

# MAX9107/MAX9108/MAX9109

# 25ns, Dual/Quad/Single, Low-Power, TTL Comparators

## General Description

The MAX9107/MAX9108/MAX9109 dual/quad/single, high-speed, low-power voltage comparators are designed for use in systems powered from a single +5V supply. Their 25ns propagation delay (with 10mV input overdrive) is achieved with a power consumption of only 1.75mW per comparator. The wide input common-mode range extends from 200mV below ground to within 1.5V of the positive supply rail.

The MAX9107/MAX9108/MAX9109 outputs are TTL-compatible, requiring no external pullup circuitry. These easy-to-use comparators incorporate internal hysteresis to ensure clean output switching even when the devices are driven by a slow-moving input signal.

The MAX9107/MAX9108/MAX9109 are higher-speed, lower-power, lower-cost upgrades to industry-standard comparators MAX907/MAX908/MAX909. The MAX9109 features an output latch but does not have complementary outputs.

The dual MAX9107 is available in both 8-pin SO and SOT23 packages. The quad MAX9108 is available in 14-pin TSSOP and SO packages while the single MAX9109 is available in an ultra-small 6-pin SC70 package, a space-saving 6-pin SOT23 package and an 8-pin SO package.

## Applications

- Battery Powered Systems
- A/D Converters
- Line Receivers
- Threshold Detectors/Discriminators
- Sampling Circuits
- Zero-Crossing Detectors

## Features

- 25ns Propagation Delay
- 350µA (1.75mW) Supply Current Per Comparator
- Single 4.5V to 5.5V Supply Operation
- Wide Input Range Includes Ground
- Low 500µV Offset Voltage
- Internal Hysteresis Provides Clean Switching (2mV)
- TTL-Compatible Outputs
- Internal Latch (MAX9109 only)
- Space-Saving Packages:
  - 6-Pin SC70 (MAX9109)
  - 8-Pin SOT23 (MAX9107)
  - 14-Pin TSSOP (MAX9108)

**Note 1:** Devices are 100% production tested at  $T_A = +25^\circ C$ . All temperature limits are guaranteed by design.

**Note 2:** Input Offset Voltage is defined as the center of the input-referred hysteresis zone. Specified for  $V_{CM} = 0$ . See Figure 1.

**Note 3:** Trip Point is defined as the input voltage required to make the comparator output change state. The difference between upper ( $V_{TRIP+}$ ) and lower ( $V_{TRIP-}$ ) trip points is equal to the width of the input-referred hysteresis zone ( $V_{HYST}$ ). Specified for an input common-mode voltage ( $V_{CM}$ ) of 0. See Figure 1.

**Note 4:** Inferred from the CMRR test. Note that a correct logic result is obtained at the output, provided that at least one input is within the  $V_{CMR}$  limits. Note also that either or both inputs can be driven to the upper or lower absolute maximum limit without damage to the part.

**Note 5:** Tested over the full-input voltage range ( $V_{CMR}$ ).

**Note 6:** Differential Propagation Delay is specified as the difference between any two channels in the MAX9107/MAX9108 (both outputs making either a low-to-high or a high-to-low transition).

**Note 7:** Propagation Delay Skew is specified as the difference between any single channel's output low-to-high transition ( $t_{PD+}$ ) and high-to-low transition ( $t_{PD-}$ ).

**Note 8:** Latch specifications apply to MAX9109 only. See Figure 2.

## Detailed Description

### Timing

Noise or undesired parasitic AC feedback cause most high-speed comparators to oscillate in the linear region (i.e., when the voltage on one input is at or near the voltage on the other input). The MAX9107/MAX9108/MAX9109 eliminate this problem by incorporating an internal hysteresis of 2mV. When the two comparator input voltages are equal, hysteresis effectively causes one comparator input voltage to move quickly past the other, thus taking the input out of the region where oscillation occurs. Standard comparators require that hysteresis be added through the use of external resistors. The MAX9107/MAX9108/MAX9109's fixed internal hysteresis eliminates these resistors. To increase hysteresis and noise margin even more, add positive feedback

with two resistors as a voltage divider from the output to the noninverting input.

Adding hysteresis to a comparator creates two trip points: one for the input voltage rising and one for the input voltage falling (Figure 1). The difference between these two input-referred trip points is the hysteresis. The average of the trip points is the offset voltage.

Figure 1 illustrates the case where IN- is fixed and IN+ is varied. If the inputs were reversed, the figure would look the same, except the output would be inverted.

The MAX9109 includes an internal latch, allowing the result of a comparison to be stored. If LE is low, the latch is transparent (i.e., the comparator operates as though the latch is not present). The state of the comparator output is latched when LE is high (Figure 2).

Applications Information

Circuit Layout

Because of the MAX9107/MAX9108/MAX9109's high gain bandwidth, special precautions must be taken to realize the full high-speed capability. A printed circuit board with a good, low-inductance ground plane is mandatory. Place the decoupling capacitor (a 0.1µF ceramic capacitor is a good choice) as close to V<sub>CC</sub> as possible. Pay close attention to the decoupling capacitor's bandwidth, keeping leads short. Short lead lengths on the inputs and outputs are also essential to avoid unwanted parasitic feedback around the comparators. Solder the device directly to the printed circuit board instead of using a socket.

Overdriving the Inputs

The inputs to the MAX9107/MAX9108/MAX9109 may be driven beyond the voltage limits given in the *Absolute Maximum Ratings*, as long as the current flowing into the device is limited to 25mA. However, if the inputs are overdriven, the output may be inverted. The addition of an external diode prevents this inversion by limiting the input voltage to 200mV to 300mV below ground (see Figure 3).

Battery-Operated Infrared Data Link

In Figure 4, the circuit allows reception of infrared data. The MAX4400 converts the photodiode current to a voltage, and the MAX9109 determines whether the amplifier output is high enough to be called a "1." The current consumption of this circuit is minimal: the MAX4400 and MAX9109 require typically 410µA and 350µA, respectively.
