

**THE DATASHEET OF  
TPS389050LQDSERQ1**

# TPS3890-Q1

## Low Quiescent Current, 1% Accurate Supervisor with Programmable Delay

### 1 Features

- Qualified for Automotive Applications
- AEC-Q100 Qualified With the Following Results:
  - Device Temperature Grade 1: -40°C to 125°C Ambient Operating Temperature Range
  - Device HBM ESD Classification Level 2
  - Device CDM ESD Classification Level C4B
- Power-On-Reset (POR) Generator with Adjustable Delay Time: 25  $\mu$ s to 30 s
- Very Low Supply Current: 2.1  $\mu$ A (Typical)
- High Threshold Accuracy: 1% (max)
- Precision Hysteresis
- Fixed and Adjustable Threshold Voltages:
  - Fixed Thresholds for Standard Rails: 1.2 V to 5 V
  - Adjustable Down to 1.15 V
- Manual Reset ( $\overline{\text{MR}}$ ) Input
- Open-Drain  $\overline{\text{RESET}}$  Output
- Temperature Range: -40°C to +125°C
- Package: 1.5-mm x 1.5-mm WSON

### 2 Applications

- Infotainment Head Unit
- Hybrid/Digital Cluster
- External Amplifier
- ADAS Camera
- Automotive Gateway

### 3 Description

The TPS3890-Q1 is a precision voltage supervisor with low-quiescent current that monitors system voltages as low as 1.15 V, asserting an open-drain  $\overline{\text{RESET}}$  signal when the SENSE voltage drops below a preset threshold or when the manual reset ( $\overline{\text{MR}}$ ) pin drops to a logic low. The  $\overline{\text{RESET}}$  output remains low for the user-adjustable delay time after the SENSE voltage and manual reset ( $\overline{\text{MR}}$ ) return above the respective thresholds. The TPS3890-Q1 family uses a precision reference to achieve 1% threshold accuracy. The reset delay time can be user-adjusted between 25  $\mu$ s and 30 s by connecting the CT pin to an external capacitor. The TPS3890-Q1 has a very low quiescent current of 2.1  $\mu$ A and is available in a small 1.5-mm x 1.5-mm package, making the device well-suited for battery-powered and space-constrained applications. The device is fully specified over a temperature range of -40°C to +125°C ( $T_J$ ).

#### Device Information<sup>(1)</sup>

PART NUMBER	PACKAGE	BODY SIZE (NOM)
TPS3890-Q1	WSON (6)	1.50 mm x 1.50 mm

(1) For all available packages, see the orderable addendum at the end of the data sheet.

## 6 Pin Configuration and Functions

### Pin Functions

PIN		I/O	DESCRIPTION
NO.	NAME		
1	SENSE	I	This pin is connected to the voltage to be monitored. When the voltage on SENSE falls below the negative threshold voltage $V_{ITN}$ , $\overline{\text{RESET}}$ goes low (asserts). When the voltage on SENSE rises above the positive threshold voltage $V_{ITP}$ , $\overline{\text{RESET}}$ goes high (deasserts).
2	GND	—	Ground
3	$\overline{\text{MR}}$	I	Driving the manual reset pin ( $\overline{\text{MR}}$ ) low causes $\overline{\text{RESET}}$ to go low (assert).
4	VDD	I	Supply voltage pin. Good analog design practice is to place a 0.1- $\mu\text{F}$ ceramic capacitor close to this pin.
5	CT	—	The CT pin offers a user-adjustable delay time. Connecting this pin to a ground-referenced capacitor sets the $\overline{\text{RESET}}$ delay time to deassert. $t_{PD(f)}$ (sec) = $C_{CT}$ ( $\mu\text{F}$ ) $\times$ 1.07 + 25 $\mu\text{s}$ (nom).
6	$\overline{\text{RESET}}$	O	$\overline{\text{RESET}}$ is an open-drain output that is driven to a low-impedance state when either the $\overline{\text{MR}}$ pin is driven to a logic low or the monitored voltage on the SENSE pin is lower than the negative threshold voltage ( $V_{ITN}$ ). $\overline{\text{RESET}}$ remains low (asserted) for the delay time period after both $\overline{\text{MR}}$ is set to a logic high and the SENSE input is above $V_{ITP}$ . A pullup resistor from 10 k $\Omega$ to 1 M $\Omega$ should be used on this pin.

## 7 Specifications

### 7.1 Absolute Maximum Ratings

over operating junction temperature range (unless otherwise noted)<sup>(1)</sup>

		MIN	MAX	UNIT
Voltage	VDD	-0.3	7	V
	SENSE	-0.3	7	
	RESET	-0.3	7	
	MR	-0.3	7	
	V <sub>CT</sub>	-0.3	7	
Current	RESET	-20	20	mA
Temperature	Operating junction, T <sub>J</sub>	-40	125	°C
	Operating ambient, T <sub>A</sub>	-40	125	
	Storage, T <sub>stg</sub>	-65	150	

- (1) Stresses beyond those listed under *Absolute Maximum Ratings* may cause permanent damage to the device. These are stress ratings only, which do not imply functional operation of the device at these or any other conditions beyond those indicated under *Recommended Operating Conditions*. Exposure to absolute-maximum-rated conditions for extended periods may affect device reliability.

### 7.2 ESD Ratings

		VALUE	UNIT
V <sub>(ESD)</sub> Electrostatic discharge	Human-body model (HBM), per AEC Q100-002 <sup>(1)</sup>	±2000	V
	Charged-device model (CDM), per AEC Q100-011	±750	

- (1) AEC Q100-002 indicates that HBM stressing shall be in accordance with the ANSI/ESDA/JEDEC JS-001 specification.

### 7.3 Recommended Operating Conditions

over operating free-air temperature range (unless otherwise noted)

		MIN	NOM	MAX	UNIT
V <sub>DD</sub>	Power-supply voltage	1.5		5.5	V
V <sub>SENSE</sub>	SENSE voltage	0		5.5	V
V <sub>RESET</sub>	RESET pin voltage	0		5.5	V
I <sub>RESET</sub>	RESET pin current	-5		5	mA
C <sub>IN</sub>	Input capacitor, VDD pin	0	0.1		μF
C <sub>CT</sub>	Reset timeout capacitor, CT pin	0		26	μF
R <sub>PU</sub>	Pullup resistor, RESET pin	1		1000	kΩ
T <sub>J</sub>	Junction temperature (free-air temperature)	-40	25	125	°C

### 7.4 Thermal Information

THERMAL METRIC <sup>(1)</sup>		TPS3890-Q1	UNIT
		DSE (WSO)	
		6 PINS	
R <sub>θJA</sub>	Junction-to-ambient thermal resistance	321.3	°C/W
R <sub>θJC(top)</sub>	Junction-to-case (top) thermal resistance	207.9	°C/W
R <sub>θJB</sub>	Junction-to-board thermal resistance	281.5	°C/W
ψ <sub>JT</sub>	Junction-to-top characterization parameter	42.4	°C/W
ψ <sub>JB</sub>	Junction-to-board characterization parameter	284.8	°C/W
R <sub>θJC(bot)</sub>	Junction-to-case (bottom) thermal resistance	142.3	°C/W

- (1) For more information about traditional and new thermal metrics, see the [Semiconductor and IC Package Thermal Metrics](#) application report.

## 7.5 Electrical Characteristics

over the operating junction temperature range of  $-40^{\circ}\text{C}$  to  $+125^{\circ}\text{C}$  ( $T_A = T_J$ ),  $1.5\text{ V} \leq V_{DD} \leq 5.5\text{ V}$ , and  $\overline{\text{MR}} = V_{DD}$  (unless otherwise noted); typical values are at  $V_{DD} = 5.5\text{ V}$  and  $T_J = 25^{\circ}\text{C}$

PARAMETER		TEST CONDITIONS	MIN	TYP	MAX	UNIT
$V_{DD}$	Input supply voltage		1.5		5.5	V
$V_{POR}$	Power-on-reset voltage	$V_{OL(max)} = 0.2\text{ V}$ , $I_{RESET} = 15\text{ }\mu\text{A}$			0.8	V
$I_{DD}$	Supply current (into VDD pin)	$V_{DD} = 3.3\text{ V}$ , $I_{RESET} = 0\text{ mA}$ , $-40^{\circ}\text{C} < T_J < 85^{\circ}\text{C}$		2.09	3.72	$\mu\text{A}$
		$V_{DD} = 3.3\text{ V}$ , $I_{RESET} = 0\text{ mA}$ , $-40^{\circ}\text{C} < T_J < 105^{\circ}\text{C}$			4.5	
		$V_{DD} = 3.3\text{ V}$ , $I_{RESET} = 0\text{ mA}$			5.8	
		$V_{DD} = 5.5\text{ V}$ , $I_{RESET} = 0\text{ mA}$ , $-40^{\circ}\text{C} < T_J < 85^{\circ}\text{C}$		2.29	4	
		$V_{DD} = 5.5\text{ V}$ , $I_{RESET} = 0\text{ mA}$ , $-40^{\circ}\text{C} < T_J < 105^{\circ}\text{C}$			5.2	
		$V_{DD} = 5.5\text{ V}$ , $I_{RESET} = 0\text{ mA}$			6.5	
$V_{ITN}$ , $V_{ITP}$	SENSE input threshold voltage accuracy		-1%	$\pm 0.5\%$	1%	
$V_{HYST}$	Hysteresis <sup>(1)</sup>		0.325%	0.575%	0.825%	
$I_{SENSE}$	Input current	$V_{SENSE} = 5\text{ V}$			8	$\mu\text{A}$
		$V_{SENSE} = 5\text{ V}$ , TPS389001-Q1, TPS389012-Q1		10	100	nA
$I_{CT}$	CT pin charge current		0.90	1.15	1.35	$\mu\text{A}$
$V_{CT}$	CT pin comparator threshold voltage		1.17	1.23	1.29	V
$R_{CT}$	CT pin pulldown resistance	When $\overline{\text{RESET}}$ is deasserted		200		$\Omega$
$V_{IL}$	Low-level input voltage ( $\overline{\text{MR}}$ pin)			$0.25 \times V_{DD}$		V
$V_{IH}$	High-level output voltage		$0.7 \times V_{DD}$			V
$V_{OL}$	Low-level output voltage	$V_{DD} \geq 1.5\text{ V}$ , $I_{RESET} = 0.4\text{ mA}$			0.25	V
		$V_{DD} \geq 2.7\text{ V}$ , $I_{RESET} = 2\text{ mA}$			0.25	
		$V_{DD} \geq 4.5\text{ V}$ , $I_{RESET} = 3\text{ mA}$			0.3	
$I_{LKG(OD)}$	Open-drain output leakage	High impedance, $V_{SENSE} = V_{RESET} = 5.5\text{ V}$			250	nA

(1)  $V_{HYST} = [(V_{ITP} - V_{ITN}) / V_{ITN}] \times 100\%$ .

## 7.6 Timing Requirements

over the operating junction temperature range of  $-40^{\circ}\text{C}$  to  $+125^{\circ}\text{C}$  ( $T_A = T_J$ ),  $1.5\text{ V} \leq V_{DD} \leq 5.5\text{ V}$ ,  $\overline{\text{MR}} = V_{DD}$ , and 5% input overdrive<sup>(1)</sup> (unless otherwise noted); typical values are at  $V_{DD} = 5.5\text{ V}$  and  $T_J = 25^{\circ}\text{C}$

		MIN	NOM	MAX	UNIT
$t_{PD(f)}$	SENSE (falling) to $\overline{\text{RESET}}$ propagation delay	$C_T = \text{open}$ , $V_{DD} = 3.3\text{ V}$	18		$\mu\text{s}$
		$C_T = \text{open}$ , $V_{DD} = 5.5\text{ V}$	8		
$t_{PD(r)}$	SENSE (rising) to $\overline{\text{RESET}}$ propagation delay	$C_T = \text{open}$ , $V_{DD} = 3.3\text{ V}$	25		$\mu\text{s}$
$t_{GI(SENSE)}$	SENSE pin glitch immunity	$V_{DD} = 5.5\text{ V}$	9		$\mu\text{s}$
$t_{GI(MR)}$	$\overline{\text{MR}}$ pin glitch immunity	$V_{DD} = 5.5\text{ V}$	100		ns
$t_{MRW}$	$\overline{\text{MR}}$ pin pulse duration to assert $\overline{\text{RESET}}$	1			$\mu\text{s}$
$t_{d(MR)}$	$\overline{\text{MR}}$ pin low to out delay		250		ns
$t_{STRT}$	Startup delay		325		$\mu\text{s}$

## 8 Detailed Description

### 8.1 Overview

The TPS3890-Q1 supervisory product family is designed to assert a  $\overline{\text{RESET}}$  signal when either the SENSE pin voltage drops below  $V_{\text{ITN}}$  or the manual reset ( $\overline{\text{MR}}$ ) is driven low. The  $\overline{\text{RESET}}$  output remains asserted for a user-adjustable time after both the manual reset ( $\overline{\text{MR}}$ ) and SENSE voltages return above their respective thresholds.

### 8.2 Functional Block Diagram

### 8.3 Feature Description

The combination of user-adjustable reset delay time with a broad range of threshold voltages allow these devices to be used in a wide array of applications. Fixed negative threshold voltages ( $V_{\text{ITN}}$ ) can be factory set from 1.15 V to 3.17 V (see the [Device Comparison Table](#) for available options), and the adjustable device can be used to customize the threshold voltage for other application needs by using an external resistor divider. The CT pin allows the reset delay to be set between 25  $\mu\text{s}$  and 30 s with the use of an external capacitor.

#### 8.3.1 User-Configurable $\overline{\text{RESET}}$ Delay Time

The rising  $\overline{\text{RESET}}$  delay time ( $t_{\text{PD}(r)}$ ) can be configured by installing a capacitor connected to the CT pin. The TPS3890-Q1 uses a CT pin charging current ( $I_{\text{CT}}$ ) of 1.15  $\mu\text{A}$  to help counter the effect of capacitor and board-level leakage currents that can be substantial in certain applications. The rising  $\overline{\text{RESET}}$  delay time can be set to any value between 25  $\mu\text{s}$  (no  $C_{\text{CT}}$  installed) and 30 s ( $C_{\text{CT}} = 26 \mu\text{F}$ ).

The capacitor value needed for a given delay time can be calculated using [Equation 1](#):

$$t_{\text{PD}(r)} (\text{SEC}) = C_{\text{CT}} \times V_{\text{CT}} \div I_{\text{CT}} + t_{\text{PD}(r)(\text{nom})} \quad (1)$$

The slope of [Equation 1](#) is determined by the time that the CT charging current ( $I_{\text{CT}}$ ) takes to charge the external capacitor up to the CT comparator threshold voltage ( $V_{\text{CT}}$ ). When  $\overline{\text{RESET}}$  is asserted, the capacitor is discharged through the internal CT pulldown resistor ( $R_{\text{CT}}$ ). When the  $\overline{\text{RESET}}$  conditions are cleared, the internal precision current source is enabled and begins to charge the external capacitor and when the voltage on this capacitor reaches 1.22 V,  $\overline{\text{RESET}}$  is deasserted. Note that in order to minimize the difference between the calculated  $\overline{\text{RESET}}$  delay time and the actual  $\overline{\text{RESET}}$  delay time, use a low-leakage type capacitor (such as a ceramic capacitor) and minimize parasitic board capacitance around this pin.

## Feature Description (continued)

### 8.3.2 Manual Reset ( $\overline{\text{MR}}$ ) Input

The manual reset ( $\overline{\text{MR}}$ ) input allows a processor or other logic circuits to initiate a reset. A logic low on  $\overline{\text{MR}}$  causes  $\overline{\text{RESET}}$  to assert. After  $\overline{\text{MR}}$  returns to a logic high and  $\text{SENSE}$  is above  $V_{\text{ITP}}$ ,  $\overline{\text{RESET}}$  is deasserted after the user-defined reset delay. If  $\overline{\text{MR}}$  is not controlled externally, then  $\overline{\text{MR}}$  must be connected to  $V_{\text{DD}}$ . Note that if the logic signal driving  $\overline{\text{MR}}$  is not greater than or equal to  $V_{\text{DD}}$ , then some additional current flows into  $V_{\text{DD}}$  and out of  $\overline{\text{MR}}$  and the difference is apparent when comparing [Figure 8](#) and [Figure 9](#).

[Figure 23](#) shows how  $\overline{\text{MR}}$  can be used to monitor multiple system voltages when only a single CT capacitor is needed to set the  $\overline{\text{RESET}}$  delay time.

Copyright © 2016, Texas Instruments Incorporated

**Figure 23. Using  $\overline{\text{MR}}$  to Monitor Multiple System Voltages**

### 8.3.3 $\overline{\text{RESET}}$ Output

$\overline{\text{RESET}}$  remains high (deasserted) as long as  $\text{SENSE}$  is above the positive threshold ( $V_{\text{ITP}}$ ) and the manual reset signal ( $\overline{\text{MR}}$ ) is logic high. If  $\text{SENSE}$  falls below the negative threshold ( $V_{\text{ITN}}$ ) or if  $\overline{\text{MR}}$  is driven low, then  $\overline{\text{RESET}}$  is asserted, driving the  $\overline{\text{RESET}}$  pin to a low impedance.

When  $\overline{\text{MR}}$  is again logic high and  $\text{SENSE}$  is above  $V_{\text{ITP}}$ , a delay circuit is enabled that holds  $\overline{\text{RESET}}$  low for a specified reset delay period ( $t_{\text{PD}(r)}$ ). When the reset delay has elapsed, the  $\overline{\text{RESET}}$  pin goes to a high-impedance state and uses a pullup resistor to hold  $\overline{\text{RESET}}$  high. Connect the pullup resistor to the proper voltage rail to enable the outputs to be connected to other devices at the correct interface voltage level.  $\overline{\text{RESET}}$  can be pulled up to any voltage up to 5.5 V, independent of the device supply voltage. To ensure proper voltage levels, give some consideration when choosing the pullup resistor values. The pullup resistor value is determined by  $V_{\text{OL}}$ , the output capacitive loading, and the output leakage current ( $I_{\text{LKG(OD)}}$ ).

### 8.3.4 SENSE Input

The  $\text{SENSE}$  input can vary from ground to 5.5 V (7.0 V, absolute maximum), regardless of the device supply voltage used. The  $\text{SENSE}$  pin is used to monitor the critical voltage rail. If the voltage on this pin drops below  $V_{\text{ITN}}$ , then  $\overline{\text{RESET}}$  is asserted. When the voltage on the  $\text{SENSE}$  pin exceeds the positive threshold voltage,  $\overline{\text{RESET}}$  deasserts after the user-defined  $\overline{\text{RESET}}$  delay time.

The internal comparator has built-in hysteresis to ensure well-defined  $\overline{\text{RESET}}$  assertions and deassertions even when there are small changes on the voltage rail being monitored.

The TPS3890-Q1 device is relatively immune to short transients on the  $\text{SENSE}$  pin. Glitch immunity is dependent on threshold overdrive, as illustrated in [Figure 19](#) for  $V_{\text{ITN}}$  and [Figure 18](#) for  $V_{\text{ITP}}$ . Although not required in most cases, for noisy applications good analog design practice is to place a 1-nF to 10-nF bypass capacitor at the  $\text{SENSE}$  input to reduce sensitivity to transient voltages on the monitored signal.

## Feature Description (continued)

The adjustable version (TPS389001-Q1) can be used to monitor any voltage rail down to 1.15 V using the circuit shown in [Figure 24](#).

**Figure 24. Using the TPS389001-Q1 to Monitor a User-Defined Threshold Voltage**

The target threshold voltage for the monitored supply ( $V_{ITx(MON)}$ ) and the resistor divider values can be calculated by using [Equation 2](#) and [Equation 3](#), respectively:

$$V_{ITx(MON)} = V_{ITx} \times (1 + R_1 \div R_2) \quad (2)$$

[Equation 3](#) can be used to calculate either the negative threshold or the positive threshold by replacing  $V_{ITx}$  with either  $V_{ITN}$  or  $V_{ITP}$ , respectively.

$$R_{TOTAL} = R_1 + R_2 \quad (3)$$

Resistors with high values minimize current consumption; however, the input bias current of the device degrades accuracy if the current through the resistors is too low. Therefore, choosing an  $R_{TOTAL}$  value so that the current through the resistor divider is at least 100 times larger than the SENSE input current is simplest. See the [Optimizing Resistor Dividers at a Comparator Input](#) application report for more details on sizing input resistors.

### 8.3.4.1 Immunity to SENSE Pin Voltage Transients

The TPS3890-Q1 is immune to short voltage transient spikes on the input pins. Sensitivity to transients depends on both transient duration and overdrive (amplitude) of the transient. Overdrive is defined by how much  $V_{SENSE}$  exceeds the specified threshold, and is important to know because the smaller the overdrive, the slower the response of the outputs (that is, undervoltage and overvoltage). Threshold overdrive is calculated as a percent of the threshold in question, as shown in [Equation 4](#).

$$\text{Overdrive} = | (V_{SENSE} / V_{ITx} - 1) \times 100\% | \quad (4)$$

[Figure 17](#) to [Figure 20](#) illustrate the glitch immunity that the TPS3890-Q1 has versus temperature with three different overdrive voltages. The propagation delay versus overdrive curves ([Figure 13](#) to [Figure 16](#)) can be used to determine how sensitive the TPS3890-Q1 family of devices are across an even wider range of overdrive voltages.

## 8.4 Device Functional Modes

Table 1 summarizes the various functional modes of the device.

**Table 1. Truth Table**

$V_{DD}$	$\overline{MR}$	SENSE	$\overline{RESET}$
$V_{DD} < V_{POR}$	—	—	Undefined
$V_{POR} < V_{DD} < V_{DD(MIN)}^{(1)}$	—	—	L
$V_{DD} \geq V_{DD(MIN)}$	L	—	L
$V_{DD} \geq V_{DD(MIN)}$	H	$V_{SENSE} < V_{ITN}$	L
$V_{DD} \geq V_{DD(MIN)}$	H	$V_{SENSE} > V_{ITP}$	H

(1) When  $V_{DD}$  falls below  $V_{DD(MIN)}$ , undervoltage-lockout (UVLO) takes effect and  $\overline{RESET}$  is held low until  $V_{DD}$  falls below  $V_{POR}$ .

### 8.4.1 Normal Operation ( $V_{DD} > V_{DD(min)}$ )

When  $V_{DD}$  is greater than  $V_{DD(min)}$ , the  $\overline{RESET}$  signal is determined by the voltage on the SENSE pin and the logic state of  $\overline{MR}$ .

- $\overline{MR}$  high: when the voltage on  $V_{DD}$  is greater than 1.5 V, the  $\overline{RESET}$  signal corresponds to the voltage on the SENSE pin relative to the threshold voltage.
- $\overline{MR}$  low: in this mode,  $\overline{RESET}$  is held low regardless of the voltage on the SENSE pin.

### 8.4.2 Above Power-On-Reset But Less Than $V_{DD(min)}$ ( $V_{POR} < V_{DD} < V_{DD(min)}$ )

When the voltage on  $V_{DD}$  is less than the  $V_{DD(min)}$  voltage, and greater than the power-on-reset voltage ( $V_{POR}$ ), the  $\overline{RESET}$  signal is asserted regardless of the voltage on the SENSE pin.

### 8.4.3 Below Power-On-Reset ( $V_{DD} < V_{POR}$ )

When the voltage on  $V_{DD}$  is lower than  $V_{POR}$ , the device does not have enough voltage to internally pull the asserted output low and  $\overline{RESET}$  is undefined and must not be relied upon for proper device function.

## 9 Application and Implementation

### NOTE

Information in the following applications sections is not part of the TI component specification, and TI does not warrant its accuracy or completeness. TI's customers are responsible for determining suitability of components for their purposes. Customers should validate and test their design implementation to confirm system functionality.

### 9.1 Application Information

The following sections describe in detail how to properly use this device, depending on the requirements of the final application.

### 9.2 Typical Application

A typical application for the TPS389018-Q1 is shown in [Figure 25](#). The TPS389018-Q1 can be used to monitor the 1.8-V VDD rail required by the TI Delfino™ microprocessor family. The open-drain RESET output of the TPS389018-Q1 is connected to the XRS input of the microprocessor. A reset event is initiated when the VDD voltage is less than  $V_{ITN}$  or when MR is driven low by an external source.

**Figure 25. TPS3890-Q1 Monitoring the Supply Voltage for a Delfino Microprocessor**

#### 9.2.1 Design Requirements

The TPS3890-Q1 RESET output can be used to drive the reset (XRS) input of a microprocessor. The RESET pin of the TPS3890-Q1 is pulled high with a 1-MΩ resistor; the reset delay time is controlled by the CT capacitor and is set depending on the reset requirement times of the microprocessor. During power-up, XRS must remain low for at least 1 ms after VDD reaches 1.5 V for the C2000™ Delfino family of microprocessors. For 100-MHz operation, the Delfino TMS320F2833x microcontroller uses a supply voltage of 1.8 V that must be monitored by the TPS3890-Q1.

#### 9.2.2 Detailed Design Procedure

The primary constraint for this application is choosing the correct device to monitor the supply voltage of the microprocessor. The TPS389018-Q1 has a negative threshold of 1.73 V and a positive threshold of 1.74 V, making the device suitable for monitoring a 1.8-V rail. The secondary constraint for this application is the reset delay time that must be at least 1 ms to allow the Delfino microprocessor enough time to startup up correctly. Because a minimum time is required, the worst-case scenario is a supervisor with a high CT charging current ( $I_{CT}$ ) and a low CT comparator threshold ( $V_{CT}$ ). For applications with ambient temperatures ranging from  $-40^{\circ}\text{C}$  to  $+125^{\circ}\text{C}$ ,  $C_{CT}$  can be calculated using  $I_{CT(\text{Max})}$ ,  $V_{CT(\text{MIN})}$ , and solving for  $C_{CT}$  in [Equation 1](#) such that the minimum capacitance required at the CT pin is 1.149 nF. If standard capacitors with  $\pm 20\%$  tolerances are used, then the CT capacitor must be 1.5 nF or larger to ensure that the 1-ms delay time is met.

A 0.1-μF decoupling capacitor is connected to the VDD pin as a good analog design practice and a 1-MΩ resistor is used as the RESET pullup resistor to minimize the current consumption when RESET is asserted. The MR pin can be connected to an external signal if desired or connected to VDD if not used.

## Typical Application (continued)

### 9.2.3 Application Curve

**Figure 26. Startup Delay vs Temperature**

## 10 Power Supply Recommendations

These devices are designed to operate from an input supply with a voltage range between 1.5 V and 5.5 V. An input supply capacitor is not required for this device; however, if the input supply is noisy, then good analog practice is to place a 0.1- $\mu$ F capacitor between the VDD pin and the GND pin. This device has a 7-V absolute maximum rating on the VDD pin. If the voltage supply providing power to VDD is susceptible to any large voltage transient that can exceed 7 V, additional precautions must be taken.

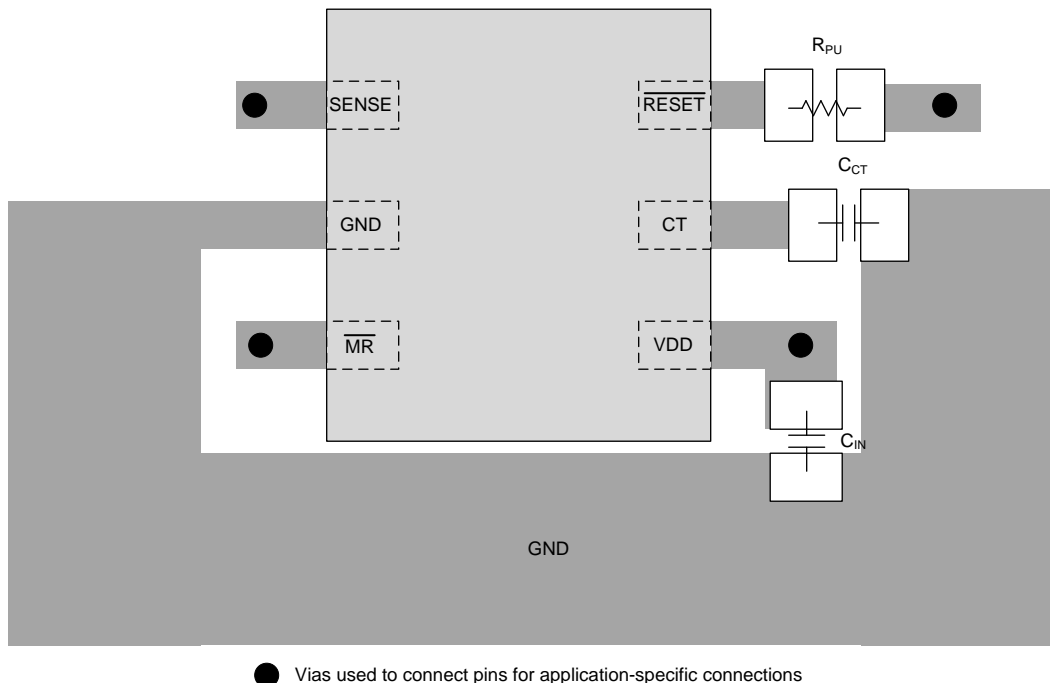

## 11 Layout

### 11.1 Layout Guidelines

Make sure that the connection to the VDD pin is low impedance. Good analog design practice is to place a 0.1- $\mu$ F ceramic capacitor near the VDD pin. If a capacitor is not connected to the CT pin, then minimize parasitic capacitance on this pin so the  $\overline{\text{RESET}}$  delay time is not adversely affected.

### 11.2 Layout Example

The layout example in shows how the TPS3890-Q1 is laid out on a printed circuit board (PCB) with a user-defined delay.

## 12 Device and Documentation Support

### 12.1 Device Support

#### 12.1.1 Device Nomenclature

Table 2 shows how to decode the function of the device based on the part number, with TPS389033G-Q1 used as an example.

**Table 2. Device Naming Convention**

DESCRIPTION	NOMENCLATURE	VALUE
TPS3890 (high-accuracy supervisor family)	—	—
33 (nominal rail voltage to be monitored)	10	1.0 V
	12	1.2 V
	18	1.8 V
	33	3.3 V
	50	5.0 V
G (percent below nominal rail voltage for $V_{ITN}$ )	—	4%
	G	7%
	K	11%
	L	12%
Q1 (automotive version)	—	—

### 12.2 Documentation Support

#### 12.2.1 Related Documentation

For related documentation see the following:

#### 12.3 Receiving Notification of Documentation Updates

To receive notification of documentation updates, navigate to the device product folder on ti.com. In the upper right corner, click on *Alert me* to register and receive a weekly digest of any product information that has changed. For change details, review the revision history included in any revised document.

### 12.4 Community Resources

The following links connect to TI community resources. Linked contents are provided "AS IS" by the respective contributors. They do not constitute TI specifications and do not necessarily reflect TI's views; see TI's [Terms of Use](#).

**TI E2E™ Online Community** *TI's Engineer-to-Engineer (E2E) Community*. Created to foster collaboration among engineers. At e2e.ti.com, you can ask questions, share knowledge, explore ideas and help solve problems with fellow engineers.

**Design Support** *TI's Design Support* Quickly find helpful E2E forums along with design support tools and contact information for technical support.

## 12.5 Trademarks

Delfino, C2000, E2E are trademarks of Texas Instruments. All other trademarks are the property of their respective owners.

## 12.6 Electrostatic Discharge Caution

This integrated circuit can be damaged by ESD. Texas Instruments recommends that all integrated circuits be handled with appropriate precautions. Failure to observe proper handling and installation procedures can cause damage.

ESD damage can range from subtle performance degradation to complete device failure. Precision integrated circuits may be more susceptible to damage because very small parametric changes could cause the device not to meet its published specifications.

## 12.7 Glossary

[SLYZ022](#) — *TI Glossary*.

This glossary lists and explains terms, acronyms, and definitions.

## 13 Mechanical, Packaging, and Orderable Information

The following pages include mechanical, packaging, and orderable information. This information is the most current data available for the designated devices. This data is subject to change without notice and revision of this document. For browser-based versions of this data sheet, refer to the left-hand navigation.

(1) The marketing status values are defined as follows:

**ACTIVE:** Product device recommended for new designs.

**LIFEBUY:** TI has announced that the device will be discontinued, and a lifetime-buy period is in effect.

**NRND:** Not recommended for new designs. Device is in production to support existing customers, but TI does not recommend using this part in a new design.

**PREVIEW:** Device has been announced but is not in production. Samples may or may not be available.

**OBSOLETE:** TI has discontinued the production of the device.

(2) **RoHS:** TI defines "RoHS" to mean semiconductor products that are compliant with the current EU RoHS requirements for all 10 RoHS substances, including the requirement that RoHS substance do not exceed 0.1% by weight in homogeneous materials. Where designed to be soldered at high temperatures, "RoHS" products are suitable for use in specified lead-free processes. TI may reference these types of products as "Pb-Free".

**RoHS Exempt:** TI defines "RoHS Exempt" to mean products that contain lead but are compliant with EU RoHS pursuant to a specific EU RoHS exemption.

**Green:** TI defines "Green" to mean the content of Chlorine (Cl) and Bromine (Br) based flame retardants meet JS709B low halogen requirements of <=1000ppm threshold. Antimony trioxide based flame retardants must also meet the <=1000ppm threshold requirement.

- (3) MSL, Peak Temp. - The Moisture Sensitivity Level rating according to the JEDEC industry standard classifications, and peak solder temperature.
- (4) There may be additional marking, which relates to the logo, the lot trace code information, or the environmental category on the device.
- (5) Multiple Device Markings will be inside parentheses. Only one Device Marking contained in parentheses and separated by a "-" will appear on a device. If a line is indented then it is a continuation of the previous line and the two combined represent the entire Device Marking for that device.
- (6) Lead finish/Ball material - Orderable Devices may have multiple material finish options. Finish options are separated by a vertical ruled line. Lead finish/Ball material values may wrap to two lines if the finish value exceeds the maximum column width.
