Electronic Fuse, 3 to 12 V

NIS6420

The NIS6420 is a cost effective, resettable fuse which can greatly enhance the reliability of a hard drive or other circuit from both catastrophic and shutdown failures.

It is designed to protect the downstream circuitry against an overcurrent event by limiting the current while protecting against high inrush current, as well as monitoring the load current in real time.

Features

- 42 mΩ Typical
- Digital and Tristate Enable
- Integrated Reverse Current Protection
- Thermally Protected
- Integrated Soft−Start Circuit
- Internal Undervoltage Lockout Circuit
- Internal Charge Pump
- Load Current Monitor Pin
- ESD Ratings:
  Human Body Model (HBM); 2000 V
  Charged Device Model (CDM); 2000 V
  Latch−Up; Class 1
- These Devices are Pb−Free and are RoHS Compliant

Typical Applications

- Hard Drives
- Solid State Drives
- Mother Boards
- Industrial
- Handheld Devices
- Portable Instruments

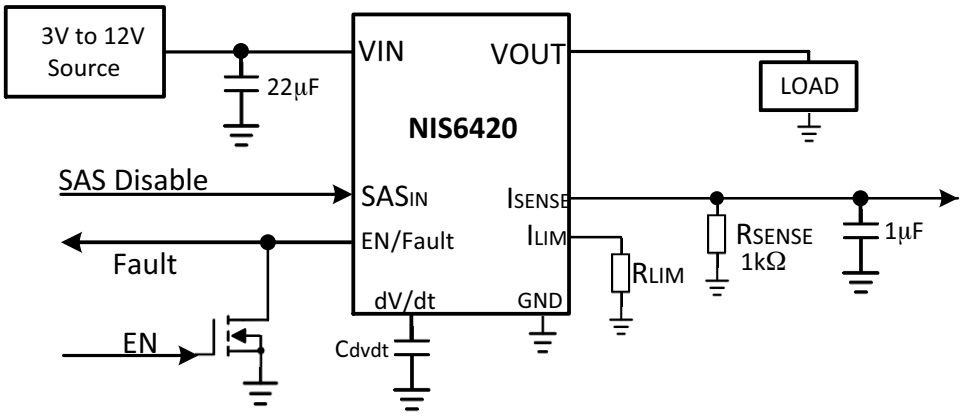

Figure 1. Typical Application Circuit

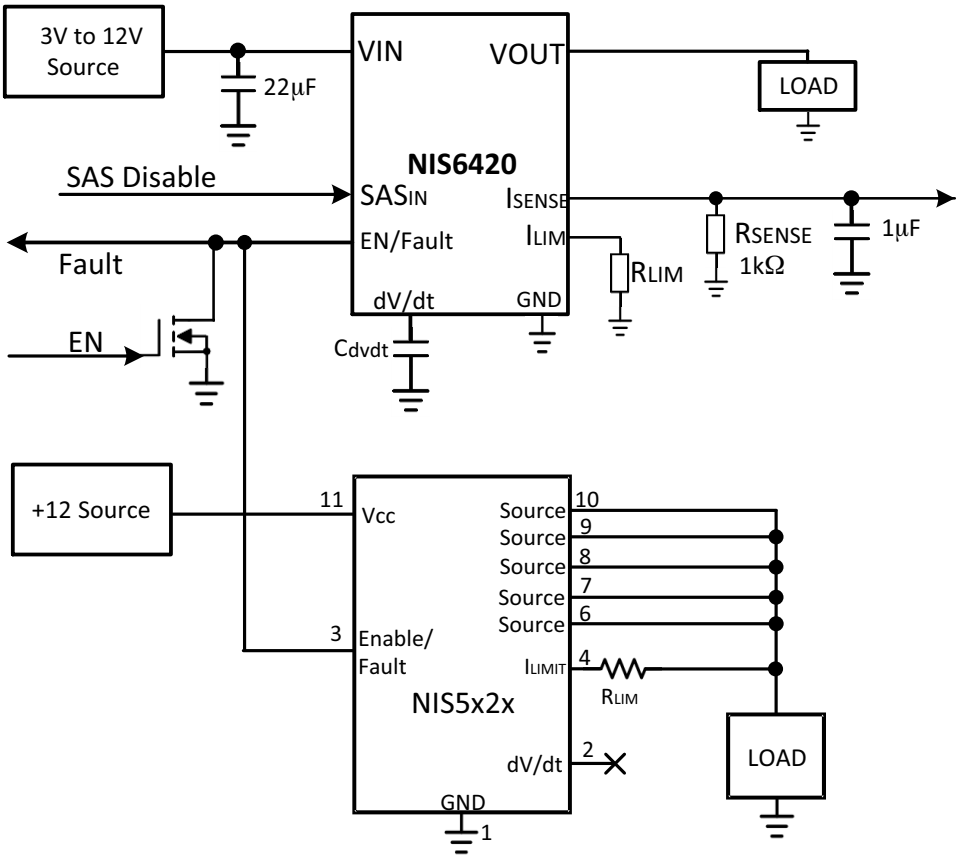

Figure 2. Common Thermal Shutdown with another eFuse

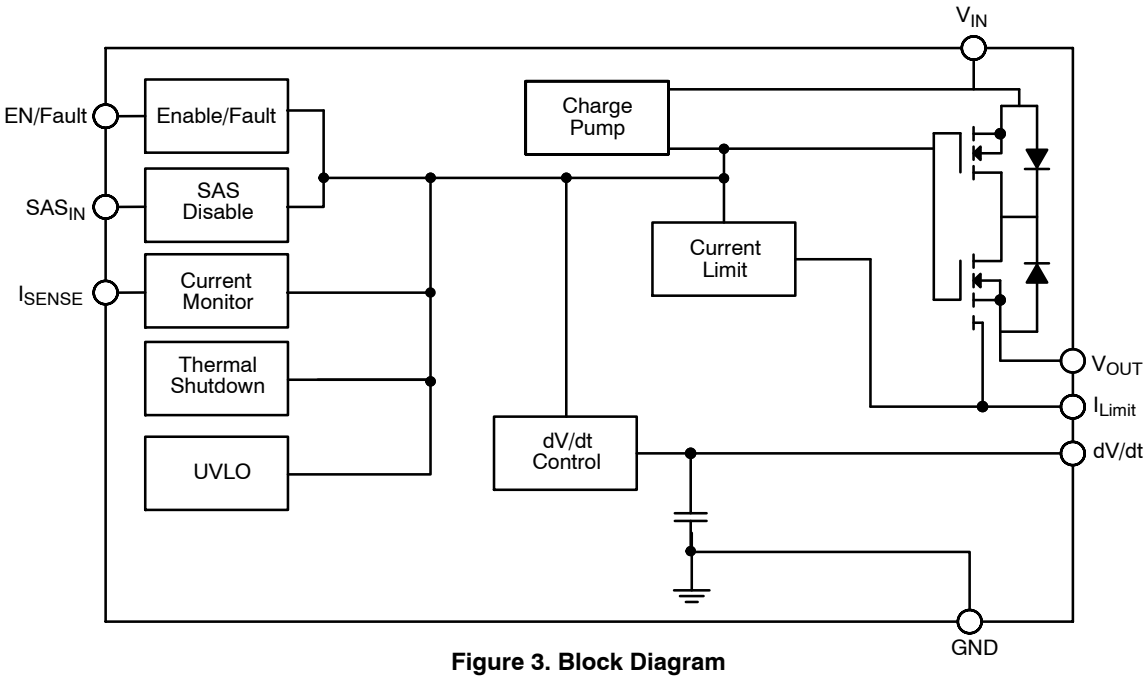

Figure 3. Block Diagram

Table 1. PIN FUNCTION DESCRIPTION

Pin No.	Pin Name	Description
1,2,3	V_{IN}	Positive input voltage to the device. Connect a 22 μF or greater capacitor to ground.
4	SAS_{IN}	When this pin is pulled high the eFuse is turned off.
5	EN/Fault	This pin is a tri−state, bidirectional interface. It can be pulled to ground with an external open−drain or open collector device to shut down the eFuse. It can also be used as a status indicator; if the voltage level is intermediate (around 1.4 V), the eFuse is in thermal shutdown. If the voltage level is high (around 3 V) the eFuse is operating normally. Do not actively drive this pin to any voltage. Do not connect a capacitor to this pin.
6	I_{SENSE}	Current Sense Pin. Connect a 1 kΩ 1% resistor and a 1 μF capacitor to ground.
7	dV/dt	The internal dV/dt circuit controls the slew rate of the output voltage at turn on.
8	I_{LIM}	A resistor between this pin and the source pin sets the overload and short circuit current limit levels.
9,10,11	V_{OUT}	Source of the internal power FET and the output terminal of the fuse
12,13	GND	Negative input voltage to the device. This is used as the internal reference for the IC.

Table 2. MAXIMUM RATINGS

Rating	Symbol	Value	Unit
Input Voltage, operating, steady−state (V_{IN} to GND) Transient (100 ms)	V_{IN}	−0.3 to +16 −0.3 to +19	V
Voltage range on EN/Fault pin Voltage range on SAS_{IN} pin		−0.3 to 6 −0.3 to 6	V

Stresses exceeding those listed in the Maximum Ratings table may damage the device. If any of these limits are exceeded, device functionality should not be assumed, damage may occur and reliability may be affected.

Table 3. THERMAL RATINGS

Thermal Resistance, Junction to Air (4 layer High−K JEDEC JESD51−7 PCB, 100 mm^2, 2 oz. Cu)	θ_{JA}	75	°C/W
Thermal Resistance, Junction−to−Lead (4 layer High−K JEDEC JESD51−7 PCB, 100 mm^2, 2 oz. Cu)	Ψ_{J-L}	12	°C/W
Thermal Resistance, Junction−to−Board (4 layer High−K JEDEC JESD51−7 PCB, 100 mm^2, 2 oz. Cu)	Ψ_{J-B}	12	°C/W
Thermal Resistance, Junction−to−Case Top (4 layer High−K JEDEC JESD51−7 PCB, 100 mm^2, 2 oz. Cu)	Ψ_{J-T}	5	°C/W
Total Power Dissipation @ T_A = 25°C (4 layer High−K JEDEC JESD51−7 PCB, 100 mm^2, 2 oz. Cu) Derate above 25°C	P_{max}	1.67 13.4	W mW/°C
Operating Ambient Temperature Range	T_A	−40 to 125	°C
Operating Junction Temperature Range	T_J	−55 to 150	°C
Non−operating Storage Temperature Range	T_{STG}	−55 to 155	°C
Lead Temperature, Soldering (10 Sec)	T_L	260	°C

Fault			100	120	

Table 4. ELECTRICAL CHARACTERISTICS

(Unless otherwise noted: V_{IN} = 12 V, dV/dt pin open, R_{LIM} = 10 kΩ, T_A = 25°C)

Characteristics	Symbol	Min	Typ	Max	Unit
FAULT EVENTS					
		EN/Fault Level	V_{OUT} State	Latch	
Under Voltage Lock Out	UVLO	$EN_{(VOL)}$	off	no	
Thermal Shutdown	TSD	$EN_{(MID)}$	off	yes, (Note 1)	
Reverse Current Protection	Ireverse	$EN_{(MID)}$	off	no, (Note 5)	
No Fault (Vin > UVLO)		$EN_{(VOH)}$	on	N/A	

Product parametric performance is indicated in the Electrical Characteristics for the listed test conditions, unless otherwise noted. Product performance may not be indicated by the Electrical Characteristics if operated under different conditions.

1. eFuse is latched off until the En/Fault pin is pulled low and then released, the SAS Disable pin is pulled high and then released or a power on reset is applied to the device.
2. Does not include fan out of Enable/Fault function.
3. Pulse test: Pulse width 300 s, duty cycle 2%
4. Verified by design.
5. Once the device has entered shutdown mode due to a reverse current event, it will re−enable its output when $V_{IN} > V_{OUT}$ for at least 100 μs. The slew rate SR will be applied when the output is re−enabled.

APPLICATIONS INFORMATION

Basic Operation

This device is a self−protected, resettable, electronic fuse. It contains circuits to monitor the input voltage, output voltage, output current and die temperature.

On application of the input voltage, the device will apply the input voltage to the load based on the restrictions of the controlling circuits. The output voltage, which is controlled by an internal dv/dt circuit, will slew from 0 V to the rated output voltage in 1.3 ms.

The device will remain on as long as the temperature does not exceed the 175°C limit that is programmed into the chip.

The internal current limit circuit does not shut down the part but will reduce the conductivity of the FET to maintain a constant current at the internally set current limit level.

An internal charge pump provides bias for the gate voltage of the internal n−channel power FET and also for the current limit circuit. The remainder of the control circuitry operates between the input voltage (V_{CC}) and ground.

Enable/Fault

The Enable/Fault Pin is a multi−function, bidirectional pin that can control the output of the chip as well as send information to other devices regarding the state of the chip. When this pin is low, the output of the fuse will be turned off. When this pin is high the output of the fuse will be turned−on. If a thermal fault occurs, this pin will be pulled low to an intermediate level by an internal circuit. To use as a simple enable pin, an open drain or open collector device should be connected to this pin. Due to its tri−state operation, it should not be connected to any type of logic with an internal pull−up device.

If the chip shuts down due to the die temperature reaching its thermal limit, this pin will be pulled down to an intermediate level. This signal can be monitored by an external circuit to communicate that a thermal shutdown has occurred. If this pin is tied to another device in this family, a thermal shutdown of one device will cause both devices to disable their outputs. Both devices will turn on once the fault is removed for the auto−retry devices.

Since this is a latching thermal device, the outputs will be enabled after the enable pin has been pulled to ground with an external switch and then allowed to go high or after the input power has been recycled.

Thermal Protection

The NIS6420 includes an internal temperature sensing circuit that senses the temperature on the die of the power FET. If the temperature reaches 175°C, the device will shut down, and remove power from the load. Output power can be restored by either recycling the input power or toggling the enable pin.

The thermal limit has been set high intentionally, to increase the trip time during high power transient events. It is not recommended to operate this device above 150°C for extended periods of time.

SAS Disable

The SAS Disable feature provides a digital interface to control the output of the eFuse. When the SAS_{IN} pin is pulled high by any external digital control circuitry the eFuse switches to its off state. When the SAS_{IN} pin is pulled low the eFuse output is turned on. All fault conditions will be cleared when the eFuse is reset through the SAS pin.

Reverse Current Protection

The NIS6420 monitors and protects against reverse current events, which can be the result of a malfunction in the power supply or noise induced in the input voltage rail under certain load characteristics (for example, when the load is largely capacitive).

The protection mechanism disables the eFuse's output and triggers when the reverse current exceeds the preset magnitude and this condition remains for at least 7.5 μs.

The NIS6420 automatically re−enables its output once the input voltage exceeds the output voltage for at least 100 μs.

Current Limit

The current limit circuit uses a SENSEFET along with a reference and amplifier to control the peak current in the device. The SENSEFET allows for a small fraction of the load current to be measured, which has the advantage of reducing the losses in the sense resistor. The current limit circuit has two limiting values, one for short circuit hold current – I_{SC}, another is overload current limit I_{OL}. Refer to Figure 14. for dependence of I_{OL} and I_{SC} vs current limit resistor R_{LIM}.

Load Current Monitoring

The current monitor I_{SENSE} pin provides a small current proportional to the main device current which is flowing through the device. This pin should have a decoupling capacitor to filter out internal sampling noise. A resistor connected between the I_{SENSE} pin and GND converts the I_{SENSE} current into a GND referenced voltage. This pin can be floated if the feature is not required by application. Connect this pin to ground through 1 kOhm 1% resistor and a 1 μF capacitor to ground to read the voltage corresponding to a load current.

Slew Rate Control

The dV/dt circuit brings the output voltage up under a linear, controlled rate regardless of the load impedance characteristics. An internal ramp generator creates a linear ramp, and a control circuit forces the output voltage to follow that ramp, scaled by a factor. The default ramp time is approximately 1.3 ms. This pin includes an internal current source of approximately 1 μA. Since the current level is very low, it is important to use a ceramic cap or other low leakage capacitor. Aluminum electrolytic capacitors are not recommended for this circuit. Refer to Figure 4. for the typical ramp time vs Cdvdt capacitor. Anytime that the unit shuts down due to a fault, enable shut−down, or recycling of input power, the timing capacitor will be discharged and the output voltage will ramp from 0 at turn on.
