPU outputs.
42	CPU1#	O, DIF	Differential CPU clock outputs. *Note: CPU1 is an iAMT clock in iAMT mode depending on the configuration set in Byte 11 Bit3:2.*
43	CPU1	O, DIF	Differential CPU clock outputs. *Note: CPU1 is an iAMT clock in iAMT mode depending on the configuration set in Byte 11 Bit3:2.*
44	VSS_CPU	GND	Ground for outputs.
45	CPU0#	O, DIF	Differential CPU clock outputs.
46	CPU0	O, DIF	Differential CPU clock outputs.
47	VDD_CPU	PWR	3.3V Power supply for CPU PLL.
48	CK_PWRGD/PWRDWN#	I	3.3V LVTTL input. This pin is a level sensitive strobe used to latch the FS_A, FS_B, FS_C, and ITP_EN. After CK_PWRGD (active HIGH) assertion, this pin becomes a real-time input for asserting power down (active LOW).
49	FSB/TEST_MODE	I	3.3V tolerant input for CPU frequency selection. Selects Ref/N or Tri-state when in test mode 0 = Tri-state, 1 = Ref/N. *Refer to DC Electrical Specifications table for Vil_FS and Vih_FS specifications.*
50	VSS_REF	GND	Ground for outputs.
51	XTAL_OUT	O, SE	14.318 MHz Crystal output.
52	XTAL_IN	I	14.318 MHz Crystal input.
53	VDD_REF	PWR	3.3V Power supply for outputs and also maintains SMBUS registers during power-down.
54	REF0/FSC/TEST_SEL	I/O	3.3V tolerant input for CPU frequency selection/fixed 14.318 clock output. Selects test mode if pulled to V_{IHFS_C} when CK_PWRGD is asserted HIGH. *Refer to DC Electrical Specifications table for* V_{ILFS_C}, V_{IMFS_C}, V_{IHFS_C} *specifications.*
55	SMB_DATA	I/O	SMBus compatible SDATA.
56	SMB_CLK	I	SMBus compatible SCLOCK.

Frequency Select Pin (FSA, FSB and FSC)

FSC	FSB	FSA	CPU	SRC	PCIF/PCI	REF	DOT96	USB
0	0	0	266 MHz	100 MHz	33 MHz	14.318 MHz	96 MHz	48 MHz
0	0	1	133 MHz					
0	1	0	200 MHz					
0	1	1	166 MHz					
1	0	0	333 MHz					
1	0	1	100 MHz					
1	1	0	400 MHz					
1	1	1	Reserved	Reserved				

Frequency Select Pin (FSA, FSB and FSC)

Apply the appropriate logic levels to FSA, FSB, and FSC inputs before CK-PWRGD assertion to achieve host clock frequency selection. When the clock chip sampled HIGH on CK-PWRGD and indicates that VTT voltage is stable then FSA, FSB, and FSC input values are sampled. This process employs a one-shot functionality and once the CK-PWRGD sampled a valid HIGH, all other FSA, FSB, FSC, and CK-PWRGD transitions are ignored except in test mode

Serial Data Interface

To enhance the flexibility and function of the clock synthesizer, a two-signal serial interface is provided. Through the Serial Data Interface, various device functions, such as individual clock output buffers are individually enabled or disabled. The registers associated with the Serial Data Interface initialize to their default setting at power-up. The use of this interface is optional. Clock device register changes are normally made at system initialization, if any are required. The interface cannot be used during system operation for power management functions.

Data Protocol

The clock driver serial protocol accepts byte write, byte read, block write, and block read operations from the controller. For block write/read operation, Access the bytes in sequential order from lowest to highest (most significant bit first) with the ability to stop after any complete byte is transferred. For byte write and byte read operations, the system controller can access individually indexed bytes. The offset of the indexed byte is encoded in the command code described in *Table 1*.

The block write and block read protocol is outlined in *Table 2* while *Table 3* outlines byte write and byte read protocol. The slave receiver address is 11010010 (D2h)

Table 1. Command Code Definition

Bit	Description
7	0 = Block read or block write operation, 1 = Byte read or byte write operation
(6:0)	Byte offset for byte read or byte write operation. For block read or block write operations, these bits should be '0000000'

Table 4. Crystal Recommendations

Frequency (Fund)	Cut	Loading	Load Cap	Drive (max.)	Shunt Cap (max.)	Motional (max.)	Tolerance (max.)	Stability (max.)	Aging (max.)
14.31818 MHz	AT	Parallel	20 pF	0.1 mW	5 pF	0.016 pF	35 ppm	30 ppm	5 ppm

The SL28504-2 requires a Parallel Resonance Crystal. Substituting a series resonance crystal causes the SL28504-2 to operate at the wrong frequency and violates the ppm specification. For most applications there is a 300-ppm frequency shift between series and parallel crystals due to incorrect loading

Crystal Loading

Crystal loading plays a critical role in achieving low ppm performance. To realize low ppm performance, use the total capacitance the crystal sees to calculate the appropriate capacitive loading (CL).

Figure 1 shows a typical crystal configuration using the two trim capacitors. It is important that the trim capacitors are in series with the crystal. It is not true that load capacitors are in parallel with the crystal and are approximately equal to the load capacitance of the crystal.

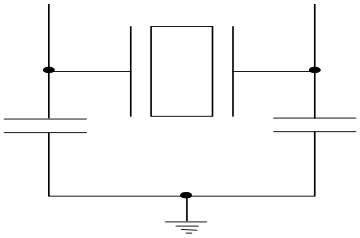

Figure 1. Crystal Capacitive Clarification

Calculating Load Capacitors

In addition to the standard external trim capacitors, consider the trace capacitance and pin capacitance to calculate the crystal loading correctly. Again, the capacitance on each side is in series with the crystal. The total capacitance on both side is twice the specified crystal load capacitance (CL). Trim capacitors are calculated to provide equal capacitive loading on both sides.

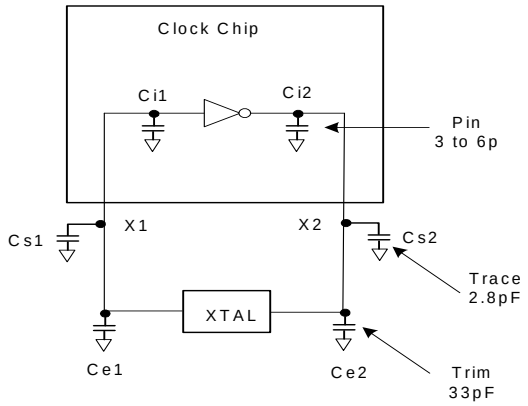

Figure 2. Crystal Loading Example

Use the following formulas to calculate the trim capacitor values for Ce1 and Ce2.

Load Capacitance (each side)

$$Ce = 2 * CL - (Cs + Ci)$$

Total Capacitance (as seen by the crystal)

$$CLe = \frac{1}{\left(\frac{1}{Ce1 + Cs1 + Ci1} + \frac{1}{Ce2 + Cs2 + Ci2}\right)}$$

CL.....Crystal load capacitance

CLe..... Actual loading seen by crystal using standard value trim capacitors

Ce..... External trim capacitors

Cs.....Stray capacitance (terraced)

Ci .....Internal capacitance (lead frame, bond wires, etc.)

Dial-A-Frequency® (CPU and PCIEX)

This feature allows the user to over-clock their system by slowly stepping up the CPU or SRC frequency. When the programmable output frequency feature is enabled, the CPU and SRC frequencies are determined by the following equation:

Fcpu = G * N/M or Fcpu=G2 * N, where G2 = G / M.

- "N" and "M" are the values programmed in Programmable Frequency Select N-Value Register and M-Value Register, respectively.
- "G" stands for the PLL Gear Constant, which is determined by the programmed value of FS[E:A]. See *Table* , *Frequency Select Table* for the Gear Constant for each Frequency selection. The PCI Express only allows user control of the N register, the M value is fixed and documented in *Table* , *Frequency Select Table*.

In this mode, the user writes the desired N and M values into the DAF I2C registers. The user cannot change only the M value and must change both the M and the N values at the same time, if they require a change to the M value. The user may change only the N value.

Associated Register Bits

- *CPU_DAF Enable* – This bit enables CPU DAF mode. By default, it is not set. When set, the operating frequency is determined by the values entered into the CPU_DAF_N register. Note that the CPU_DAF_N and M register must contain valid values before CPU_DAF is set. Default = 0, (No DAF).
- *CPU_DAF_N* – There are nine bits (for 512 values) to linearly change the CPU frequency (limited by VCO range). Default = 0, (0000). The allowable values for N are detailed in *Table* , *Frequency Select Table*.
- *CPU DAF M* – There are 7 bits (for 128 values) to linearly change the CPU frequency (limited by VCO range). Default = 0, the allowable values for M are detailed in *Table* , *Frequency Select Table*
- *SRC_DAF Enable* – This bit enables SRC DAF mode. By default, it is not set. When set, the operating frequency is determined by the values entered into the SRC_DAF_N register. Note that the SRC_DAF_N register must contain valid values before SRC_DAF is set. Default = 0, (No DAF).
- *SRC_DAF_N* – There are nine bits (for 512 values) to linearly change the CPU frequency (limited by VCO range). Default = 0, (0000). The allowable values for N are detailed in *Table* , *Frequency Select Table*.

Smooth Switching

The device contains one smooth switch circuit that is shared by the CPU PLL and SRC PLL. The smooth switch circuit ensures that when the output frequency changes by overclocking, the transition from the old frequency to the new frequency is a slow, smooth transition containing no glitches. The rate of change of output frequency when using the smooth switch circuit is less than 1 MHz/0.667 µs. The frequency overshoot and undershoot is less than 2%.

The Smooth Switch circuit assigns auto or manual. In Auto mode, clock generator assigns smooth switch automatically when the PLL does overclocking. For manual mode, assign the smooth switch circuit to PLL via Smbus. By default the smooth switch circuit is set to auto mode. PLL can be over-clocked when it does not have control of the smooth switch circuit but it is not guaranteed to transition to the new frequency without large frequency glitches.

Do not enable over-clocking and change the N values of both PLLs in the same SMBUS block write and use smooth switch mechanism on spread spectrum on/off.

PD_RESTORE

If a '0' is set for Byte 0 bit 0 then, upon assertion of PWRDWN# LOW, the SL28504-2 initiates a full reset. The result of this is that the clock chip emulates a cold power on start and goes to the "Latches Open" state. If the PD_RESTORE bit is set to a '1' then the configuration is stored upon PWRDWN# asserted LOW. Note that if the iAMT bit, Byte 0 bit 3, is set to a '1' then the PD_RESTORE bit must be ignored. In other words, in Intel iAMT mode, PWRDWN# reset is not allowed.

PWRDWN# (Power down) Clarification

The CKPWRGD/PWRDWN# pin is a dual-function pin. During initial power up, the pin functions as CKPWRGD. Once CKPWRGD has been sampled HIGH by the clock chip, the pin assumes PD# functionality. The PD# pin is an asynchronous active LOW input used to shut off all clocks cleanly before shutting off power to the device. This signal is synchronized internally to the device before powering down the clock synthesizer. PD# is also an asynchronous input for powering up the system. When PD# is asserted LOW, clocks are driven to a LOW value and held before turning off the VCOs and the crystal oscillator.

PWRDWN# (Power down) Assertion

When PD is sampled HIGH by two consecutive rising edges of CPUC, all single-ended outputs will be held LOW on their next HIGH-to-LOW transition and differential clocks must held LOW. When PD mode is desired as the initial power on state, PD must be asserted HIGH in less than 10 µs after asserting CKPWRGD.

PWRDWN# Deassertion

The power up latency is less than 1.8 ms. This is the time from the deassertion of the PD# pin or the ramping of the power supply until the time that stable clocks are generated from the clock chip. All differential outputs stopped in a three-state condition, resulting from power down are driven high in less than 300 µs of PD# deassertion to a voltage greater than 200 mV. After the clock chip's internal PLL is powered up and locked, all outputs are enabled within a few clock cycles of each clock. *Figure 4* is an example showing the relationship of clocks coming up.

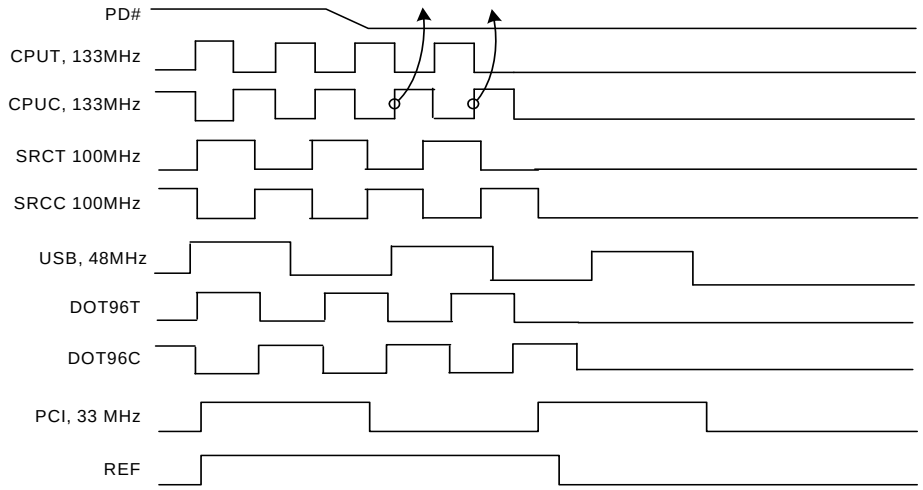

Figure 3. Power down Assertion Timing Waveform

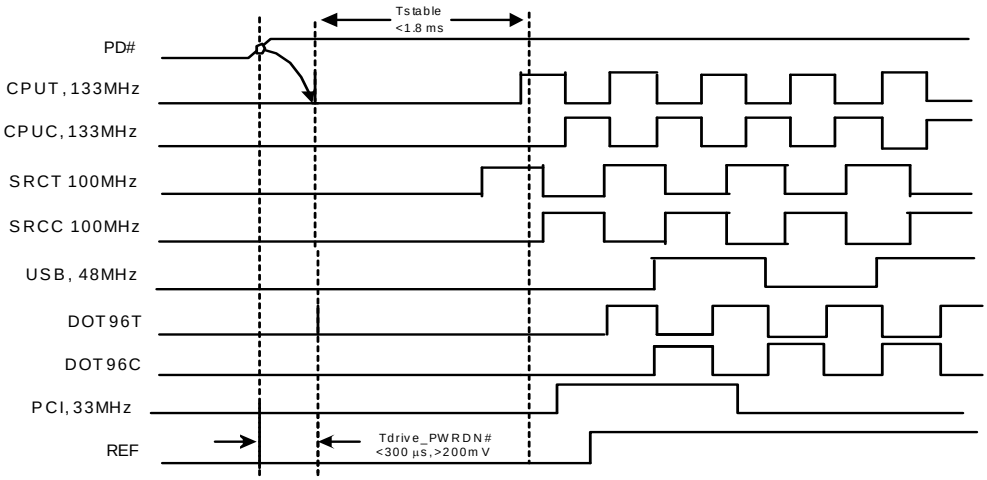

Figure 4. Power down Deassertion Timing Waveform

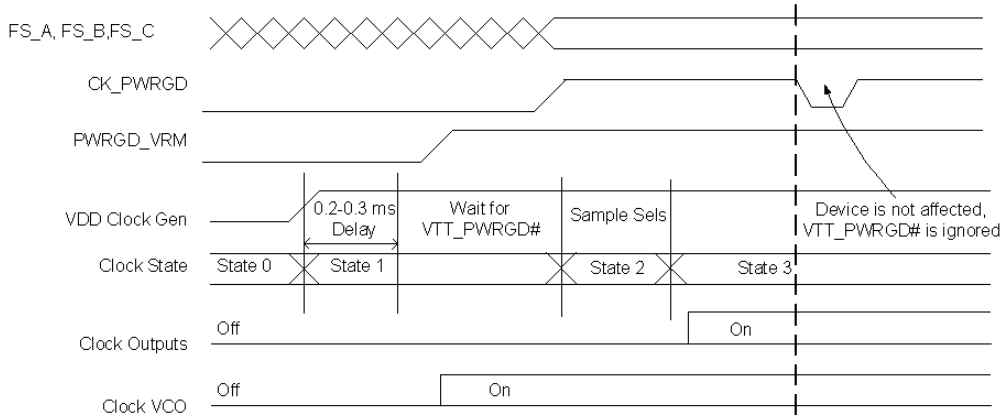

Figure 5. CK_PWRGD Timing Diagram

CPU_STP# Assertion

The CPU_STP# signal is an active LOW input used for synchronous stopping and starting the CPU output clocks while the rest of the clock generator continues to function. When the CPU_STP# pin is asserted, all CPU outputs that are set with the SMBus configuration to be stoppable are stopped within two to six CPU clock periods after sampled by two rising edges of the internal CPUC clock. The final states of the stopped CPU signals are CPUT = HIGH and CPUC = LOW.

CPU_STP# Deassertion

The deassertion of the CPU_STP# signal causes all stopped CPU outputs to resume normal operation in a synchronous manner. No short or stretched clock pulses are produced when the clock resumes. The maximum latency from the deassertion to active outputs is no more than two CPU clock cycles.

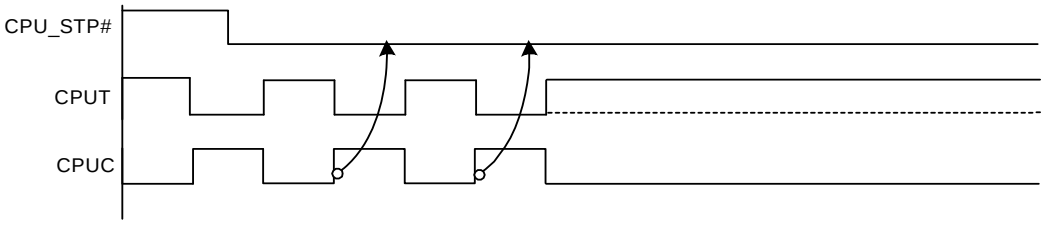

Figure 6. CPU_STP# Assertion Waveform

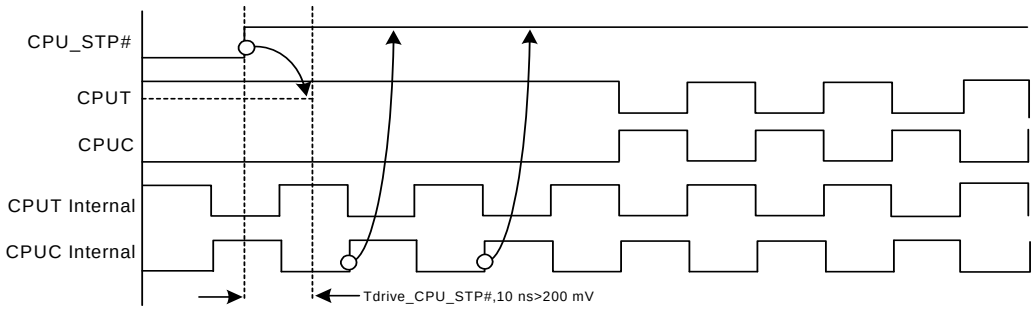

Figure 7. CPU_STP# Deassertion Waveform

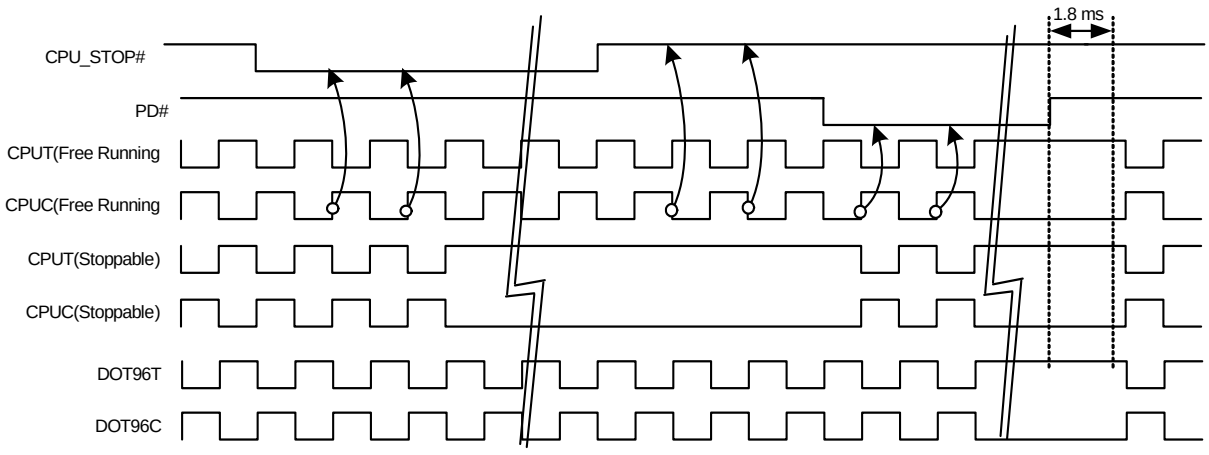

Figure 8. CPU_STP# = Driven, CPU_PD = Driven, DOT_PD = Driven

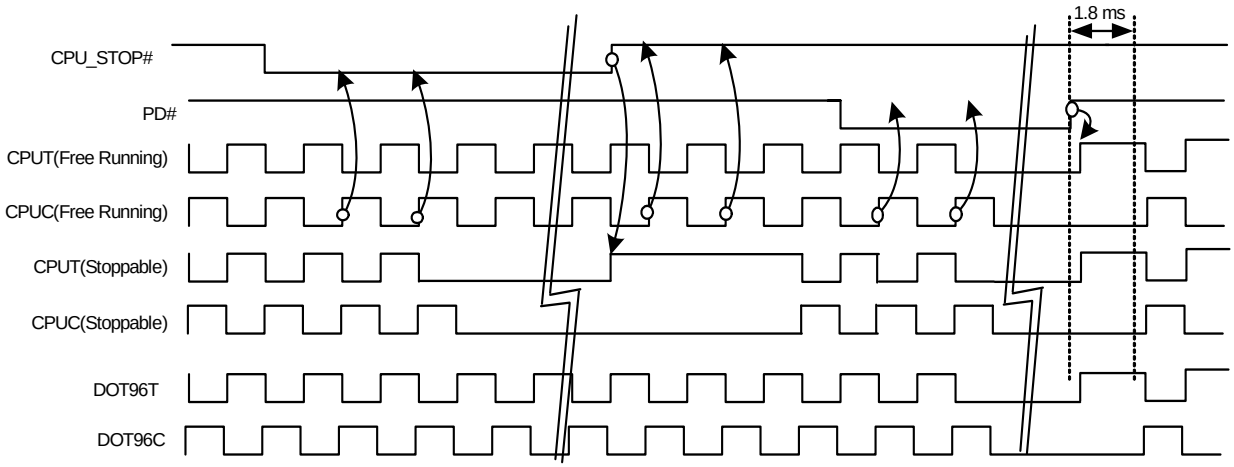

Figure 9. CPU_STP# = Tri-state, CPU_PD = Tri-state, DOT_PD = Tri-state

PCI_STP# Assertion

The PCI_STP# signal is an active LOW input used for synchronously stopping and starting the PCI outputs while the rest of the clock generator continues to function. The set-up time for capturing PCI_STP# going LOW is 10 ns (t_{SU}). (See *Figure 10*.) The PCIF clocks are affected by this pin if their corresponding control bit in the SMBus register is set to allow them to be free running.

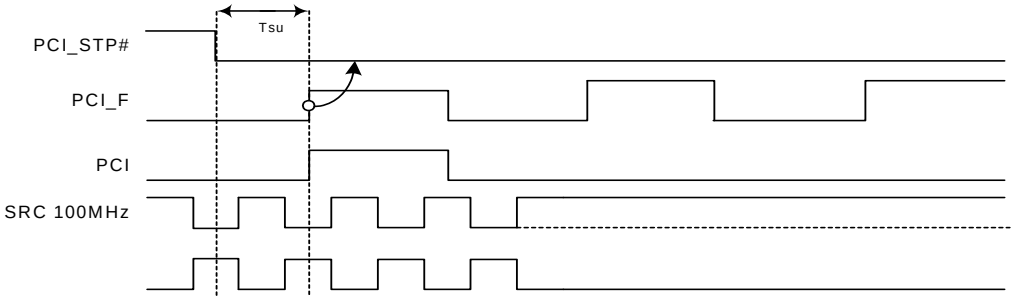

Figure 10. PCI_STP# Assertion Waveform

PCI_STP# Deassertion

The deassertion of the PCI_STP# signal causes all PCI and stoppable PCIF clocks to resume running in a synchronous manner within two PCI clock periods, after PCI_STP# transitions to a HIGH level.

$T_{PERIODAbs}$	REF Absolute Period	Measurement at 1.5V	68.83429	70.84826	ns
T_{HIGH}	REF High time	Measurement at 2V	29.97543	38.46654	ns
T_{LOW}	REF Low time	Measurement at 0.8V	29.57543	38.26654	ns
T_R / T_F	REF Rising and Falling Edge Rate	Measured between 0.8V and 2.0V	1.0	4.0	V/ns
T_{SKEW}	REF Clock to REF Clock	Measurement at 1.5V	–	500	ps

AC Electrical Specifications (continued)

Parameter	Description	Condition	Min.	Max.	Unit
T_{CCJ}	REF Cycle to Cycle Jitter	Measurement at 1.5V	–	1000	ps
L_{ACC}	Long Term Accuracy	Measurement at 1.5V	–	100	ppm
ENABLE/DISABLE and SET-UP					
T_{STABLE}	Clock Stabilization from Power-up		–	1.8	ms
T_{SS}	Stopclock Set-up Time		10.0	–	ns

Test and Measurement Set-up

For PCI Single-ended Signals and Reference

The following diagram shows the test load configurations for the single-ended PCI, USB, and REF output signals.

NOTES

1. LEAD WIDTH AND LEAD THICKNESS EXCLUSIVE OF SOLDER PLATE
2. PACKAGE OUTLINE EXCLUSIVE OF MOLD FLASHES AND BURR DIMENSIONS
3. ALLOWABLE MOLD FLASH IS 5 MILS PER SIDE.
4. LEAD COPLANARITY IS 0.003 INCH MAX.

Document Title: SL28504-2 Clock Generator for Intel®Eaglelake Chipset DOC #: SP-AP-0051 (Rev. AA)				
REV.	**ECR#**	**Issue Date**	**Orig. of Change**	**Description of Change**
1.0		10/5/07	BSHEN	Initial Release
1.1		10/16/07	BSHEN	Add SRC1 to pin 17/18. and tri-level trigger at 24.576M
1.2		01/21/08	BSHEN	1. Change Revision ID Byte7[7:4] to be 0001 2. Updated block diagram 3. Change Byte10[6:2] and Byte11[4] to be reserved
1.3		07/26/09	BSHEN	1. Updated Package Dimensions to compliant to SLI POD specification 2. Updated the CR# pin & register 3. Remove PCIE Gen II compliant on Feature
AA	1575	04/29/09	BSHEN	1. Correct VDD_IO pin description 2. Updated Industrial ordering information 3. Change document format for ISO complaint
