

**THE DATASHEET OF
1ED44173N01BXTSA1**

1ED44173N01B

Single-channel low-side MOSFET gate driver IC with fast OCP

Features

- Over-current detection (OCP) with negative voltage input
- -0.246 V over-current threshold with accurate $\pm 5\%$ tolerance
- Single pin for fault output and enable
- Programmable fault clear time
- Under voltage lockout for MOSFETs
- CMOS Schmitt-triggered inputs
- 3.3 V, 5 V and 15 V input logic compatible
- 25 V V_{CC} voltage supply support (max)
- Output in phase with input
- $-10 V_{DC}$ negative Input capability of OCP pin
- 3 kV ESD HBM
- RoHS compliant

Potential applications

- Digitally controlled PFC
- Home appliances
- Air conditioner
- Industrial applications
- General purpose low-side gate driver for single-ended topologies

Description

The 1ED44173N01B is a low-voltage, power MOSFET non-inverting gate driver. Proprietary latch immune CMOS technologies enable ruggedized monolithic construction. The logic input is compatible with standard CMOS or LSTTL output. The output driver features a current buffer stage. The 1ED44173N01B has OCP pin for over current protection sense and a FAULT status output (Once it is active, EN/ \overline{FLT} pin is internally pulled down). The EN/ \overline{FLT} needs to be outside pulled up to provide normal operation, pulling EN/ \overline{FLT} low disable the driver. Internal circuitry on V_{CC} pin provides an under voltage lockout protection that holds output low until V_{CC} supply voltage is within operating range.

2 Pin configuration and functionality

2.1 Pin configuration

Table 1 Pin configuration

Pin no.	Name	Function
1	OCP	Current sense input
2	COM	Ground
3	OUT	Gate drive output
4	V _{CC}	Supply Voltage
5	EN/ $\overline{\text{FLT}}$	Enable, fault reporting and fault clear time program pin, three functions: <ol style="list-style-type: none"> 1. Logic input to enable I/O functionality. I/O logic functions when ENABLE is high. 2. Fault reporting function like over-current or undervoltage lockout, this pin has negative logic and an open-drain output. 3. Fault clear time program with external resistor and capacitor.
6	IN	Logic input for gate driver output (OUT), in phase

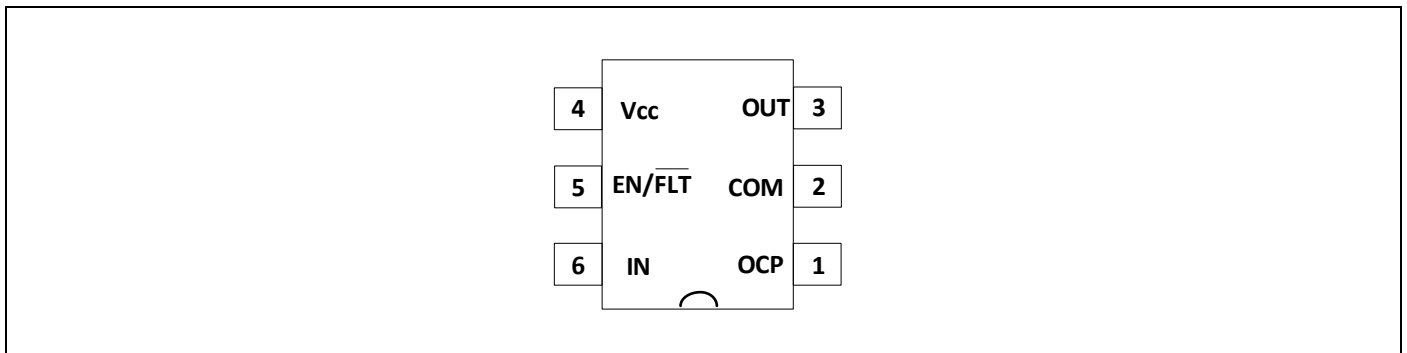

Figure 3 PG-SOT23-6-3 (top view)

2.2 Input/output logic truth table

Table 2 Input/output logic truth table

IN	UVLO ¹⁾	OCP ²⁾	EN/ $\overline{\text{FLT}}$ ³⁾	OUT	Note
L	H	L	H	L	OUT = L
H	H	L	H	H	OUT = H
X	L	X	L	L	OUT = L, EN/ $\overline{\text{FLT}}$ = L, (UVLO protection will disable input signals until EN/ $\overline{\text{FLT}}$ returns to high level.)
X	H	H	L	L	OUT = L, EN/ $\overline{\text{FLT}}$ = L, (Over current protection will disable input signals until EN/ $\overline{\text{FLT}}$ returns to high level.)
X	H	X	L	L	OUT = L (Externally pull down EN/ $\overline{\text{FLT}}$ pin will disable I/O logic until EN/ $\overline{\text{FLT}}$ returns to high level.)

1) UVLO "L" state is under-voltage protection.

2) OCP "H" state is over-current protection.

3) EN/ $\overline{\text{FLT}}$ "H" state is EN/ $\overline{\text{FLT}}$ pin externally pulling up and internally pull down MOSFET (QFLT) is off. (See Block Diagram.)

3 Qualification information

Qualification level		Industrial ¹⁾
		Comments: This family of ICs has passed JEDEC's Industrial qualification. Consumer qualification level is granted by extension of the higher Industrial level.
Moisture sensitivity level		MSL1 ²⁾ 260°C (per JEDEC standard J-STD-020)
ESD	Charged device model	1.5 kV (per ANSI/ESDA/JEDEC standard JS-002)
	Human body model	3 kV (per ANSI/ESDA/JEDEC standard JS-001)
IC latch-up test		Class II, Level A (per JESD78)
RoHS compliant		Yes

- 1) Higher qualification ratings may be available should the user have such requirements. Please contact your Infineon sales representative for further information.
- 2) Higher MSL ratings may be available for the specific package types listed here. Please contact your Infineon sales representative for further information.

4 Electrical parameters

4.1 Absolute maximum ratings

Absolute maximum ratings indicate sustained limits beyond which damage to the device may occur. The device may not function or not be operable above the recommended operating conditions and stressing the parts to these levels is not recommended. In addition, extended exposure to stresses above the recommended operating conditions may affect device reliability. All voltage parameters are absolute voltages referenced to COM. The thermal resistance and power dissipation ratings are measured under board mounted and still air conditions.

Table 3 Absolute maximum ratings

Symbol	Definition	Min	Max	Units
V_{CC}	Fixed supply voltage	- 0.3	25	V
V_O	Output voltage (OUT)	- 0.3	$V_{CC} + 0.3$	
V_{OCP}	Voltage at current sense pin (OCP)	- 10	$V_{CC} + 0.3$	
$V_{EN/\overline{FLT}}$	Voltage at enable and fault reporting pin (EN/ \overline{FLT})	- 0.3	$V_{CC} + 0.3$	
V_{IN}	Logic input voltage (IN)	- 10	$V_{CC} + 0.3$	
P_D	Package power dissipation @ $T_A \leq 25^\circ\text{C}$	—	0.5	W
R_{thJA}	Thermal resistance, junction to ambient	PG-SOT23-6	250	$^\circ\text{C}/\text{W}$
T_J	Junction temperature	- 40	150	$^\circ\text{C}$
T_S	Storage temperature	- 55	150	
T_L	Lead temperature (soldering, 10 seconds)	—	260	

4.2 Recommended operating conditions

For proper operation, the device should be used within the recommended conditions. All voltage parameters are absolute voltages referenced to COM unless otherwise stated in the table.

Table 4 Recommended operating conditions

Symbol	Definition	Min	Max	Units
V_{CC}	Fixed supply voltage	8.6	20	V
V_O	Output voltage	COM	V_{CC}	
V_{OCP}	Voltage at current sense pin (OCP)	-5	V_{CC}	
$V_{EN/\overline{FLT}}$	Voltage at enable and fault reporting pin (EN/ \overline{FLT})	0	V_{CC}	
V_{IN}	Logic input voltage (IN)	- 5	V_{CC}	
T_A	Ambient temperature	- 40	125	$^\circ\text{C}$

4.3 Static electrical characteristics

$V_{CC} = 15V$, $T_A = 25^\circ C$ unless otherwise specified. The V_{INL} , V_{INH} , V_{ENL} , V_{ENH} , V_{OCTH} , and I_{IN} , I_{FLT} parameters are referenced to COM and are applicable to input leads: IN, OCP and EN/ \overline{FLT} . The V_O and I_O parameters are referenced to COM and are applicable to the output lead: OUT.

Table 5 Static electrical characteristics

Symbol	Definition	Min	Typ	Max	Units	Test Conditions	
V_{CCUV+}	V_{CC} supply undervoltage positive going threshold	7.4	8.0	8.6	V		
V_{CCUV-}	V_{CC} supply undervoltage negative going threshold	6.7	7.3	7.8			
V_{CCUVH}	V_{CC} supply undervoltage lockout hysteresis	—	0.7	—			
V_{INL}	Logic “0” input voltage (OUT = LO)	0.8	1.0	1.2			
V_{INH}	Logic “1” input voltage (OUT = HI)	1.9	2.1	2.3			
V_{ENL}	Logic “0” disable voltage	0.8	1.0	1.2			
V_{ENH}	Logic “1” enable voltage	1.9	2.1	2.3			
V_{OH}	High level output voltage, $V_{CC} - V_{OUT}$	—	0.02	0.1			$I_O = 2 \text{ mA}$
V_{OL}	Low level output voltage, V_{OUT}	—	0.02	0.1			$I_O = 2 \text{ mA}$
V_{OCTH}	Current limit threshold voltage	-259	-246	-233			mV
I_{IN+}	Logic “1” input bias current IN pin	35	50	70	μA	$V_{IN} = 5 \text{ V}$	
I_{IN-}	Logic “0” input bias current IN pin	-10	-6	—		$V_{IN} = 0 \text{ V}$	
I_{OCC}	Quiescent V_{CC} supply current	—	700	1200	A	$V_{IN} = 0 \text{ V}$ or 5 V	
I_{O+}	Output sourcing short circuit pulsed current	2	2.6	—		$V_O = 0 \text{ V}$, $PW \leq 2 \mu s$	
I_{O-}	Output sinking short circuit pulsed current	2	2.6	—		$V_O = 15 \text{ V}$, $PW \leq 2 \mu s$	
I_{FLT}	EN/ \overline{FLT} pull down sinking current	18	—	—	mA	$V_{EN/\overline{FLT}} = 0.4 \text{ V}$	
V_{ACTSD}	Active shut down voltage	—	2.0	2.3	V	$V_{CC} = \text{open}$, $I_{OUT}/I_{O-} = 0.1$	

4.4 Dynamic electrical characteristics

$V_{CC} = 15 \text{ V}$, $T_A = 25^\circ C$, and $C_L = 1000 \text{ pF}$ unless otherwise specified.

Table 6 Dynamic electrical characteristics

Symbol	Definition	Min	Typ	Max	Units	Test Conditions
t_{on}	Turn-on propagation delay	27	34	45	ns	Figure 6 V_{IN} pulse = 5 V
t_{off}	Turn-off propagation delay	27	34	45		
t_r	Turn-on rise time	—	5	—

t_{VCCUV}	V_{CC} supply UVLO filter time *	—	2	—	μs	Figure 8

*Parameter verified by design, not tested in production.

5 Application information and additional details

Information regarding the following topics is included as subsections within this section of the datasheet.

- MOSFET gate driver
- Switching and timing relationships
- Input logic compatibility
- Undervoltage lockout protection
- Over current protection (OCP)
- Fault reporting and programmable fault clear timer
- Enable input

See the **1ED44173N01B Application Note AN2020-09** Low-side MOSFET driver with fast over current protection and fault/enable (negative current sense) for interface circuit examples and recommended layout guidelines.

5.1 MOSFET gate driver

The 1ED44173N01B is designed to drive MOSFET power devices. Figure 4 **Error! Reference source not found.** and Figure 5 illustrate several parameters associated with the gate driver functionality of the driver. The output current of the driver, used to drive the gate of the power switch, is defined as I_{O} . The voltage that drives the gate of the external power switch is defined as V_{OUT} .

Figure 4 Gate output sourcing current

Figure 5 Gate output sinking current

5.2 Switching and timing relationships

The relationships between the input and output signals of the 1ED44173N01B are illustrated below Figure 6. From the figure, we can see the definitions of several timing parameters (i.e. t_{on} , t_{off} , t_r , and t_f) associated with this device.

Figure 6 Switching time waveforms

5.3 Input logic compatibility

The input of this IC is compatible with standard CMOS and TTL outputs. The 1ED44173N01B has been designed to be compatible with 3.3 V, 5 V and 15 V logic-level signals. The input high threshold (V_{INH}) is typ. 2.1 V and low threshold (V_{INL}) is typ. 1 V. Input hysteresis offers enhanced noise immunity. The 1ED44173N01B includes an important feature: wherein, whenever the input pin is in a floating condition, the output is held in the low state. This is achieved using GND pull-down resistors on the input pin. Figure 7 illustrates an input signal to the 1ED44173N01B, its input threshold values, and the logic state of the IC as a result of the input signal.

Figure 7 IN input thresholds

5.4 Undervoltage lockout (V_{CC})

The 1ED44173N01B has internal UVLO protection feature on the V_{CC} pin supply circuit blocks. When V_{CC} bias voltage keeps lower than the V_{CCUV-} threshold more than UVLO filter time (t_{VCCUV}), the V_{CC} UVLO feature holds the output low, regardless of the status of the IN input.

At the same time, the internal MOSFET Q_{FLT} turns on and the EN/\overline{FLT} pin is internally pulled down to COM. The EN/\overline{FLT} output stays in the low state until the UVLO has been removed; once the UVLO is removed, the internal MOSFET Q_{FLT} turns off, and the voltage on the EN/\overline{FLT} pin is charged up by external voltage V_{DD} . The length of the fault clear time period (t_{FLTc}) is determined by exponential charging characteristics of the capacitor where the time constant is set by R_{FLTc} and C_{FLTc} .

And when V_{CC} is higher than V_{CCUV+} and longer than fault clear time (t_{FLTc}), the OUT still keeps low until next input signal IN is high. (See Figure 8)

The filter time (t_{VCCUV}) of about 2 μ s helps to suppress noise from the UVLO circuit, so that negative going voltage spikes at the supply pin will avoid parasitic UVLO events.

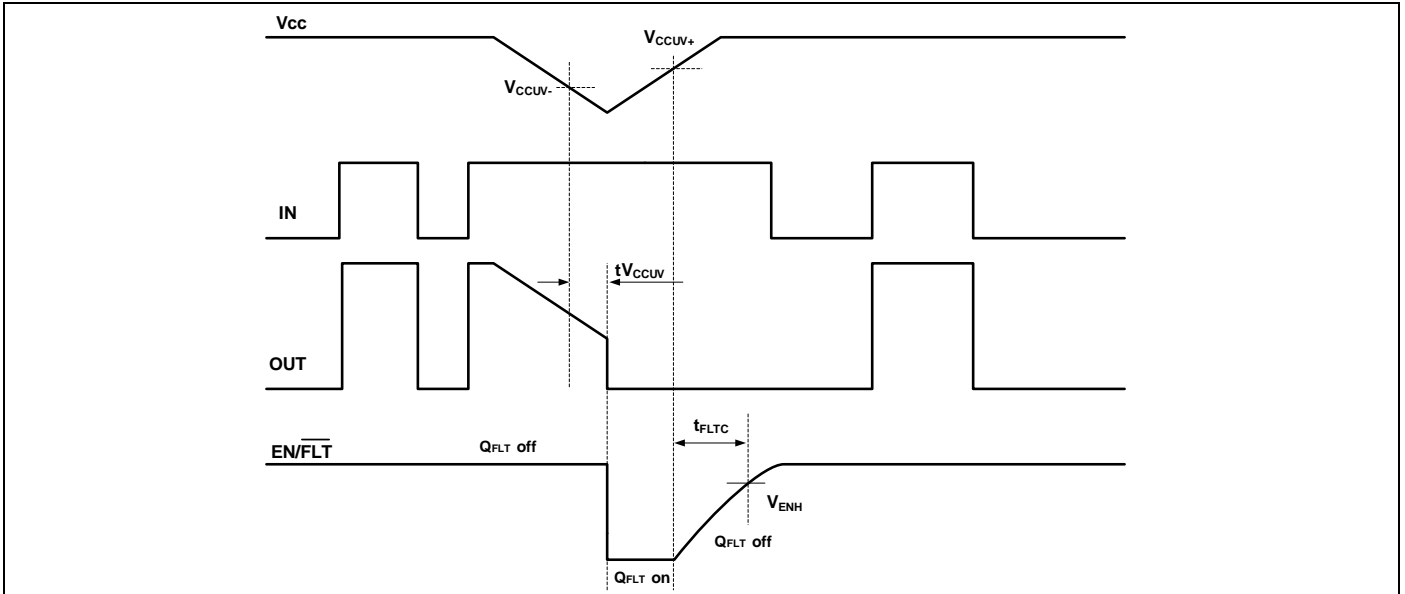

Figure 8 V_{CC} under voltage protection waveform definitions

5.5 Over current protection (OCP)

The 1ED44173N01B has a function of over current protection with a threshold V_{CSTH} at the OCP pin input. The voltage at this pin is the negative voltage drop sensed across the system current sense resistor. It is up to minus 10 VDC negative input capability of OCP pin. To avoid false tripping due to the fast high current switch on transient that occurs at the switch on of a MOSFET resulting from the circuit parasitic capacitors, there is blanking interval which disables over current detection for the period of t_{BLK} (Additional RC filter is recommended, if internal t_{BLK} is not enough in the very noisy circuit.). After t_{BLK} and the voltage of OCP pin is over V_{CSTH} , the 1ED44173N01B causes fault logic to initiate a fault shutdown sequence. This sequence starts with the generation of a fault signal and internal MOSFET Q_{FLT} is turned on and $\overline{EN/FLT}$ pin is pulled down.

At the same time the 1ED44173N01B terminates the present cycle, and the gate output is immediately pulled down with internal propagation delay (t_{OCPDEL}), see the Figure 9 and Figure 10.

Figure 9 is the diagram of 1ED44173N01B in boost application. And Figure 10 is the typical waveforms of the application. If the OCP fault condition is removed, the internal pull down NMOS of $\overline{EN/FLT}$ is released and $\overline{EN/FLT}$ will be pull up again with V_{DD} , but the output still keeps low until the next input signal IN is high.

Figure 9 1ED44173N01B in Boost application

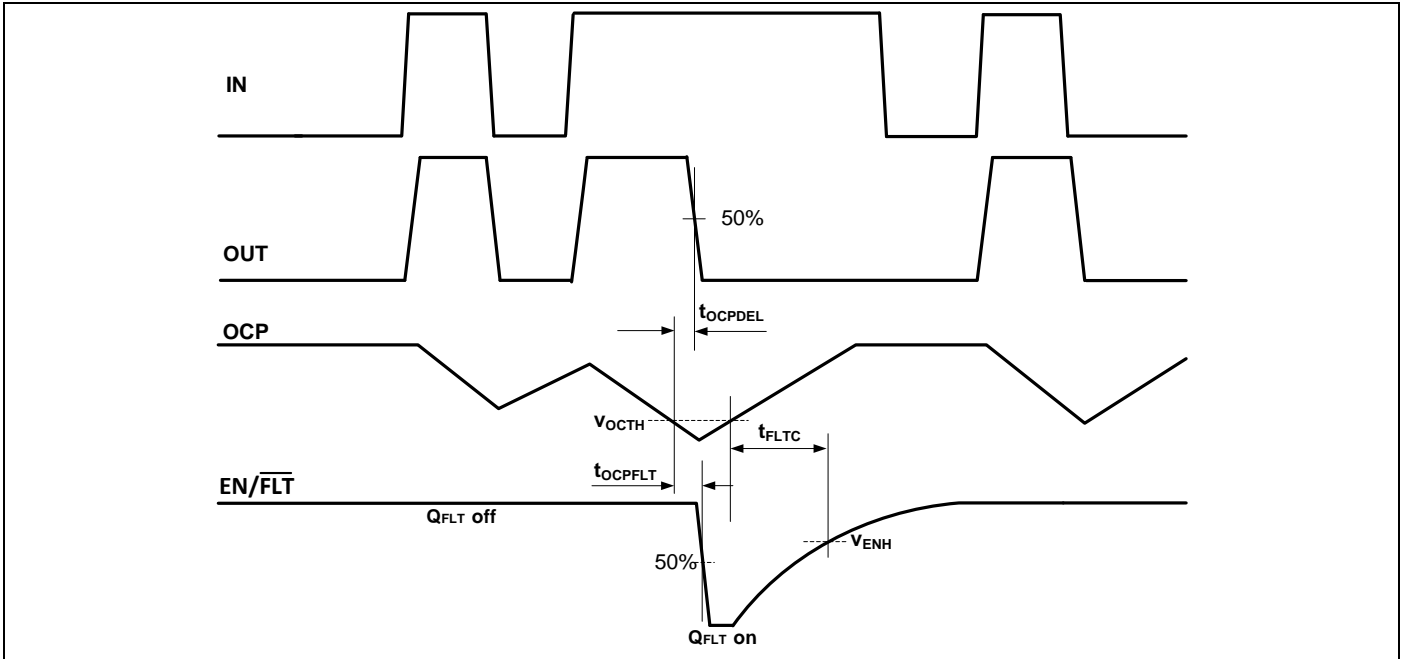

Figure 10 OCP fault detection and fault clear waveforms

5.6 Fault reporting and programmable fault clear timer

The 1ED44173N01B provides an integrated fault reporting output and an adjustable fault clear timer. There are two situations that would cause the driver to report a fault via the EN/FLT pin. The first is an under voltage condition of V_{CC} and the second is if the OCP pin recognizes a fault. Once the fault condition occurs, the EN/FLT pin is internally pulled to COM. The EN/FLT output stays in the low state until the fault condition has been removed and the internal pull down NMOS Q_{FLT} turns off, the voltage on the EN/FLT pin is charged up with external pull-up voltage.

The length of the fault clear time period (t_{FLTC}) is determined by exponential charging characteristics of the capacitor where the time constant is set by R_{FLTC} and C_{FLTC}. Figure 9 shows that R_{FLTC} is connected between the external supply (V_{dd}) and the EN/FLT pin, while C_{FLTC} is placed between the EN/FLT and COM pins. EN/FLT is weakly pulled up to 3.3 V reference voltage with 2.15 M resistor internally. So the length of the fault clear time period can be determined by using the formula below (If V_{dd} = 3.3 V).

$$t_{FLTC} = - \left(\frac{R_{FLTC} \times 2.15M}{R_{FLTC} + 2.15M} \right) \times C_{FLTC} \times \ln \left(1 - \frac{V_{ENH}}{V_{dd}} \right)$$

5.7 Enable input

1ED44173N01B provides an enable functionality that allows to shutdown or to enable the output. When EN/FLT is pulled up (the enable voltage is higher than V_{ENH}) the output is able to operate normally, pulling EN/FLT low (the enable voltage is lower than V_{ENL}) the output is disable. The relationships between the input, output, and enable signals of the 1ED44173N01B are illustrated below in Figure 11~13. From these figures, we can see the definitions of several timing parameters and threshold voltages (i.e. t_{DISA}, V_{ENH} and V_{ENL}) associated with this device.
