

# THE DATASHEET OF NRF9160-SIAA-B1A-R

# nRF9160

## Product Specification

v2.0

# nRF9160 features

## Features:

### Microcontroller:

- ARM Cortex -M33
  - 243 EEMBC CoreMark score running from flash memory
  - Data watchpoint and trace (DWT), embedded trace macrocell (ETM), and instrumentation trace macrocell (ITM)
  - Serial wire debug (SWD)
  - Trace port
- 1 MB flash
- 256 kB low leakage RAM
- ARM Trustzone
- ARM Cryptocell 310
- Up to 4x SPI master/slave with EasyDMA
- Up to 4x I2C compatible two-wire master/slave with EasyDMA
- Up to 4x UART (CTS/RTS) with EasyDMA
- I2S with EasyDMA
- Digital microphone interface (PDM) with EasyDMA
- 4x pulse width modulator (PWM) unit with EasyDMA
- 12-bit, 200 ksp/s ADC with EasyDMA - eight configurable channels with programmable gain
- 3x 32-bit timer with counter mode
- 2x real-time counter (RTC)
- Programmable peripheral interconnect (PPI)
- 32 general purpose I/O pins
- Single supply voltage: 3.0 – 5.5 V
- All necessary clock sources integrated
- Package: 10 × 16 × 1.04 mm LGA

### LTE modem:

- Transceiver and baseband
  - 3GPP LTE release 13 Cat-M1 and Cat-NB1 compliant
    - 3GPP release 13 coverage enhancement
  - 3GPP LTE release 14 Cat-NB2 compliant
  - GPS receiver
    - GPS L1 C/A supported
  - RF transceiver for global coverage
    - Up to 23 dBm output power
    - -108 dBm sensitivity (LTE-M) for low band, -107 dBm for mid band
    - Single 50 Ω antenna interface
  - LTE band support in hardware:
    - Cat-M1: B1, B2, B3, B4, B5, B8, B12, B13, B14, B17, B18, B19, B20, B25, B26, B28, B66
    - Cat-NB1/NB2: B1, B2, B3, B4, B5, B8, B12, B13, B17, B19, B20, B25, B26, B28, B66
  - Supports SIM and eSIM with an ETSI TS 102 221 compatible UICC interface
  - Power saving features: DRX, eDRX, PSM
  - IP v4/v6 stack
  - Secure socket (TLS/DTLS) API
- Current consumption @ 3.7 V:**
- Power saving mode (PSM) floor current: 2.7 µA
  - eDRX @ 82.91s: 18 µA in Cat-M1, 37 µA in Cat-NB1 (UICC included)

## Applications:

- Sensor networks
- Logistics and asset tracking
- Smart energy
- Smart building automation
- Smart agriculture
- Industrial
- Retail and monitor devices
- Medical devices
- Wearables

| 4.5 FICR — Factory information configuration registers . . . . .           | 35        |

|                                                                                                    |           |
|----------------------------------------------------------------------------------------------------|-----------|
| 4.5.1 Registers . . . . .                                                                          | 36        |
| 4.6 UICR — User information configuration registers . . . . .                                      | 41        |
| 4.6.1 Registers . . . . .                                                                          | 41        |
| 4.7 EasyDMA . . . . .                                                                              | 45        |
| 4.7.1 EasyDMA error handling . . . . .                                                             | 46        |
| 4.7.2 EasyDMA array list . . . . .                                                                 | 46        |
| 4.8 AHB multilayer interconnect . . . . .                                                          | 47        |
| <b>5 Power and clock management. . . . .</b>                                                       | <b>48</b> |
| 5.1 Functional description . . . . .                                                               | 48        |
| 5.1.1 Power management . . . . .                                                                   | 48        |
| 5.1.2 Power supply . . . . .                                                                       | 50        |
| 5.1.3 Power supply monitoring . . . . .                                                            | 51        |
| 5.1.4 Clock management . . . . .                                                                   | 53        |
| 5.1.5 Reset . . . . .                                                                              | 56        |
| 5.2 Current consumption . . . . .                                                                  | 58        |
| 5.2.1 Electrical specification . . . . .                                                           | 59        |
| 5.3 Register description . . . . .                                                                 | 64        |
| 5.3.1 POWER — Power control . . . . .                                                              | 64        |
| 5.3.2 CLOCK — Clock control . . . . .                                                              | 70        |
| 5.3.3 REGULATORS — Voltage regulators control . . . . .                                            | 77        |
| <b>6 Peripherals. . . . .</b>                                                                      | <b>79</b> |
| 6.1 CRYPTOCELL — ARM TrustZone CryptoCell 310 . . . . .                                            | 79        |
| 6.1.1 Usage . . . . .                                                                              | 80        |
| 6.1.2 Always-on (AO) power domain . . . . .                                                        | 80        |
| 6.1.3 Lifecycle state (LCS) . . . . .                                                              | 80        |
| 6.1.4 Cryptographic key selection . . . . .                                                        | 81        |
| 6.1.5 Direct memory access (DMA) . . . . .                                                         | 81        |
| 6.1.6 Standards . . . . .                                                                          | 81        |
| 6.1.7 Registers . . . . .                                                                          | 82        |
| 6.1.8 Host interface . . . . .                                                                     | 83        |
| 6.2 DPPI - Distributed programmable peripheral interconnect . . . . .                              | 86        |

# 2 About this document

This document is organized into chapters that are based on the modules and peripherals available in the IC. The relevant Product Specification version for each nRF9160 revision is described by the [nRF9160 Compatibility Matrix](#).

## 2.1 Document status

The document status reflects the level of maturity of the document.

| Document name                         | Description                                                                                                                                                                                                                                                      |
|---------------------------------------|------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Objective Product Specification (OPS) | Applies to document versions up to 1.0.<br><br>This document contains target specifications for product development.                                                                                                                                             |
| Product Specification (PS)            | Applies to document versions 1.0 and higher.<br><br>This document contains final product specifications. Nordic Semiconductor ASA reserves the right to make changes at any time without notice in order to improve design and supply the best possible product. |

*Table 1: Defined document names*

## 2.2 Peripheral chapters

Every peripheral has a unique capitalized name or an abbreviation of its name, e.g. TIMER, used for identification and reference. This name is used in chapter headings and references, and it will appear in the ARM Cortex Microcontroller Software Interface Standard (CMSIS) hardware abstraction layer to identify the peripheral.

The peripheral instance name, which is different from the peripheral name, is constructed using the peripheral name followed by a numbered postfix, starting with 0, for example, TIMER0. A postfix is normally only used if a peripheral can be instantiated more than once. The peripheral instance name is also used in the CMSIS to identify the peripheral instance.

The chapters describing peripherals may include the following information:

- A detailed functional description of the peripheral
- Register configuration for the peripheral
- Electrical specification tables, containing performance data which apply for the operating conditions described in [Peripheral chapters](#) on page 11.

## 2.3 Register tables

Individual registers are described using register tables. These tables are built up of two sections. The first three colored rows describe the position and size of the different fields in the register. The following rows describe the fields in more detail.

### 2.3.1 Fields and values

The **Id (Field Id)** row specifies the bits that belong to the different fields in the register. If a field has enumerated values, then every value will be identified with a unique value id in the **Value Id** column.

A blank space means that the field is reserved and read as undefined, and it also must be written as 0 to secure forward compatibility. If a register is divided into more than one field, a unique field name is specified for each field in the **Field** column. The **Value Id** may be omitted in the single-bit bit fields when values can be substituted with a Boolean type enumerator range, e.g. true/false, disable(d)/enable(d), on/off, and so on.

Values are usually provided as decimal or hexadecimal. Hexadecimal values have a 0x prefix, decimal values have no prefix.

The **Value** column can be populated in the following ways:

- Individual enumerated values, for example 1, 3, 9.
- Range of values, e.g. [0..4], indicating all values from and including 0 and 4.
- Implicit values. If no values are indicated in the **Value** column, all bit combinations are supported, or alternatively the field's translation and limitations are described in the text instead.

If two or more fields are closely related, the **Value Id**, **Value**, and **Description** may be omitted for all but the first field. Subsequent fields will indicate inheritance with '..'.

A feature marked **Deprecated** should not be used for new designs.

### 2.3.2 Permissions

Different fields in a register might have different access permissions enforced by hardware.

The access permission for each register field is documented in the **Access** column in the following ways:

| Access | Description     | Hardware behavior                                                                                                      |
|--------|-----------------|------------------------------------------------------------------------------------------------------------------------|
| RO     | Read-only       | Field can only be read. A write will be ignored.                                                                       |
| WO     | Write-only      | Field can only be written. A read will return an undefined value.                                                      |
| RW     | Read-write      | Field can be read and written multiple times.                                                                          |
| W1     | Write-once      | Field can only be written once per reset. Any subsequent write will be ignored. A read will return an undefined value. |
| RW1    | Read-write-once | Field can be read multiple times, but only written once per reset. Any subsequent write will be ignored.               |

Table 2: Register field permission schemes

## 2.4 Registers

| Register | Offset | Description                                       |
|----------|--------|---------------------------------------------------|
| DUMMY    | 0x514  | Example of a register controlling a dummy feature |

Table 3: Register overview

## 2.4.1 DUMMY

Address offset: 0x514

Example of a register controlling a dummy feature

# 3 Product overview

## 3.1 Introduction

The nRF9160 is a low-power cellular IoT (Internet of Things) solution, integrating an ARM® Cortex®-M33 processor with advanced security features, a range of peripherals, as well as a complete LTE modem compliant with 3GPP LTE release 13 Cat-M1 and Cat-NB1, and 3GPP LTE release 14 Cat-NB1 and Cat-NB2 standards.

The ARM Cortex-M33 processor is exclusively for user application software, and it offers 1 MB of flash and 256 kB of RAM dedicated to this use. The M33 application processor shares the power, clock and peripheral architecture with Nordic Semiconductor nRF51 and nRF52 Series of PAN/LAN SoCs, ensuring minimal porting efforts.

The peripheral set offers a variety of analog and digital functionality enabling single-chip implementation of a wide range of cellular IoT (Internet of Things) applications. ARM TrustZone technology, Cryptocell 310 and supporting blocks for system protection and key management, are embedded to enable advanced security needed for IoT applications.

The LTE modem integrates a very flexible transceiver that in hardware supports frequency range from 700 to 2200 MHz (through a single 50  $\Omega$  antenna pin), and a baseband processor handling LTE Cat-M1/NB1/NB2 protocol layers L1-L3 as well as IP upper layers offering secure socket API for the application. The modem is supported by pre-qualified software builds available for free from Nordic Semiconductor.

On specific nRF9160 device variants, the LTE modem supports A-GPS operation during sleep intervals in the LTE operation (RRC idle and PSM modes).

**Note:** Cat-NB2 is supported in LTE modem HW, but needs modem firmware support to get enabled. Please refer to *nRF9160 modem firmware release notes* found under nRF91 FW binaries downloads concerning availability of Cat-NB2 feature support".

## 3.2 Block diagram

This block diagram illustrates the overall system. Arrows with white heads indicate signals that share physical pins with other signals.

Figure 1: Block diagram

### 3.3 Peripheral interface

Peripherals are controlled by the CPU through configuration registers, as well as task and event registers. Task registers are inputs, enabling the CPU and other peripherals to initiate a functionality. Event registers are outputs, enabling a peripheral to trigger tasks in other peripherals and/or the CPU by tying events to CPU interrupts.

Figure 2: Peripheral interface

The distributed programmable peripheral interconnect (DPPI) feature enables peripherals to connect events to tasks without CPU intervention.

**Note:** For more information on DPPI and the DPPI channels, see [DPPI - Distributed programmable peripheral interconnect](#) on page 86.

### 3.3.1 Peripheral ID

Every peripheral is assigned a fixed block of 0x1000 bytes of address space, which is equal to 1024 x 32 bit registers.

See [Instantiation](#) on page 24 for more information about which peripherals are available and where they are located in the address map.

There is a direct relationship between peripheral ID and base address. For example, a peripheral with base address 0x40000000 is assigned ID=0, a peripheral with base address 0x40001000 is assigned ID=1, and a peripheral with base address 0x4001F000 is assigned ID=31.

Peripherals may share the same ID, which may impose one or more of the following limitations:

- Shared registers or common resources
- Limited availability due to mutually exclusive operation; only one peripheral in use at a time

- Enforced peripheral behavior when switching between peripherals (disable the first peripheral before enabling the second)

### 3.3.2 Peripherals with shared ID

In general (with the exception of ID 0), peripherals sharing an ID and base address may not be used simultaneously. Only one peripheral can be enabled at a given ID.

When switching between two peripherals sharing an ID, the following should be performed to prevent unwanted behavior:

1. Disable the previously used peripheral.
2. Disable any publish/subscribe connection to the DPPI system for the peripheral that is being disabled.
3. Clear all bits in the INTEN register, i.e. `INTENCLR = 0xFFFFFFFF`.
4. Explicitly configure the peripheral being enabled. Do not rely on inherited configuration from the disabled peripheral.
5. Enable the now configured peripheral.

For a list of which peripherals that share an ID see [Instantiation](#) on page 24.

### 3.3.3 Peripheral registers

Most peripherals feature an ENABLE register. Unless otherwise specified, the peripheral registers must be configured before enabling the peripheral.

PSEL registers need to be set before a peripheral is enabled or started. Updating PSEL registers while the peripheral is running has no effect. In order to connect a peripheral to a different GPIO, the peripheral must be disabled, the PSEL register updated, and the peripheral re-enabled. It takes four CPU cycles between the PSEL register update and the connection between a peripheral and a GPIO becoming effective.

**Note:** Note that the peripheral must be enabled before tasks and events can be used.

Most of the register values are lost during System OFF or when a reset is triggered. Some registers will retain their values in System OFF or for some specific reset sources. These registers are marked as retained in the register description for a given peripheral. For more information on their behavior, see chapter [Reset](#) on page 56.

### 3.3.4 Bit set and clear

Registers with multiple single-bit bit fields may implement the set-and-clear pattern. This pattern enables firmware to set and clear individual bits in a register without having to perform a read-modify-write operation on the main register.

This pattern is implemented using three consecutive addresses in the register map, where the main register is followed by dedicated SET and CLR registers (in that exact order).

In the main register, the SET register sets individual bits and the CLR register clears them. Writing '1' to a bit in the SET or CLR register will set or clear the same bit in the main register respectively. Writing '0' to a bit in the SET or CLR register has no effect. Reading the SET or CLR register returns the value of the main register.

**Note:** The main register may not be visible and therefore not directly accessible in all cases.

### 3.3.5 Tasks

Tasks are used to trigger actions in a peripheral, such as to start a particular behavior. A peripheral can implement multiple tasks with each task having a separate register in that peripheral's task register group.

A task is triggered when firmware writes '1' to the task register, or when the peripheral itself or another peripheral toggles the corresponding task signal. See the figure [Peripheral interface](#) on page 16.

### 3.3.6 Events

Events are used to notify peripherals and the CPU about events that have happened, for example a state change in a peripheral. A peripheral may generate multiple events, where each event has a separate register in that peripheral's event register group.

An event is generated when the peripheral itself toggles the corresponding event signal, and the event register is updated to reflect that the event has been generated, see figure [Peripheral interface](#) on page 16. An event register is cleared when a '0' is written to it by firmware. Events can be generated by the peripheral even when the event register is set to '1'.

### 3.3.7 Publish and subscribe

Events and tasks from different peripherals can be connected together through the DPPI system using the PUBLISH and SUBSCRIBE registers in each peripheral. See [Peripheral interface](#) on page 16. An event can be published onto a DPPI channel by configuring the event's PUBLISH register. Similarly, a task can subscribe to a DPPI channel by configuring the task's SUBSCRIBE register.

See [DPPI - Distributed programmable peripheral interconnect](#) on page 86 for details.

### 3.3.8 Shortcuts

A shortcut is a direct connection between an event and a task within the same peripheral. If a shortcut is enabled, the associated task is automatically triggered when its associated event is generated.

Using shortcuts is equivalent to making the connection outside the peripheral and through the DPPI. However, the propagation delay when using shortcuts is usually shorter than the propagation delay through the DPPI.

Shortcuts are predefined, which means that their connections cannot be configured by firmware. Each shortcut can be individually enabled or disabled through the shortcut register, one bit per shortcut, giving a maximum of 32 shortcuts for each peripheral.

### 3.3.9 Interrupts

All peripherals support interrupts which are generated by events.

A peripheral only occupies one interrupt, and the interrupt number follows the peripheral ID. For example, the peripheral with ID=4 is connected to interrupt number 4 in the nested vectored interrupt controller (NVIC).

Using registers INTEN, INTENSET, and INTENCLR, every event generated by a peripheral can be configured to generate that peripheral's interrupt. Multiple events can be enabled to generate interrupts simultaneously. To resolve the correct interrupt source, the event registers in the event group of peripheral registers will indicate the source.

Some peripherals implement only INTENSET and INTENCLR registers, and the INTEN register is not available on those peripherals. See the individual peripheral chapters for details. In all cases, reading back the INTENSET or INTENCLR register returns the same information as in INTEN.

Each event implemented in the peripheral is associated with a specific bit position in the INTEN, INTENSET, and INTENCLR registers.

The relationship between tasks, events, shortcuts, and interrupts is illustrated in figure [Peripheral interface](#) on page 16.

### 3.3.9.1 Interrupt clearing and disabling

Interrupts should always be cleared by writing '0' to the corresponding EVENT register.

Until cleared, interrupts will immediately be re-triggered and cause software interrupt service routines to be executed repeatedly.

Because the clearing of the EVENT register may take a number of CPU clock cycles, the program should perform a read from the EVENT register that has been cleared before exiting the interrupt service routine. This will ensure that the EVENT clearing has taken place before the interrupt service routine is exited. Care should be taken to ensure that the compiler does not remove the read operation as an optimization.

Similarly, when disabling an interrupt inside an interrupt service routine, the program should perform a read from the INTEN or INTENCLR registers to ensure that the interrupt is disabled before exiting the interrupt service routine.

### 3.3.10 Secure/non-secure peripherals

For some peripherals, the security configuration can change from secure to non-secure, or vice versa. Care must be taken when changing the security configuration of a peripheral, to prevent security information leakage and ensure correct operation.

The following sequence should be followed, where applicable, when configuring and changing the security settings of a peripheral in the [SPU — System protection unit](#) on page 259:

1. Stop peripheral operation
2. Disable the peripheral
3. Remove pin connections
4. Disable DPPI connections
5. Clear sensitive registers (e.g. writing back default values)
6. Change peripheral security setting in the [SPU — System protection unit](#) on page 259
7. Re-enable the peripheral

**Note:** Changing security settings on a peripheral during runtime is not advisable.

# 4 Application core

## 4.1 CPU

The ARM Cortex-M33 processor has a 32-bit instruction set (Thumb-2 technology) that implements a superset of 16 and 32-bit instructions to maximize code density and performance.

This processor implements several features that enable energy-efficient arithmetic and high-performance signal processing, including:

- Digital signal processing (DSP) instructions
- Single-cycle multiply and accumulate (MAC) instructions
- Hardware divide
- 8- and 16-bit single instruction, multiple data (SIMD) instructions
- Single-precision floating-point unit (FPU)
- Memory Protection Unit (MPU)
- ARM TrustZone for ARMv8-M

The ARM Cortex Microcontroller Software Interface Standard (CMSIS) hardware abstraction layer for the ARM Cortex processor series is implemented and available for the M33 CPU.

Real-time execution is highly deterministic in thread mode, to and from sleep modes, and when handling events at configurable priority levels via the nested vectored interrupt controller (NVIC).

Executing code from internal or external flash will have a wait state penalty. The instruction cache can be enabled to minimize flash wait states when fetching instructions. For more information on cache, see [Cache](#) on page 31. The section [Electrical specification](#) on page 21 shows CPU performance parameters including the wait states in different modes, CPU current and efficiency, and processing power and efficiency based on the CoreMark benchmark.

### 4.1.1 CPU and support module configuration

The ARM Cortex-M33 processor has a number of CPU options and support modules implemented on the device.

| Option / Module   | Description                                               | Implemented                                                           |
|-------------------|-----------------------------------------------------------|-----------------------------------------------------------------------|
| Core options      |                                                           |                                                                       |
| NVIC              | Nested vectored interrupt controller                      |                                                                       |
| PRIORITIES        | Priority bits                                             | 3                                                                     |
| WIC               | Wake-up interrupt controller                              | NO                                                                    |
| Endianness        | Memory system endianness                                  | Little endian                                                         |
| DWT               | Data watchpoint and trace                                 | YES                                                                   |
| Modules           |                                                           |                                                                       |
| MPU_NS            | Number of non-secure memory protection unit (MPU) regions | 16                                                                    |
| MPU_S             | Number of secure MPU regions                              | 16                                                                    |
| SAU               | Number of security attribution unit (SAU) regions         | 0, see <a href="#">SPU</a> for more information about secure regions. |
| FPU               | Floating-point unit                                       | YES                                                                   |
| DSP               | Digital signal processing extension                       | YES                                                                   |
| ARMv8-M TrustZone | ARMv8-M security extensions                               | YES                                                                   |
| CPIF              | Co-processor interface                                    | NO                                                                    |

## 4.1.2 Electrical specification

### 4.1.2.1 CPU performance

The CPU clock speed is 64 MHz. Current and efficiency data is taken when in System ON and the CPU is executing the CoreMark benchmark. It includes power regulator and clock base currents. All other blocks are IDLE.

| Symbol                   | Description                                                   | Min. | Typ.   | Max. | Units            |
|--------------------------|---------------------------------------------------------------|------|--------|------|------------------|
| W <sub>FLASH</sub>       | CPU wait states, running from flash, cache disabled           | 0    |        | 4    |                  |
| W <sub>FLASH</sub> CACHE | CPU wait states, running from flash, cache enabled            | 0    |        | 2    |                  |
| W <sub>RAM</sub>         | CPU wait states, running from RAM                             |      |        | 0    |                  |

| CM <sub>FLASH</sub> /MHz | CoreMark per MHz, running from flash, cache enabled           |      | 3.79   |      | CoreMark/<br>MHz |
| CM <sub>FLASH</sub> /mA  | CoreMark per mA, running from flash, cache enabled, DC/<br>DC |      | 110.45 |      | CoreMark/<br>mA  |

## 4.2 Memory

The application microcontroller has embedded 1024 kB flash and 256 kB RAM for application code and data storage.

As illustrated in [Memory layout](#) on page 22, both CPU and EasyDMA are able to access RAM via the AHB multilayer interconnect. See [AHB multilayer interconnect](#) on page 47 and [EasyDMA](#) on page 45 for more information about AHB multilayer interconnect and EasyDMA respectively. The LTE modem can access all application MCU memory, but typically a small portion of RAM is dedicated to data exchange between application MCU and the modem baseband controller.

<sup>1</sup> Using IAR compiler

Figure 3: Memory layout

## RAM - Random access memory

RAM can be read and written an unlimited number of times by the CPU and the EasyDMA.

Each RAM AHB slave is connected to one or more RAM sections. See [Memory layout](#) on page 22 for more information.

The RAM blocks power states and retention states in System ON and System OFF modes are controlled by the [VMC](#).

## Flash - Non-volatile memory

Flash can be read an unlimited number of times by the CPU and is accessible via the AHB interface connected to the CPU, see [Memory layout](#) on page 22 for more information. There are restrictions on the number of times flash can be written and erased, and also on how it can be written. For more information, see [Absolute maximum ratings](#) on page 392. Writing to flash is managed by the non-volatile memory controller (NVMC).

### 4.2.1 Memory map

All memory and registers are found in the same address space, as illustrated in the device memory map below.

Figure 4: Memory map

Some of the registers are retained (their values kept). Read more about retained registers in [Retained registers](#) on page 57 and [Reset behavior](#) on page 57.

## 4.2.2 Instantiation

| ID | Base address | Peripheral | Instance | Secure mapping | DMA security | Description            |
|----|--------------|------------|----------|----------------|--------------|------------------------|
| 3  | 0x50003000   | SPU        | SPU      | S              | NA           | System Protection Unit |

| ID | Base address             | Peripheral | Instance                          | Secure mapping | DMA security | Description                                                |

Table 4: Instantiation table

### 4.2.3 Peripheral access control capabilities

Information about the peripheral access control capabilities can be found in the instantiation table.

The instantiation table has two columns containing the information about access control capabilities for a peripheral:

- Secure mapping: This column defines configuration capabilities for TrustZone-M secure attribute.
- DMA security: This column indicates if the peripheral has DMA capabilities, and if DMA transfer can be assigned to a different security attribute than the peripheral itself.

For details on options in secure mapping column and DMA security column, see the following tables respectively.

| Abbreviation | Description                                                                                                      |
|--------------|------------------------------------------------------------------------------------------------------------------|
| NS           | Non-secure: This peripheral is always accessible as a non-secure peripheral.                                     |
| S            | Secure: This peripheral is always accessible as a secure peripheral.                                             |
| US           | User-selectable: Non-secure or secure attribute for this peripheral is defined by the PERIPHID[0].PERM register. |
| SPLIT        | Both non-secure and secure: The same resource is shared by both secure and non-secure code.                      |

Table 5: Secure mapping column options

| Abbreviation | Description                                                                                                                                |
|--------------|--------------------------------------------------------------------------------------------------------------------------------------------|
| NA           | Not applicable: Peripheral has no DMA capability.                                                                                          |
| NSA          | No separate attribute: Peripheral has DMA, and DMA transfers always have the same security attribute as assigned to the peripheral.        |
| SA           | Separate attribute: Peripheral has DMA, and DMA transfers can have a different security attribute than the one assigned to the peripheral. |

Table 6: DMA security column options

## 4.3 VMC — Volatile memory controller

The volatile memory controller (VMC) provides power control of RAM blocks.

Each of the available RAM blocks, which can contain multiple RAM sections, can be turned on or off independently in System ON mode, using the RAM[n] registers. These registers also control if a RAM block, or some of its sections, is retained in System OFF mode. See [Memory](#) chapter for more information about RAM blocks and sections.

**Note:** Powering up a RAM block takes typically 10 cycles. Thus, it is recommended reading the POWER register before accessing a RAM block that has been recently powered on.

## 4.3.1 Registers

| Base address | Peripheral | Instance | Secure mapping | DMA security | Description                | Configuration |
|--------------|------------|----------|----------------|--------------|----------------------------|---------------|
| 0x5003A000   | VMC        | VMC : S  | US             | NA           | Volatile memory controller |               |
| 0x4003A000   |            | VMC : NS |                |              |                            |               |

Table 7: Instances

| Register        | Offset | Security | Description                       |
|-----------------|--------|----------|-----------------------------------|
| RAM[n].POWER    | 0x600  |          | RAMn power control register       |
| RAM[n].POWERSET | 0x604  |          | RAMn power control set register   |
| RAM[n].POWERCLR | 0x608  |          | RAMn power control clear register |

Table 8: Register overview

### 4.3.1.1 RAM[n].POWER (n=0..7)

Address offset:  $0x600 + (n \times 0x10)$

## 4.4 NVMC — Non-volatile memory controller

The non-volatile memory controller (NVMC) is used for writing and erasing of the internal flash memory and the user information configuration register (UICR).

The NVMC is a split security peripheral. This means that when the NVMC is configured as non-secure, only a subset of the registers is available from the non-secure code. See [SPU — System protection unit](#) on page 259 and [Registers](#) on page 32 for more details.

When the NVMC is configured to be a secure peripheral, only secure code has access.

Before a write can be performed, the NVMC must be enabled for writing in CONFIG.WEN. Similarly, before an erase can be performed, the NVMC must be enabled for erasing in CONFIG.EEN, see [CONFIG](#) on page 33. The user must make sure that writing and erasing are not enabled at the same time. Failing to do so may result in unpredictable behavior.

### 4.4.1 Writing to flash

When writing is enabled, in CONFIG register for secure region, or in CONFIGNS register for non-secure region, flash is written by writing a full 32-bit word to a word-aligned address in flash.

Secure code has access to both secure and non-secure regions, by using the appropriate configuration of CONFIG and CONFIGNS registers. Non-secure code, in contrast, has access to non-secure regions only. Thus, non-secure code only needs CONFIGNS.

The NVMC is only able to write '0' to erased bits in flash, that is bits set to '1'. It cannot write a bit back to '1'.

As illustrated in [Memory](#) on page 21, flash is divided into multiple pages. The same address in flash can only be written  $n_{\text{WRITE}}$  number of times before a page erase must be performed.

Only full 32-bit words can be written to flash using the NVMC interface. To write less than 32 bits to flash, write the data as a word, and set all the bits that should remain unchanged in the word to '1'. Note that the restriction about the number of writes (see above) still applies in this case.

The time it takes to write a word to flash is specified by  $t_{\text{WRITE}}$ . If CPU executes code from flash while the NVMC is writing to flash, the CPU will be stalled.

Only word-aligned writes are allowed. Byte or half-word-aligned writes will result in a bus fault.

## 4.4.2 Erasing a secure page in flash

When secure region erase is enabled (in CONFIG register), a flash page can be erased by writing 0xFFFFFFFF into the first 32-bit word in a flash page.

Page erase is only applicable to the code area in the flash and does not work with UICR.

After erasing a flash page, all bits in the page are set to '1'. The time it takes to erase a page is specified by  $t_{\text{ERASEPAGE}}$ . The CPU is stalled if the CPU executes code from the flash while the NVMC performs the erase operation.

See [Partial erase of a page in flash](#) for information on splitting the erase time in smaller chunks.

## 4.4.3 Erasing a non-secure page in flash

When non-secure region erase is enabled, a non-secure flash page can be erased by writing 0xFFFFFFFF into the first 32-bit word of the flash page.

Page erase is only applicable to the code area in the flash and does not work with UICR.

After erasing a flash page, all bits in the page are set to '1'. The time it takes to erase a page is specified by  $t_{\text{ERASEPAGE}}$ . The CPU is stalled if the CPU executes code from the flash while the NVMC performs the erase operation.

## 4.4.4 Writing to user information configuration registers (UICR)

User information configuration registers (UICR) are written in the same way as flash. After UICR has been written, the new UICR configuration will only take effect after a reset.

UICR is only accessible by secure code. Any write from non-secure code will be faulted.

In order to lock the chip after uploading non-secure code, a simple sequence must be followed:

1. Block access to secure code by setting UICR register [SECUREAPPROTECT](#) on page 42 to protected
2. Use the [WRITEUICRNS](#) on page 35 register, via non-secure debugger, in order to set APPROTECT (APPROTECT is automatically written to 0x00000000 by the NVMC)

UICR can only be written  $n_{\text{WRITE}}$  number of times before an erase must be performed using [ERASEALL](#).

The time it takes to write a word to the UICR is specified by  $t_{\text{WRITE}}$ . The CPU is stalled if the CPU executes code from the flash while the NVMC is writing to the UICR.

## 4.4.5 Erase all

When erase is enabled, the whole flash and UICR can be erased in one operation by using the [ERASEALL](#) register. [ERASEALL](#) will not erase the factory information configuration registers (FICR).

This functionality can be blocked by some configuration of the UICR protection bits, see the table [NVMC protection \(1 - Enabled, 0 - Disabled, X - Don't care\)](#) on page 31.

The time it takes to perform an [ERASEALL](#) on page 33 command is specified by  $t_{\text{ERASEALL}}$ . The CPU is stalled if the CPU executes code from the flash while the NVMC performs the erase operation.

## 4.4.6 NVMC protection mechanisms

This chapter describes the different protection mechanisms for the non-volatile memory.

### 4.4.6.1 NVMC blocking

UICR integrity is assured through use of multiple levels of protection. UICR protection bits can be configured to allow or block certain operations.

The table below shows the different status of UICR protection bits, and which operations are allowed or blocked.

| UICR protection bit status |           |              | NVMC protection     |                  |
|----------------------------|-----------|--------------|---------------------|------------------|
| SECUREAPPROTECT            | APPROTECT | ERASEPROTECT | CTRL-AP<br>ERASEALL | NVMC<br>ERASEALL |
| 0                          | 0         | 0            | Available           | Available        |
| 1                          | X         | 0            | Available           | Blocked          |
| X                          | 1         | 0            | Available           | Blocked          |
| X                          | X         | 1            | Blocked             | Blocked          |

Table 9: NVMC protection (1 - Enabled, 0 - Disabled, X - Don't care)

**Note:** Erase can still be performed through CTRL-AP, regardless of the above settings. See [CTRL-AP - Control access port](#) on page 372 for more information.

## Uploading code with secure debugging blocked

Non-secure code can program non-secure flash regions. In order to perform these operations, the NVMC has the following non-secure registers: CONFIGNS, READY and READYNEXT.

Register [CONFIGNS](#) on page 34 works as the CONFIG register but it is used only for non-secure transactions. Both page erase and writing inside the flash require a write transaction (see [Erasing a secure page in flash](#) on page 30 or [Erasing a non-secure page in flash](#) on page 30). Because of this, the [SPU — System protection unit](#) on page 259 will guarantee that the non-secure code cannot write inside a secure page, since the transaction will never reach the NVMC controller.

### 4.4.6.2 NVMC power failure protection

NVMC power failure protection is possible through use of power-fail comparator that is monitoring power supply.

If the power-fail comparator is enabled, and the power supply voltage is below  $V_{POF}$  threshold, the power-fail comparator will prevent the NVMC from performing erase or write operations in non-volatile memory (NVM).

If a power failure warning is present at the start of an NVM write or erase operation, the NVMC will block the operation and a bus error will be signalled. If a power failure warning occurs during an ongoing NVM write operation, the NVMC will try to finish the operation. And if the power failure warning persists, consecutive NVM write operations will be blocked by the NVMC, and a bus error will be signalled. If a power failure warning occurs during an NVM erase operation, the operation is aborted and a bus error is signalled.

### 4.4.7 Cache

An instruction cache (I-Cache) can be enabled for the ICODE bus in the NVMC.

See [Memory map](#) on page 23 for the location of flash.

A cache hit is an instruction fetch from the cache, and it has a 0 wait-state delay. The number of wait-states for a cache miss, where the instruction is not available in the cache and needs to be fetched from flash, depends on the processor frequency, see CPU parameter `W_FLASHCACHE`.

Enabling the cache can increase the CPU performance, and reduce power consumption by reducing the number of wait cycles and the number of flash accesses. This will depend on the cache hit rate. Cache draws current when enabled. If the reduction in average current due to reduced flash accesses is larger than the cache power requirement, the average current to execute the program code will be reduced.

When disabled, the cache does not draw current and its content is not retained.

It is possible to enable cache profiling to analyze the performance of the cache for your program using the register **ICACHECNF**. When profiling is enabled, registers **IHIT** and **IMISS** are incremented for every instruction cache hit or miss respectively.

## 4.4.8 Registers

| Base address | Peripheral | Instance  | Secure mapping | DMA security | Description                    | Configuration |
|--------------|------------|-----------|----------------|--------------|--------------------------------|---------------|
| 0x50039000   | NVMC       | NVMC : S  | SPLIT          | NA           | Non-volatile memory controller |               |
| 0x40039000   |            | NVMC : NS |                |              |                                |               |

Table 10: Instances

| Register            | Offset | Security | Description                                       |
|---------------------|--------|----------|---------------------------------------------------|
| READY               | 0x400  | NS       | Ready flag                                        |
| READYNEXT           | 0x408  | NS       | Ready flag                                        |
| CONFIG              | 0x504  | S        | Configuration register                            |
| ERASEALL            | 0x50C  | S        | Register for erasing all non-volatile user memory |
| ERASEPAGEPARTIALCFG | 0x51C  | S        | Register for partial erase configuration          |
| ICACHECNF           | 0x540  | S        | I-code cache configuration register               |
| IHIT                | 0x548  | S        | I-code cache hit counter                          |
| IMISS               | 0x54C  | S        | I-code cache miss counter                         |
| CONFIGNS            | 0x584  | NS       |                                                   |
| WRITEIUCRNS         | 0x588  | NS       | Non-secure APPROTECT enable register              |

Table 11: Register overview

### 4.4.8.1 READY

Address offset: 0x400

Ready flag

|                  |  |  |  |   | Register          | Offset | Security | Description                                                 |
|-------------------|--------|----------|-------------------------------------------------------------|
| INFO.DEVICEID[n]  | 0x204  |          | Device identifier                                           |
| INFO.PART         | 0x20C  |          | Part code                                                   |
| INFO.VARIANT      | 0x210  |          | Part Variant, Hardware version and Production configuration |
| INFO.PACKAGE      | 0x214  |          | Package option                                              |
| INFO.RAM          | 0x218  |          | RAM variant                                                 |
| INFO.FLASH        | 0x21C  |          | Flash variant                                               |
| INFO.CODEPAGESIZE | 0x220  |          | Code memory page size                                       |
| INFO.CODESIZE     | 0x224  |          | Code memory size                                            |
| INFO.DEVICETYPE   | 0x228  |          | Device type                                                 |
| TRIMCNF[n].ADDR   | 0x300  |          | Address                                                     |
| TRIMCNF[n].DATA   | 0x304  |          | Data                                                        |
| TRNG90B.BYTES     | 0xC00  |          | Amount of bytes for the required entropy bits               |
| TRNG90B.RCCUTOFF  | 0xC04  |          | Repetition counter cutoff                                   |
| TRNG90B.APCUTOFF  | 0xC08  |          | Adaptive proportion cutoff                                  |
| TRNG90B.STARTUP   | 0xC0C  |          | Amount of bytes for the startup tests                       |
| TRNG90B.ROSC1     | 0xC10  |          | Sample count for ring oscillator 1                          |
| TRNG90B.ROSC2     | 0xC14  |          | Sample count for ring oscillator 2                          |
| TRNG90B.ROSC3     | 0xC18  |          | Sample count for ring oscillator 3                          |
| TRNG90B.ROSC4     | 0xC1C  |          | Sample count for ring oscillator 4                          |

Table 13: Register overview

### 4.5.1.1 INFO.DEVICEID[n] (n=0..1)

Address offset: 0x204 + (n × 0x4)

Device identifier

 ## 4.6 UICR — User information configuration registers

The user information configuration registers (UICRs) are non-volatile memory (NVM) registers for configuring user specific settings.

For information on writing UICR registers, see the [NVMC — Non-volatile memory controller](#) on page 29 and [Memory](#) on page 21 chapters.

### 4.6.1 Registers

| Base address | Peripheral | Instance | Secure mapping | DMA security | Description                    | Configuration |
|--------------|------------|----------|----------------|--------------|--------------------------------|---------------|
| 0x00FF8000   | UICR       | UICR     | S              | NA           | User information configuration |               |

Table 14: Instances

| Register                | Offset | Security | Description                                                                                                                                                                                                                                                                                               |

| OTP[n]                  | 0x108  |          | One time programmable memory                                                                                                                                                                                                                                                                              |
| KEYSLOT.CONFIG[n].DEST  | 0x400  |          | Destination address where content of the key value registers (KEYSLOT.KEYn.VALUE[0-3]) will be pushed by KMU. Note that this address must match that of a peripherals APB mapped write-only key registers, else the KMU can push this key value into an address range which the CPU can potentially read. |
| KEYSLOT.CONFIG[n].PERM  | 0x404  |          | Define permissions for the key slot. Bits 0-15 and 16-31 can only be written when equal to 0xFFFF.                                                                                                                                                                                                        |
| KEYSLOT.KEY[n].VALUE[o] | 0x800  |          | Define bits [31+o*32:0+o*32] of value assigned to KMU key slot.                                                                                                                                                                                                                                           |

#### 4.6.1.9 KEYSLOT.CONFIG[n].PERM (n=0..127)

Address offset:  $0x404 + (n \times 0x8)$

Define permissions for the key slot. Bits 0-15 and 16-31 can only be written when equal to 0xFFFF.

**Note:** Writing/reading this register requires the KMU SELECTKEYSLOT register to be set to n+1.

  1 1 1 1 1 1 |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |

## 4.7 EasyDMA

EasyDMA is a module implemented by some peripherals to gain direct access to Data RAM.

EasyDMA is an AHB bus master similar to CPU and is connected to the AHB multilayer interconnect for direct access to Data RAM. EasyDMA is not able to access flash.

A peripheral can implement multiple EasyDMA instances to provide dedicated channels. For example, for reading and writing of data between the peripheral and RAM. This concept is illustrated in [EasyDMA example](#) on page 45.

Figure 5: EasyDMA example

An EasyDMA channel is implemented in the following way, but some variations may occur:

```

READERBUFFER_SIZE 5
WRITERBUFFER_SIZE 6

uint8_t readerBuffer[READERBUFFER_SIZE] __at__ 0x20000000;
uint8_t writerBuffer[WRITERBUFFER_SIZE] __at__ 0x20000005;

// Configuring the READER channel
MYPERIPHERAL->READER.MAXCNT = READERBUFFER_SIZE;
MYPERIPHERAL->READER.PTR = &readerBuffer;

// Configure the WRITER channel
MYPERIPHERAL->WRITER.MAXCNT = WRITERBUFFER_SIZE;
MYPERIPHERAL->WRITER.PTR = &writerBuffer;

```

This example shows a peripheral called MYPERIPHERAL that implements two EasyDMA channels - one for reading called READER, and one for writing called WRITER. When the peripheral is started, it is assumed that the peripheral will perform the following tasks:

- Read 5 bytes from the readerBuffer located in RAM at address 0x20000000
- Process the data
- Write no more than 6 bytes back to the writerBuffer located in RAM at address 0x20000005

The memory layout of these buffers is illustrated in [EasyDMA memory layout](#) on page 46.

|            |                 |                 |                 |                 |
|------------|-----------------|-----------------|-----------------|-----------------|
| 0x20000000 | readerBuffer[0] | readerBuffer[1] | readerBuffer[2] | readerBuffer[3] |
| 0x20000004 | readerBuffer[4] | writerBuffer[0] | writerBuffer[1] | writerBuffer[2] |
| 0x20000008 | writerBuffer[3] | writerBuffer[4] | writerBuffer[5] |                 |

Figure 6: EasyDMA memory layout

The WRITER.MAXCNT register should not be specified larger than the actual size of the buffer (writerBuffer). Otherwise, the channel would overflow the writerBuffer.

Once an EasyDMA transfer is completed, the AMOUNT register can be read by the CPU to see how many bytes were transferred. For example, CPU can read MYPERIPHERAL->WRITER.AMOUNT register to see how many bytes WRITER wrote to RAM.

**Note:** The PTR register of a READER or WRITER must point to a valid memory region before use. The reset value of a PTR register is not guaranteed to point to valid memory. See [Memory](#) on page 21 for more information about the different memory regions and EasyDMA connectivity.

### 4.7.1 EasyDMA error handling

Some errors may occur during DMA handling.

If READER.PTR or WRITER.PTR is not pointing to a valid memory region, an EasyDMA transfer may result in a HardFault or RAM corruption. See [Memory](#) on page 21 for more information about the different memory regions.

If several AHB bus masters try to access the same AHB slave at the same time, AHB bus congestion might occur. An EasyDMA channel is an AHB master. Depending on the peripheral, the peripheral may either stall and wait for access to be granted, or lose data.

### 4.7.2 EasyDMA array list

EasyDMA is able to operate in Array List mode.

The Array List mode is implemented in channels where the LIST register is available.

The array list does not provide a mechanism to explicitly specify where the next item in the list is located. Instead, it assumes that the list is organized as a linear array where items are located one after the other in RAM.

The EasyDMA Array List can be implemented by using the data structure `ArrayList_type` as illustrated in the code example below using a `READER` EasyDMA channel as an example:

```
#define BUFFER_SIZE 4

typedef struct ArrayList
{
    uint8_t buffer[BUFFER_SIZE];
} ArrayList_type;

ArrayList_type ReaderList[3] __at__ 0x20000000;

MYPERIPHERAL->READER.MAXCNT = BUFFER_SIZE;
MYPERIPHERAL->READER.PTR = &ReaderList;
MYPERIPHERAL->READER.LIST = MYPERIPHERAL_READER_LIST_ArrayList;
```

The data structure only includes a buffer with size equal to the size of `READER.MAXCNT` register. EasyDMA uses the `READER.MAXCNT` register to determine when the buffer is full.

Figure 7: EasyDMA array list

## 4.8 AHB multilayer interconnect

On the AHB multilayer interconnect, the application CPU and all EasyDMA instances are AHB bus masters while RAM, cache and peripherals are AHB slaves. External MCU subsystems can be seen both as master and slave on the AHB multilayer interconnect.

Multiple AHB masters can access slave resources within the AHB multilayer interconnect as illustrated in [Memory](#) on page 21. Access rights to each of the AHB slaves are resolved using the natural priority of the different bus masters in the system.

# 5 Power and clock management

## 5.1 Functional description

The power and clock management system automatically ensures maximum power efficiency.

The nRF9160 provides a total of three power modes; two internal (automatically handled by the device), and one external (driven by the ENABLE pin and overriding internal ones).

The core of the automatic power and clock management is the power management unit (PMU) illustrated in the image below.

Figure 8: Power management unit

When the device is powered and enabled, the PMU automatically tracks the power and clock resources required by the different components in the system. It then starts/stops and chooses operation modes in supply regulators and clock sources, without user interaction, to achieve the lowest power consumption possible.

### 5.1.1 Power management

The two internal modes are handled by the power management unit (PMU), whereas the external is handled by the user via the ENABLE pin.

The System Disabled mode provides a way to override the PMU by manipulating voltages presented to the ENABLE pin.

The PMU steers system-wide clock and power in order to provide the power modes - System ON and System OFF. Under the various modes, internal blocks are automatically powered by the PMU as required by the application.

#### 5.1.1.1 System Disabled mode

The entire device can be powered down by presenting the appropriate voltage to the externally available ENABLE pin.

The nRF9160 provides a feature to be able to disable power throughout the entire device externally. This can be useful when the device is operating as slave processor where it does not need to be powered on at all times, then it is possible to avoid unnecessary current leaking by driving the ENABLE pin to low. The nRF9160 will not start if it is not enabled. Moreover, a change from disable to enable, will result in a power-on-reset behavior inside the device.

**Note:** VDD\_GPIO input must be driven low when device is disabled, failing to do so could result in increased leakage. For more information, see VDD\_GPIO considerations in [Operating conditions](#) on page 391.

**Note:** In case the System Disabled mode is not used, ENABLE must be connected to VDD.

| Pin Value | Power status | description                                |
|-----------|--------------|--------------------------------------------|
| Low       | Disabled     | Device's internal power regulator disabled |
| High      | Enabled      | Device's internal power regulator enabled  |

Table 16: ENABLE pin configuration

### 5.1.1.2 System OFF mode

System OFF is the deepest internal power saving mode the system can enter.

In this mode, the core system functionality is powered down and ongoing tasks terminated, and only the reset and the wakeup functions are available and responsive.

The device is put into System OFF mode using the [REGULATORS](#) register interface. When in System OFF mode, one of the following signals/actions will wake up the device:

1. DETECT signal, generated by the GPIO peripheral
2. RESET
3. start of debug session

When the device wakes up from System OFF mode, a system reset is performed.

One or more RAM blocks can be retained in System OFF mode depending on the settings in the RAM[n].POWER registers in [VMC](#). RAM[n].POWER are retained registers, see [Reset behavior](#) on page 57. Note that these registers are usually overwritten by the startup code provided with the nRF application examples.

Before entering System OFF mode, the user must make sure that all on-going EasyDMA transactions have completed. This can be accomplished by making sure that EasyDMA enabled peripherals have stopped and END events from them received. The LTE modem also needs to be stopped, by issuing a command through the modem API, before entering System OFF mode. Once the command is issued, one should wait for the modem to respond that it actually has stopped, as there may be a delay until modem is disconnected from the network.

#### 5.1.1.2.1 Emulated System OFF mode

If the device is in debug interface mode, System OFF will be emulated to secure that all required resources needed for debugging are available during System OFF.

See [Overview](#) on page 369 chapter for more information. Required resources needed for debugging include the following key components: [Overview](#) on page 369, [CLOCK — Clock control](#) on page 70, [POWER — Power control](#) on page 64, [NVMC — Non-volatile memory controller](#) on page 29, [CPU](#) on page 20, flash, and RAM. Since the CPU is kept on in emulated System OFF mode, it is required to add an infinite loop directly after entering System OFF, to prevent the CPU from executing code that normally should not be executed.

### 5.1.1.3 System ON mode

System ON is the power mode entered after a power-on reset.

While in System ON, the system can reside in one of two sub modes:

- Low power
- Constant latency

The low power mode is default after power-on reset.

In low power mode, whenever no application or wireless activity takes place, function blocks like the application CPU, LTE modem and all peripherals are in IDLE state. That particular state is referred to as System ON IDLE. In this state, all function blocks retain their state and configuration, so they are ready to become active once configured by the CPU.

If any application or modem activity occurs, the system leaves the System ON IDLE state. Once a given activity in a function block is completed, the system automatically returns to IDLE, retaining its configuration.

As long as the system resides in low power mode, the PMU ensures that the appropriate regulators and clock sources are started or stopped based on the needs of the function blocks active at any given time.

This automatic power management can be overridden by switching to constant latency mode. In this mode, the CPU wakeup latency and the PPI task response are constant and kept at a minimum. This is secured by keeping a set of base resources that are always enabled. The advantage of having a constant and predictable latency will be at the cost of having significantly increased power consumption compared to the low power mode. The constant latency mode is enabled by triggering the CONSTLAT task ([TASKS\\_CONSTLAT](#) on page 64).

While the system is in constant latency mode, the low power mode can be enabled by triggering LOWPWR task ([TASKS\\_LOWPWR](#) on page 65).

To reduce power consumption while in System ON IDLE, RAM blocks can be turned off in System ON mode while enabling the retention of these RAM blocks in RAM[n].POWER registers in [VMC](#). RAM[n].POWER are retained registers, see [Reset behavior](#) on page 57. Note that these registers are usually overwritten by the startup code provided with the nRF application examples.

### 5.1.1.4 Registers

### 5.1.1.5 Electrical specification

#### 5.1.1.5.1 ENABLE pin voltage requirements

| Symbol                           | Description                                                | Min.    | Typ. | Max. | Units |
|----------------------------------|------------------------------------------------------------|---------|------|------|-------|
| V <sub>SYSTEM_DISABLED_ON</sub>  | Operational voltage to enforce System-Disabled power mode. | 0.8*VDD |      |      | V     |
| V <sub>SYSTEM_DISABLED_OFF</sub> | Operational voltage to cancel System-Disabled power mode.  |         |      | 0.4  | V     |

### 5.1.2 Power supply

The nRF9160 has a single main power supply VDD, and the internal components are powered by integrated voltage regulators. The PMU manages these regulators automatically, no voltage regulator control needs to be included in application firmware.

#### 5.1.2.1 General purpose I/O supply

The input/output (I/O) drivers of P0.00 - P0.31 pins are supplied independently of VDD through VDD\_GPIO. This enables easy match to signal voltage levels in the printed circuit board design.

Figure 9: GPIO supply input (VDD\_GPIO)

The I/Os are supplied via VDD\_GPIO pin as shown in figure above. VDD\_GPIO pin supports voltage levels within range given in table [Operating conditions](#) on page 391

### 5.1.3 Power supply monitoring

Power monitor solutions are available in the device, in order to survey the VDD (battery voltage).

#### 5.1.3.1 Power supply supervisor

The power supply supervisor enables monitoring of the connected power supply.

Two functionalities are implemented:

- Power-on reset (POR): Generates a reset when the supply is applied to the device, and ensures that the device starts up in a known state
- Brownout reset (BOR): Generates a reset when the supply drops below the minimum voltage required for safe operations

Two BOR levels are used:

- $V_{BOROFF}$ , used in System OFF
- $V_{BORON}$ , used in System ON

The power supply supervisor is illustrated in the image below.

Figure 10: Power supply supervisor

### 5.1.3.2 Battery monitoring on VDD

A battery voltage (VDD) monitoring capability is provided via a modem API

**Note:** For details regarding the modem API, please refer to *nRF Connect SDK* document and *nRF91 AT Commands, Command Reference Guide* document.

### 5.1.3.3 Registers

### 5.1.3.4 Electrical specification

#### 5.1.3.4.1 Device startup times

| Symbol                           | Description                                                                                                                                                                                                                                           | Min. | Typ. | Max. | Units |
|----------------------------------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|------|------|------|-------|
| t <sub>POR</sub>                 | Time in power-on reset after VDD has reached 3V, ENABLE is tied to VDD.                                                                                                                                                                               |      | 1.2  |      | ms    |
| t <sub>PINR</sub>                | The maximum time taken to pull up the nRESET pin and release reset after power-on reset. Dependent on the pin capacitive load (C) <sup>2</sup> : t=TRC; Typical: T=2 R=13 kΩ; Max: T=5 R=16 kΩ.                                                       | ..   | ..   | ..   |       |
| t <sub>PINR,500nF</sub>          | C=500 nF                                                                                                                                                                                                                                              |      | 13   | 40   | ms    |
| t <sub>PINR,10uF</sub>           | C=10 μF                                                                                                                                                                                                                                               |      | 260  | 800  | ms    |
| t <sub>R2ON</sub>                | Time from reset to ON (CPU execute)                                                                                                                                                                                                                   |      | 127  |      | μs    |
| t <sub>OFF2ON</sub>              | Time from OFF to CPU execute                                                                                                                                                                                                                          |      | 73   |      | μs    |

### 5.1.4 Clock management

The clock control system can source the system clocks from a range of high and low frequency oscillators, and distribute them to modules based upon a module's individual requirements. Clock generation and distribution is handled automatically by PMU to optimize current consumption.

Listed here are the available clock signal sources:

- 64 MHz oscillator (HFINT)
- 64 MHz high accuracy oscillator (HFXO)
- 32.768 kHz RC oscillator (LFRC)
- 32.768 kHz high accuracy oscillator (LFXO)

The clock and oscillator resources are configured and controlled via the CLOCK peripheral as illustrated below.

Figure 11: Clock and oscillator setup

#### 5.1.4.1 HFCLK clock controller

The HFCLK clock controller provides several clocks in the system.

These are as follows:

- HCLK: 64 MHz CPU clock
- PCLK1M: 1 MHz peripheral clock
- PCLK16M: 16 MHz peripheral clock
- PCLK32M: 32 MHz peripheral clock

The HFCLK controller uses the following high frequency clock (HFCLK) sources:

- 64 MHz oscillator (HFINT)
- 64 MHz high accuracy oscillator (HFXO)

For illustration, see [Clock and oscillator setup](#) on page 54.

The HFCLK controller will automatically provide the clock(s) requested by the system. If the system does not request any clocks from the HFCLK controller, the controller will switch off all its clock sources and enter a power saving mode.

The HFINT source will be used when HFCLK is requested and HFXO has not been started.

The HFXO is started by triggering the HFCLKSTART task and stopped using the HFCLKSTOP task. A HFCLKSTARTED event will be generated when the HFXO has started and its frequency is stable.

#### 5.1.4.2 LFCLK clock controller

The system supports several low frequency clock sources.

As illustrated in [Clock and oscillator setup](#) on page 54, the system supports the following low frequency clock sources:

- LFRC: 32.768 kHz RC oscillator
- LFXO: 32.768 kHz high accuracy oscillator

The LFCLK clock controller and all LFCLK clock sources are always switched off when in System OFF mode.

The LFCLK clock is started by first selecting the preferred clock source in the [LFCLKSRC](#) on page 77 register and then triggering the LFCLKSTART task. LFXO is highly recommended as the LFCLK clock source, since the LFRC has a large frequency variation.

**Note:** The LTE modem requires using LFXO as the LFCLK source.

Switching between LFCLK clock sources can be done without stopping the LFCLK clock. A LFCLK clock source which is running prior to triggering the LFCLKSTART task will continue to run until the selected clock source has been available. After that the clock sources will be switched. Switching between clock sources will never introduce a glitch but it will stretch a clock pulse by 0.5 to 1.0 clock cycle (i.e. will delay rising edge by 0.5 to 1.0 clock cycle).

**Note:** If the watchdog timer (WDT) is running, the default LFCLK clock source (LFRC - see [LFCLKSRC](#) on page 77) is started automatically (LFCLKSTART task doesn't have to be triggered).

A LFCLKSTARTED event will be generated when the selected LFCLK clock source has started.

**Note:** When selecting LFXO as clock source for the first time, LFRC quality is provided until LFXO is stable.

A LFCLKSTOP task will stop global requesting of the LFCLK clock. However, if any system component (e.g. WDT, modem) requires the LFCLK, the clock won't be stopped. The LFCLKSTOP task should only be triggered after the STATE field in the LFCLKSTAT register indicates a LFCLK running-state.

#### 5.1.4.2.1 32.768 kHz RC oscillator (LFRC)

The default source of the low frequency clock (LFCLK) is the 32.768 kHz RC oscillator (LFRC).

The LFRC frequency will be affected by variation in temperature.

### 5.1.4.3 Registers

#### 5.1.4.4 Electrical specification

##### 5.1.4.4.1 64 MHz internal oscillator (HFINT)

| Symbol                    | Description              | Min. | Typ. | Max. | Units         |

| $t_{\text{START\_LFXO}}$ | Startup time        |      | 200    |      | ms    |

#### 5.1.4.4.4 32.768 kHz RC oscillator (LFRC)

| Symbol                   | Description         | Min. | Typ.   | Max. | Units         |
|--------------------------|---------------------|------|--------|------|---------------|
| $f_{\text{NOM\_LFRC}}$   | Nominal frequency   |      | 32.768 |      | kHz           |
| $f_{\text{TOL\_LFRC}}$   | Frequency tolerance |      | 30     |      | %             |
| $t_{\text{START\_LFRC}}$ | Startup time        |      | 600    |      | $\mu\text{s}$ |

### 5.1.5 Reset

There are multiple reset sources that may trigger a reset of the system. After a reset the CPU can query the RESETREAS (reset reason register) to find out which source generated the reset.

#### 5.1.5.1 Power-on reset

The power-on reset generator initializes the system at power-on. The system is held in reset state until the supply has reached the minimum operating voltage and the internal voltage regulators have started.

#### 5.1.5.2 Pin reset

A pin reset is generated when the physical reset pin (nRESET) on the device is pulled low.

To ensure that reset is issued correctly, the reset pin should be held low for time given in [Pin reset](#) on page 58.

nRESET pin has an always-on internal pull-up resistor connected to nRF9160 internal voltage typically of 2.2 V level. This is illustrated in the figure below. The value of the pull-up resistor is given in [Pin reset](#) on page 58.

**Note:** Driving nRESET high with a voltage lower than 2.2V will result in additional leakage.

Figure 12: Pin reset internal generation

#### 5.1.5.3 Wakeup from System OFF mode reset

The device is reset when it wakes up from System OFF mode.

The Debug access port is not reset following a wake up from System OFF mode if the device is in debug interface mode, see [Overview](#) on page 369 chapter for more information.

#### 5.1.5.4 Soft reset

A soft reset is generated when the SYSRESETREQ bit of the application interrupt and reset control register (AIRC\_R register) in the ARM core is set.

#### 5.1.5.5 Watchdog reset

A watchdog reset is generated when the watchdog timer (WDT) times out.

See [WDT — Watchdog timer](#) on page 354 chapter for more information.

#### 5.1.5.6 Brownout reset

The brownout reset generator puts the system in reset state if the supply voltage drops below the brownout reset threshold.

#### 5.1.5.7 Retained registers

A retained register is a register that will retain its value in System OFF mode, and through a reset depending on reset source. See individual peripheral chapters for information of which registers are retained for the different peripherals.

#### 5.1.5.8 Reset behavior

Reset behavior depends on the reset source.

The reset behavior is summarized in the table below.

| Reset source                         | Reset target |       |                    |        |                                  |                              |     |           |
|--------------------------------------|--------------|-------|--------------------|--------|----------------------------------|------------------------------|-----|-----------|
|                                      | CPU          | Modem | Debug <sup>3</sup> | SWJ-DP | Not retained<br>RAM <sup>4</sup> | Retained<br>RAM <sup>4</sup> | WDT | RESETREAS |
| CPU lockup <sup>5</sup>              | x            | x     |                    |        |                                  |                              |     |           |
| Soft reset                           | x            | x     |                    |        |                                  |                              |     |           |
| Wakeup from System OFF<br>mode reset | x            | x     | x <sup>6</sup>     |        | x                                |                              | x   |           |
| Watchdog reset <sup>7</sup>          | x            | x     | x                  |        | x                                |                              | x   |           |
| Pin reset                            | x            | x     | x                  | x      | x                                |                              | x   |           |
| Brownout reset                       | x            | x     | x                  | x      | x                                | x                            | x   | x         |
| Power-on reset                       | x            | x     | x                  | x      | x                                | x                            | x   |           |

Table 17: Reset behavior for the main components

**Note:** The RAM is never reset but its content may be corrupted after reset in the cases given in the table above.

<sup>3</sup> All debug components excluding SWJ-DP. See [Overview](#) on page 369 chapter for more information about the different debug components in the system.

<sup>4</sup> RAM can be configured to be retained using registers in [VMC — Volatile memory controller](#) on page 27

<sup>5</sup> Reset from CPU lockup is disabled if the device is in debug interface mode. CPU lockup is not possible in System OFF.

<sup>6</sup> The debug components will not be reset if the device is in debug interface mode.

<sup>7</sup> Watchdog reset is not available in System OFF.

| Brownout reset                    | x                            | x         | x                    | x                    | x                          | x              |
| Power-on reset                    | x                            | x         | x                    | x                    | x                          | x              |

Table 18: Reset behavior for the retained registers

### 5.1.5.9 Registers

#### 5.1.5.10 Electrical specification

##### 5.1.5.10.1 Pin reset

| Symbol                 | Description                                    | Min. | Typ. | Max. | Units |
|------------------------|------------------------------------------------|------|------|------|-------|
| t <sub>HOLDRESET</sub> | Hold time for reset pin when doing a pin reset | 5    |      |      | μs    |
| R <sub>PULL-UP</sub>   | Value of the internal pull-up resistor         |      | 13   |      | kΩ    |

## 5.2 Current consumption

As the system is being constantly tuned by the PMU described in [Functional description](#) on page 48, estimating the current consumption of an application can be challenging if the designer is not able to perform measurements directly on the hardware. To facilitate the estimation process, a set of current consumption scenarios are provided to show the typical current drawn from the VDD supply.

Each scenario specifies a set of operations and conditions applying to the given scenario. [Current consumption scenarios, common conditions](#) on page 59 shows a set of common conditions used in all scenarios, unless otherwise is stated in the description of a given scenario. Similarly, [Current consumption scenarios, common conditions for LTE modem](#) on page 59 describes the conditions used for the modem current consumption specifications. All scenarios are listed in [Electrical specification](#) on page 59

Peripherals typically share one or more power sources. This results in a current consumption that does not scale linearly with the number of peripherals enabled. For example, the current consumption for an application with two peripherals enabled, is not the sum of the currents reported by their individual peripherals.

| Condition     | Value                                               |
|---------------|-----------------------------------------------------|
| Supply        | 3.7 V                                               |
| Temperature   | 25 °C                                               |
| CPU           | WFI (wait for interrupt)/WFE (wait for event) sleep |
| Peripherals   | All idle <sup>8</sup>                               |
| Clock         | Not running                                         |
| RAM           | No retention                                        |
| Cache enabled | Yes                                                 |

Table 19: Current consumption scenarios, common conditions

| Condition                                                                                                               |
|-------------------------------------------------------------------------------------------------------------------------|
| Cat-M1 and Cat-NB1 HD FDD mode                                                                                          |
| Good channel, RF cable, no errors in DL/UL communication                                                                |
| Network response times at minimum                                                                                       |
| Output power at antenna port, single-ended 50 Ω                                                                         |
| Modem eDRX current consumption quoted with UICC that allows UICC supply shut down at eDRX intervals. <sup>9 10 11</sup> |
| Modem PSM TAU event energy is measured from the modem PSM wake-up until end of RX inactivity time                       |
| All LTE modem current consumption numbers include application core idle mode consumption                                |

Table 20: Current consumption scenarios, common conditions for LTE modem

## 5.2.1 Electrical specification

### 5.2.1.1 Current consumption during System Disabled

| Symbol           | Description                       | Min. | Typ. | Max. | Units |
|------------------|-----------------------------------|------|------|------|-------|
| ISYSTEM_DISABLED | ENABLE and VDD_GPIO pins grounded |      | 150  |      | nA    |

<sup>8</sup> Except for currents reported for a given peripheral. Peripheral's currents are estimated during momentary transmission.

<sup>9</sup> Required UICC restart current consumption is included.

<sup>10</sup> If the used UICC does not support supply shut down, then UICC will remain in clock stop mode. Depending on the used UICC a clock stop current of typ. 20-60uA@3.7V needs to be added to get the total average consumption.

<sup>11</sup> Minimum UICC supply shut down interval and clock stop mode current consumption must be obtained from the UICC supplier.

### 5.2.1.2 Sleep

| Symbol               | Description                                                  | Min. | Typ. | Max. | Units |
|----------------------|--------------------------------------------------------------|------|------|------|-------|
| I <sub>MCUOFF0</sub> | MCU off, modem off, no RAM retention, wake on GPIO and reset |      | 1.4  |      | μA    |
| I <sub>MCUON0</sub>  | MCU on IDLE, modem off, RTC off                              |      | 1.8  |      | μA    |
| I <sub>MCUON1</sub>  | MCU on IDLE, modem off, RTC on                               |      | 2.2  |      | μA    |

### 5.2.1.3 Application CPU active current consumption

| Symbol                          | Description                                                           | Min. | Typ.   | Max. | Units           |
|---------------------------------|-----------------------------------------------------------------------|------|--------|------|-----------------|
| I <sub>CPU0_FLASH</sub>         | CPU running CoreMark @64 MHz from flash, clock = HFINT, cache enabled |      | 2.20   |      | mA              |
| I <sub>COREMARK_PER_MA_FL</sub> | CoreMark per mA, executing from flash, CoreMark=243                   |      | 110.45 |      | CoreMark/<br>mA |
| I <sub>CPU0_RAM</sub>           | CPU running CoreMark @64 MHz from RAM, clock = HFINT                  |      | 2.19   |      | mA              |
| I <sub>COREMARK_PER_MA_RA</sub> | CoreMark per mA, executing from RAM, CoreMark=235                     |      | 107.31 |      | CoreMark/<br>mA |

### 5.2.1.4 I2S

| Symbol            | Description                                                                                                                      | Min. | Typ. | Max. | Units |
|-------------------|----------------------------------------------------------------------------------------------------------------------------------|------|------|------|-------|
| I <sub>I2S0</sub> | I2S transferring data left-channel (mono) @ 16 bit x 16 kHz<br>(CONFIG.MCKFREQ = 32MDIV8, CONFIG.RATIO = 256X),<br>Clock = HFINT |      | 0.69 |      | mA    |
| I <sub>I2S1</sub> | I2S transferring data left-channel (mono) @ 16 bit x 16 kHz<br>(CONFIG.MCKFREQ = 32MDIV8, CONFIG.RATIO = 256X),<br>Clock = HFXO  |      | 1.65 |      | mA    |

### 5.2.1.5 PDM

| Symbol           | Description                                                                                     | Min. | Typ. | Max. | Units |
|------------------|-------------------------------------------------------------------------------------------------|------|------|------|-------|
| I <sub>PDM</sub> | PDM receiving and processing data 16KHz, with FREQ = 1.28MHz, MODE.OPERATION = mono             |      | 0.71 |      | mA    |
| I <sub>PDM</sub> | PDM receiving and processing data 16KHz, with FREQ = 1.28MHz, MODE.OPERATION = mono, clock HFXO |      | 1.67 |      | mA    |

### 5.2.1.6 PWM

| Symbol            | Description                             | Min. | Typ.   | Max. | Units |
|-------------------|-----------------------------------------|------|--------|------|-------|
| I <sub>PWM0</sub> | PWM running @ 125 kHz, fixed duty cycle |      | 623.97 |      | μA    |
| I <sub>PWM1</sub> | PWM running @ 16 MHz, fixed duty cycle  |      | 723.1  |      | μA    |

### 5.2.1.7 SAADC

| Symbol                   | Description                                                                       | Min. | Typ.  | Max. | Units |
|--------------------------|-----------------------------------------------------------------------------------|------|-------|------|-------|
| I <sub>SAADC_HFXO</sub>  | SAADC sampling @ 16 ksps, with high accuracy clock HFXO, acquisition time = 20 μs |      | 1288  |      | μA    |
| I <sub>SAADC_HFINT</sub> | SAADC sampling @ 16 ksps, with low accuracy clock HFINT, acquisition time = 20 μs |      | 297.7 |      | μA    |

### 5.2.1.8 TIMER

| Symbol              | Description            | Min. | Typ.  | Max. | Units |
|---------------------|------------------------|------|-------|------|-------|
| I <sub>TIMER0</sub> | TIMER running @ 1 MHz  |      | 503.7 |      | μA    |
| I <sub>TIMER1</sub> | TIMER running @ 16 MHz |      | 556.3 |      | μA    |

### 5.2.1.9 SPIM

| Symbol             | Description                                    | Min. | Typ. | Max. | Units |
|--------------------|------------------------------------------------|------|------|------|-------|
| I <sub>SPIM0</sub> | SPIM transferring data @ 2 Mbps, Clock = HFINT |      | 0.63 |      | mA    |
| I <sub>SPIM1</sub> | SPIM transferring data @ 2 Mbps, Clock = HFXO  |      | 1.58 |      | mA    |
| I <sub>SPIM2</sub> | SPIM transferring data @ 8 Mbps, Clock = HFINT |      | 0.67 |      | mA    |
| I <sub>SPIM3</sub> | SPIM transferring data @ 8 Mbps, Clock = HFXO  |      | 1.62 |      | mA    |

### 5.2.1.10 SPIS

| Symbol                 | Description                               | Min. | Typ. | Max. | Units |
|------------------------|-------------------------------------------|------|------|------|-------|
| I <sub>SPIS_2M</sub>   | SPIS receiving data @ 2 Mbps, Clock=HFINT |      | 0.63 |      | mA    |
| I <sub>SPIS_2MXO</sub> | SPIS receiving data @ 2 Mbps, Clock=HFXO  |      | 1.58 |      | mA    |
| I <sub>SPIS_8M</sub>   | SPIS receiving data @ 8 Mbps, Clock=HFINT |      | 0.67 |      | mA    |
| I <sub>SPIS_8MXO</sub> | SPIS receiving data @ 8 Mbps, Clock=HFXO  |      | 1.62 |      | mA    |

### 5.2.1.11 TWIM

| Symbol                  | Description                            | Min. | Typ. | Max. | Units |
|-------------------------|----------------------------------------|------|------|------|-------|
| I <sub>TWIM_100</sub>   | TWIM running @ 100 kbps, Clock=HFINT   |      | 0.61 |      | mA    |
| I <sub>TWIM_400</sub>   | TWIM running @ 400 kbps, Clock = HFINT |      | 0.61 |      | mA    |
| I <sub>TWIM_100XO</sub> | TWIM running @ 100 kbps, Clock = HFXO  |      | 1.56 |      | mA    |
| I <sub>TWIM_400XO</sub> | TWIM running @ 400 kbps, Clock = HFXO  |      | 1.56 |      | mA    |

### 5.2.1.12 TWIS

| Symbol                      | Description                                     | Min. | Typ. | Max. | Units |
|-----------------------------|-------------------------------------------------|------|------|------|-------|
| I <sub>TWIS,RUN_100</sub>   | TWIS transferring data @ 100 kbps, Clock=HFINT  |      | 0.60 |      | mA    |
| I <sub>TWIS1,RUN_400</sub>  | TWIS transferring data @ 400 kbps, Clock=HFINT  |      | 0.60 |      | mA    |
| I <sub>TWIS,RUN_100XO</sub> | TWIS transferring data @ 100 kbps, Clock = HFXO |      | 1.55 |      | mA    |
| I <sub>TWIS,RUN_400XO</sub> | TWIS transferring data @ 400 kbps, Clock = HFXO |      | 1.55 |      | mA    |

### 5.2.1.13 UARTE

| Symbol                  | Description                          | Min. | Typ.  | Max. | Units |
|-------------------------|--------------------------------------|------|-------|------|-------|
| I <sub>UARTE,1M</sub>   | UARTE transferring data @ 1200 bps   |      | 819.2 |      | mA    |
| I <sub>UARTE,115K</sub> | UARTE transferring data @ 115200 bps |      | 620.6 |      | mA    |

### 5.2.1.14 WDT

| Symbol           | Description | Min. | Typ. | Max. | Units |
|------------------|-------------|------|------|------|-------|
| I <sub>WDT</sub> | WDT started |      | 2.50 |      | μA    |

### 5.2.1.15 Modem current consumption

For estimating particular use cases, see [nRF9160 Online Power Profiler for LTE](#)

| Symbol                                                                         | Description                                                                                                                                | B13<br>(typ.) | B20<br>(typ.) | B3<br>(typ.) | B4<br>(typ.) | Units |

## 5.3 Register description

### 5.3.1 POWER — Power control

The POWER module provides an interface to tasks, events, interrupt and reset related configuration settings of the power management unit.

**Note:** Registers [INTEN](#) on page 67, [INTENSET](#) on page 67, and [INTENCLR](#) on page 68 are the same registers (at the same address) as corresponding registers in [CLOCK — Clock control](#) on page 70.

#### 5.3.1.1 Registers

| Base address | Peripheral | Instance   | Secure mapping | DMA security | Description   | Configuration |
|--------------|------------|------------|----------------|--------------|---------------|---------------|
| 0x50005000   | POWER      | POWER : S  | US             | NA           | Power control |               |
| 0x40005000   |            | POWER : NS |                |              |               |               |

Table 21: Instances

| Register           | Offset | Security | Description                                                |
|--------------------|--------|----------|------------------------------------------------------------|
| TASKS_CONSTLAT     | 0x78   |          | Enable constant latency mode.                              |
| TASKS_LOWPWR       | 0x7C   |          | Enable low power mode (variable latency)                   |
| SUBSCRIBE_CONSTLAT | 0xF8   |          | Subscribe configuration for task <a href="#">CONSTLAT</a>  |
| SUBSCRIBE_LOWPWR   | 0xFC   |          | Subscribe configuration for task <a href="#">LOWPWR</a>    |
| EVENTS_POFWARN     | 0x108  |          | Power failure warning                                      |
| EVENTS_SLEEPENTER  | 0x114  |          | CPU entered WFI/WFE sleep                                  |
| EVENTS_SLEEPEXIT   | 0x118  |          | CPU exited WFI/WFE sleep                                   |
| PUBLISH_POFWARN    | 0x188  |          | Publish configuration for event <a href="#">POFWARN</a>    |
| PUBLISH_SLEEPENTER | 0x194  |          | Publish configuration for event <a href="#">SLEEPENTER</a> |
| PUBLISH_SLEEPEXIT  | 0x198  |          | Publish configuration for event <a href="#">SLEEPEXIT</a>  |
| INTEN              | 0x300  |          | Enable or disable interrupt                                |
| INTENSET           | 0x304  |          | Enable interrupt                                           |
| INTENCLR           | 0x308  |          | Disable interrupt                                          |
| RESETREAS          | 0x400  |          | Reset reason                                               |
| POWERSTATUS        | 0x440  |          | Modem domain power status                                  |
| GPREGRET[n]        | 0x51C  |          | General purpose retention register                         |

Table 22: Register overview

#### 5.3.1.1.1 TASKS\_CONSTLAT

Address offset: 0x78

Enable constant latency mode.

### 5.3.2 CLOCK — Clock control

The CLOCK module provides one of the interfaces to power and clock management configuration settings.

Through CLOCK module it is able to configure the following:

- LFCLK clock source setup
- LFCLK and HFCLK status
- Tasks and events
- Interrupts
- Reset

**Note:** Registers [INTEN](#) on page 74, [INTENSET](#) on page 74, and [INTENCLR](#) on page 74 are the same registers (at the same address) as corresponding registers in [POWER — Power control](#) on page 64.

#### 5.3.2.1 Registers

| Base address | Peripheral | Instance   | Secure mapping | DMA security | Description   | Configuration |
|--------------|------------|------------|----------------|--------------|---------------|---------------|
| 0x50005000   | CLOCK      | CLOCK : S  | US             | NA           | Clock control |               |
| 0x40005000   |            | CLOCK : NS |                |              |               |               |

Table 23: Instances

| Register             | Offset | Security | Description                                                                                                                               |
|----------------------|--------|----------|-------------------------------------------------------------------------------------------------------------------------------------------|

# 6 Peripherals

## 6.1 CRYPTOCELL — ARM TrustZone CryptoCell 310

ARM TrustZone CryptoCell 310 (CRYPTOCELL) is a security subsystem which provides root of trust (RoT) and cryptographic services for a device.

Figure 13: Block diagram for CRYPTOCELL

The following cryptographic features are provided:

- True random number generator (TRNG) compliant with NIST 800-90B, AIS-31, and FIPS 140-2
- Pseudorandom number generator (PRNG) using underlying AES engine compliant with NIST 800-90A
- RSA public key cryptography
  - Up to 2048-bit key size
  - PKCS#1 v2.1/v1.5
  - Optional CRT support
- Elliptic curve cryptography (ECC)
  - NIST FIPS 186-4 recommended curves using pseudorandom parameters, up to 521 bits:
    - Prime field: P-192, P-224, P-256, P-384, P-521
  - SEC 2 recommended curves using pseudorandom parameters, up to 521 bits:
    - Prime field: secp160r1, secp192r1, secp224r1, secp256r1, secp384r1, secp521r1
  - Koblitz curves using fixed parameters, up to 256 bits:

- Prime field: secp160k1, secp192k1, secp224k1, secp256k1
- Edwards/Montgomery curves:
  - Ed25519, Curve25519
- ECDH/ECDSA support
- Secure remote password protocol (SRP)
  - Up to 3072-bit operations
- Hashing functions
  - SHA-1, SHA-2 up to 256 bits
  - Keyed-hash message authentication code (HMAC)
- AES symmetric encryption
  - General purpose AES engine (encrypt/decrypt, sign/verify)
  - 128-bit key size
  - Supported encryption modes: ECB, CBC, CMAC/CBC-MAC, CTR, CCM/CCM\* (CCM\* is a minor variation of CCM)
- ChaCha20/Poly1305 symmetric encryption
  - Supported key size: 128 and 256 bits
  - Authenticated encryption with associated data (AEAD) mode

### 6.1.1 Usage

The CRYPTOCELL state is controlled via a register interface. The cryptographic functions of CRYPTOCELL are accessible by using a software library provided in the device SDK, not directly via a register interface.

To enable CRYPTOCELL, use register [ENABLE](#) on page 82.

**Note:** Keeping the CRYPTOCELL subsystem enabled will prevent the device from reaching the System ON, All Idle state.

### 6.1.2 Always-on (AO) power domain

The CRYPTOCELL subsystem has an internal always-on (AO) power domain for retaining device secrets when CRYPTOCELL is disabled.

The following information is retained by the AO power domain:

- 4 bits indicating the configured CRYPTOCELL lifecycle state (LCS)
- 1 bit indicating if the hard-coded RTL key,  $K_{RTL}$  (see [RTL key](#) on page 81), is available for use
- 128-bit device root key,  $K_{DR}$  (see [Device root key](#) on page 81)

A reset from any reset source will erase the content in the AO power domain.

### 6.1.3 Lifecycle state (LCS)

Lifecycle refers to multiple states a device goes through during its lifetime. Two valid lifecycle states are offered for the device - debug and secure.

The CRYPTOCELL subsystem lifecycle state (LCS) is controlled through register [HOST\\_IOT\\_LCS](#) on page 85. A valid LCS is configured by writing either value `Debug` or `Secure` into the LCS field of this register. A correctly configured LCS can be validated by reading back the read-only field `LCS_IS_VALID` from the abovementioned register. The `LCS_IS_VALID` field value will change from `Invalid` to `Valid` once a valid LCS value has been written.

| LCS field value | LCS_IS_VALID field value | Description                                                                                                                                                             |
|-----------------|--------------------------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Secure          | Invalid                  | Default reset value indicating that LCS has not been configured.                                                                                                        |
| Secure          | Valid                    | LCS set to secure mode, and LCS is valid. Registers <a href="#">HOST_IOT_KDR[0..3]</a> can only be written once per reset cycle. Any additional writes will be ignored. |
| Debug           | Valid                    | LCS set to debug mode, and LCS is valid. Registers <a href="#">HOST_IOT_KDR[0..3]</a> can be written multiple times.                                                    |

Table 27: Lifecycle states

## 6.1.4 Cryptographic key selection

The CRYPTOCELL subsystem can be instructed to operate on different cryptographic keys.

Through register [HOST\\_CRYPTKEY\\_SEL](#) on page 83, the following key types can be selected for cryptographic operations:

- RTL key  $K_{PRTL}$
- Device root key  $K_{DR}$
- Session key

$K_{PRTL}$  and  $K_{DR}$  are configured as part of the CRYPTOCELL initialization process, while session keys are provided by the application through the software library API.

### 6.1.4.1 RTL key

The ARM TrustZone CryptoCell 310 contains one hard-coded RTL key referred to as  $K_{PRTL}$ . This key is set to the same value for all devices with the same part code in the hardware design and cannot be changed.

The  $K_{PRTL}$  key can be requested for use in cryptographic operations by the CRYPTOCELL, without revealing the key value itself. Access to use of  $K_{PRTL}$  in cryptographic operations can be disabled until next reset by writing to register [HOST\\_IOT\\_KPRTL\\_LOCK](#) on page 84. If a locked  $K_{PRTL}$  key is requested for use, a zero vector key will be routed to the AES engine instead.

### 6.1.4.2 Device root key

The device root key  $K_{DR}$  is a 128-bit AES key programmed into the CRYPTOCELL subsystem using firmware. It is retained in the AO power domain until the next reset.

Once configured, it is possible to perform cryptographic operations using the the CRYPTOCELL subsystem where  $K_{DR}$  is selected as key input without having access to the key value itself. The  $K_{DR}$  key value must be written to registers [HOST\\_IOT\\_KDR\[0..3\]](#). These 4 registers are write-only if LCS is set to debug mode, and write-once if LCS is set to secure mode. The  $K_{DR}$  key value is successfully retained when the read-back value of register [HOST\\_IOT\\_KDR0](#) on page 84 changes to 1.

## 6.1.5 Direct memory access (DMA)

The CRYPTOCELL subsystem implements direct memory access (DMA) for accessing memory without CPU intervention.

Any data stored in memory type(s) not accessible by the DMA engine must be copied to SRAM before it can be processed by the CRYPTOCELL subsystem. Maximum DMA transaction size is limited to  $2^{16}-1$  bytes.

## 6.1.6 Standards

ARM TrustZone CryptoCell 310 (CRYPTOCELL) supports a number of cryptography standards.

| Algorithm family | Identification code    | Document title                                                                                                                                                                                     |
|------------------|------------------------|----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| TRNG             | NIST SP 800-90B        | <i>Recommendation for the Entropy Sources Used for Random Bit Generation</i>                                                                                                                       |

## 6.1.8 Host interface

This chapter describes host registers used to control the CRYPTOCELL subsystem behavior.

### 6.1.8.1 HOST\_RGF block

The HOST\_RGF block contains registers for configuring LCS and device root key  $K_{DR}$ , in addition to selecting which cryptographic key is connected to the AES engine.

#### 6.1.8.1.1 Registers

| Base address | Peripheral  | Instance      | Secure mapping | DMA security | Description             | Configuration |
|--------------|-------------|---------------|----------------|--------------|-------------------------|---------------|
| 0x50840000   | CC_HOST_RGF | CC_HOST_RGF S |                | NSA          | Host platform interface |               |

Table 31: Instances

| Register            | Offset | Security | Description                                                                                                                                                                                                          |
|---------------------|--------|----------|----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| HOST_CRYPTOKY_SEL   | 0x1A38 |          | AES hardware key select                                                                                                                                                                                              |
| HOST_IOT_KPRTL_LOCK | 0x1A4C |          | This write-once register is the K_PRTL lock register. When this register is set, K_PRTL cannot be used and a zeroed key will be used instead. The value of this register is saved in the CRYPTOCELL AO power domain. |
| HOST_IOT_KDR0       | 0x1A50 |          | This register holds bits 31:0 of K_DR. The value of this register is saved in the CRYPTOCELL AO power domain. Reading from this address returns the K_DR valid status indicating if K_DR is successfully retained.   |
| HOST_IOT_KDR1       | 0x1A54 |          | This register holds bits 63:32 of K_DR. The value of this register is saved in the CRYPTOCELL AO power domain.                                                                                                       |
| HOST_IOT_KDR2       | 0x1A58 |          | This register holds bits 95:64 of K_DR. The value of this register is saved in the CRYPTOCELL AO power domain.                                                                                                       |
| HOST_IOT_KDR3       | 0x1A5C |          | This register holds bits 127:96 of K_DR. The value of this register is saved in the CRYPTOCELL AO power domain.                                                                                                      |
| HOST_IOT_LCS        | 0x1A60 |          | Controls lifecycle state (LCS) for CRYPTOCELL subsystem                                                                                                                                                              |

Table 32: Register overview

##### 6.1.8.1.1.1 HOST\_CRYPTOKY\_SEL

Address offset: 0x1A38

AES hardware key select

**Note:** If the HOST\_IOT\_KPRTL\_LOCK register is set, and the HOST\_CRYPTOKY\_SEL register set to 1, then the HW key that is connected to the AES engine is zero

|                  |     |                   |          |                                                                                       |                                                                |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |

#### 6.1.8.1.1.2 HOST\_IOT\_KPRTL\_LOCK

Address offset: 0x1A4C

This write-once register is the K\_PRTL lock register. When this register is set, K\_PRTL cannot be used and a zeroed key will be used instead. The value of this register is saved in the CRYPTOCELL AO power domain.

If K_PRTL is selected anyway, a zeroed key will be used instead.                                                                                  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |

#### 6.1.8.1.1.3 HOST\_IOT\_KDR0

Address offset: 0x1A50

This register holds bits 31:0 of K\_DR. The value of this register is saved in the CRYPTOCELL AO power domain. Reading from this address returns the K\_DR valid status indicating if K\_DR is successfully retained.

## 6.2 DPPI - Distributed programmable peripheral interconnect

The distributed programmable peripheral interconnect (DPPI) enables peripherals to interact autonomously with each other by using tasks and events, without any intervention from the CPU. DPPI allows precise synchronization between peripherals when real-time application constraints exist, and eliminates the need for CPU involvement to implement behavior which can be predefined using the DPPI.

**Note:** For more information on tasks, events, publish/subscribe, interrupts, and other concepts, see [Peripheral interface](#) on page 15.

The DPPI has the following features:

- Peripheral tasks can subscribe to channels
- Peripheral events can be published on channels
- Publish/subscribe pattern enabling multiple connection options that include the following:
  - One-to-one
  - One-to-many
  - Many-to-one
  - Many-to-many

The DPPI consists of several PPIBus modules, which are connected to a fixed number of DPPI channels and a DPPI configuration (DPPIC).

Figure 14: DPPI overview

### 6.2.1 Subscribing to and publishing on channels

The PPIBus can route peripheral events onto the channels (publishing), or route events from the channels into peripheral tasks (subscribing).

All peripherals include the following:

- One subscribe register per task
- One publish register per event

Publish and subscribe registers use a channel index field to determine the channel to which the event is published or tasks subscribed. In addition, there is an enable bit for the subscribe and publish registers that needs to be enabled before the subscription or publishing takes effect.

Writing non-existing channel index (CHIDX) numbers into a peripheral's publish or subscribe registers will yield unexpected results.

One event can trigger multiple tasks by subscribing different tasks to the same channel. Similarly, one task can be triggered by multiple events by publishing different events to the same channel. For advanced use cases, multiple events and multiple tasks can connect to the same channel forming a many-to-many connection. If multiple events are published on the same channel at the same time, the events are merged and only one event is routed through the DPPI.

How peripheral events are routed onto different channels based on publish registers is illustrated in the following figure.

Figure 15: DPPI events flow

The following figure illustrates how peripheral tasks are triggered from different channels based on subscribe registers.

Figure 16: DPPI tasks flow

### 6.2.2 DPPI configuration (DPPIC)

Enabling and disabling of channels globally is handled through the DPPI configuration (DPPIC). Connection (connect/disconnect) between a channel and a peripheral is handled locally by the PPIBus.

There are two ways of enabling and disabling global channels using the DPPI configuration:

- Enable or disable channels individually using registers CHEN, CHENSET, and CHENCLR.
- Enable or disable channels in channel groups using the groups' tasks ENABLE and DISABLE. It needs to be defined which channels belong to which channel groups before these tasks are triggered.

**Note:** ENABLE tasks are prioritized over DISABLE tasks. When a channel belongs to two or more groups, for example group m and n, and the tasks CHG[m].EN and CHG[n].DIS occur simultaneously (m and n can be equal or different), the CHG[m].EN task on that channel is prioritized.

The DPPI configuration tasks (for example CHG[0].EN) can be triggered through DPPI like any other task, which means they can be linked to a DPPI channel through the subscribe registers.

In order to write to CHG[x], the corresponding CHG[x].EN and CHG[x].DIS subscribe registers must be disabled. Writes to CHG[x] are ignored if any of the two subscribe registers are enabled.

### 6.2.3 Connection examples

DPPI offers several connection options. Examples are given for how to create one-to-one and many-to-many connections.

## One-to-one connection

This example shows how to create a one-to-one connection between TIMER compare register and SAADC start task.

The channel configuration is set up first. TIMER0 will publish its COMPARE0 event on channel 0, and SAADC will subscribe its START task to events on the same channel. After that, the channel is enabled through the DPPIC.

```
NRF_TIMER0->PUBLISH_COMPARE0 = (DPPI_PUB_CHIDX_Ch0) |
                                (DPPI_PUB_EN_Msk);
NRF_SAADC->SUBSCRIBE_START    = (DPPI_SUB_CHIDX_Ch0) |
                                (DPPI_SUB_EN_Msk);

NRF_DPPIC->CHENSET = (DPPI_CHENSET_CH0_Set << DPPI_CHENSET_CH0_Pos);
```

## Many-to-many connection

The example shows how to create a many-to-many connection, showcasing the DPPIC's channel group functionality.

A channel group that includes only channel 0 is set up first. Then the GPIOTE and TIMER0 configure their IN0 and COMPARE0 events respectively to be published on channel 0, while the SAADC configures its START task to subscribe to events on channel 0. Through DPPIC, the CHG0 DISABLE task is configured to subscribe to events on channel 0. After an event is received on channel 0 it will be disabled. Finally, channel 0 is enabled using the DPPIC task to enable a channel group.

```
NRF_DPPIC->CHG[0] = (DPPI_CHG_CH0_Included << PPI_CHG_CH0_Pos);

NRF_GPIOTE->PUBLISH_IN0      = (DPPI_PUB_CHIDX_Ch0) |
                                (DPPI_PUB_EN_Msk);
NRF_TIMER0->PUBLISH_COMPARE0 = (DPPI_PUB_CHIDX_Ch0) |
                                (DPPI_PUB_EN_Msk);
NRF_SAADC->SUBSCRIBE_START    = (DPPI_SUB_CHIDX_Ch0) |
                                (DPPI_SUB_EN_Msk);
NRF_DPPIC->SUBSCRIBE_CHG[0].DIS = (DPPI_SUB_CHIDX_Ch0) |
                                (DPPI_SUB_EN_Msk);

NRF_DPPIC->TASK_CHG[0].EN = 1;
```

## 6.2.4 Special considerations for a system implementing TrustZone for Cortex-M processors

DPPI is implemented with split security, meaning it handles both secure and non-secure accesses. In a system implementing the TrustZone for Cortex-M technology, DPPI channels can be defined as secure or non-secure using the SPU.

A peripheral configured as non-secure will only be able to subscribe to or publish on non-secure DPPI channels. A peripheral configured as secure will be able to access all DPPI channels. DPPI handles both secure and non-secure accesses, but behaves differently depending on the access type:

- A non-secure peripheral access can only configure and control the DPPI channels defined as non-secure in the SPU.DPPI.PERM[] register(s)

- A secure peripheral access can control all the DPPI channels, independently of the SPU.DPPI.PERM[] register(s)

A group of channels can be created, making it possible to simultaneously enable or disable all channels within the group. The security attribute of a group of channels (secure or non-secure) is defined as follows:

- If all channels (enabled or not) within a group are non-secure, then the group is considered non-secure
- If at least one of the channels (enabled or not) within the group is secure, then the group is considered secure

A non-secure access to a DPPI register, or a bit field, controlling a channel marked as secure in SPU.DPPI[].PERM register(s) will be ignored. Write accesses will have no effect, and read accesses will always return a zero value.

No exceptions are triggered when non-secure accesses target a register or a bit field controlling a secure channel. For example, if the bit  $i$  is set in the SPU.DPPI[0].PERM register (declaring DPPI channel  $i$  as secure), then:

- Non-secure write accesses to registers CHEN, CHENSET, and CHENCLR cannot write bit  $i$  of these registers
- Non-secure write accesses to TASK\_CHG[j].EN and TASK\_CHG[j].DIS registers are ignored if the channel group  $j$  contains at least one channel defined as secure (it can be the channel  $i$  itself or any channel declared as secure)
- Non-secure read accesses to registers CHEN, CHENSET, and CHENCLR always read 0 for the bit at position  $i$

For the channel configuration registers (CHG[]), access from non-secure code is only possible if the included channels are all non-secure, whether the channels are enabled or not. If a CHG[g] register included one or more secure channel(s), then the group  $g$  is considered as secure, and only secure transfers can read to or write from CHG[g]. A non-secure write access is ignored, and a non-secure read access returns 0.

The DPPI can subscribe to secure and non-secure channels through the SUBSCRIBE\_CHG[] registers, in order to trigger the task for enabling or disabling groups of channels. An event from a secure channel will be ignored if the group subscribing to this channel is non-secure. A secure group can subscribe to a non-secure channel or a secure channel.

## 6.2.5 Registers

| Base address | Peripheral | Instance   | Secure mapping | DMA security | Description        | Configuration |

## 6.3 EGU — Event generator unit

Event generator unit (EGU) provides support for interlayer signaling. This means providing support for atomic triggering of both CPU execution and hardware tasks, from both firmware (by CPU) and hardware (by PPI). This feature can, for instance, be used for triggering CPU execution at a lower priority execution from a higher priority execution, or to handle a peripheral's interrupt service routine (ISR) execution at a lower priority for some of its events. However, triggering any priority from any priority is possible.

Listed here are the main EGU features:

- Software-enabled interrupt triggering
- Separate interrupt vectors for every EGU instance
- Up to 16 separate event flags per interrupt for multiplexing

Each instance of EGU implements a set of tasks which can individually be triggered to generate the corresponding event, for example, the corresponding event for TASKS\_TRIGGER[n] is EVENTS\_TRIGGERED[n]. See [Instances](#) on page 95 for a list of EGU instances.

## 6.3.1 Registers

## 6.3.2 Electrical specification

### 6.3.2.1 EGU Electrical Specification

| Symbol               | Description                                                                   | Min. | Typ. | Max. | Units  |
|----------------------|-------------------------------------------------------------------------------|------|------|------|--------|
| $t_{\text{EGU,EVT}}$ | Latency between setting an EGU event flag and the system setting an interrupt |      | 1    |      | cycles |

## 6.4 GPIO — General purpose input/output

The general purpose input/output pins (GPIOs) are grouped as one or more ports with each port having up to 32 GPIOs.

The number of ports and GPIOs per port may vary with product variant and package. Refer to [Registers](#) on page 101 and [Pin assignments](#) on page 385 for more information about the number of GPIOs that are supported.

GPIO has the following user-configurable features:

- Up to 32 GPIO pins per GPIO port
- Configurable output drive strength
- Internal pull-up and pull-down resistors
- Wake-up from high or low level triggers on all pins

- Trigger interrupt on state changes on any pin
- All pins can be used by the PPI task/event system
- One or more GPIO outputs can be controlled through PPI and GPIOTE channels
- All pins can be individually mapped to interface blocks for layout flexibility
- GPIO state changes captured on SENSE signal can be stored by LATCH register
- Support for secure and non-secure attributes for pins in conjunction with the system protection unit (SPU — System protection unit on page 259)

GPIO port and the GPIO pin details on page 98 illustrates the GPIO port containing 32 individual pins, where PIN0 is illustrated in more detail as a reference. All signals on the left side in the illustration are used by other peripherals in the system and therefore not directly available to the CPU.

Figure 17: GPIO port and the GPIO pin details

### 6.4.1 Pin configuration

The GPIO port peripheral implements up to 32 pins, PIN0 through PIN31. Each of these pins can be individually configured in the PIN\_CNF[n] registers (n=0..31).

The following parameters can be configured through these registers:

- Direction
- Drive strength
- Enabling of pull-up and pull-down resistors
- Pin sensing
- Input buffer disconnect
- Analog input (for selected pins)

**Note:** All write-capable registers are retained registers, see [POWER — Power control](#) on page 64 for more information.

The input buffer of a GPIO pin can be disconnected from the pin to enable power savings when the pin is not used as an input, see [GPIO port and the GPIO pin details](#) on page 98. Inputs must be connected to get a valid input value in the IN register, and for the sense mechanism to get access to the pin.

Other peripherals in the system can connect to GPIO pins and override their output value and configuration, or read their analog or digital input value. See [GPIO port and the GPIO pin details](#) on page 98.

Selected pins also support analog input signals, see ANAIN in [GPIO port and the GPIO pin details](#) on page 98. The assignment of the analog pins can be found in [Pin assignments](#) on page 385.

The following delays should be taken into considerations:

- There is a delay of 2 CPU clock cycles from the GPIO pad to the IN register.

- The GPIO pad must be low (or high depending on the SENSE polarity) for 3 CPU clock cycles after DETECT has gone high to generate a new DETECT signal.

**Note:** When a pin is configured as digital input, care has been taken to minimize increased current consumption when the input voltage is between  $V_{IL}$  and  $V_{IH}$ . However, it is a good practice to ensure that the external circuitry does not drive that pin to levels between  $V_{IL}$  and  $V_{IH}$  for a long period of time.

## 6.4.2 Pin sense mechanism

Pins sensitivity can be individually configured, through the SENSE field in the PIN\_CNF[n] register, to detect either a high level or a low level on their input.

When the correct level is detected on any such configured pin, the sense mechanism will set the DETECT signal high. Each pin has a separate DETECT signal. Default behavior, defined by the DETECTMODE register, is that the DETECT signals from all pins in the GPIO port are combined into one common DETECT signal that is routed throughout the system, which then can be utilized by other peripherals. This mechanism is functional in both System ON and System OFF modes.

DETECTMODE and DETECTMODE\_SEC are provided to handle secure and non-secure pins.

DETECTMODE\_SEC register is available to control the behavior associated to pin marked as secure, while the DETECTMODE register is restricted to pin marked as non-secure. Please refer to [GPIO security](#) on page 100 for more details.

Make sure that a pin is in a level that cannot trigger the sense mechanism before enabling it. The DETECT signal will go high immediately if the SENSE condition configured in the PIN\_CNF registers is met when the sense mechanism is enabled. This will trigger a PORT event if the DETECT signal was low before enabling the sense mechanism.

The DETECT signal is also used by power and clock management system to exit from System OFF mode, and by GPIOTE to generate the PORT event. In addition GPIOTE\_SEC is used for PORT event related to secure pins). See [POWER — Power control](#) on page 64 and [GPIOTE — GPIO tasks and events](#) on page 106 for more information about how the DETECT signal is used.

When a pin's PINx.DETECT signal goes high, a flag will be set in the LATCH register. For example, when the PIN0.DETECT signal goes high, bit 0 in the LATCH register will be set to '1'. If the CPU performs a clear operation on a bit in the LATCH register when the associated PINx.DETECT signal is high, the bit in the LATCH register will not be cleared. The LATCH register will only be cleared if the CPU explicitly clears it by writing a '1' to the bit that shall be cleared, i.e. the LATCH register will not be affected by a PINx.DETECT signal being set low.

The LDETECT signal will be set high when one or more bits in the LATCH register are '1'. The LDETECT signal will be set low when all bits in the LATCH register are successfully cleared to '0'.

If one or more bits in the LATCH register are '1' after the CPU has performed a clear operation on the LATCH registers, a rising edge will be generated on the LDETECT signal. This is illustrated in [DETECT signal behavior](#) on page 100.

**Note:** The CPU can read the LATCH register at any time to check if a SENSE condition has been met on one or more of the the GPIO pins, even if that condition is no longer met at the time the CPU queries the LATCH register. This mechanism will work even if the LDETECT signal is not used as the DETECT signal.

The LDETECT signal is by default not connected to the GPIO port's DETECT signal, but via the DETECTMODE register it is possible to change from default behavior to DETECT signal being derived directly from the LDETECT signal instead. See [GPIO port and the GPIO pin details](#) on page 98. [DETECT signal behavior](#) on page 100 illustrates the DETECT signal behavior for these two alternatives.

Figure 18: DETECT signal behavior

### 6.4.3 GPIO security

The general purpose input/output (GPIO) peripheral is implemented as a *split-security* peripheral. If marked as non-secure, it can be accessed by both secure and non-secure accesses but will behave differently depending on the access type.

A non-secure peripheral access will only be able to configure and control pins defined as non-secure in the system protection unit (SPU) GPIOPORT.PERM[] register(s).

A non-secure access to a register or a bitfield controlling a pin marked as secure in GPIO.PERM[] register(s) will be ignored:

- write accesses will have no effect
- read accesses will always return a zero value

No exception is triggered when a non-secure access targets a register or bitfield controlling a secure pin.

For example, if the bit  $i$  is set in the SPU.GPIO.PERM[0] register (declaring Pin P0. $i$  as secure), then

- non-secure write accesses to OUT, OUTSET, OUTCLR, DIR, DIRSET, DIRCLR and LATCH registers will not be able to write to bit  $i$  of those registers
- non-secure write accesses to registers PIN[ $i$ ].OUT and PIN\_CNF[ $i$ ] will be ignored
- non-secure read accesses to registers OUT, OUTSET, OUTCLR, IN, DIR, DIRSET, DIRCLR and LATCH will always read a 0 for the bit at position  $i$
- non-secure read accesses to registers PIN[ $i$ ].OUT, PIN[ $i$ ].IN and PIN\_CNF[ $i$ ] will always return 0

The GPIO.DETECTMODE and GPIO.DETECTMODE\_SEC registers are handled differently than the other registers mentioned before. When accessed by a secure access, the DETECTMODE\_SEC register controls the source for the DETECT\_SEC signal for the pins marked as secure. When accessed by a non-secure access, the DETECTMODE\_SEC is read as zero and write accesses are ignored. The GPIO.DETECTMODE register controls the source for the DETECT\_NSEC signal for the pins defined as non-secure.

The DETECT\_NSEC signal is routed to the GPIOTE peripheral, allowing generation of events and interrupts from pins marked as non-secure. The DETECT\_SEC signal is routed to the GPIOTESEC peripheral, allowing generation of events and interrupts from pins marked as secure. [Principle of direct pin access](#) on

page 101 illustrates how the DETECT\_NSEC and DETECT\_SEC signals are generated from the GPIO PIN[].DETECT signals.

Figure 19: Principle of direct pin access

## 6.4.4 Registers

| Base address | Peripheral | Instance | Secure mapping | DMA security | Description                      | Configuration |

| $C_{PAD}$      | Pad capacitance                                                               |              | 3    |              | pF         |

## 6.5 GPIOTE — GPIO tasks and events

The GPIO tasks and events (GPIOTE) module provides functionality for accessing GPIO pins using tasks and events. Each GPIOTE channel can be assigned to one pin.

A GPIOTE block enables GPIOs to generate events on pin state change which can be used to carry out tasks through the PPI system. A GPIO can also be driven to change state on system events using the PPI system. Tasks and events are briefly introduced in [Peripheral interface](#) on page 15, and GPIO is described in more detail in [GPIO — General purpose input/output](#) on page 97.

Low power detection of pin state changes is possible when in System ON or System OFF.

| Instance | Number of GPIOTE channels |
|----------|---------------------------|
| GPIOTE   | 8                         |

Table 39: GPIOTE properties

Up to three tasks can be used in each GPIOTE channel for performing write operations to a pin. Two tasks are fixed (SET and CLR), and one (OUT) is configurable to perform following operations:

- Set
- Clear
- Toggle

<sup>1</sup> Rise and fall times based on simulations

An event can be generated in each GPIOTE channel from one of the following input conditions:

- Rising edge
- Falling edge
- Any change

### 6.5.1 Pin events and tasks

The GPIOTE module has a number of tasks and events that can be configured to operate on individual GPIO pins.

The tasks SET[n], CLR[n], and OUT[n] can write to individual pins, and events IN[n] can be generated from input changes of individual pins.

The SET task will set the pin selected in [GPIOTE.CONFIG\[n\].PSEL](#) to high. The CLR task will set the pin low.

The effect of the OUT task on the pin is configurable in [CONFIG\[n\].POLARITY](#). It can set the pin high, set it low, or toggle it.

Tasks and events are configured using the CONFIG[n] registers. One CONFIG[n] register is associated with a set of SET[n], CLR[n], and OUT[n] tasks and IN[n] events.

As long as a SET[n], CLR[n], and OUT[n] task or an IN[n] event is configured to control pin **n**, the pin's output value will only be updated by the GPIOTE module. The pin's output value, as specified in the GPIO, will be ignored as long as the pin is controlled by GPIOTE. Attempting to write to the pin as a normal GPIO pin will have no effect. When the GPIOTE is disconnected from a pin, the associated pin gets the output and configuration values specified in the GPIO module, see [MODE](#) field in [CONFIG\[n\]](#) register.

When conflicting tasks are triggered simultaneously (i.e. during the same clock cycle) in one channel, the priority of the tasks is as described in the following table.

| Priority | Task |
|----------|------|
| 1        | OUT  |
| 2        | CLR  |
| 3        | SET  |

Table 40: Task priorities

When setting the CONFIG[n] registers, [MODE=Disabled](#) does not have the same effect as [MODE=Task](#) and [POLARITY=None](#). In the latter case, a CLR or SET task occurring at the exact same time as OUT will end up with no change on the pin, based on the priorities described in the table above.

When a GPIOTE channel is configured to operate on a pin as a task, the initial value of that pin is configured in the [OUTINIT](#) field of [CONFIG\[n\]](#).

### 6.5.2 Port event

PORT is an event that can be generated from multiple input pins using the GPIO DETECT signal.

The event will be generated on the rising edge of the DETECT signal. See [GPIO — General purpose input/output](#) on page 97 for more information about the DETECT signal.

The GPIO DETECT signal will not wake the system up again if the system is put into System ON IDLE while the DETECT signal is high. Clear all DETECT sources before entering sleep. If the LATCH register is used as a source, a new rising edge will be generated on DETECT if any bit in LATCH is still high after clearing all or part of the register. This could occur if one of the [PINx.DETECT](#) signals is still high, for example. See [Pin sense mechanism](#) on page 99 for more information.

Setting the system to System OFF while DETECT is high will cause a wakeup from System OFF reset.

This feature can be used to wake up the CPU from a WFI or WFE type sleep in System ON when all peripherals and the CPU are idle, meaning the lowest power consumption in System ON mode.

To prevent spurious interrupts from the PORT event while configuring the sources, the following steps must be performed:

1. Disable interrupts on the PORT event (through INTENCLR.PORT).
2. Configure the sources (PIN\_CNF[n].SENSE).
3. Clear any potential event that could have occurred during configuration (write 0 to EVENTS\_PORT).
4. Enable interrupts (through INTENSET.PORT).

### 6.5.3 Tasks and events pin configuration

Each GPIOTE channel is associated with one physical GPIO pin through the CONFIG.PSEL field.

When Event mode is selected in CONFIG.MODE, the pin specified by CONFIG.PSEL will be configured as an input, overriding the DIR setting in GPIO. Similarly, when Task mode is selected in CONFIG.MODE, the pin specified by CONFIG.PSEL will be configured as an output overriding the DIR setting and OUT value in GPIO. When Disabled is selected in CONFIG.MODE, the pin specified by CONFIG.PSEL will use its configuration from the PIN[n].CNF registers in GPIO. CONFIG.MODE must be disabled in order to be able to change the value of the PSEL field.

**Note:** A pin can only be assigned to one GPIOTE channel at a time. Failing to do so may result in unpredictable behavior.

### 6.5.4 Registers

| Base address | Peripheral | Instance | Secure mapping | DMA security | Description                      | Configuration |
|--------------|------------|----------|----------------|--------------|----------------------------------|---------------|
| 0x5000D000   | GPIOTE     | GPIOTE0  | S              | NA           | Secure GPIO tasks and events     |               |
| 0x40031000   | GPIOTE     | GPIOTE1  | NS             | NA           | Non Secure GPIO tasks and events |               |

Table 41: Instances

| Register         | Offset | Security | Description                                                                                             |
|------------------|--------|----------|---------------------------------------------------------------------------------------------------------|
| TASKS_OUT[n]     | 0x000  |          | Task for writing to pin specified in CONFIG[n].PSEL. Action on pin is configured in CONFIG[n].POLARITY. |
| TASKS_SET[n]     | 0x030  |          | Task for writing to pin specified in CONFIG[n].PSEL. Action on pin is to set it high.                   |
| TASKS_CLR[n]     | 0x060  |          | Task for writing to pin specified in CONFIG[n].PSEL. Action on pin is to set it low.                    |
| SUBSCRIBE_OUT[n] | 0x080  |          | Subscribe configuration for task OUT[n]                                                                 |
| SUBSCRIBE_SET[n] | 0x0B0  |          | Subscribe configuration for task SET[n]                                                                 |
| SUBSCRIBE_CLR[n] | 0x0E0  |          | Subscribe configuration for task CLR[n]                                                                 |
| EVENTS_IN[n]     | 0x100  |          | Event generated from pin specified in CONFIG[n].PSEL                                                    |
| EVENTS_PORT      | 0x17C  |          | Event generated from multiple input GPIO pins with SENSE mechanism enabled                              |
| PUBLISH_IN[n]    | 0x180  |          | Publish configuration for event IN[n]                                                                   |
| PUBLISH_PORT     | 0x1FC  |          | Publish configuration for event PORT                                                                    |
| INTENSET         | 0x304  |          | Enable interrupt                                                                                        |
| INTENCLR         | 0x308  |          | Disable interrupt                                                                                       |
| CONFIG[n]        | 0x510  |          | Configuration for OUT[n], SET[n], and CLR[n] tasks and IN[n] event                                      |

Table 42: Register overview

#### 6.5.4.1 TASKS\_OUT[n] (n=0..7)

Address offset: 0x000 + (n × 0x4)

Task for writing to pin specified in CONFIG[n].PSEL. Action on pin is configured in CONFIG[n].POLARITY.

|                  |     |           |          |                                                                                       |                                                                                                         |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |

## 6.5.5 Electrical specification

## 6.6 IPC — Interprocessor communication

The interprocessor communication (IPC) peripheral is used to send and receive events between MCUs in the system.

Figure 20: IPC block diagram

## Functional description

[IPC block diagram](#) on page 114 illustrates the interprocessor communication (IPC) peripheral. In a multi-MCU system, each MCU has one dedicated IPC peripheral. The IPC peripheral can be used to send and receive events to and from other IPC peripherals. An instance of the IPC peripheral can have multiple SEND tasks and RECEIVE events. A single SEND task can be configured to signal an event on one or more IPC channels, and a RECEIVE event can be configured to listen on one or more IPC channels. The IPC channels that are triggered in a SEND task can be configured through the [SEND\\_CNF](#) registers, and the IPC channels that trigger a RECEIVE event are configured through the [RECEIVE\\_CNF](#) registers. The figure below illustrates how the [SEND\\_CNF](#) and [RECEIVE\\_CNF](#) registers work. Both the SEND task and the RECEIVE event can be connected to all IPC channels.

Figure 21: IPC registers *SEND\_CNF* and *RECEIVE\_CNF*

A SEND task can be viewed as broadcasting events onto one or more IPC channels, and a RECEIVE event can be seen as subscribing to a subset of IPC channels. It is possible for multiple IPCs to trigger events onto the same channel at the same time. When two or more events on the same channel occur within  $t_{IPC}$ , the events may be merged into a single event seen from the IPC receiver. One of the events can therefore be lost. To prevent this, the user must ensure that events on the same IPC channel do not occur within  $t_{IPC}$  of each other. When implementing firmware data structures, such as queues or mailboxes, this can be done by using one channel for acknowledgements.

An IPC event often does not contain any data itself, it is used to signal other MCUs that something has occurred. Data can be shared through shared memory, for example in the form of a software implemented mailbox, or command/event queues. It is up to software to assign a logical functionality to an IPC channel. For instance, one IPC channel can be used to signal that a command is ready to be executed, and any processor in the system can subscribe to that particular channel and decode/execute the command.

## General purpose memory

The **GP MEM** registers can be used freely to store information. These registers are accessed like any other of the IPC peripheral's registers.

### 6.6.1 IPC and PPI connections

The IPC SEND tasks and RECEIVE events can be connected through PPI channels. This makes it possible to relay events from peripherals in one MCU to another, without CPU involvement.

Figure below illustrates a timer COMPARE event that is relayed from one MCU to IPC using PPI, then back into a timer CAPTURE event in another MCU.

Figure 22: Example of PPI and IPC connections

## 6.6.2 Registers

| Base address | Peripheral | Instance | Secure mapping | DMA security | Description                  | Configuration |
|--------------|------------|----------|----------------|--------------|------------------------------|---------------|

| t <sub>IPC</sub> | Time window during which IPC events can be merged |      |      | 165  | μs    |

## 6.7 I<sup>2</sup>S — Inter-IC sound interface

The I<sup>2</sup>S (Inter-IC Sound) module, supports the original two-channel I<sup>2</sup>S format, and left or right-aligned formats. It implements EasyDMA for sample transfer directly to and from RAM without CPU intervention.

The I<sup>2</sup>S peripheral has the following main features:

- Master and Slave mode
- Simultaneous bi-directional (TX and RX) audio streaming
- Original I<sup>2</sup>S and left- or right-aligned format

- 8, 16 and 24-bit sample width
- Low-jitter Master Clock generator
- Various sample rates

Figure 23: I<sup>2</sup>S master

### 6.7.1 Mode

The I<sup>2</sup>S protocol specification defines two modes of operation, Master and Slave.

The I<sup>2</sup>S mode decides which of the two sides (Master or Slave) shall provide the clock signals LRCK and SCK, and these signals are always supplied by the Master to the Slave.

### 6.7.2 Transmitting and receiving

The I<sup>2</sup>S module supports both transmission (TX) and reception (RX) of serial data. In both cases the serial data is shifted synchronously to the clock signals SCK and LRCK.

TX data is written to the SDOUT pin on the falling edge of SCK, and RX data is read from the SDIN pin on the rising edge of SCK. The most significant bit (MSB) is always transmitted first.

**Note:** When starting a transmission in master mode, two frames (two left-and-right sample pairs) of value zero will be transmitted after triggering the START task, prior to the RXTD.MAXCNT samples specified by the TXD.PTR pointer.

TX and RX are available in both Master and Slave modes and can be enabled/disabled independently in the [CONFIG.TXEN](#) on page 134 and [CONFIG.RXEN](#) on page 134.

Transmission and/or reception is started by triggering the START task. When started and transmission is enabled (in [CONFIG.TXEN](#) on page 134), the TXPTRUPD event will be generated for every [RXTD.MAXCNT](#) on page 137 number of transmitted data words (containing one or more samples).

Similarly, when started and reception is enabled (in [CONFIG.RXEN](#) on page 134), the RXPTRUPD event will be generated for every [RXTXD.MAXCNT](#) on page 137 received data words.

Figure 24: Transmitting and receiving. *CONFIG.FORMAT = Aligned, CONFIG.SWIDTH = 8Bit, CONFIG.CHANNELS = Stereo, RXTXD.MAXCNT = 1.*

### 6.7.3 Left right clock (LRCK)

The Left Right Clock (LRCK), often referred to as "word clock", "sample clock" or "word select" in I<sup>2</sup>S context, is the clock defining the frames in the serial bit streams sent and received on SDOU and SDIN, respectively.

In I2S mode, each frame contains one left and right sample pair, with the left sample being transferred during the low half period of LRCK followed by the right sample being transferred during the high period of LRCK.

In Aligned mode, each frame contains one left and right sample pair, with the left sample being transferred during the high half period of LRCK followed by the right sample being transferred during the low period of LRCK.

Consequently, the LRCK frequency is equivalent to the audio sample rate.

When operating in Master mode, the LRCK is generated from the MCK, and the frequency of LRCK is then given as:

$$\text{LRCK} = \text{MCK} / \text{CONFIG.RATIO}$$

LRCK always toggles around the falling edge of the serial clock SCK.

### 6.7.4 Serial clock (SCK)

The serial clock (SCK), often referred to as the serial bit clock, pulses once for each data bit being transferred on the serial data lines SDIN and SDOU.

When operating in Master mode the SCK is generated from the MCK, and the frequency of SCK is then given as:

$$\text{SCK} = 2 * \text{LRCK} * \text{CONFIG.SWIDTH}$$

The falling edge of the SCK falls on the toggling edge of LRCK.

When operating in Slave mode SCK is provided by the external I<sup>2</sup>S master.

## 6.7.5 Master clock (MCK)

The master clock (MCK) is the clock from which LRCK and SCK are derived when operating in Master mode.

The MCK is generated by an internal MCK generator. This generator always needs to be enabled when in Master mode, but the generator can also be enabled when in Slave mode. Enabling the generator when in slave mode can be useful in the case where the external Master is not able to generate its own master clock.

The MCK generator is enabled/disabled in the register [CONFIG.MCKEN](#) on page 134, and the generator is started or stopped by the START or STOP tasks.

In Master mode the LRCK and the SCK frequencies are closely related, as both are derived from MCK and set indirectly through [CONFIG.RATIO](#) on page 135 and [CONFIG.SWIDTH](#) on page 136.

When configuring these registers, the user is responsible for fulfilling the following requirements:

1. SCK frequency can never exceed the MCK frequency, which can be formulated as:

$$\text{CONFIG.RATIO} \geq 2 * \text{CONFIG.SWIDTH}$$

2. The MCK/LRCK ratio shall be a multiple of  $2 * \text{CONFIG.SWIDTH}$ , which can be formulated as:

$$\text{Integer} = (\text{CONFIG.RATIO} / (2 * \text{CONFIG.SWIDTH}))$$

The MCK signal can be routed to an output pin (specified in PSEL.MCK) to supply external I<sup>2</sup>S devices that require the MCK to be supplied from the outside.

When operating in Slave mode, the I<sup>2</sup>S module does not use the MCK and the MCK generator does not need to be enabled.

Figure 25: Relation between RATIO, MCK and LRCK.

| Desired LRCK [Hz] | CONFIG.SWIDTH | CONFIG.RATIO | CONFIG.MCKF | MCK [Hz]  | LRCK [Hz] | LRCK error [%] |
|-------------------|---------------|--------------|-------------|-----------|-----------|----------------|
| 16000             | 16Bit         | 32X          | 32MDIV63    | 507936.5  | 15873.0   | -0.8           |

Table 45: Configuration examples

## 6.7.6 Width, alignment and format

The CONFIG.SWIDTH register primarily defines the sample width of the data written to memory. In master mode, it then also sets the amount of bits per frame. In Slave mode it controls padding/trimming if required. Left, right, transmitted, and received samples always have the same width. The CONFIG.FORMAT

register specifies the position of the data frames with respect to the LRCK edges in both Master and Slave modes.

When using  $I^2S$  format, the first bit in a half-frame (containing one left or right sample) gets sampled on the second rising edge of the SCK after a LRCK edge. When using Aligned mode, the first bit in a half-frame gets sampled on the first rising edge of SCK following a LRCK edge.

For data being received on SDIN the sample value can be either right or left-aligned inside a half-frame, as specified in [CONFIG.ALIGN](#) on page 136. [CONFIG.ALIGN](#) on page 136 affects only the decoding of the incoming samples (SDIN), while the outgoing samples (SDOUT) are always left-aligned (or justified).

When using left-alignment, each half-frame starts with the MSB of the sample value (both for data being sent on SDOUT and received on SDIN).

When using right-alignment, each half-frame of data being received on SDIN ends with the LSB of the sample value, while each half-frame of data being sent on SDOUT starts with the MSB of the sample value (same as for left-alignment).

In Master mode, the size of a half-frame (in number of SCK periods) equals the sample width (in number of bits), and in this case the alignment setting does not care as each half-frame in any case will start with the MSB and end with the LSB of the sample value.

In slave mode, however, the sample width does not need to equal the frame size. This means you might have extra or fewer SCK pulses per half-frame than what the sample width specified in [CONFIG.SWIDTH](#) requires.

In the case where we use **left-alignment** and the number of SCK pulses per half-frame is **higher** than the sample width, the following will apply:

- For data received on SDIN, all bits after the LSB of the sample value will be discarded.
- For data sent on SDOUT, all bits after the LSB of the sample value will be 0.

In the case where we use **left-alignment** and the number of SCK pulses per frame is **lower** than the sample width, the following will apply:

- Data sent and received on SDOUT and SDIN will be truncated with the LSBs being removed first.

In the case where we use **right-alignment** and the number of SCK pulses per frame is **higher** than the sample width, the following will apply:

- For data received on SDIN, all bits before the MSB of the sample value will be discarded.
- For data sent on SDOUT, all bits after the LSB of the sample value will be 0 (same behavior as for left-alignment).

In the case where we use **right-alignment** and the number of SCK pulses per frame is **lower** than the sample width, the following will apply:

- Data received on SDIN will be sign-extended to "sample width" number of bits before being written to memory.
- Data sent on SDOUT will be truncated with the LSBs being removed first (same behavior as for left-alignment).

Figure 26:  $I^2S$  format. [CONFIG.SWIDTH](#) equalling half-frame size.

Figure 27: Aligned format. *CONFIG.SWIDTH* equalling half-frame size.

### 6.7.7 EasyDMA

The I<sup>2</sup>S module implements EasyDMA for accessing internal Data RAM without CPU intervention.

The source and destination pointers for the TX and RX data are configured in [TXD.PTR](#) on page 137 and [RXD.PTR](#) on page 137. The memory pointed to by these pointers will only be read or written when TX or RX are enabled in [CONFIG.TXEN](#) on page 134 and [CONFIG.RXEN](#) on page 134.

The addresses written to the pointer registers [TXD.PTR](#) on page 137 and [RXD.PTR](#) on page 137 are double-buffered in hardware, and these double buffers are updated for every [RXTXD.MAXCNT](#) on page 137 words (containing one or more samples) read/written from/to memory. The events TXPTRUPD and RXPTRUPD are generated whenever the TXD.PTR and RXD.PTR are transferred to these double buffers.

If [TXD.PTR](#) on page 137 is not pointing to the Data RAM region when transmission is enabled, or [RXD.PTR](#) on page 137 is not pointing to the Data RAM region when reception is enabled, an EasyDMA transfer may result in a HardFault and/or memory corruption. See [Memory](#) on page 21 for more information about the different memory regions.

Due to the nature of I<sup>2</sup>S, where the number of transmitted samples always equals the number of received samples (at least when both TX and RX are enabled), one common register [RXTXD.MAXCNT](#) on page 137 is used for specifying the sizes of these two memory buffers. The size of the buffers is specified in a number of 32-bit words. Such a 32-bit memory word can either contain four 8-bit samples, two 16-bit samples or one right-aligned 24-bit sample sign extended to 32 bit.

In stereo mode ([CONFIG.CHANNELS](#)=Stereo), the samples are stored as "left and right sample pairs" in memory. Figure [Memory mapping for 8 bit stereo. CONFIG.SWIDTH = 8Bit, CONFIG.CHANNELS = Stereo.](#) on page 124, [Memory mapping for 16 bit stereo. CONFIG.SWIDTH = 16Bit, CONFIG.CHANNELS = Stereo.](#) on page 125 and [Memory mapping for 24 bit stereo. CONFIG.SWIDTH = 24Bit, CONFIG.CHANNELS = Stereo.](#) on page 125 show how the samples are mapped to memory in this mode. The mapping is valid for both RX and TX.

In mono mode ([CONFIG.CHANNELS](#)=Left or Right), RX sample from only one channel in the frame is stored in memory, the other channel sample is ignored. Illustrations [Memory mapping for 8 bit mono. CONFIG.SWIDTH = 8Bit, CONFIG.CHANNELS = Left.](#) on page 125, [Memory mapping for 16 bit mono, left channel only. CONFIG.SWIDTH = 16Bit, CONFIG.CHANNELS = Left.](#) on page 125 and [Memory mapping for 24 bit mono, left channel only. CONFIG.SWIDTH = 24Bit, CONFIG.CHANNELS = Left.](#) on page 126 show how RX samples are mapped to memory in this mode.

For TX, the same outgoing sample read from memory is transmitted on both left and right in a frame, resulting in a mono output stream.

Figure 28: Memory mapping for 8 bit stereo. *CONFIG.SWIDTH = 8Bit, CONFIG.CHANNELS = Stereo.*

Figure 33: Memory mapping for 24 bit mono, left channel only. CONFIG.SWIDTH = 24Bit, CONFIG.CHANNELS = Left.

## 6.7.8 Module operation

Described here is a typical operating procedure for the I<sup>2</sup>S module.

### 1. Configure the I<sup>2</sup>S module using the CONFIG registers

```
// Enable reception
NRF_I2S->CONFIG.RXEN = (I2S_CONFIG_RXEN_RXEN_Enabled <<
                        I2S_CONFIG_RXEN_RXEN_Pos);

// Enable transmission
NRF_I2S->CONFIG.TXEN = (I2S_CONFIG_TXEN_TXEN_Enabled <<
                        I2S_CONFIG_TXEN_TXEN_Pos);

// Enable MCK generator
NRF_I2S->CONFIG.MCKEN = (I2S_CONFIG_MCKEN_MCKEN_Enabled <<
                        I2S_CONFIG_MCKEN_MCKEN_Pos);

// MCKFREQ = 4 MHz
NRF_I2S->CONFIG.MCKFREQ = I2S_CONFIG_MCKFREQ_MCKFREQ_32MDIV8 <<
                        I2S_CONFIG_MCKFREQ_MCKFREQ_Pos;

// Ratio = 256
NRF_I2S->CONFIG.RATIO = I2S_CONFIG_RATIO_RATIO_256X <<
                        I2S_CONFIG_RATIO_RATIO_Pos;

// MCKFREQ = 4 MHz and Ratio = 256 gives sample rate = 15.625 ks/s
// Sample width = 16 bit
NRF_I2S->CONFIG.SWIDTH = I2S_CONFIG_SWIDTH_SWIDTH_16Bit <<
                        I2S_CONFIG_SWIDTH_SWIDTH_Pos;

// Alignment = Left
NRF_I2S->CONFIG.ALIGN = I2S_CONFIG_ALIGN_ALIGN_Left <<
                        I2S_CONFIG_ALIGN_ALIGN_Pos;

// Format = I2S
NRF_I2S->CONFIG.FORMAT = I2S_CONFIG_FORMAT_FORMAT_I2S <<
                        I2S_CONFIG_FORMAT_FORMAT_Pos;

// Use stereo
NRF_I2S->CONFIG.CHANNELS = I2S_CONFIG_CHANNELS_CHANNELS_Stereo <<
                        I2S_CONFIG_CHANNELS_CHANNELS_Pos;
```

## 2. Map IO pins using the PINSEL registers

```
// MCK routed to pin 0
NRF_I2S->PSEL.MCK = (0 << I2S_PSEL_MCK_PIN_Pos) |
                    (I2S_PSEL_MCK_CONNECT_Connected <<
                     I2S_PSEL_MCK_CONNECT_Pos);

// SCK routed to pin 1
NRF_I2S->PSEL.SCK = (1 << I2S_PSEL_SCK_PIN_Pos) |
                    (I2S_PSEL_SCK_CONNECT_Connected <<
                     I2S_PSEL_SCK_CONNECT_Pos);

// LRCK routed to pin 2
NRF_I2S->PSEL.LRCK = (2 << I2S_PSEL_LRCK_PIN_Pos) |
                     (I2S_PSEL_LRCK_CONNECT_Connected <<
                      I2S_PSEL_LRCK_CONNECT_Pos);

// SDOUT routed to pin 3
NRF_I2S->PSEL.SDOUT = (3 << I2S_PSEL_SDOUT_PIN_Pos) |
                      (I2S_PSEL_SDOUT_CONNECT_Connected <<
                       I2S_PSEL_SDOUT_CONNECT_Pos);

// SDIN routed on pin 4
NRF_I2S->PSEL.SDIN = (4 << I2S_PSEL_SDIN_PIN_Pos) |
                     (I2S_PSEL_SDIN_CONNECT_Connected <<
                      I2S_PSEL_SDIN_CONNECT_Pos);
```

## 3. Configure TX and RX data pointers using the TXD, RXD and RXTXD registers

```
NRF_I2S->TXD.PTR = my_tx_buf;
NRF_I2S->RXD.PTR = my_rx_buf;
NRF_I2S->TXD.MAXCNT = MY_BUF_SIZE;
```

## 4. Enable the I<sup>2</sup>S module using the ENABLE register

```
NRF_I2S->ENABLE = 1;
```

## 5. Start audio streaming using the START task

```
NRF_I2S->TASKS_START = 1;
```

## 6. Handle received and transmitted data when receiving the TXPTRUPD and RXPTRUPD events

```
if (NRF_I2S->EVENTS_TXPTRUPD != 0)
{
    NRF_I2S->TXD.PTR = my_next_tx_buf;
    NRF_I2S->EVENTS_TXPTRUPD = 0;
}

if (NRF_I2S->EVENTS_RXPTRUPD != 0)
{
    NRF_I2S->RXD.PTR = my_next_rx_buf;
    NRF_I2S->EVENTS_RXPTRUPD = 0;
}
```

## 6.7.9 Pin configuration

The MCK, SCK, LRCK, SDIN and SDOUT signals associated with the I<sup>2</sup>S module are mapped to physical pins according to the pin numbers specified in the PSEL.x registers.

These pins are acquired whenever the I<sup>2</sup>S module is enabled through the register [ENABLE](#) on page 133.

When a pin is acquired by the I<sup>2</sup>S module, the direction of the pin (input or output) will be configured automatically, and any pin direction setting done in the GPIO module will be overridden. The directions for the various I<sup>2</sup>S pins are shown below in [GPIO configuration before enabling peripheral \(master mode\)](#) on page 128 and [GPIO configuration before enabling peripheral \(slave mode\)](#) on page 128.

To secure correct signal levels on the pins when the system is in OFF mode, and when the I<sup>2</sup>S module is disabled, these pins must be configured in the GPIO peripheral directly.

| I <sup>2</sup> S signal | I <sup>2</sup> S pin       | Direction | Output value   | Comment |
|-------------------------|----------------------------|-----------|----------------|---------|
| MCK                     | As specified in PSEL.MCK   | Output    | 0              |         |
| LRCK                    | As specified in PSEL.LRCK  | Output    | 0              |         |
| SCK                     | As specified in PSEL.SCK   | Output    | 0              |         |
| SDIN                    | As specified in PSEL.SDIN  | Input     | Not applicable |         |
| SDOUT                   | As specified in PSEL.SDOUT | Output    | 0              |         |

Table 46: GPIO configuration before enabling peripheral (master mode)

| I <sup>2</sup> S signal | I <sup>2</sup> S pin       | Direction | Output value   | Comment |
|-------------------------|----------------------------|-----------|----------------|---------|
| MCK                     | As specified in PSEL.MCK   | Output    | 0              |         |
| LRCK                    | As specified in PSEL.LRCK  | Input     | Not applicable |         |
| SCK                     | As specified in PSEL.SCK   | Input     | Not applicable |         |
| SDIN                    | As specified in PSEL.SDIN  | Input     | Not applicable |         |
| SDOUT                   | As specified in PSEL.SDOUT | Output    | 0              |         |

### 6.7.10.2 TASKS\_STOP

Address offset: 0x004

Stops I2S transfer. Also stops MCK generator. Triggering this task will cause the [STOPPED](#) event to be generated.

|                  |     |            |          |                                                                                       |                                                                                                                  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |   |

 ### 6.7.10.5 EVENTS RXPTRUPD

Address offset: 0x104

The RXD.PTR register has been copied to internal double-buffers. When the I2S module is started and RX is enabled, this event will be generated for every RXTXD.MAXCNT words that are received on the SDIN pin.

### 6.7.10.7 EVENTS\_TXPTRUPD

Address offset: 0x114

The TDX.PTR register has been copied to internal double-buffers. When the I2S module is started and TX is enabled, this event will be generated for every RXTXD.MAXCNT words that are sent on the SDOUT pin.

    ## 6.8 KMU — Key management unit

The key management unit (KMU) enforces access policies to a subset region of user information configuration register (UICR). This subset region is used for storing cryptographic key values inside the key slots, which the CPU has no access to.

In total there are 128 key slots available, where each key slot can store one 128-bit key value together with an access policy and a destination address for the key value. Multiple key slots can be combined in order to support key sizes larger than 128 bits. The access policy of a key slot governs if and how a key value can

be used, while the destination address determines where in the memory map the KMU pushes the key value upon a request from the CPU.

Key slots can be configured to be pushed directly into write-only key registers in cryptographic accelerators, like e.g. CryptoCell, without exposing the key value itself to the CPU. This enables the CPU to use the key values stored inside the key slots for cryptographic operations without being exposed to the key value.

Access to the KMU, and the key slots in the UICR, is only allowed from secure mode.

### 6.8.1 Functional view

From a functional view the UICR is divided into two different regions, one-time programmable (OTP) memory and key storage.

Figure 35: Memory map overview

### OTP

One-time programmable (OTP) memory is typically used for holding values that are written once, and then never to be changed again throughout the product lifetime. The OTP region of UICR is emulated by placing a write-once per halfword limitation on registers defined here.

### Key storage

The key storage region contains multiple key slots, where each slot consists of a key header and an associated key value. The key value is limited to 128 bits. Any key size greater than 128 bits must be divided and distributed over multiple key slot instances.

Key headers are allocated an address range of 0x400 in the UICR memory map, allowing a total of 128 keys to be addressable inside the key storage region.

**Note:** The use of the key storage region in UICR should be limited to keys with a certain life span, and not per-session derived keys where the CPU is involved in the key exchange.

### 6.8.2 Access control

Access control to the underlying UICR infopage in flash is enforced by a hardware finite-state machine (FSM). The FSM can allow or block transactions, depending both on the security of the transaction (secure or non-secure) and on the type of register being written and/or read.

| Access type | Key headers | Key values |
|-------------|-------------|------------|
| Read        | Allowed     | Restricted |
| Write       | Restricted  | Restricted |

Table 50: Access control

Any restricted access requires an explicit key slot selection through the KMU register interface. Any illegal access to restricted key slot registers will be blocked and word `0xDEADDEAD` will be returned on the AHB.

The OTP region has individual access control behavior, while access control to the key storage region is configured on a per key slot basis. The KMU FSM operates on only one key slot instance at a time, and the permissions and the usage restriction for a key value associated with a key slot can be configured individually.

**Note:** Even if the KMU can be configured as non-secure, all non-secure transactions will be blocked.

### 6.8.3 Protecting the UICR content

The UICR content can be protected against device-internal NVMC.ERASEALL requests, in addition to device-external ERASEALL requests, through the CTRL-AP interface. This feature is useful if the firmware designers want to prevent the OTP region from being erased.

Since enabling this step will permanently disable erase for the UICR, the procedure requires an implementation defined 32-bit word to be written into the UICR's ERASEPROTECT register.

In case of a field return handling, it is still possible to erase the UICR even if the ERASEPROTECT is set. If this functionality is desired, the secure boot code must implement a secure communication channel over the CTRL-AP mailbox interface. Upon successful authentication of the external party, the secure boot code can temporarily re-enable the CTRL-AP ERASEALL functionality.

### 6.8.4 Usage

This section describes the specific KMU and UICR behavior in more detail, to help the reader get a better overview of KMU's features and the intended usage.

#### 6.8.4.1 OTP

The OTP region of the UICR contains a user-defined static configuration of the device. The KMU emulates the OTP functionality by placing a write-once per halfword limitation of registers defined in this region, i.e. only halfwords containing all '1's can be written.

An OTP write transaction must consist of a full 32-bit word. Both halfwords can either be written simultaneously or one at a time. The KMU FSM will block any write to a halfword in the OTP region, if the initial value of this halfword is not `0xFFFF`. When writing halfwords one at a time, the non-active halfword must be masked as `0xFFFF`, otherwise the request will be blocked. For example, writing `0x1234XXXX` to an OTP destination address which already contains the value `0xFFFFAABB`, must be configured as `0x1234FFFF`. The OTP destination address will contain the value `0x1234AABB` after both write transactions have been processed.

The KMU will also only allow secure AHB write transactions into the OTP region of the UICR. Any AHB write transaction to this region that does not satisfy the above requirements will be ignored, and the `STATUS.BLOCKED` register will be set to '1'.

#### 6.8.4.2 Key storage

The key storage region of the UICR can contain multiple keys of different type, including symmetrical keys, hashes, public/private key pairs and other device secrets. One of the key features of the KMU, is that these

device secrets can be installed and made available for use in cryptographic operations without revealing the actual secret values.

Keys in this region will typically have a certain life span. The region is not designed to be used for per-session derived keys where the non-secure side (i.e. application) is participating in the key exchange.

All key storage is done through the concept of multiple key slots, where each key slot instance consists of one key header and an associated key value. Each key header supports the configuration of usage permissions and an optional secure destination address.

The key header secure destination address option enables the KMU to push the associated key value over a dedicated secure APB to a pre-configured secure location within the memory map. Such locations typically include a write-only key register of the hardware cryptographic accelerator, allowing the KMU to distribute keys within the system without compromising the key values.

One key slot instance can store a key value of maximum 128 bits. If a key size exceeds this limit, the key value itself must be split over multiple key slot instances.

The following usage and read permissions scheme is applicable for each key slot:

| State          | Push            | Read            | Write           | Description                                                                                          |
|----------------|-----------------|-----------------|-----------------|------------------------------------------------------------------------------------------------------|
| Active (1)     | Enabled<br>(1)  | Enabled<br>(1)  | Enabled<br>(1)  | Default flash erase value. Key slot cannot be pushed, write is enabled.                              |
| Active (1)     | Enabled<br>(1)  | Enabled<br>(1)  | Disabled<br>(0) | Key slot is active, push is enabled. Key slot VALUE registers can be read, but write is disabled.    |
| Active (1)     | Enabled<br>(1)  | Disabled<br>(0) | Disabled<br>(0) | Key slot is active, push is enabled. Read and write to key slot VALUE registers are disabled.        |
| Active (1)     | Disabled<br>(0) | Enabled<br>(1)  | Disabled<br>(0) | Key slot is active, push is disabled. Key slot VALUE registers can be read, but write is disabled.   |
| Revoked<br>(0) | -               | -               | -               | Key slot is revoked. Cannot be read or pushed over secure APB regardless of the permission settings. |

Table 51: Valid key slot permission schemes

#### 6.8.4.2.1 Selecting a key slot

The KMU FSM is designed to process only one key slot at a time, effectively operating as a memory protection unit for the key storage region. Whenever a key slot is selected, the KMU will allow access to writing, reading, and/or pushing the associated key value according to the selected slot configuration.

A key slot must be selected prior to use, by writing the key slot ID into the KMU SELECTKEYSLOT register. Because the reset value of this register is 0x00000000, there is no key slot associated with ID=0 and no slot is selected by default. All key slots are addressed using IDs from 1 to 128.

SELECTED status is set when a key slot is selected, and a read or write access to that keyslot occurs.

BLOCKED status is set when any illegal access to key slot registers is detected.

When the use of the particular key slot is stopped, the key slot selection in SELECTKEYSLOT must be set back to '0'.

By default, all KMU key slots will consist of a 128-bit key value of '1's, where the key headers have no secure destination address, or any usage and read restrictions.

#### 6.8.4.2.2 Writing to a key slot

Writing a key slot into UICR is a five-step process.

1. Select which key slot the KMU shall operate on by writing the desired key slot ID into KMU->SELECTKEYSLOT. The selected key slot must be empty in order to add a new entry to UICR.
2. If the key value shall be pushable over secure APB, the destination address of the recipient must be configured in register KEYSLOT.CONFIG[ID-1].DEST.

3. Write the 128-bit key value into KEYSLOT.KEY[ID-1].VALUE[0-3].
4. Write the desired key slot permissions into KEYSLOT.CONFIG[ID-1].PERM, including any applicable usage restrictions.
5. Select key slot 0.

In case the total key size is greater than 128 bits, the key value itself must be split into 128-bit segments and written to multiple key slot instances. Steps 1 through 5 above must be repeated for the entire key size.

**Note:** If a key slot is configured as readable, and KEYSLOT.CONFIG[ID-1].DEST is not to be used, it is recommended to disable the push bit in KEYSLOT.CONFIG[ID-1].PERM when configuring key slot permissions.

**Note:** A key value distributed over multiple key slots should use the same key slot configuration in its key headers, but the secure destination address for each key slot instance must be incremented by 4 words (128 bits) for each key slot instance spanned.

**Note:** Write to flash must be enabled in NVMC->CONFIG prior to writing keys to flash, and subsequently disabled once writing is complete.

Steps 1 through 5 above will be blocked if any of the following violations are detected:

- No key slot selected
- Non-empty key slot selected
- NVM destination address not empty
- AHB write to KEYSLOT.KEY[ID-1].VALUE[0-3] registers not belonging to selected key slot

#### 6.8.4.2.3 Reading a key value

Key slots that are configured as readable can have their key value read directly from the UICR memory map by the CPU.

Readable keys are typically used during the secure boot sequence, where the CPU is involved in falsifying or verifying the integrity of the system. Since the CPU is involved in this decision process, it makes little sense not to trust the CPU having access to the actual key value but ultimately trust the decision of the integrity check. Another use-case for readable keys is if the key type in question does not have a HW peripheral in the platform that is able to accept such keys over secure APB.

Reading a key value from the UICR is a three-step process:

1. Select the key slot which the KMU shall operate on by writing the desired key slot ID into KMU->SELECTKEYSLOT.
2. If STATE and READ permission requirements are fulfilled as defined in KEYSLOT.CONFIG[ID-1].PERM, the key value can be read from region KEYSLOT.KEY[ID-1].VALUE[0-3] for selected key slot.
3. Select key slot 0.

Step 2 will be blocked and word 0xDEADDEAD will be returned on AHB if any of the following violations are detected:

- No key slot selected
- Key slot not configured as readable
- Key slot is revoked
- AHB read to KEYSLOT.KEY[ID-1].VALUE[0-3] registers not belonging to selected key slot

#### 6.8.4.2.4 Push over secure APB

Key slots that are configured as non-readable cannot be read by the CPU regardless of the mode the system is in, and must be pushed over secure APB in order to use the key value for cryptographic operations.

The secure APB destination address is set in the key slot configuration DEST register. Such destination addresses are typically write-only key registers in a hardware cryptographic accelerators memory map. The secure APB allows key slots to be utilized by the software side, without exposing the key value itself.

Figure 36: Tasks and events pattern for key slots

Pushing a key slot over secure APB is a four-step process:

1. Select the key slot on which the KMU shall operate by writing the desired key slot ID into KMU->SELECTKEYSLOT.
2. Start TASKS\_PUSH\_KEYSL0T to initiate a secure APB transaction, writing the 128-bit key value associated with the selected key slot into address defined in KEYSLOT.CONFIG[ID-1].DEST.
3. After completing the secure APB transaction, the 128-bit key value is ready for use by the peripheral and EVENTS\_KEYSL0T\_PUSHED is triggered.
4. Select key slot 0.

**Note:** If a key value is distributed over multiple key slots due to its key size, exceeding the maximum 128-bit key value limitation, then each distributed key slot must be pushed individually in order to transfer the entire key value over secure APB.

Step 3 will trigger other events than EVENTS\_KEYSL0T\_PUSHED if the following violations are detected:

- EVENTS\_KEYSL0T\_ERROR:
  - If no key slot is selected
  - If a key slot has no destination address configured
  - If when pushing a key slot, flash or peripheral returns an error
  - If pushing a key slot when push permissions are disabled

- If attempting to push a key slot with default permissions
- `EVENTS_KEYSLOT_REVOKED` if a key slot is marked as revoked in its key header configuration

#### 6.8.4.2.5 Revoking the key slots

All key slots within the key storage area can be marked as revoked.

To revoke any key slots, write to the `STATE` field in the `KEYSLOT.CONFIG[ID-1].PERM` register. The following rules apply to keys that have been revoked:

1. Key slots that have the `PUSH` field enabled in `PERM` register can no longer be pushed. If a revoked key slot is selected and task `TASKS_PUSH_KEYSLOT` is started, the event `EVENTS_KEYSLOT_REVOKED` is triggered.
2. Key slots that have the `READ` field enabled in `PERM` register can no longer be read. Any read operation to a revoked key value will return word `0xDEADDEAD`.
3. Previously pushed key values stored in a peripheral write-only key register are not affected by key revocation. If secure code wants to enforce that a revoked key is no longer usable by a peripheral for cryptographic operations, the secure code should disable or reset the peripheral in question.

#### 6.8.4.3 STATUS register

The KMU uses a `STATUS` register to indicate its status of operation. The `SELECTED` bit will be asserted whenever the currently selected key slot is successfully read from or written to.

All read or write operations to other key slots than what is currently selected in `KMU->SELECTKEYSLOT` will assert the `BLOCKED` bit. The `BLOCKED` bit will also be asserted if the KMU fails to select a key slot, or if a request has been blocked due to an access violation. Normal operation using the KMU should never trigger the `BLOCKED` bit. If this bit is triggered during the development phase, it indicates that the code is using the KMU incorrectly.

The `STATUS` register is reset every time register `SELECTKEYSLOT` is written.

### 6.8.5 Registers

| Base address | Peripheral | Instance | Secure mapping | DMA security | Description         | Configuration |
|--------------|------------|----------|----------------|--------------|---------------------|---------------|
| 0x50039000   | KMU        | KMU : S  | SPLIT          | NA           | Key management unit |               |
| 0x40039000   |            | KMU : NS |                |              |                     |               |

## 6.9 PDM — Pulse density modulation interface

The pulse density modulation (PDM) module enables input of pulse density modulated signals from external audio frontends, for example, digital microphones. The PDM module generates the PDM clock and supports single-channel or dual-channel (left and right) data input. Data is transferred directly to RAM buffers using EasyDMA.

Listed here are the main features for PDM:

- Up to two PDM microphones configured as a left/right pair using the same data input
- 16 kHz output sample rate, 16-bit samples
- EasyDMA support for sample buffering
- HW decimation filters
- Selectable ratio of 64 or 80 between PDM\_CLK and output sample rate

The PDM module illustrated below is interfacing up to two digital microphones with the PDM interface. EasyDMA is implemented to relieve the real-time requirements associated with controlling of the PDM slave from a low priority CPU execution context. It also includes all the necessary digital filter elements to produce pulse code modulation (PCM) samples. The PDM module allows continuous audio streaming.

Figure 37: PDM module

### 6.9.1 Master clock generator

The master clock generator's PDMCLKCTRL register allows adjusting the PDM clock's frequency.

The master clock generator does not add any jitter to the HFCLK source chosen. It is recommended (but not mandatory) to use the Xtal as HFCLK source.

## 6.9.2 Module operation

By default, bits from the left PDM microphone are sampled on PDM\_CLK falling edge, and bits for the right are sampled on the rising edge of PDM\_CLK, resulting in two bitstreams. Each bitstream is fed into a digital filter which converts the PDM stream into 16-bit PCM samples, then filters and down-samples them to reach the appropriate sample rate.

The EDGE field in the MODE register allows swapping left and right, so that left will be sampled on rising edge, and right on falling.

The PDM module uses EasyDMA to store the samples coming out from the filters into one buffer in RAM. Depending on the mode chosen in the OPERATION field in the MODE register, memory either contains alternating left and right 16-bit samples (Stereo), or only left 16-bit samples (Mono). To ensure continuous PDM sampling, it is up to the application to update the EasyDMA destination address pointer as the previous buffer is filled.

The continuous transfer can be started or stopped by sending the START and STOP tasks. STOP becomes effective after the current frame has finished transferring, which will generate the STOPPED event. The STOPPED event indicates that all activity in the module is finished, and that the data is available in RAM (EasyDMA has finished transferring as well). Attempting to restart before receiving the STOPPED event may result in unpredictable behavior.

## 6.9.3 Decimation filter

In order to convert the incoming data stream into PCM audio samples, a decimation filter is included in the PDM interface module.

The input of the filter is the two-channel PDM serial stream (with left channel on clock high, right channel on clock low). Depending on the RATIO selected, its output is  $2 \times 16$ -bit PCM samples at a sample rate either 64 times or 80 times (depending on the RATIO register) lower than the PDM clock rate.

The filter stage of each channel is followed by a digital volume control, to attenuate or amplify the output samples in a range of -20 dB to +20 dB around the default (reset) setting, defined by  $G_{PDM,default}$ . The gain is controlled by the GAINL and GAINR registers.

As an example, if the goal is to achieve 2500 RMS output samples (16-bit) with a 1 kHz 90 dBA signal into a -26 dBFS sensitivity PDM microphone, do the following:

- Sum the PDM module's default gain (  $G_{PDM,default}$  ) and the gain introduced by the microphone and acoustic path of his implementation (an attenuation would translate into a negative gain)
- Adjust GAINL and GAINR by the above summed amount. Assuming that only the PDM module influences the gain, GAINL and GAINR must be set to  $-G_{PDM,default}$  dB to achieve the requirement.

With  $G_{PDM,default}=3.2$  dB, and as GAINL and GAINR are expressed in 0.5 dB steps, the closest value to program would be 3.0 dB, which can be calculated as:

$$GAINL = GAINR = (DefaultGain - (2 * 3))$$

Remember to check that the resulting values programmed into GAINL and GAINR fall within MinGain and MaxGain.

## 6.9.4 EasyDMA

Samples will be written directly to RAM, and EasyDMA must be configured accordingly.

The address pointer for the EasyDMA channel is set in SAMPLE.PTR register. If the destination address set in SAMPLE.PTR is not pointing to the Data RAM region, an EasyDMA transfer may result in a HardFault or RAM corruption. See [Memory](#) on page 21 for more information about the different memory regions.

DMA supports Stereo (Left+Right 16-bit samples) and Mono (Left only) data transfer, depending on the setting in the OPERATION field in the MODE register. The samples are stored little endian.

| MODE.OPERATION | Bits per sample | Result stored per RAM word | Physical RAM allocated (32-bit words) | Result boundary indexes in RAM | Note    |
|----------------|-----------------|----------------------------|---------------------------------------|--------------------------------|---------|
| Stereo         | 32 (2x16)       | L+R                        | $\text{ceil}(\text{SAMPLE.MAXCNT}/2)$ | R0=[31:16]; L0=[15:0]          | Default |
| Mono           | 16              | 2xL                        | $\text{ceil}(\text{SAMPLE.MAXCNT}/2)$ | L1=[31:16]; L0=[15:0]          |         |

Table 54: DMA sample storage

The destination buffer in RAM consists of one block, the size of which is set in SAMPLE.MAXCNT register. Format is number of 16-bit samples. The physical RAM allocated is always:

```
(RAM allocation, in bytes) = SAMPLE.MAXCNT * 2;
```

(but the mapping of the samples depends on MODE.OPERATION.

If OPERATION=Stereo, RAM will contain a succession of left and right samples.

If OPERATION=Mono, RAM will contain a succession of left only samples.

For a given value of SAMPLE.MAXCNT, the buffer in RAM can contain half the stereo sampling time as compared to the mono sampling time.

The PDM acquisition can be started by the START task, after the SAMPLE.PTR and SAMPLE.MAXCNT registers have been written. When starting the module, it will take some time for the filters to start outputting valid data. Transients from the PDM microphone itself may also occur. The first few samples (typically around 50) might hence contain invalid values or transients. It is therefore advised to discard the first few samples after a PDM start.

As soon as the STARTED event is received, the firmware can write the next SAMPLE.PTR value (this register is double-buffered), to ensure continuous operation.

When the buffer in RAM is filled with samples, an END event is triggered. The firmware can start processing the data in the buffer. Meanwhile, the PDM module starts acquiring data into the new buffer pointed to by SAMPLE.PTR, and sends a new STARTED event, so that the firmware can update SAMPLE.PTR to the next buffer address.

### 6.9.5 Hardware example

PDM can be configured with a single microphone (mono), or with two microphones.

When a single microphone is used, connect the microphone clock to CLK, and data to DIN.

Figure 38: Example of a single PDM microphone, wired as left

Figure 39: Example of a single PDM microphone, wired as right

Note that in a single-microphone (mono) configuration, depending on the microphone's implementation, either the left or the right channel (sampled at falling or rising CLK edge respectively) will contain reliable data.

If two microphones are used, one of them has to be set as left, the other as right (L/R pin tied high or to GND on the respective microphone). It is strongly recommended to use two microphones of exactly the same brand and type so that their timings in left and right operation match.

Figure 40: Example of two PDM microphones

### 6.9.6 Pin configuration

The CLK and DIN signals associated to the PDM module are mapped to physical pins according to the configuration specified in the PSEL.CLK and PSEL.DIN registers respectively. If the CONNECT field in any PSEL register is set to Disconnected, the associated PDM module signal will not be connected to the required physical pins, and will not operate properly.

The PSEL.CLK and PSEL.DIN registers and their configurations are only used as long as the PDM module is enabled, and retained only as long as the device is in System ON mode. See [POWER — Power control](#) on page 64 for more information about power modes. When the peripheral is disabled, the pins will behave as regular GPIOs, and use the configuration in their respective OUT bit field and PIN\_CNF[n] register.

To ensure correct behavior in the PDM module, the pins used by the PDM module must be configured in the GPIO peripheral as described in [GPIO configuration before enabling peripheral](#) on page 152 before enabling the PDM module. This is to ensure that the pins used by the PDM module are driven correctly if the PDM module itself is temporarily disabled or the device temporarily enters System OFF. This configuration must be retained in the GPIO for the selected I/Os as long as the PDM module is supposed to be connected to an external PDM circuit.

Only one peripheral can be assigned to drive a particular GPIO pin at a time. Failing to do so may result in unpredictable behavior.

| PDM signal | PDM pin                  | Direction | Output value   | Comment |
|------------|--------------------------|-----------|----------------|---------|
| CLK        | As specified in PSEL.CLK | Output    | 0              |         |
| DIN        | As specified in PSEL.DIN | Input     | Not applicable |         |

Table 55: GPIO configuration before enabling peripheral

    ## 6.10 PWM — Pulse width modulation

The pulse with modulation (PWM) module enables the generation of pulse width modulated signals on GPIO. The module implements an up or up-and-down counter with four PWM channels that drive assigned GPIOs.

The following are the main features of a PWM module:

- Programmable PWM frequency
- Up to four PWM channels with individual polarity and duty cycle values
- Edge or center-aligned pulses across PWM channels
- Multiple duty cycle arrays (sequences) defined in RAM
- Autonomous and glitch-free update of duty cycle values directly from memory through EasyDMA (no CPU involvement)
- Change of polarity, duty cycle, and base frequency possibly on every PWM period
- RAM sequences can be repeated or connected into loops

Figure 42: PWM module

### 6.10.1 Wave counter

The wave counter is responsible for generating the pulses at a duty cycle that depends on the compare values, and at a frequency that depends on COUNTERTOP.

There is one common 15-bit counter with four compare channels. Thus, all four channels will share the same period (PWM frequency), but can have individual duty cycle and polarity. The polarity is set by a

value read from RAM (see figure [Decoder memory access modes](#) on page 165). Whether the counter counts up, or up and down, is controlled by the MODE register.

The timer top value is controlled by the COUNTERTOP register. This register value, in conjunction with the selected PRESCALER of the PWM\_CLK, will result in a given PWM period. A COUNTERTOP value smaller than the compare setting will result in a state where no PWM edges are generated. OUT[n] is held high, given that the polarity is set to FallingEdge. All compare registers are internal and can only be configured through decoder presented later. COUNTERTOP can be safely written at any time.

Sampling follows the START task. If DECODER.LOAD=WaveForm, the register value is ignored and taken from RAM instead (see section [Decoder with EasyDMA](#) on page 165 for more details). If DECODER.LOAD is anything else than the WaveForm, it is sampled following a STARTSEQ[n] task and when loading a new value from RAM during a sequence playback.

The following figure shows the counter operating in up mode (MODE=PWM\_MODE\_Up), with three PWM channels with the same frequency but different duty cycle:

Figure 43: PWM counter in up mode example - FallingEdge polarity

The counter is automatically reset to zero when COUNTERTOP is reached and OUT[n] will invert. OUT[n] is held low if the compare value is 0 and held high if set to COUNTERTOP, given that the polarity is set to

**FallingEdge.** Counter running in up mode results in pulse widths that are edge-aligned. The following is the code for the counter in up mode example:

```
uint16_t pwm_seq[4] = {PWM_CH0_DUTY, PWM_CH1_DUTY, PWM_CH2_DUTY, PWM_CH3_DUTY};
NRF_PWM0->PSEL.OUT[0] = (first_pin << PWM_PSEL_OUT_PIN_Pos) |
                        (PWM_PSEL_OUT_CONNECT_Connected <<
                         PWM_PSEL_OUT_CONNECT_Pos);
NRF_PWM0->PSEL.OUT[1] = (second_pin << PWM_PSEL_OUT_PIN_Pos) |
                        (PWM_PSEL_OUT_CONNECT_Connected <<
                         PWM_PSEL_OUT_CONNECT_Pos);
NRF_PWM0->ENABLE      = (PWM_ENABLE_ENABLE_Enabled << PWM_ENABLE_ENABLE_Pos);
NRF_PWM0->MODE        = (PWM_MODE_UPDOWN_Up << PWM_MODE_UPDOWN_Pos);
NRF_PWM0->PRESCALER   = (PWM_PRESCALER_PRESCALER_DIV_1 <<
                         PWM_PRESCALER_PRESCALER_Pos);
NRF_PWM0->COUNTERTOP  = (16000 << PWM_COUNTERTOP_COUNTERTOP_Pos); //1 msec
NRF_PWM0->LOOP        = (PWM_LOOP_CNT_Disabled << PWM_LOOP_CNT_Pos);
NRF_PWM0->DECODER     = (PWM_DECODER_LOAD_Individual << PWM_DECODER_LOAD_Pos) |
                        (PWM_DECODER_MODE_RefreshCount << PWM_DECODER_MODE_Pos);
NRF_PWM0->SEQ[0].PTR  = ((uint32_t)(pwm_seq) << PWM_SEQ_PTR_PTR_Pos);
NRF_PWM0->SEQ[0].CNT  = ((sizeof(pwm_seq) / sizeof(uint16_t)) <<
                         PWM_SEQ_CNT_CNT_Pos);
NRF_PWM0->SEQ[0].REFRESH = 0;
NRF_PWM0->SEQ[0].ENDDELAY = 0;
NRF_PWM0->TASKS_SEQSTART[0] = 1;
```

When the counter is running in up mode, the following formula can be used to compute the PWM period and the step size:

**PWM period:**  $T_{PWM(Up)} = T_{PWM\_CLK} * COUNTERTOP$

**Step width/Resolution:**  $T_{steps} = T_{PWM\_CLK}$

The following figure shows the counter operating in up-and-down mode (MODE=PWM\_MODE\_UpAndDown), with two PWM channels with the same frequency but different duty cycle and output polarity:

Figure 44: PWM counter in up-and-down mode example

The counter starts decrementing to zero when COUNTERTOP is reached and will invert the OUT[n] when compare value is hit for the second time. This results in a set of pulses that are center-aligned. The following is the code for the counter in up-and-down mode example:

```
uint16_t pwm_seq[4] = {PWM_CH0_DUTY, PWM_CH1_DUTY, PWM_CH2_DUTY, PWM_CH3_DUTY};
NRF_PWM0->PSEL.OUT[0] = (first_pin << PWM_PSEL_OUT_PIN_Pos) |
    (PWM_PSEL_OUT_CONNECT_Connected <<
        PWM_PSEL_OUT_CONNECT_Pos);
NRF_PWM0->PSEL.OUT[1] = (second_pin << PWM_PSEL_OUT_PIN_Pos) |
    (PWM_PSEL_OUT_CONNECT_Connected <<
        PWM_PSEL_OUT_CONNECT_Pos);
NRF_PWM0->ENABLE = (PWM_ENABLE_ENABLE_Enabled << PWM_ENABLE_ENABLE_Pos);
NRF_PWM0->MODE = (PWM_MODE_UPDOWN_UpAndDown << PWM_MODE_UPDOWN_Pos);
NRF_PWM0->PRESCALER = (PWM_PRESCALER_PRESCALER_DIV_1 <<
    PWM_PRESCALER_PRESCALER_Pos);
NRF_PWM0->COUNTERTOP = (16000 << PWM_COUNTERTOP_COUNTERTOP_Pos); //1 msec
NRF_PWM0->LOOP = (PWM_LOOP_CNT_Disabled << PWM_LOOP_CNT_Pos);
NRF_PWM0->DECODER = (PWM_DECODER_LOAD_Individual << PWM_DECODER_LOAD_Pos) |
    (PWM_DECODER_MODE_RefreshCount << PWM_DECODER_MODE_Pos);
NRF_PWM0->SEQ[0].PTR = ((uint32_t)(pwm_seq) << PWM_SEQ_PTR_PTR_Pos);
NRF_PWM0->SEQ[0].CNT = ((sizeof(pwm_seq) / sizeof(uint16_t)) <<
    PWM_SEQ_CNT_CNT_Pos);
NRF_PWM0->SEQ[0].REFRESH = 0;
NRF_PWM0->SEQ[0].ENDDELAY = 0;
NRF_PWM0->TASKS_SEQSTART[0] = 1;
```

When the counter is running in up-and-down mode, the following formula can be used to compute the PWM period and the step size:

$$T_{\text{PWM(Up And Down)}} = T_{\text{PWM\_CLK}} * 2 * \text{COUNTERTOP}$$

$$\text{Step width/Resolution: } T_{\text{steps}} = T_{\text{PWM\_CLK}} * 2$$

## 6.10.2 Decoder with EasyDMA

The decoder uses EasyDMA to take PWM parameters stored in RAM and update the internal compare registers of the wave counter, based on the mode of operation.

PWM parameters are organized into a sequence containing at least one half word (16 bit). Its most significant bit[15] denotes the polarity of the OUT[n] while bit[14:0] is the 15-bit compare value.

|            |  |  |  |                                                                                       |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  | The DECODER register controls how the RAM content is interpreted and loaded into the internal compare registers. The LOAD field controls if the RAM values are loaded to all compare channels, or to update a group or all channels with individual values. The following figure illustrates how parameters stored in RAM are organized and routed to various compare channels in different modes:

Figure 45: Decoder memory access modes

A special mode of operation is available when DECODER.LOAD is set to WaveForm. In this mode, up to three PWM channels can be enabled - OUT[0] to OUT[2]. In RAM, four values are loaded at a time: the first, second and third location are used to load the values, and the fourth RAM location is used to load the COUNTERTOP register. This way one can have up to three PWM channels with a frequency base that changes on a per PWM period basis. This mode of operation is useful for arbitrary wave form generation in applications, such as LED lighting.

The register SEQ[n].REFRESH=N (one per sequence n=0 or 1) will instruct a new RAM stored pulse width value on every (N+1)<sup>th</sup> PWM period. Setting the register to zero will result in a new duty cycle update every PWM period, as long as the minimum PWM period is observed.

Note that registers SEQ[n].REFRESH and SEQ[n].ENDDELAY are ignored when DECODER.MODE=NextStep. The next value is loaded upon every received NEXTSTEP task.

SEQ[n].PTR is the pointer used to fetch COMPARE values from RAM. If the SEQ[n].PTR is not pointing to a RAM region, an EasyDMA transfer may result in a HardFault or RAM corruption. See [Memory](#) on page 21 for more information about the different memory regions. After the SEQ[n].PTR is set to the desired RAM location, the SEQ[n].CNT register must be set to the number of 16-bit half words in the sequence. It is important to observe that the Grouped mode requires one half word per group, while the Single mode requires one half word per channel, thus increasing the RAM size occupation. If PWM generation is not running when the SEQSTART[n] task is triggered, the task will load the first value from RAM and then start the PWM generation. A SEQSTARTED[n] event is generated as soon as the EasyDMA has read the first PWM parameter from RAM and the wave counter has started executing it. When LOOP.CNT=0, sequence n=0 or 1 is played back once. After the last value in the sequence has been loaded and started executing, a SEQEND[n] event is generated. The PWM generation will then continue with the last loaded value. The following figure illustrates an example of a simple playback.

Figure 46: Simple sequence example

The following source code is used for configuration and timing details in a sequence where only sequence 0 is used and only run once with a new PWM duty cycle for each period.

```
NRF_PWM0->PSEL.OUT[0] = (first_pin << PWM_PSEL_OUT_PIN_Pos) |
                        (PWM_PSEL_OUT_CONNECT_Connected <<
                          PWM_PSEL_OUT_CONNECT_Pos);
NRF_PWM0->ENABLE      = (PWM_ENABLE_ENABLE_Enabled << PWM_ENABLE_ENABLE_Pos);
NRF_PWM0->MODE        = (PWM_MODE_UPDOWN_Up << PWM_MODE_UPDOWN_Pos);
NRF_PWM0->PRESCALER    = (PWM_PRESCALER_PRESCALER_DIV_1 <<
                          PWM_PRESCALER_PRESCALER_Pos);
NRF_PWM0->COUNTERTOP   = (16000 << PWM_COUNTERTOP_COUNTERTOP_Pos); //1 msec
NRF_PWM0->LOOP         = (PWM_LOOP_CNT_Disabled << PWM_LOOP_CNT_Pos);
NRF_PWM0->DECODER      = (PWM_DECODER_LOAD_Common << PWM_DECODER_LOAD_Pos) |
                        (PWM_DECODER_MODE_RefreshCount << PWM_DECODER_MODE_Pos);
NRF_PWM0->SEQ[0].PTR    = ((uint32_t)(seq0_ram) << PWM_SEQ_PTR_PTR_Pos);
NRF_PWM0->SEQ[0].CNT    = ((sizeof(seq0_ram) / sizeof(uint16_t)) <<
                          PWM_SEQ_CNT_CNT_Pos);
NRF_PWM0->SEQ[0].REFRESH = 0;
NRF_PWM0->SEQ[0].ENDDELAY = 0;
NRF_PWM0->TASKS_SEQSTART[0] = 1;
```

To completely stop the PWM generation and force the associated pins to a defined state, a STOP task can be triggered at any time. A STOPPED event is generated when the PWM generation has stopped at the end of the currently running PWM period, and the pins go into their idle state as defined in GPIO OUT register.

PWM generation can then only be restarted through a SEQSTART[n] task. SEQSTART[n] will resume PWM generation after having loaded the first value from the RAM buffer defined in the SEQ[n].PTR register.

The following table indicates when specific registers get sampled by the hardware. Care should be taken when updating these registers to avoid that values are applied earlier than expected.

| Register        | Taken into account by hardware                                                                                                               | Recommended (safe) update                                                                    |
|-----------------|----------------------------------------------------------------------------------------------------------------------------------------------|----------------------------------------------------------------------------------------------|
| SEQ[n].PTR      | When sending the SEQSTART[n] task                                                                                                            | After having received the SEQSTARTED[n] event                                                |
| SEQ[n].CNT      | When sending the SEQSTART[n] task                                                                                                            | After having received the SEQSTARTED[n] event                                                |
| SEQ[0].ENDDELAY | When sending the SEQSTART[0] task                                                                                                            | Before starting sequence [0] through a SEQSTART[0] task                                      |
|                 | Every time a new value from sequence [0] has been loaded from RAM and gets applied to the Wave Counter (indicated by the PWMPERIODEND event) | When no more value from sequence [0] gets loaded from RAM (indicated by the SEQEND[0] event) |
|                 |                                                                                                                                              | At any time during sequence [1] (which starts when the SEQSTARTED[1] event is generated)     |
| SEQ[1].ENDDELAY | When sending the SEQSTART[1] task                                                                                                            | Before starting sequence [1] through a SEQSTART[1] task                                      |
|                 | Every time a new value from sequence [1] has been loaded from RAM and gets applied to the Wave Counter (indicated by the PWMPERIODEND event) | When no more value from sequence [1] gets loaded from RAM (indicated by the SEQEND[1] event) |
|                 |                                                                                                                                              | At any time during sequence [0] (which starts when the SEQSTARTED[0] event is generated)     |
| SEQ[0].REFRESH  | When sending the SEQSTART[0] task                                                                                                            | Before starting sequence [0] through a SEQSTART[0] task                                      |
|                 | Every time a new value from sequence [0] has been loaded from RAM and gets applied to the Wave Counter (indicated by the PWMPERIODEND event) | At any time during sequence [1] (which starts when the SEQSTARTED[1] event is generated)     |
| SEQ[1].REFRESH  | When sending the SEQSTART[1] task                                                                                                            | Before starting sequence [1] through a SEQSTART[1] task                                      |
|                 | Every time a new value from sequence [1] has been loaded from RAM and gets applied to the Wave Counter (indicated by the PWMPERIODEND event) | At any time during sequence [0] (which starts when the SEQSTARTED[0] event is generated)     |
| COUNTERTOP      | In DECODER.LOAD=WaveForm: this register is ignored.                                                                                          | Before starting PWM generation through a SEQSTART[n] task                                    |
|                 | In all other LOAD modes: at the end of current PWM period (indicated by the PWMPERIODEND event)                                              | After a STOP task has been triggered, and the STOPPED event has been received.               |
| MODE            | Immediately                                                                                                                                  | Before starting PWM generation through a SEQSTART[n] task                                    |
|                 |                                                                                                                                              | After a STOP task has been triggered, and the STOPPED event has been received.               |
| DECODER         | Immediately                                                                                                                                  | Before starting PWM generation through a SEQSTART[n] task                                    |
|                 |                                                                                                                                              | After a STOP task has been triggered, and the STOPPED event has been received.               |

Table 58: When to safely update PWM registers

**Note:** SEQ[n].REFRESH and SEQ[n].ENDDELAY are ignored at the end of a complex sequence, indicated by a LOOPSDONE event. The reason for this is that the last value loaded from RAM is maintained until further action from software (restarting a new sequence, or stopping PWM generation).

The following figure shows a more complex example using the register `LOOP` on page 182.

Figure 47: Example using two sequences

In this case, an automated playback takes place, consisting of SEQ[0], delay 0, SEQ[1], delay 1, then again SEQ[0], etc. The user can choose to start a complex playback with SEQ[0] or SEQ[1] through sending the SEQSTART[0] or SEQSTART[1] task. The complex playback always ends with delay 1.

The two sequences 0 and 1 are defined by the addresses of value tables in RAM (pointed to by SEQ[n].PTR) and the buffer size (SEQ[n].CNT). The rate at which a new value is loaded is defined individually for each sequence by SEQ[n].REFRESH. The chaining of sequence 1 following the sequence 0 is implicit, the LOOP.CNT register allows the chaining of sequence 1 to sequence 0 for a determined number of times. In other words, it allows to repeat a complex sequence a number of times in a fully automated way.

In the following code example, sequence 0 is defined with SEQ[0].REFRESH set to 1, meaning that a new PWM duty cycle is pushed every second PWM period. This complex sequence is started with the SEQSTART[0] task, so SEQ[0] is played first. Since SEQ[0].ENDDELAY=1 there will be one PWM period delay between last period on sequence 0 and the first period on sequence 1. Since SEQ[1].ENDDELAY=0 there is no delay 1, so SEQ[0] would be started immediately after the end of SEQ[1]. However, as LOOP.CNT is

1, the playback stops after having played SEQ[1] only once, and both SEQEND[1] and LOOPSDONE are generated (their order is not guaranteed in this case).

```

NRF_PWM0->PSEL.OUT[0] = (first_pin << PWM_PSEL_OUT_PIN_Pos) |
                        (PWM_PSEL_OUT_CONNECT_Connected <<
                          PWM_PSEL_OUT_CONNECT_Pos);
NRF_PWM0->ENABLE      = (PWM_ENABLE_ENABLE_Enabled << PWM_ENABLE_ENABLE_Pos);
NRF_PWM0->MODE        = (PWM_MODE_UPDOWN_Up << PWM_MODE_UPDOWN_Pos);
NRF_PWM0->PRESCALER   = (PWM_PRESCALER_PRESCALER_DIV_1 <<
                          PWM_PRESCALER_PRESCALER_Pos);
NRF_PWM0->COUNTERTOP  = (16000 << PWM_COUNTERTOP_COUNTERTOP_Pos); //1 msec
NRF_PWM0->LOOP        = (1 << PWM_LOOP_CNT_Pos);
NRF_PWM0->DECODER     = (PWM_DECODER_LOAD_Common << PWM_DECODER_LOAD_Pos) |
                        (PWM_DECODER_MODE_RefreshCount << PWM_DECODER_MODE_Pos);
NRF_PWM0->SEQ[0].PTR  = ((uint32_t)(seq0_ram) << PWM_SEQ_PTR_PTR_Pos);
NRF_PWM0->SEQ[0].CNT  = ((sizeof(seq0_ram) / sizeof(uint16_t)) <<
                          PWM_SEQ_CNT_CNT_Pos);

NRF_PWM0->SEQ[0].REFRESH = 1;
NRF_PWM0->SEQ[0].ENDDELAY = 1;
NRF_PWM0->SEQ[1].PTR  = ((uint32_t)(seq1_ram) << PWM_SEQ_PTR_PTR_Pos);
NRF_PWM0->SEQ[1].CNT  = ((sizeof(seq1_ram) / sizeof(uint16_t)) <<
                          PWM_SEQ_CNT_CNT_Pos);

NRF_PWM0->SEQ[1].REFRESH = 0;
NRF_PWM0->SEQ[1].ENDDELAY = 0;
NRF_PWM0->TASKS_SEQSTART[0] = 1;

```

The decoder can also be configured to asynchronously load new PWM duty cycle. If the DECODER.MODE register is set to NextStep, then the NEXTSTEP task will cause an update of internal compare registers on the next PWM period.

The following figures provide an overview of each part of an arbitrary sequence, in various modes (LOOP.CNT=0 and LOOP.CNT>0). In particular, the following are represented:

- Initial and final duty cycle on the PWM output(s)
- Chaining of SEQ[0] and SEQ[1] if LOOP.CNT>0
- Influence of registers on the sequence
- Events generated during a sequence
- DMA activity (loading of next value and applying it to the output(s))

[illegible]

170

This example shows how the PWM module can be configured to repeat a single sequence until stopped.

4418 1315 v2.0

### 6.10.3 Limitations

The previous compare value is repeated if the PWM period is shorter than the time it takes for the EasyDMA to retrieve from RAM and update the internal compare registers. This is to ensure a glitch-free operation even for very short PWM periods.

Only SEQ[1] can trigger the **LOOPSDONE** event upon completion, not SEQ[0]. This requires looping to be enabled (**LOOP** > 0) and **SEQ[1].CNT** > 0 when sequence playback starts.

### 6.10.4 Pin configuration

The OUT[n] (n=0..3) signals associated with each PWM channel are mapped to physical pins according to the configuration of PSEL.OUT[n] registers. If PSEL.OUT[n].CONNECT is set to Disconnected, the associated PWM module signal will not be connected to any physical pins.

The PSEL.OUT[n] registers and their configurations are used as long as the PWM module is enabled and the PWM generation active (wave counter started). They are retained only as long as the device is in System ON mode (see the **POWER** section for more information about power modes).

To ensure correct behavior in the PWM module, the pins that are used must be configured in the GPIO peripheral in the following way before the PWM module is enabled:

| PWM signal | PWM pin                                 | Direction | Output value | Comment                                 |
|------------|-----------------------------------------|-----------|--------------|-----------------------------------------|
| OUT[n]     | As specified in PSEL.OUT[n]<br>(n=0..3) | Output    | 0            | Idle state defined in GPIO OUT register |

Table 59: Recommended GPIO configuration before starting PWM generation

The idle state of a pin is defined by the OUT register in the GPIO module, to ensure that the pins used by the PWM module are driven correctly. If PWM generation is stopped by triggering a STOP task, the PWM module itself is temporarily disabled or the device temporarily enters System OFF. This configuration must be retained in the GPIO for the selected pins (I/Os) for as long as the PWM module is supposed to be connected to an external PWM circuit.

Only one peripheral can be assigned to drive a particular GPIO pin at a time. Failing to do so may result in unpredictable behavior.

### 6.10.5 Registers

| Base address             | Peripheral | Instance              | Secure mapping | DMA security | Description                   | Configuration |

Table 61: Register overview

### 6.10.5.1 TASKS\_STOP

Address offset: 0x004

Stops PWM pulse generation on all channels at the end of current PWM period, and stops sequence playback

### 6.10.5.2 TASKS\_SEQSTART[n] (n=0..1)

Address offset: 0x008 + (n × 0x4)

Loads the first PWM value on all enabled channels from sequence n, and starts playing that sequence at the rate defined in SEQ[n]REFRESH and/or DECODER.MODE. Causes PWM generation to start if not running.

|                  |     |                |          |                                                                                       |  |  |  |                                                                                                                                                                                                              |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |

### 6.10.5.3 TASKS\_NEXTSTEP

Address offset: 0x010

Steps by one value in the current sequence on all enabled channels if DECODER.MODE=NextStep. Does not cause PWM generation to start if not running.

### 6.10.5.11 EVENTS\_LOOPSDONE

Address offset: 0x11C

Concatenated sequences have been played the amount of times defined in LOOP.CNT

This event triggers after the last SEQ[1] completion of the loop, and only if looping was enabled (LOOP > 0) when the sequence playback was started.

    ## 6.11 RTC — Real-time counter

The real-time counter (RTC) module provides a generic, low-power timer on the low frequency clock source (LFCLK).

Figure 51: RTC block diagram

The RTC module features a 24-bit COUNTER, a 12-bit (1/X) prescaler, compare registers, and a tick event generator.

### 6.11.1 Clock source

The RTC will run off the LFCLK.

When started, the RTC will automatically request the LFCLK source with RC oscillator if the LFCLK is not already running.

See [CLOCK — Clock control](#) on page 70 for more information about clock sources.

### 6.11.2 Resolution versus overflow and the prescaler

The relationship between the prescaler, counter resolution, and overflow is summarized in the following table.

| Prescaler  | Counter resolution | Overflow       |
|------------|--------------------|----------------|
| 0          | 30.517 $\mu$ s     | 512 seconds    |
| $2^8-1$    | 7812.5 $\mu$ s     | 131072 seconds |
| $2^{12}-1$ | 125 ms             | 582.542 hours  |

Table 62: RTC resolution versus overflow

The counter increment frequency is given by the following equation:

$$f_{\text{RTC}} [\text{kHz}] = 32.768 / (\text{PRESCALER} + 1)$$

The **PRESCALER** register can only be written when the RTC is stopped.

The prescaler is restarted on tasks **START**, **CLEAR** and **TRIGOVFLW**. That is, the prescaler value is latched to an internal register (<<PRESC>>) on these tasks.

Examples:

1. Desired COUNTER frequency 100 Hz (10 ms counter period)

$$\text{PRESCALER} = \text{round}(32.768 \text{ kHz} / 100 \text{ Hz}) - 1 = 327$$

$$f_{\text{RTC}} = 99.9 \text{ Hz}$$

$$10009.576 \text{ } \mu\text{s counter period}$$

## 2. Desired COUNTER frequency 8 Hz (125 ms counter period)

$$\text{PRESCALER} = \text{round}(32.768 \text{ kHz} / 8 \text{ Hz}) - 1 = 4095$$

$$f_{\text{RTC}} = 8 \text{ Hz}$$

125 ms counter period

### 6.11.3 Counter register

The internal <<COUNTER>> register increments on LFCLK when the internal PRESCALER register (<<PRESC>>) is 0x00. <<PRESC>> is reloaded from the PRESCALER register. If enabled, the TICK event occurs on each increment of the COUNTER.

Figure 52: Timing diagram - COUNTER\_PRESCALER\_0

Figure 53: Timing diagram - COUNTER\_PRESCALER\_1

#### 6.11.3.1 Reading the counter register

To read the COUNTER register, the internal <<COUNTER>> value is sampled.

To ensure that the <<COUNTER>> is safely sampled (considering that an LFCLK transition may occur during a read), the CPU and core memory bus are halted for PCLK16M cycles. In addition, the read takes the CPU two PCLK16M cycles, resulting in the COUNTER register read taking maximum six PCLK16M clock cycles.

### 6.11.4 Overflow

An OVRFLW event is generated on COUNTER register overflow (overflowing from 0xFFFFF to 0).

The TRIGOVFLW task will set the COUNTER value to 0xFFFFF0, to allow software test of the overflow condition.

**Note:** The OVRFLW event is disabled by default.

### 6.11.5 Tick event

The **TICK** event enables low-power tickless RTOS implementation, as it optionally provides a regular interrupt source for an RTOS with no need for use of the ARM SysTick feature.

Using the **TICK** event, rather than the SysTick, allows the CPU to be powered down while keeping RTOS scheduling active.

**Note:** The **TICK** event is disabled by default.

### 6.11.6 Event control

To optimize the RTC power consumption, events in the RTC can be individually disabled to prevent PCLK16M and HFCLK from being requested when those events are triggered. This is managed using the **EVTEN** register.

This means that the RTC implements a slightly different task and event system compared to the standard system described in [Peripheral interface](#) on page 15. The RTC task and event system is illustrated in the following figure.

Figure 54: Tasks, events, and interrupts in the RTC

### 6.11.7 Compare

The RTC implements one **COMPARE** event for every available compare register.

When the **COUNTER** is incremented and then becomes equal to the value specified in the register **CC[n]**, the corresponding compare event **COMPARE[n]** is generated.

When writing a **CC[n]** register, the **RTC COMPARE** event exhibits several behaviors. See the following figures for more information.

If a **CC** value is 0 when a **CLEAR** task is set, this will not trigger a **COMPARE** event.

Figure 55: Timing diagram - COMPARE\_CLEAR

If a **CC** value is N and the **COUNTER** value is N when the **START** task is set, this will not trigger a **COMPARE** event.

Figure 56: Timing diagram - COMPARE\_START

A **COMPARE** event occurs when a **CC** value is N, and the **COUNTER** value transitions from N-1 to N.

Figure 57: Timing diagram - COMPARE

If the **COUNTER** value is N, writing N+2 to a **CC** register is guaranteed to trigger a **COMPARE** event at N+2.

Figure 58: Timing diagram - COMPARE\_N+2

If the **COUNTER** value is N, writing N or N+1 to a **CC** register may not trigger a **COMPARE** event.

Figure 59: Timing diagram - COMPARE\_N+1

If the **COUNTER** value is N, and the current **CC** value is N+1 or N+2 when a new CC value is written, a match may trigger on the previous CC value before the new value takes effect. If the current CC value is greater than N+2 when the new value is written, there will be no event due to the old value.

Figure 60: Timing diagram - COMPARE\_N-1

### 6.11.8 Task and event jitter/delay

Jitter or delay in the RTC, is due to the peripheral clock being a low frequency clock (LFCLK), which is not synchronous to the faster PCLK16M.

Registers in the peripheral interface that are part of the PCLK16M domain, have a set of mirrored registers in the LFCLK domain. For example, the **COUNTER** value accessible from the CPU is in the PCLK16M domain, and is latched on a read from an internal COUNTER register in the LFCLK domain. The **COUNTER** register

is modified each time the RTC ticks. The registers are synchronised between the two clock domains (PCLK16M and LFCLK).

**CLEAR** and **STOP** (and **TRIGOVRFLOW**, which is not shown) will be delayed as long as it takes for the peripheral to clock a falling edge and a rising edge of the LFCLK. This is between 15.2585  $\mu\text{s}$  and 45.7755  $\mu\text{s}$  – rounded to 15  $\mu\text{s}$  and 46  $\mu\text{s}$  for the remainder of the section.

Figure 61: Timing diagram - DELAY\_CLEAR

When a **STOP** task is triggered, the PCLK16M domain will immediately prevent the generation of any EVENTS from the RTC. However, as seen in the following figure, the **COUNTER** value can still increment one final time.

Figure 62: Timing diagram - DELAY\_STOP

The **START** task will start the RTC. Assuming that the LFCLK was previously running and stable, the first increment of **COUNTER** (and instance of TICK event) will be typically after 30.5  $\mu\text{s}$   $\pm$  15  $\mu\text{s}$ . Additional delay will occur if the RTC is started before the LFCLK is running, see **CLOCK — Clock control** on page 70 for LFLK startup times. The software should therefore wait for the first TICK if it has to make sure that the RTC is running. Sending a TRIGOVRFLOW task sets the **COUNTER** to a value close to overflow. However, since the update of **COUNTER** relies on a stable LFCLK, sending this task while LFCLK is not running will also add additional delay as previously described. The figures show the smallest and largest delays on the **START** task, appearing as a  $\pm$  15  $\mu\text{s}$  jitter on the first **COUNTER** increment.

Figure 63: Timing diagram - JITTER\_START-

Figure 64: Timing diagram - JITTER\_START+

The following tables summarize jitter introduced for tasks and events. Any 32.768 kHz clock jitter will come in addition to these numbers.

| Task                            | Delay             |
|---------------------------------|-------------------|
| CLEAR, START, STOP, TRIGOVRFLOW | +15 to 46 $\mu$ s |

Table 63: RTC jitter magnitudes on tasks

| Operation/Function               | Jitter         |
|----------------------------------|----------------|
| START to COUNTER increment       | $\pm 15 \mu$ s |
| COMPARE to COMPARE <sup>12</sup> | $\pm 62.5$ ns  |

Table 64: RTC jitter magnitudes on events

### 6.11.9 Registers

| Base address             | Peripheral | Instance              | Secure mapping | DMA security | Description         | Configuration |

### 6.11.10 Electrical specification

## 6.12 SAADC — Successive approximation analog-to-digital converter

The SAADC is a differential successive approximation register (SAR) analog-to-digital converter.

Listed here are the main features of SAADC:

- 8/10/12-bit resolution, 14-bit resolution with oversampling
- Multiple analog inputs:
  - AIN0 to AIN7 pins
  - VDD\_GPIO pin
- Up to eight input channels:
  - One channel per single-ended input and two channels per differential input
  - Scan mode can be configured with both single-ended channels and differential channels
  - Each channel can be configured to select any of the above analog inputs
- Full scale input range (0 to VDD\_GPIO)
- Sampling triggered via a task from software or a PPI channel for full flexibility on sample frequency source from low-power 32.768 kHz RTC or more accurate 1/16 MHz timers
- One-shot conversion mode to sample a single channel
- Scan mode to sample a series of channels in sequence with configurable sample delay
- Support for direct sample transfer to RAM using EasyDMA
- Interrupts on single sample and full buffer events
- Samples stored as 16-bit two's complement values for differential and single-ended sampling
- Continuous sampling without the need of an external timer
- Internal resistor string
- On-the-fly limit checking

### 6.12.1 Overview

The ADC supports up to eight external analog input channels. It can be operated in One-shot mode with sampling under software control, or Continuous mode with a programmable sampling rate.

The analog inputs can be configured as eight single-ended inputs, four differential inputs or a combination of these. Each channel can be configured to select:

- AIN0 to AIN7 pins
- VDD\_GPIO pin

Channels can be sampled individually in one-shot or continuous sampling modes, or, using scan mode, multiple channels can be sampled in sequence. Channels can also be oversampled to improve noise performance.

Figure 65: Simplified ADC block diagram

Internally, the ADC is always a differential analog-to-digital converter, but by default it is configured with single-ended input in the MODE field of the CH[n].CONFIG register. In single-ended mode, the negative input will be shorted to ground internally.

The assumption in single-ended mode is that the internal ground of the ADC is the same as the external ground that the measured voltage is referred to. The ADC is thus sensitive to ground bounce on the PCB in single-ended mode. If this is a concern we recommend using differential measurement.

### 6.12.2 Digital output

The output result of the ADC depends on the settings in the CH[n].CONFIG and RESOLUTION registers as follows:

$$\text{RESULT} = [V(P) - V(N)] * \text{GAIN}/\text{REFERENCE} * 2^{(\text{RESOLUTION} - m)}$$

where

**V(P)**

is the voltage at input P

**V(N)**

is the voltage at input N

**GAIN**

is the selected gain setting

**m**

is the mode setting. Use m=0 if CONFIG.MODE=SE, or m=1 if CONFIG.MODE=Diff

**REFERENCE**

is the selected reference voltage

The result generated by the ADC will deviate from the expected due to DC errors like offset, gain, differential non-linearity (DNL), and integral non-linearity (INL). See [Electrical specification](#) for details on these parameters. The result can also vary due to AC errors like non-linearities in the GAIN block, settling errors

due to high source impedance and sampling jitter. For battery measurement, the DC errors are most noticeable.

The ADC has a wide selection of gains controlled in the GAIN field of the CH[n].CONFIG register. If CH[n].CONFIG.REFSEL=0, the input range of the ADC core is nominally  $\pm 0.6$  V differential and the input must be scaled accordingly.

The ADC has a temperature dependent offset. If the ADC is to operate over a large temperature range, we recommend running CALIBRATEOFFSET at regular intervals. The CALIBRATEDONE event will be fired when the calibration has been completed. Note that the DONE and RESULTDONE events will also be generated.

### 6.12.3 Analog inputs and channels

Up to eight analog input channels, CH[n](n=0..7), can be configured.

Any one of the available channels can be enabled for the ADC to operate in one-shot mode. If more than one CH[n] is configured, the ADC enters scan mode.

An analog input is selected as a positive converter input if CH[n].PSEL<sub>P</sub> is set, setting CH[n].PSEL<sub>P</sub> also enables the particular channel.

An analog input is selected as a negative converter input if CH[n].PSEL<sub>N</sub> is set. The CH[n].PSEL<sub>N</sub> register will have no effect unless differential mode is enabled, see MODE field in CH[n].CONFIG register.

If more than one of the CH[n].PSEL registers is set, the device enters scan mode. Input selections in scan mode are controlled by the CH[n].PSEL<sub>P</sub> and CH[n].PSEL<sub>N</sub> registers, where CH[n].PSEL<sub>N</sub> is only used if the particular scan channel is specified as differential, see MODE field in CH[n].CONFIG register.

### 6.12.4 Operation modes

The ADC input configuration supports one-shot mode, continuous mode and scan mode.

**Note:** Scan mode and oversampling cannot be combined.

The ADC indicates a single ongoing conversion via the register [STATUS](#) on page 219. During scan mode, oversampling, or continuous modes, more than a single conversion take place in the ADC. As consequence, the value reflected in STATUS register will toggle at the end of each single conversion.

#### 6.12.4.1 One-shot mode

One-shot operation is configured by enabling only one of the available channels defined by CH[n].PSEL<sub>P</sub>, CH[n].PSEL<sub>N</sub>, and CH[n].CONFIG registers.

Upon a SAMPLE task, the ADC starts to sample the input voltage. The CH[n].CONFIG.TACQ controls the acquisition time.

A DONE event signals that one sample has been taken.

In this mode, the RESULTDONE event has the same meaning as DONE when no oversampling takes place. Note that both events may occur before the actual value has been transferred into RAM by EasyDMA. For more information, see [EasyDMA](#) on page 202.

#### 6.12.4.2 Continuous mode

Continuous sampling can be achieved by using the internal timer in the ADC, or triggering the SAMPLE task from one of the general purpose timers through the PPI system.

Care shall be taken to ensure that the sample rate fulfils the following criteria, depending on how many channels are active:

$$f_{\text{SAMPLE}} < 1 / (t_{\text{ACQ}} + t_{\text{conv}})$$

The SAMPLERATE register can be used as a local timer instead of triggering individual SAMPLE tasks. When SAMPLERATE.MODE is set to Timers, it is sufficient to trigger SAMPLE task only once in order to start the SAADC and triggering the STOP task will stop sampling. The SAMPLERATE.CC field controls the sample rate.

The SAMPLERATE timer mode cannot be combined with SCAN mode, and only one channel can be enabled in this mode.

A DONE event signals that one sample has been taken.

In this mode, the RESULTDONE event has the same meaning as DONE when no oversampling takes place. Note that both events may occur before the actual value has been transferred into RAM by EasyDMA.

### 6.12.4.3 Oversampling

An accumulator in the ADC can be used to average noise on the analog input. In general, oversampling improves the signal-to-noise ratio (SNR). Oversampling, however, does not improve the integral non-linearity (INL), or differential non-linearity (DNL).

Oversampling and scan should not be combined, since oversampling and scan will average over input channels.

The accumulator is controlled in the OVERSAMPLE register. The SAMPLE task must be set  $2^{\text{OVERSAMPLE}}$  number of times before the result is written to RAM. This can be achieved by:

- Configuring a fixed sampling rate using the local timer or a general purpose timer and the PPI system to trigger a SAMPLE task
- Triggering SAMPLE  $2^{\text{OVERSAMPLE}}$  times from software
- Enabling BURST mode

CH[n].CONFIG.BURST can be enabled to avoid setting SAMPLE task  $2^{\text{OVERSAMPLE}}$  times. With BURST = 1 the ADC will sample the input  $2^{\text{OVERSAMPLE}}$  times as fast as it can (actual timing:  $<(t_{\text{ACQ}}+t_{\text{CONV}}) \times 2^{\text{OVERSAMPLE}}$ ). Thus, for the user it will just appear like the conversion took a bit longer time, but other than that, it is similar to one-shot mode.

A DONE event signals that one sample has been taken.

In this mode, the RESULTDONE event signals that enough conversions have taken place for an oversampled result to get transferred into RAM. Note that both events may occur before the actual value has been transferred into RAM by EasyDMA.

### 6.12.4.4 Scan mode

A channel is considered enabled if CH[n].PSEL is set. If more than one channel, CH[n], is enabled, the ADC enters scan mode.

In scan mode, one SAMPLE task will trigger one conversion per enabled channel. The time it takes to sample all channels is:

$$\text{Total time} < \text{Sum}(\text{CH}[x].t_{\text{ACQ}}+t_{\text{CONV}}), \quad x=0..\text{enabled channels}$$

A DONE event signals that one sample has been taken.

In this mode, the RESULTDONE event signals has the same meaning as DONE when no oversampling takes place. Note that both events may occur before the actual values have been transferred into RAM by EasyDMA.

The figure below provides an example of results placement in Data RAM, with an even RESULT.MAXCNT. In this example, channels 1, 2 and 5 are enabled, all others are disabled.

|                                       | 31                           | 16 | 15                           | 0 |
|---------------------------------------|------------------------------|----|------------------------------|---|
| RESULT.PTR                            | CH[2] 1 <sup>st</sup> result |    | CH[1] 1 <sup>st</sup> result |   |
| RESULT.PTR + 4                        | CH[1] 2 <sup>nd</sup> result |    | CH[5] 1 <sup>st</sup> result |   |
| RESULT.PTR + 8                        | CH[5] 2 <sup>nd</sup> result |    | CH[2] 2 <sup>nd</sup> result |   |
|                                       | (...)                        |    |                              |   |
| RESULT.PTR +<br>2*(RESULT.MAXCNT - 2) | CH[5] last result            |    | CH[2] last result            |   |

Figure 66: Example of RAM placement (even RESULT.MAXCNT), channels 1, 2 and 5 enabled

The figure below provides an example of results placement in Data RAM, with an odd RESULT.MAXCNT. In this example, channels 1, 2 and 5 are enabled, all others are disabled. The last 32-bit word is populated only with one 16-bit result.

|                                       | 31                           | 16 | 15                           | 0 |
|---------------------------------------|------------------------------|----|------------------------------|---|
| RESULT.PTR                            | CH[2] 1 <sup>st</sup> result |    | CH[1] 1 <sup>st</sup> result |   |
| RESULT.PTR + 4                        | CH[1] 2 <sup>nd</sup> result |    | CH[5] 1 <sup>st</sup> result |   |
| RESULT.PTR + 8                        | CH[5] 2 <sup>nd</sup> result |    | CH[2] 2 <sup>nd</sup> result |   |
|                                       | (…)                          |    |                              |   |
| RESULT.PTR +<br>2*(RESULT.MAXCNT – 1) |                              |    | CH[5] last result            |   |

Figure 67: Example of RAM placement (odd RESULT.MAXCNT), channels 1, 2 and 5 enabled

### 6.12.5 EasyDMA

After configuring RESULT.PTR and RESULT.MAXCNT, the ADC resources are started by triggering the START task. The ADC is using EasyDMA to store results in a Result buffer in RAM.

The Result buffer is located at the address specified in the RESULT.PTR register. The RESULT.PTR register is double-buffered and it can be updated and prepared for the next START task immediately after the STARTED event is generated. The size of the Result buffer is specified in the RESULT.MAXCNT register and the ADC will generate an END event when it has filled up the Result buffer, see [ADC](#) on page 203. Results are stored in little-endian byte order in Data RAM. Every sample will be sign extended to 16 bit before stored in the Result buffer.

The ADC is stopped by triggering the STOP task. The STOP task will terminate an ongoing sampling. The ADC will generate a STOPPED event when it has stopped. If the ADC is already stopped when the STOP task is triggered, the STOPPED event will still be generated.

Figure 68: ADC

If the RESULT.PTR is not pointing to a RAM region accessible from the peripheral, an EasyDMA transfer may result in a HardFault and/or memory corruption. See [Memory](#) on page 21 for more information about the different memory regions.

The EasyDMA will have finished accessing the RAM when the END or STOPPED event has been generated.

The RESULT.AMOUNT register can be read following an END event or a STOPPED event to see how many results have been transferred to the Result buffer in RAM since the START task was triggered.

In scan mode, SAMPLE tasks can be triggered once the START task is triggered. The END event is generated when the number of samples transferred to memory reaches the value specified by RESULT.MAXCNT. After an END event, the START task needs to be triggered again before new samples can be taken. Also make sure that the size of the Result buffer is large enough to have space for minimum one result from each of the enabled channels, by specifying RESULT.MAXCNT >= number of channels enabled. For more information about the scan mode, see [Scan mode](#) on page 201.

### 6.12.6 Resistor ladder

The ADC has an internal resistor string for positive and negative input.

See [Resistor ladder for positive input \(negative input is equivalent, using RESN instead of RESP\)](#) on page 204. The resistors are controlled in the CH[n].CONFIG.RESP and CH[n].CONFIG.RESN registers.

Figure 69: Resistor ladder for positive input (negative input is equivalent, using RESN instead of RESP)

### 6.12.7 Reference

The ADC can use two different references, controlled in the REFSEL field of the CH[n].CONFIG register.

These are:

- Internal reference
- VDD\_GPIO as reference

The internal reference results in an input range of  $\pm 0.6$  V on the ADC core. VDD\_GPIO as reference results in an input range of  $\pm VDD\_GPIO/4$  on the ADC core. The gain block can be used to change the effective input range of the ADC.

$$\text{Input range} = (+/- 0.6 \text{ V or } +/- VDD\_GPIO/4) / \text{Gain}$$

For example, choosing VDD\_GPIO as reference, single ended input (grounded negative input), and a gain of 1/4 the input range will be:

$$\text{Input range} = (VDD\_GPIO/4) / (1/4) = VDD\_GPIO$$

With internal reference, single ended input (grounded negative input), and a gain of 1/6 the input range will be:

$$\text{Input range} = (0.6 \text{ V}) / (1/6) = 3.6 \text{ V}$$

The AIN0-AIN7 inputs cannot exceed VDD\_GPIO, or be lower than VSS.

### 6.12.8 Acquisition time

To sample the input voltage, the ADC connects a capacitor to the input.

For illustration, see [Simplified ADC sample network](#) on page 205. The acquisition time indicates how long the capacitor is connected, see TACQ field in CH[n].CONFIG register. The required acquisition time depends on the source ( $R_{\text{source}}$ ) resistance. For high source resistance the acquisition time should be increased, see [Acquisition time](#) on page 205.

Figure 70: Simplified ADC sample network

| TACQ [ $\mu$ s] | Maximum source resistance [kOhm] |
|-----------------|----------------------------------|
| 3               | 10                               |
| 5               | 40                               |
| 10              | 100                              |
| 15              | 200                              |
| 20              | 400                              |
| 40              | 800                              |

Table 67: Acquisition time

### 6.12.9 Limits event monitoring

A channel can be event monitored by configuring limit register CH[n].LIMIT.

If the conversion result is higher than the defined high limit, or lower than the defined low limit, the appropriate event will get fired.

Figure 71: Example of limits monitoring on channel 'n'

Note that when setting the limits, CH[n].LIMIT.HIGH shall always be higher than or equal to CH[n].LIMIT.LOW. In other words, an event can be fired only when the input signal has been sampled outside of the defined limits. It is not possible to fire an event when the input signal is inside a defined range by swapping high and low limits.

The comparison to limits always takes place, there is no need to enable it. If comparison is not required on a channel, the software shall simply ignore the related events. In that situation, the value of the limits registers is irrelevant, so it does not matter if CH[n].LIMIT.LOW is lower than CH[n].LIMIT.HIGH or not.

## 6.12.10 Registers

| Base address | Peripheral | Instance   | Secure mapping | DMA security | Description                 | Configuration |
|--------------|------------|------------|----------------|--------------|-----------------------------|---------------|
| 0x5000E000   | SAADC      | SAADC : S  | US             | SA           | Analog to digital converter |               |
| 0x4000E000   |            | SAADC : NS |                |              |                             |               |

Table 68: Instances

| Register                  | Offset | Security | Description                                                                                                                              |
|---------------------------|--------|----------|------------------------------------------------------------------------------------------------------------------------------------------|
| TASKS_START               | 0x000  |          | Start the ADC and prepare the result buffer in RAM                                                                                       |
| TASKS_SAMPLE              | 0x004  |          | Take one ADC sample, if scan is enabled all channels are sampled                                                                         |

### 6.12.10.1 TASKS START

Start the ADC and prepare the result buffer in RAM

### 6.12.10.2 TASKS SAMPLE

Take one ADC sample, if scan is enabled all channels are sampled

### 6.12.10.3 TASKS\_STOP

Stop the ADC and terminate any on-going conversion

#### 6.12.10.4 TASKS CALIBRATEOFFSET

Starts offset auto-calibration

Address offset: 0x080

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       |  ### 6.12.10.35 OVERSAMPLE

Address offset: 0x5F4

Oversampling configuration. OVERSAMPLE should not be combined with SCAN. The RESOLUTION is applied before averaging, thus for high OVERSAMPLE a higher RESOLUTION should be used.
