# Monolithic CMOS Analog Multiplexers

## General Description

Maxim's DG506A/DG507A are monolithic CMOS analog multiplexers. The DG506A is a single 16-channel (1 of 16) multiplexer and the DG507A is a differential 8-channel (2 of 16) multiplexer.

Both devices feature break-before-make switching. Maxim guarantees that these multiplexers will not latch-up if the power supplies are turned off with the input signals still present as long as absolute maximum ratings are not violated. The multiplexers operate over a wide range of power supplies from  $\pm 4.5\text{V}$  to  $\pm 18\text{V}$ .

Compared to the original manufacturer's devices, Maxim's DG506A/DG507A consume significantly less power, making them ideal for portable equipment.

Maxim's DG506A/DG507A meet or exceed the specifications of, and are drop-in replacements for Intersil's IH6116 and IH6216, Siliconix's DG506A and DG507A, and Harris' HI506 and HI507.

## Applications

## ELECTRICAL CHARACTERISTICS (Overtemperature) (continued)

( $V_+ = 15V$ ,  $V_- = -15V$ ,  $V_{GND} = 0V$ ,  $T_A$  = over temperature range, unless otherwise noted.)

- Note 1:** Signals on  $S_X$ ,  $D_X$ , or  $IN_X$  exceeding  $V_+$  or  $V_-$  will be clamped by internal diodes. Limit forward diode current to maximum current ratings.
- Note 2:** The algebraic convention whereby the most negative value is a minimum, and the most positive value is a maximum, is used in this data sheet.
- Note 3:** Typical values are for design aid only, not guaranteed nor subject to production testing.
- Note 4:**  $I_{D(ON)}$  is leakage from driver into on switch.
- Note 5:** Off-isolation =  $20 \log \times V_O/V_S$ ,  $V_S$  = input to off switch,  $V_D$  = output due to  $V_S$ .
