## GENERAL DESCRIPTION

A capacitor is a component which is capable of storing electrical energy. It consists of two conductive plates (electrodes) separated by insulating material which is called the dielectric. A typical formula for determining capacitance is:

$$C = \frac{.224 KA}{t}$$

- C** = capacitance (picofarads)
- K** = dielectric constant (Vacuum = 1)
- A** = area in square inches
- t** = separation between the plates in inches (thickness of dielectric)
- .224** = conversion constant (.0884 for metric system in cm)

**Capacitance** – The standard unit of capacitance is the farad. A capacitor has a capacitance of 1 farad when 1 coulomb charges it to 1 volt. One farad is a very large unit and most capacitors have values in the micro ( $10^{-6}$ ), nano ( $10^{-9}$ ) or pico ( $10^{-12}$ ) farad level.

**Dielectric Constant** – In the formula for capacitance given above the dielectric constant of a vacuum is arbitrarily chosen as the number 1. Dielectric constants of other materials are then compared to the dielectric constant of a vacuum.

**Dielectric Thickness** – Capacitance is indirectly proportional to the separation between electrodes. Lower voltage requirements mean thinner dielectrics and greater capacitance per volume.

**Area** – Capacitance is directly proportional to the area of the electrodes. Since the other variables in the equation are usually set by the performance desired, area is the easiest parameter to modify to obtain a specific capacitance within a material group.

**Energy Stored** – The energy which can be stored in a capacitor is given by the formula:

$$E = \frac{1}{2}CV^2$$

- E** = energy in joules (watts-sec)
- V** = applied voltage
- C** = capacitance in farads

**Potential Change** – A capacitor is a reactive component which reacts against a change in potential across it. This is shown by the equation for the linear charge of a capacitor:

$$I_{\text{ideal}} = C \frac{dV}{dt}$$

where

- I** = Current
- C** = Capacitance
- dV/dt** = Slope of voltage transition across capacitor

Thus an infinite current would be required to instantly change the potential across a capacitor. The amount of current a capacitor can “sink” is determined by the above equation.

**Equivalent Circuit** – A capacitor, as a practical device, exhibits not only capacitance but also resistance and inductance. A simplified schematic for the equivalent circuit is:

- C** = Capacitance
- L** = Inductance
- Rs** = Series Resistance
- Rp** = Parallel Resistance

**Reactance** – Since the insulation resistance ( $R_p$ ) is normally very high, the total impedance of a capacitor is:

$$Z = \sqrt{R_s^2 + (X_C - X_L)^2}$$

where

- Z** = Total Impedance
- Rs** = Series Resistance
- X<sub>C</sub>** = Capacitive Reactance =  $\frac{1}{2 \pi fC}$
- X<sub>L</sub>** = Inductive Reactance =  $2 \pi fL$

The variation of a capacitor's impedance with frequency determines its effectiveness in many applications.

**Phase Angle** – Power Factor and Dissipation Factor are often confused since they are both measures of the loss in a capacitor under AC application and are often almost identical in value. In a “perfect” capacitor the current in the capacitor will lead the voltage by 90°.

In practice the current leads the voltage by some other phase angle due to the series resistance  $R_s$ . The complement of this angle is called the loss angle and:

$$\text{Power Factor (P.F.)} = \cos \phi \text{ or } \sin \delta$$

$$\text{Dissipation Factor (D.F.)} = \tan \delta$$

for small values of the tan and sine are essentially equal which has led to the common interchangeability of the two terms in the industry.

**Equivalent Series Resistance** – The term E.S.R. or Equivalent Series Resistance combines all losses both series and parallel in a capacitor at a given frequency so that the equivalent circuit is reduced to a simple R-C series connection.

## Dissipation Factor

The DF/PF of a capacitor tells what percent of the apparent power input will turn to heat in the capacitor.

$$\text{Dissipation Factor} = \frac{\text{E.S.R.}}{X_c} = (2 \pi f C) (\text{E.S.R.})$$

The watts loss are:

$$\text{Watts loss} = (2 \pi f C V^2) (\text{D.F.})$$

Very low values of dissipation factor are expressed as their reciprocal for convenience. These are called the “Q” or Quality factor of capacitors.

**Insulation Resistance** – Insulation Resistance is the resistance

measured across the terminals of a capacitor and consists principally of the parallel resistance  $R_p$  shown in the equivalent circuit. As capacitance values and hence the area of dielectric increases, the I.R. decreases and hence the product ( $C \times IR$  or  $RC$ ) is often specified in ohm farads or more commonly megohm microfarads. Leakage current is determined by dividing the rated voltage by  $IR$  (Ohm's Law).

**Dielectric Strength** – Dielectric Strength is an expression of the ability of a material to withstand an electrical stress. Although dielectric strength is ordinarily expressed in volts, it is actually dependent on the thickness of the dielectric and thus is also more generically a function of volts/mil.

**Dielectric Absorption** – A capacitor does not discharge instantaneously upon application of a short circuit, but drains gradually after the capacitance proper has been discharged. It is common practice to measure the dielectric absorption by determining the “reappearing voltage” which appears across a capacitor at some point in time after it has been fully discharged under short circuit conditions.

**Corona** – Corona is the ionization of air or other vapors which causes them to conduct current. It is especially prevalent in high voltage units but can occur with low voltages as well where high voltage gradients occur. The energy discharged degrades the performance of the capacitor and can in time cause catastrophic failures.

## CERAMIC CAPACITORS

Multilayer ceramic capacitors are manufactured by mixing the ceramic powder in an organic binder (slurry) and casting it by one technique or another into thin layers typically ranging from about 3 mils in thickness down to 1 mil or thinner.

Metal electrodes are deposited onto the green ceramic layers which are then stacked to form a laminated structure. The metal electrodes are arranged so that their terminations alternate from one edge of the capacitor to another. Upon sintering at high temperature the part becomes a monolithic block which can provide extremely high capacitance values in small mechanical volumes. Figure 1 shows a pictorial view of a multilayer ceramic capacitor.

Multilayer ceramic capacitors are available in a wide range of characteristics, Electronic Industries Association (EIA) and the military have established categories to help divide the basic characteristics into more easily specified classes. The basic industry specification for ceramic capacitors is EIA specification RS-198 and as noted in the general section it specifies temperature compensating

**Figure 1**

EIA Temperature Compensating Ceramic temperature characteristics in accordance with EIA-198.

capacitors as Class 1 capacitors. These are specified by the military under specification MIL-PRF-20. General purpose capacitors with non-linear temperature coefficients are called Class 2 capacitors by EIA and are specified by the military under MIL-C-11015 and MIL-PRF-39014. The new high reliability military specification, MIL-PRF-123 covers both Class 1 and Class 2 dielectrics.

**Class 1** – Class 1 capacitors or temperature compensating capacitors are usually made from mixtures of titanates where barium titanate is normally not a major part of the mix. They have predictable temperature coefficients and in general, do not have an aging characteristic. Thus they are the most stable capacitor available. Normally the T.C.s of Class 1 temperature compensating capacitors are COG (NP0) (negative-positive 0 ppm/°C). Class 1 extended temperature compensating capacitors are also manufactured in T.C.s from P100 through N2200.

**Class 2** – General purpose ceramic capacitors are called Class 2 capacitors and have become extremely popular because of the high capacitance values available in very small size. Class 2 capacitors are “ferro electric” and vary in capacitance value under the influence of the environmental and electrical operating conditions. Class 2 capacitors are affected by temperature, voltage (both AC and DC), frequency and time. Temperature effects for Class 2 ceramic capacitors are exhibited as non-linear capacitance changes with temperature.

In specifying capacitance change with temperature for Class 2 materials, EIA expresses the capacitance change over an operating temperature range by a 3 symbol code. The first symbol represents the cold temperature end of the temperature range, the second represents the upper limit of the operating temperature range and the third symbol represents the capacitance change allowed over the operating temperature range. Table 2 provides a detailed explanation of the EIA system.

**Effects of Voltage** – Variations in voltage affects only the capacitance and dissipation factor. The application of DC voltage reduces both the capacitance and dissipation factor

while the application of an AC voltage within a reasonable range tends to increase both capacitance and dissipation factor readings. If a high enough AC voltage is applied, eventually it will reduce capacitance just as a DC voltage will. Figure 2 shows the effects of AC voltage.

Capacitor specifications specify the AC voltage at which to measure (normally 0.5 or 1 VAC) and application of the wrong voltage can cause spurious readings. Figure 3 gives the voltage coefficient of dissipation factor for various AC voltages at 1 kilohertz. Applications of different frequencies will affect the percentage changes versus voltages.

Figure 2

Figure 3

The effect of the application of DC voltage is shown in Figure 4. The voltage coefficient is more pronounced for higher K dielectrics. These figures are shown for room temperature conditions. The combination characteristic known as voltage temperature limits which shows the effects of rated voltage over the operating temperature range is shown in Figure 5 for the military BX characteristic.

Figure 4

Figure 6

Figure 7

**Effects of Frequency** – Frequency affects capacitance and dissipation factor as shown in Figures 6 and 7.

Variation of impedance with frequency is an important consideration for decoupling capacitor applications. Lead length, lead configuration and body size all affect the impedance level over more than ceramic formulation variations. (Figure 8)

**Effects of Time** – Class 2 ceramic capacitors change capacitance and dissipation factor with time as well as temperature, voltage and frequency. This change with time is known as aging. Aging is caused by a gradual re-alignment of the crystalline structure of the ceramic and produces an exponential loss in capacitance and decrease in dissipation factor versus time. A typical curve of aging rate for semistable ceramics is shown in Figure 9 and a table is given showing the aging rates of various dielectrics.

If a ceramic capacitor that has been sitting on the shelf for a period of time, is heated above its curie point, (125°C for 4 hours or 150°C for 1/2 hour will suffice) the part will de-age and return to its initial capacitance and dissipation factor readings. Because the capacitance changes rapidly, immediately after deaging, the basic capacitance measurements are normally referred to a time period sometime after the de-aging process. Various manufacturers use different time bases but the most popular one is one day or twenty-four hours after "last heat." Change in the aging curve can be caused by the application of voltage and other stresses. The possible changes in capacitance due to de-aging by heating the unit explain why capacitance changes are allowed after test, such as temperature cycling, moisture resistance, etc., in MIL specs. The application of high voltages such as dielectric withstanding voltages also tends to de-age capacitors and is why re-reading of capacitance after 12 or 24 hours is allowed in military specifications after dielectric strength tests have been performed.

**Effects of Mechanical Stress** – High “K” dielectric ceramic capacitors exhibit some low level piezoelectric reactions under mechanical stress. As a general statement, the piezoelectric output is higher, the higher the dielectric constant of the ceramic. It is desirable to investigate this effect before using high “K” dielectrics as coupling capacitors in extremely low level applications.

**Reliability** – Historically ceramic capacitors have been one of the most reliable types of capacitors in use today. The approximate formula for the reliability of a ceramic capacitor is:

$$\frac{L_o}{L_t} = \left(\frac{V_t}{V_o}\right)^X \times \left(\frac{T_t}{T_o}\right)^Y$$

where

$L_o$  = operating life                       $T_t$  = test temperature and  
 $L_t$  = test life                               $T_o$  = operating temperature in °C  
 $V_t$  = test voltage  
 $V_o$  = operating voltage   **X,Y**= see text

Historically for ceramic capacitors exponent X has been considered as 3. The exponent Y for temperature effects typically tends to run about 8.

## General Electrical and Environmental Specifications

Many KYOCERA AVX ceramic capacitors are purchased in accordance with Military Specifications, MIL-PRF-39014, MIL-C-11015, MIL-PRF-20, MIL-PRF-55681, and MIL-PRF-123 or according to individual customer specification. When ordered to these specifications, the parts will meet the requirements set forth in these documents. The General Electrical and Environmental Specifications listed below detail test conditions which are common to the foregoing and to most ceramic capacitor specifications. If additional information is needed, KYOCERA AVX Application Engineers are ready to assist you.

**Capacitance** – Capacitance shall be tested in accordance with Method 305 of MIL-STD-202.

**Insulation Resistance** – Insulation Resistance shall be measured in accordance with Method 302 of MIL-STD-202 with rated voltage or 200 VDC whichever is less applied. The current shall be limited to 50 ma. max. and the charging time shall be 2.0 minutes maximum.

**Burn-In** – (Where specified.) 100% of the parts shall be subjected to 5 cycles of Thermal Shock per Method 107 Test Condition A of MIL-STD-202 followed by voltage conditioning at twice rated voltage and maximum rated temperature for 100 hours or as specified. After Burn-In, parts shall meet all initial requirements.

**Barometric Pressure** – Capacitors shall be tested in accordance with Method 105 of MIL-STD-202 Test Condition D (100,000 ft.) with 100% rated voltage applied for 5 seconds with current limited to 50 ma. No evidence of flashover or damage is permitted.

The specimens shall be tested in 3 mutually perpendicular planes for a total of 8 hours with 125% rated DC voltage applied. No evidence of opens, intermittents or shorts

is permitted.

**Shock** – Capacitors shall be tested in accordance with Method 213 Condition 1 (100 Gs) of MIL-STD-202 with the bodies rigidly clamped. No evidence of opens, intermittents or shorts is permitted.

**Thermal Shock and Immersion** – Capacitors shall be tested in accordance with Method 107 Condition A of MIL-STD-202 with high test temperature (maximum rated operating temperature) followed by Method 104 of MIL-STD-202 Test Condition B.

**Moisture Resistance** – Capacitors shall be tested in accordance with Method 106 of MIL-STD-202 with rated voltage or 100 VDC whichever is less applied for the first 10 cycles.

**Resistance to Solder Heat** – Capacitors shall be tested in accordance with Method 210 of MIL-STD-202 with immersion to .050 of body. KYOCERA AVX Ceralam capacitors are manufactured with solder which melts at a temperature greater than 450°F.

**General Considerations** – The application of voltage or temperature usually causes temporary changes in the capacitance of Class 2 ceramic capacitors. These changes are normally in the positive direction and may cause out-of-tolerance capacitance readings. If a capacitance reading is made immediately after a dielectric strength or insulation resistance test and parts are high capacitance, they should be re-read after a minimum wait of 12 hours.

C =  $\pm 0.25\text{pF}$   
D =  $\pm 0.5\text{pF}$   
F =  $\pm 1\%$   
( $>50\text{pF}$  only)

### HOW TO ORDER

**AR21**

**Style**

**5**

**Voltage**  
5 = 50V  
1 = 100V  
2 = 200V  
A = 1000V  
G = 2000V  
H = 3000V

**F**

**Temperature Coefficient**  
A = C0G (NP0)  
C = X7R  
F = X8R  
L = X8L

**104**

**Capacitance**  
First two digits are the significant figures of capacitance. Third digit indicates the additional number of zeros. For example, order 100,000 pF as 104. (For values below 10pF use "R" in place of decimal point, e.g., 1R4 = 1.4pF.)

**M**

**Capacitance Tolerance**  
C0G (NP0):  
C =  $\pm 0.25\text{pF}$   
D =  $\pm 0.5\text{pF}$   
F =  $\pm 1\%$   
( $>50\text{pF}$  only)  
G =  $\pm 2\%$   
( $>25\text{pF}$  only)  
J =  $\pm 5\%$   
K =  $\pm 10\%$   
X7R:  
J =  $\pm 5\%$   
K =  $\pm 10\%$   
M =  $\pm 20\%$   
X8R:  
J =  $\pm 5\%$   
K =  $\pm 10\%$   
M =  $\pm 20\%$

**4**

**Failure Rate**  
4 = AEC-Q200

#### Dielectric

A = C0G (NP0)  
C = X7R  
E = Z5U

#### Capacitance

First two digits are the significant figures of capacitance. Third digit indicates the additional number of zeros. For example, order 100,000 pF as 104. (For values below 10pF use "R" in place of decimal point, e.g., 1R4 = 1.4pF.)

#### Capacitance Tolerance

C0G (NP0):  
D =  $\pm 5\text{pF}$   
( $>10\text{pF}$  only)  
F =  $\pm 1\%$   
( $>50\text{pF}$  only)  
G =  $\pm 2\%$

**Not RoHS Compliant**

<sup>1</sup> Trimmed lead length for the MR05 style will be measured from the bend in the lead (seating plane).

## HOW TO ORDER

**Military Type Designation: Styles CKR04, CKR05, CKR06, CKR08**

**Dash Number Option: MIL-PRF-39014/01** (Appropriate Dash Number)

### CKR05

#### Style

CK = General purpose, ceramic dielectric, fixed capacitors  
R = Established Reliability Parts  
05 = Remaining two numbers identify shape and dimension

### BX

#### Voltage-

#### Temperature Limits

First letter identifies temperature range.  
B = -55°C to +125°C  
Second letter identifies voltage-temperature coefficient.

#### Capacitance Change with Reference to 25°C

| Second Letter | No Voltage | Rated Voltage |
|---------------|------------|---------------|
| X             | +15, -15%  | +15, -25%     |

### 104

#### Capacitance

First two digits are the significant figures of capacitance. Third digit indicates the additional number of zeros. For example, order 100,000 pF as 104. (For values below 10pF use "R" in place of decimal point, e.g., 1R4 = 1.4pF.)

### K

#### Capacitance Tolerance

K =  $\pm 10\%$   
M =  $\pm 20\%$

### S

#### Military Failure Rate

M = 1% per 1000 hours  
P = 0.1% per 1000 hours  
R = 0.01% per 1000 hours  
S = 0.001% per 1000 hours

Note:  
KYOCERA AVX reserves the right to substitute a lower failure rate part per MIL-PRF-39014. Substitutability for failure rate levels shall be as follows:

| Failure Rate Level | Will Replace Failure Rate Level |
|--------------------|---------------------------------|
| S (STD) (X-ray)    | R, P, M, L                      |
| R (STD) (No X-ray) | P, M, L                         |
| P                  | M, L                            |
| M                  | L                               |

### (V)

#### Standoff Option

To order standoff option, place "V" at the end of the part number.  
Example:

**Not RoHS Compliant**

HOW TO ORDER

Military Type Designation: Styles CKR11, CKR12, CKR14, CKR15, CKR16

Dash Number Option: MIL-PRF-39014/05 (Add Appropriate Dash Number)

**CKR11**

**Style**

CK= General purpose, ceramic dielectric, fixed capacitors  
R = Established Reliability parts  
11 = Remaining two numbers identify shape and dimension

**BX**

**Voltage-Temperature Limits**

First letter identifies temperature range.  
B = -55°C to +125°C  
Second letter identifies voltage-temperature coefficient.

| Capacitance Change with Reference to 25°C |            |               |
|-------------------------------------------|------------|---------------|
| Second Letter                             | No Voltage | Rated Voltage |
| R                                         | +15, -15%  | +15, -40%     |
| X                                         | +15, -15%  | +15, -25%     |

**103**

**Capacitance**

First two digits are the significant figures of capacitance. Third digit indicates the additional number of zeros. For example, order 10,000 pF as 103.

**K**

**Capacitance Tolerance**

K = ±10%  
M = ±20%

**S**

**Military Failure Rate**

M = 1% per 1000 hours  
P = 0.1% per 1000 hours  
R = 0.01% per 1000 hours  
S = 0.001% per 1000 hours

Note:  
KYOCERA AVX reserves the right to substitute a lower failure rate part per MIL-PRF-39014/5E.  
Substitutability for failure rate levels shall be as follows:

| Failure Rate Level | Will Replace Failure Rate Level |
|--------------------|---------------------------------|
| S (STD) (X-ray)    | R, P, M, L                      |
| R (STD) (No X-ray) | P, M, L                         |
| P                  | M, L                            |

HOW TO ORDER

Military Type Designation: Styles CKR22, CKR23, CKR24

Dash Number Option: MIL-PRF-39014/22 (Add Appropriate Dash Number)

**CKR22**

**Style**

CK = General purpose, ceramic dielectric, fixed capacitors  
R = Established Reliability parts  
22 = Remaining two numbers identify shape and dimension

**BX**

**Voltage-Temperature Limits**

First letter identifies temperature range.  
B = -55°C to +125°C  
C = -55°C to +125°C  
Second letter identifies voltage-temperature coefficient.

| Second Letter | No Voltage  | Rated Voltage |
|---------------|-------------|---------------|
| G             | +30, -30ppm | +30, -30ppm   |
| H             | +60, -60ppm | +60, -60ppm   |
| R             | +15, -15%   | +15, -40%     |
| X             | +15, -15%   | +15, -25%     |

**104**

**Capacitance**

First two digits are the significant figures of capacitance. Third digit indicates the additional number of zeros. For example, order 100,000 pF as 104. (For values below 10pF use "R" in place of decimal point, e.g., 1R5 = 1.5pF.)

**K**

**Capacitance Tolerance**

D = ±.5pF  
F = ±1%  
J = ±5%  
K = ±10%  
M = ±20%

**R**

**Military Failure Rate**

M = 1% per 1000 hours  
P = 0.1% per 1000 hours  
R = 0.01% per 1000 hours  
S = 0.001% per 1000 hours  
Note:  
KYOCERA AVX reserves the right to substitute a lower failure rate part per MIL-PRF-39014. Substitutability for failure rate levels shall be as follows:

| Failure Rate Level | Will Replace Failure Rate Level |
|--------------------|---------------------------------|
| S (STD) (X-ray)    | R, P, M, L                      |
| R (STD) (No X-ray) | P, M, L                         |
| P                  | M, L                            |
| M                  | L                               |

HOW TO ORDER

Military Type Designation: Styles CK05, CK06

For values, tolerances, voltages, sizes, configurations and dielectrics not shown, contact KYOCERA AVX facilities directly for information.

**CK05**

**Style**

CK = General purpose, ceramic dielectric, fixed capacitors  
05 = Remaining two numbers identify shape and dimension

**BX**

**Voltage-Temperature Limits**

First letter identifies temperature range.  
B = -55°C to +125°C  
Second letter identifies voltage-temperature coefficient.

| Capacitance Change with Reference to 25°C |            |               |
|-------------------------------------------|------------|---------------|
| Second Letter                             | No Voltage | Rated Voltage |
| X                                         | +15, -15%  | +15, -25%     |

**104**

**Capacitance**

First two digits are the significant figures of capacitance. Third digit indicates the additional number of zeros. For example, order 100,000 pF as 104.

**K**

**Capacitance Tolerance**

K = ±10%  
M = ±20%

### MARKING

HOW TO ORDER

Military Type Designation: Styles CK12, CK13, CK14, CK15, CK16

**CK12**

**Style**

CK = General purpose, ceramic dielectric, fixed capacitors  
12 = Remaining two numbers identify shape and dimension

**BX**

**Voltage-Temperature Limits**

First letter identifies temperature range.  
B = -55°C to +125°C  
Second letter identifies voltage-temperature coefficient.

| Capacitance Change with Reference to 25°C |            |               |
|-------------------------------------------|------------|---------------|
| Second Letter                             | No Voltage | Rated Voltage |
| R                                         | +15, -15%  | +15, -40%     |
| X                                         | +15, -15%  | +15, -25%     |

**103**

**Capacitance**

First two digits are the significant figures of capacitance. Third digit indicates the additional number of zeros. For example, order 10,000 pF as 103.

**K**

**Capacitance Tolerance**

K = ±10%  
M = ±20%

**Not RoHS Compliant**

183

Capacitance

First two digits are the significant figures of capacitance. Third digit indicates the additional number of zeros. For example, order 18,000 pF as 183. (For values below 10pF use "R" in place of decimal point, e.g., 1R4 = 1.4pF)

J

Capacitance Tolerance

C = ±0.25pF  
D = ±0.5pF  
F = ±1%  
G = ±2%  
J = ±5%  
K = ±10%

R

Military Failure Rate

M = 1% per 1000 hours  
P = 0.1% per 1000 hours  
R = 0.01% per 1000 hours  
S = 0.001% per 1000 hours

(V)

Standoff Option

To order standoff option, place "V" at the end of the part number.  
Example:

**102**

**Capacitance**

First two digits are the significant figures of capacitance. Third digit indicates the additional number of zeros. For example, order 1,000 pF as 102. (For values below 10pF use "R" in place of decimal point, e.g., 1R8 = 1.8pF.)

**K**

**Capacitance Tolerance**

C = ±0.25pF  
D = ±0.5pF  
F = ±1%  
G = ±2%  
J = ±5%  
K = ±10%

**R**

**Military Failure Rate**

M = 1% per 1000 hours  
P = 0.1% per 1000 hours  
R = 0.01% per 1000 hours  
S = 0.001% per 1000 hours
