SKYWORKS®

DATA SHEET

# Si8941/Si8946/Si8947 Isolated Delta-Sigma Modulator for Current Shunt Measurement

## Applications

- Industrial, HEV and renewable energy inverters
- AC, brushless, and DC motor controls and drives
- Variable speed motor control in consumer white goods
- Isolated switch mode and UPS power supplies
- Automotive on-board chargers, battery management systems, and charging stations

## Features

- Low voltage differential input
  - $\pm 62.5$  mV and  $\pm 250$  mV options
- Modulator clock options
  - External clock up to 25 MHz (Si8941)
  - 10 MHz internal clock (Si8946)
  - 20 MHz internal clock (Si8947)
- Typical input offset:  $\pm 50$   $\mu$ V
- Typical gain error:  $\pm 0.05\%$
- Excellent drift specifications
  - $\pm 0.5$   $\mu$ V/ $^{\circ}$ C typical offset drift
  - $\pm 4$  ppm/ $^{\circ}$ C typical gain drift
- Typical 14-bit (ENOB) precision
- High common-mode transient immunity: 75 kV/ $\mu$ s
- Typical SNR: 90 dB
- Typical THD:  $-97$  dB
- Automotive-grade OPNs available
  - AEC-Q100 qualification
  - AIAG-compliant PPAP documentation support
  - IMDS and CAMDS listing support
- Compact packages
  - 8-pin wide body stretched SOIC
  - 8-pin narrow body SOIC
- $-40$  to  $125$   $^{\circ}$ C

## Safety Approvals

- UL 1577 recognized
  - Up to 5000 kV<sub>RMS</sub> for 1 minute
- CSA certification conformity
  - 62368-1 (reinforced insulation)
- VDE certification conformity (Pending)
  - 60747-17 (reinforced insulation)
- CQC certification approval
  - GB4943.1

Figure 1. Si894x Block Diagram

## Description

The Si8941/46/47 are galvanically isolated delta-sigma modulators which output a digital signal proportional to the voltage level at the input. The low-voltage differential input is ideal for measuring voltage across a current shunt resistor or for any place where a sensor must be isolated from the control system. Low noise, low error, and high precision ensure an accurate measurement of system current.

The output of the Si8941/46/47 comes from a second order delta-sigma modulator. The modulator can be clocked either from an on-board oscillator (Si8946/47) or from an external clock (Si8941). The output is typically digitally filtered by an MCU or FPGA in the system.

The Si8941/46/47 isolated delta-sigma modulator utilizes Skyworks proprietary isolation technology. It supports up to 5.0 kV<sub>RMS</sub> withstand voltage per UL1577. This technology enables higher performance, reduced variation with temperature and age, tighter part-to-part matching, and longer lifetimes compared to other isolation technologies.

Automotive Grade is available for certain part numbers. These products are built using automotive-specific flows at all steps in the manufacturing process to ensure the robustness and low defectivity required for automotive applications.

Skyworks Green™ products are compliant with all applicable legislation and are halogen-free. For additional information, refer to *Skyworks Definition of Green™*, document number SQ04-0074.

Figure 2. Si894x Pinout (Top View)

Table 1. Si894x Pin Descriptions

Name	Pin Number	Description
VDDA	1	Input side power supply
AIP	2	Analog input high
AIN	3	Analog input low
GNDA	4	Input side ground
GNDB	5	Output side ground
ADAT	6	Delta-Sigma modulator data output
ACLK	7	Delta-Sigma modulator clock (input on Si8941, output on Si8946/47)
VDDB	8	Output side power supply

## 1. Technical Description

The input to the Si8941/46/47 is designed for low-voltage, differential signals. This is ideal for connection to low-resistance current shunt measurement resistors. The Si8941A/46A/47A has a specified full scale input range of  $\pm 62.5$  mV, and the Si8941B/46B/47B has a specified full scale input range of  $\pm 250$  mV. This allows the user to choose low-ohmic resistance value sense resistors to minimize system power loss.

The analog input stage of the Si8941/46/47 is a fully differential amplifier feeding the input of a second-order, delta-sigma modulator that digitizes the input signal into a 1-bit output stream. The isolated data output ADAT pin of the converter provides a stream of digital ones and zeros that is synchronous to the ACLK pin.

The Si8946/47 clock is generated internally while the Si8941 clock is provided externally. The time average of this serial bit-stream output is proportional to the analog input voltage.

Figure 3. Si8941/Si8946/Si8947 Functional Block Diagram

### 1.1. Fail-Safe and Low-Power Modes

The Si8941/46/47 implements a fail-safe output when the high voltage-side supply voltage VDDA goes away. The fail-safe output is a steady state logic 0 on ADAT for the externally clocked Si8941. The fail-safe output is a steady state logic 1 on ADAT for the internally clocked Si8946/47.

The clock output ACLK of the Si8946/47 will stop after 256 cycles with a steady state logic 1. When the supply comes back, the clock will be turned back on and the normal DSM data stream will be output in approximately 250  $\mu$ s. To differentiate from the failsafe output, a maximum nominal input signal will generate a single 1 every 128 bits at ADAT.

In addition to the fail-safe output, when a loss of VDDA supply occurs, the part will automatically move into a lower power mode that reduces IDDB current to approximately 1 mA. Similarly, a loss of VDDB supply will reduce IDDA current to approximately 1 mA. When the supply voltage is returned, normal operation begins in approximately 250  $\mu$ s.

### 1.2. Modulator

The output of the Si8941/46/47 comes from a second order delta-sigma modulator, see Figure 3. The modulator provides 1-bit data stream whose average represents the input analog voltage. Zero volts across the inputs is represented at the output by a pulse train that has 50% ones density.

Positive specified linear full-scale at the input (e.g., +250 mV for the Si8941B/46B/47B and +62.5 mV for the Si8941A/46A/47A) produces an output datastream that has 89.06% ones density, and negative specified full scale gives an output that has 10.94% ones density. Table xx shows the values for other input levels and for both full-scale input options of the device.

Figure 4. Typical Second Order Delta-Sigma Modulator Block Diagram

Table 2. Modulator Output

Differential Input		Bitstream % Ones
Si8941A/46A/47A	Si8941B/46B/47B	
+62.5 mV	+250 mV	89.06%
+31.25 mV	+125 mV	69.53%
0 mV	0 mV	50%
-31.25 mV	-125 mV	30.47%
-62.5 mV	-250 mV	10.94%

## 2. Current Sense Application

In the driver circuit presented below, the Si8941/46/47 is used to amplify the voltage across the sense resistor, RSENSE, where it is oversampled and converted into a 1-bit bitstream, then transmitted across the isolation barrier to be processed by the system controller/FPGA. Placing the sense resistor before the load is known as high-side sensing and isolation is needed because the voltage of RSENSE with respect to ground will swing between 0 V and the high voltage rail connected to the drain of Q1.

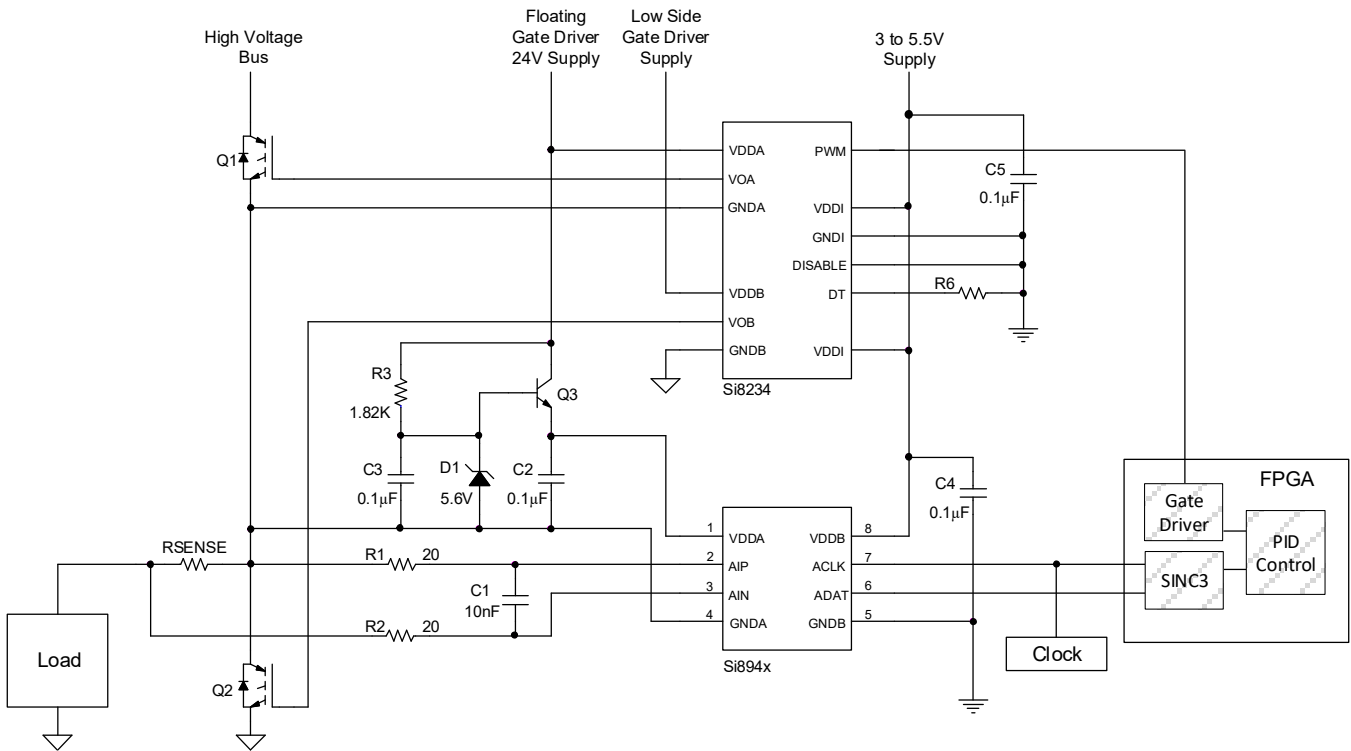

Figure 5. Current Sense Application

The load in this application can be a motor winding or a similar inductive winding. In a three-phase motor drive application, this circuit would be repeated three times, one for each phase. RSENSE should be a small value resistor to reduce power loss. However, an excessively low resistance will reduce the signal-to-noise ratio of the measurement.

Si8941/46/47 offers two specified linear full-scale input options,  $\pm 62.5$  mV (Si8941A/46A/47A) and  $\pm 250$  mV (Si8941B/46B/47B), for optimizing the value of RSENSE. Further product ordering options include whether the CLK pin is an input (Si8941) or an output (Si8946/47).

AIP and AIN connections to the RSENSE resistor should be made as close as possible to each end of the RSENSE resistor as trace resistance will add error to the measurement. The input to the Si8941/46/47 is differential, and the PCB traces back to the input pins should run in parallel. This ensures that any large noise transients that occur on the high-voltage side are coupled equally to the AIP and AIN pins and will be rejected by the Si8941/46/47 as a common-mode signal.

The Si8941/46/47 has intrinsic low-pass filtering at approximately 800 kHz. If further input filtering is required, a passive, differential RC low-pass filter can be placed between RSENSE and the input pins. Values of  $R1 = R2 = 20 \Omega$  and  $C1 = 10$  nF provides a cutoff at approximately 400 kHz. For the lowest gain error, R1 and R2 should always be less than  $33 \Omega$  to keep the source impedance sufficiently low compared to the Si8941/46/47 input impedance.

The common-mode voltage of AIN and AIP must be greater than  $-0.2$  V but less than 1 V with respect to GNDA. To meet this requirement, route a trace from the GNDA pin of the Si8941/46/47 to one side of the RSENSE resistor. In this circuit, GNDA, RSENSE, the source of Q1, and the drain of Q2 are connected. The ground of the gate driver (one half of the Skyworks Si8234 in this example) is also commonly connected to the same node.

The Q1 gate driver has a floating supply of 24 V. Since the input and output of the Si8941/46/47 are galvanically isolated from each other, separate power supplies are necessary on each side. Q3, R3, C3, and D1 make a regulator circuit for powering the input side of the Si8941/46/47 from this floating supply. D1 establishes a voltage of 5.6 V at the base of Q3. R3 is selected to provide a Zener current of 10 mA for D1. C3 provides filtering at the base of Q3, and the emitter output of Q3 provides approximately 5 V to VDDA. C2 is a bypass capacitor for the supply and should be placed at the VDDA pin with its return trace connecting to the GNDA connection at RSENSE.

C4, the local bypass capacitor for the B-side of Si8941/46/47, should be placed close to the VDDDB supply pin with its return close to GNDB. The output signal typically goes directly to a digital filter for additional processing. The digital filter may be implemented by a dedicated FPGA in the system or may be a peripheral in the main system controller.

The Si8941 expects an external clock to provide the clock signal for the modulator. That external clock can be provided by the same device that implements the digital filtering or another device that syncs both the modulator and the digital filter. The Si8946/47 generates an internal clock to the digital filter.

### 3. Electrical and Mechanical Specifications

The absolute maximum ratings of the Si8941/Si8946/Si8947 are provided below, followed by electrical specifications, performance graphs, and mechanical specifications.

**Table 3. Si8941/Si8946/Si8947 Absolute Maximum Ratings<sup>1</sup>**

Parameter	Symbol	Min	Max	Unit
Storage temperature	$T_{STG}$	-65	150	°C
Ambient temperature under bias	$T_A$	-40	125	°C
Junction temperature	$T_J$		150	°C
Supply voltage	VDDA, VDDB	-0.5	6.0	V
Input voltage respect to GNDA	$V_{IN}$	-0.5	VDDA + 0.5	V
Output sink or source current	$I_O$		5	mA
Total power dissipation	$P_T$		212	mW
Lead solder temperature (10 s)			260	°C
Human Body Model ESD rating		6000		V
Charged Device Model ESD rating		2000		V

1. Exposure to maximum rating conditions for extended periods may reduce device reliability. Exceeding any of the limits listed here may result in permanent damage to the device.

---

**ESD Handling: Industry-standard ESD handling precautions must be adhered to at all times to avoid damage to this device.**

## 5. Safety Certifications and Specifications

**Table 5. Regulatory Information<sup>1</sup>**

<b>CSA</b>
The Si8941/Si8946/Si8947 is certified under CSA. For more details, see Master Contract File 232873.
62368-1: Up to 600 V <sub>RMS</sub> reinforced insulation working voltage; up to 1000 V <sub>RMS</sub> basic insulation working voltage.
<b>VDE</b>
The Si8941/Si8946/Si8947 is certified under VDE. For more details, see File 5028467.
60747-17: Up to 2121 V <sub>peak</sub> for reinforced insulation working voltage.
<b>UL</b>
The Si8941/Si8946/Si8947 is certified under UL1577 component recognition program. For more details, see File E257455.
Rated up to 5000 V <sub>RMS</sub> V <sub>ISO</sub> isolation voltage for basic protection.
<b>CQC</b>
The Si8941/Si8946/Si8947 is certified under GB4943.1.
Rated up to 250 V <sub>RMS</sub> reinforced insulation working voltage at 5000 meters tropical climate.

1. For more information, see Section 15. [Ordering Information](#)

**Table 6. Insulation and Safety-Related Specifications**

Parameter	Symbol	Test Condition	Value		Unit
			WB Stretched SOIC-8	NB SOIC-8	
Nominal external air gap (clearance)	CLR		8.0	4.0	mm
Nominal external tracking (creepage)	CRP		8.0	4.0	mm
Minimum internal gap (internal clearance)	DTI		0.036	0.036	mm
Tracking resistance	PTI or CTI	IEC60112	600	600	V <sub>RMS</sub>
Erosion depth	ED		0.04	0.04	mm

## 6. Package Handling Information

Since the device package is sensitive to moisture absorption, it is baked and vacuum packed before shipping. Instructions on the shipping container label regarding exposure to moisture after the container seal is broken must be followed. Otherwise, problems related to moisture absorption may occur when the part is subjected to high temperature during solder assembly.

The Si8941AD-IS4, Si8941BD-IS4, Si8946AD-IS4, Si8946BD-IS4, Si8947AD-IS4, Si8947BD-IS4, Si8941AD-AS4, Si8941BD-AS4, Si8946AD-AS4, Si8946BD-AS4, Si8947AD-AS4, and Si8947BD-AS4 are rated to Moisture Sensitivity Level 2A (MSL2A) at 260°C.

The Si8941AB-IS, Si8941BB-IS, Si8946AB-IS, Si8946BB-IS, Si8947AB-IS, Si8947BB-IS, Si8941AB-AS, Si8941BB-AS, Si8946AB-AS, Si8946BB-AS, Si8947AB-AS, Si8947BB-AS are rated to MSL 2 at 260°C.

They can be used for lead or lead-free soldering. For additional information, refer to Skyworks Application Note, "PCB Design and SMT Assembly/Rework Guidelines," Document Number 101752.

Care must be taken when attaching this product, whether it is done manually or in a production solder reflow environment. Refer to Standard SMT Reflow Profiles: JEDEC Standard J-STD-020.

## 9. Land Pattern: 8-Pin Wide Body Stretched SOIC

### General Guidelines

1. All dimensions shown are at Maximum Material Condition (MMC). Least Material Condition (LMC) is calculated based on a fabrication allowance of 0.05 mm.
2. This land pattern design is based on the IPC-7351 guidelines.

### Solder Mask Design

1. All metal pads are to be non-solder mask defined (NSMD).
2. Clearance between the solder mask and the metal pad is to be 60 μm minimum, all the way around the pad.

### Stencil Design

1. A stainless steel, laser-cut and electro-polished stencil with trapezoidal walls should be used to assure good solder paste release.
2. The stencil thickness should be 0.125 mm (5 mils).
3. The ratio of stencil aperture to land pad size should be 1:1 for all perimeter pins.

### Card Assembly

1. A No-clean, Type-3 solder paste is recommended.
2. The recommended card reflow profile is per the JEDEC/IPC J-STD-020 specification for Small Body Components.

Figure 45. 8-Pin Wide Body Stretched SOIC Land Pattern

Table 14. 8-Pin Wide Body Stretched SOIC Land Pattern Dimensions<sup>1</sup>

Dimension	(mm)
C1	10.60
E	1.27
X1	0.60
Y1	1.85

1. See General Guidelines

## 10. Land Pattern: 8-Pin Narrow Body SOIC

### General Guidelines

1. All feature sizes shown are at Maximum Material Condition (MMC) and a card fabrication tolerance of 0.05 mm is assumed.
2. This Land Pattern Design is based on IPC-7351 pattern SOIC127P600X173-8N for Density Level B (Median Land Protrusion).

Figure 46. 8-Pin Narrow Body SOIC Land Pattern

## 15. Ordering Information

### Industrial and Automotive Grade Ordering Part Numbers (OPNs)

Industrial-grade devices (part numbers with an “-I” in their suffix) are built using well-controlled, high-quality manufacturing flows to ensure robustness and reliability. Qualifications are compliant with JEDEC, and defect reduction methodologies are used throughout definition, design, evaluation, qualification, and mass production steps.

Automotive-grade devices (part numbers with an “-A” in their suffix) are built using automotive-specific flows at all steps in the manufacturing process to ensure robustness and low defectivity. These devices are supported with AIAG-compliant Production Part Approval Process (PPAP) documentation, and feature International Material Data System (IMDS) and China Automotive Material Data System (CAMDS) listings. Qualifications are compliant with AEC-Q100, and a zero-defect methodology is maintained throughout definition, design, evaluation, qualification, and mass production steps.

Ordering Part Number <sup>1, 2, 3</sup>	Automotive Ordering Part Number <sup>1, 2, 3, 4, 5</sup>	Ordering Options			
		Specified Input Range	Isolation Rating	Clock	Package Type
Si8941AD-IS4	Si8941AD-AS4	±62.5 mV	5.0 kV <sub>RMS</sub>	Input	WB stretched SOIC-8
Si8941BD-IS4	Si8941BD-AS4	±250 mV	5.0 kV <sub>RMS</sub>	Input	WB stretched SOIC-8
Si8946AD-IS4	Si8946AD-AS4	±62.5 mV	5.0 kV <sub>RMS</sub>	10 MHz output	WB stretched SOIC-8
Si8946BD-IS4	Si8946BD-AS4	±250 mV	5.0 kV <sub>RMS</sub>	10 MHz output	WB stretched SOIC-8
Si8947AD-IS4	Si8947AD-AS4	±62.5 mV	5.0 kV <sub>RMS</sub>	20 MHz output	WB stretched SOIC-8
Si8947BD-IS4	Si8947BD-AS4	±250 mV	5.0 kV <sub>RMS</sub>	20 MHz output	WB stretched SOIC-8
Si8941AB-IS	Si8941AB-AS	±62.5 mV	2.5 kV <sub>RMS</sub>	Input	NB SOIC-8
Si8941BB-IS	Si8941BB-AS	±250 mV	2.5 kV <sub>RMS</sub>	Input	NB SOIC-8
Si8946AB-IS	Si8946AB-AS	±62.5 mV	2.5 kV <sub>RMS</sub>	10 MHz output	NB SOIC-8
Si8946BB-IS	Si8946BB-AS	±250 mV	2.5 kV <sub>RMS</sub>	10 MHz output	NB SOIC-8
Si8947AB-IS	Si8947AB-AS	±62.5 mV	2.5 kV <sub>RMS</sub>	20 MHz output	NB SOIC-8
Si8947BB-IS	Si8947BB-AS	±250 mV	2.5 kV <sub>RMS</sub>	20 MHz output	NB SOIC-8

1. All packages are RoHS-compliant.
2. “Si” and “SI” are used interchangeably.
3. An “R” at the end of the part number denotes tape and reel packaging option.
4. Automotive-grade devices (“-A” suffix) are identical in construction materials, topside marking, and electrical parameters to their Industrial Grade (“-I suffix”) version counterparts. Automotive-Grade products are produced utilizing full automotive process flows and additional statistical process controls throughout the manufacturing flow. The Automotive-Grade part number is included on shipping labels.
5. In the top markings of each device, the Manufacturing Code represented by “TTTTT” contains as its first character a letter in the range N through Z to indicate Automotive Grade.

## Revision History

### Revision B

October 2, 2023

Re-formatted to new standards. Added new text for Automotive Grade products, AEC-Q100 qualification, updated regulatory information, updated absolute maximum note 1, removed not needed IDD minimum specs, added tape and reel information, and added MSL ratings.

### Revision 206439A

December, 2022

- Updated decimal-based revision number to alphanumeric code.

### Revision 0.8

September, 2022

- Updated Safety Approvals on front page.
- Updated minimum supply currents in Electrical Specifications.
- Updated Regulatory Information.

### Revision 0.7

April, 2021

- Updated Applications and Key Features on front page.
- Updated Electrical Specifications after full characterization.
- Added Automotive OPNs to Ordering Guide.
- Updated Insulation and Safety-Related Specifications table.
- Numerous clarifications throughout.

### Revision 0.5

March, 2019

- Updated specifications.
- Added narrow body SOIC package.
- Added timing diagram.

### Revision 0.1

January, 2018

- Initial release.
