

THE DATASHEET OF EPC2066

EPC2066 – Enhancement Mode Power Transistor

 $V_{DS}, 40\text{ V}$
 $R_{DS(on)}, 1.1\text{ m}\Omega\text{ max}$
 $I_D, 90\text{ A}$

Gallium Nitride's exceptionally high electron mobility and low temperature coefficient allows very low $R_{DS(on)}$, while its lateral device structure and majority carrier diode provide exceptionally low Q_G and zero Q_{RR} . The end result is a device that can handle tasks where very high switching frequency, and low on-time are beneficial as well as those where on-state losses dominate.

Application Notes:

- Easy-to-use and reliable gate, Gate Drive ON = 5 V typical, OFF = 0 V (negative voltage not needed)
- Top of FET is electrically connected to source

Questions:

6.05 x 2.3 mm

EPC2066 eGaN® FETs are supplied in passivated die form with solder bumps.

All measurements were done with substrate shorted to source.

Note 1: $C_{OSS(ER)}$ is a fixed capacitance that gives the same stored energy as C_{OSS} while V_{DS} is rising from 0 to 50% BV_{DSS} .

Note 2: $C_{OSS(TR)}$ is a fixed capacitance that gives the same charging time as C_{OSS} while V_{DS} is rising from 0 to 50% BV_{DSS} .
