THE DATASHEET OF

ADIS16362BMLZ

Six Degrees of Freedom Inertial Sensor

Data Sheet

ADIS16362

FEATURES

- **Triaxis digital gyroscope with digital range scaling**
  - **±75°/sec, ±150°/sec, ±300°/sec settings**
  - **Tight orthogonal alignment: <0.05°**
- **Triaxis digital accelerometer: ±1.7 *g***
- **Wide sensor bandwidth: 330 Hz**
- **Autonomous operation and data collection**
  - **No external configuration commands required**
  - **Start-up time: 180 ms**
  - **Sleep mode recovery time: 4 ms**
- **Factory-calibrated sensitivity, bias, and axial alignment**
  - **Calibration temperature range: −20°C to +70°C**
- **SPI-compatible serial interface**
- **Embedded temperature sensor**
- **Programmable operation and control**
  - **Automatic and manual bias correction controls**
  - **Bartlett window FIR filter length, number of taps**
  - **Digital I/O: data ready, alarm indicator, general-purpose**
  - **Alarms for condition monitoring**
  - **Sleep mode for power management**
  - **DAC output voltage**
  - **Enable external sample clock input: up to 1.2 kHz**
  - **Single-command self-test**
- **Single-supply operation: 4.75 V to 5.25 V**
- **2000 *g* shock survivability**
- **Operating temperature range: −40°C to +105°C**

APPLICATIONS

- **Medical instrumentation**
- **Robotics**
- **Platform control**
- **Navigation**

FUNCTIONAL BLOCK DIAGRAM

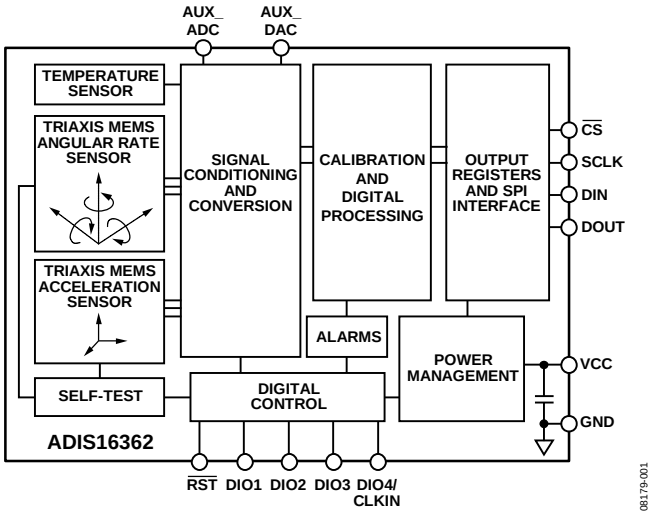

Figure 1.

GENERAL DESCRIPTION

The ADIS16362 *i*Sensor® is a complete inertial system that includes a triaxis gyroscope and triaxis accelerometer. Each sensor in the ADIS16362 combines industry-leading *i*MEMS® technology with signal conditioning that optimizes dynamic performance. The factory calibration characterizes each sensor for sensitivity, bias, alignment, and linear acceleration (gyro bias). As a result, each sensor has its own dynamic compensation formulas that provide accurate sensor measurements over a temperature range of −20°C to +70°C.

The ADIS16362 provides a simple, cost-effective method for integrating accurate, multiaxis, inertial sensing into industrial systems, especially when compared with the complexity and investment associated with discrete designs. All necessary motion testing and calibration are part of the production process at the factory, greatly reducing system integration time. Tight orthogonal alignment simplifies inertial frame alignment in navigation systems. An improved SPI interface and register structure provide faster data collection and configuration control. The ADIS16362 uses a compatible pinout and the same package as the ADIS1635x family. Therefore, systems that currently use the ADIS1635x family can upgrade their performance with minor firmware adjustments in their processor designs.

This compact module is approximately 23 mm × 23 mm × 23 mm and provides a flexible connector interface that enables multiple mounting orientation options.

Integral Nonlinearity			±2		LSB
Differential Nonlinearity			±1		LSB
Offset Error			±4		LSB
Gain Error			±2		LSB
Input Range		0		3.3	V
Input Capacitance	During acquisition		20		pF

Parameter	Test Conditions/Comments	Min	Typ	Max	Unit
DAC OUTPUT	5 kΩ/100 pF to GND				
Resolution			12		Bits
Relative Accuracy	101 LSB ≤ input code ≤ 4095 LSB		±4		LSB
Differential Nonlinearity			±1		LSB
Offset Error			±5		mV
Gain Error			±0.5		%
Output Range		0		3.3	V
Output Impedance			2		Ω
Output Settling Time			10		µs
LOGIC INPUTS[2]					
Input High Voltage, V_{IH}		2.0			V
Input Low Voltage, V_{IL}				0.8	V
	$\overline{CS}$ signal to wake up from sleep mode			0.55	V
$\overline{CS}$ Wake-Up Pulse Width		20			µs
Logic 1 Input Current, I_{IH}	V_{IH} = 3.3 V		±0.2	±10	µA
Logic 0 Input Current, I_{IL}	V_{IL} = 0 V				
All Pins Except $\overline{RST}$			40	60	µA
$\overline{RST}$ Pin			1		mA
Input Capacitance, C_{IN}			10		pF
DIGITAL OUTPUTS[2]					
Output High Voltage, V_{OH}	I_{SOURCE} = 1.6 mA	2.4			V
Output Low Voltage, V_{OL}	I_{SINK} = 1.6 mA			0.4	V
FLASH MEMORY	Endurance[3]	10,000			Cycles
Data Retention[4]	T_J = 85°C	20			Years
FUNCTIONAL TIMES[5]	Time until data is available				
Power-On Start-Up Time	Normal mode, SMPL_PRD ≤ 0x09		180		ms
	Low power mode, SMPL_PRD ≥ 0x0A		250		ms
Reset Recovery Time	Normal mode, SMPL_PRD ≤ 0x09		60		ms
	Low power mode, SMPL_PRD ≥ 0x0A		130		ms
Sleep Mode Recovery Time	Normal mode, SMPL_PRD ≤ 0x09		4		ms
	Low power mode, SMPL_PRD ≥ 0x0A		9		ms
Flash Memory Test Time	Normal mode, SMPL_PRD ≤ 0x09		17		ms
	Low power mode, SMPL_PRD ≥ 0x0A		90		ms
Automatic Self-Test Time	SMPL_PRD = 0x01		12		ms
CONVERSION RATE	SMPL_PRD = 0x01 to 0xFF	0.413		819.2	SPS
Clock Accuracy				±3	%
Sync Input Clock		0.8[6]		1.2	kHz
POWER SUPPLY	Operating voltage range, VCC	4.75	5.0	5.25	V
Power Supply Current	Low power mode		24		mA
	Normal mode		49		mA
	Sleep mode		500		µA

[1] X-ray exposure may degrade this performance metric.
[2] The digital I/O signals are driven by an internal 3.3 V supply, and the inputs are 5 V tolerant.
[3] Endurance is qualified as per JEDEC Standard 22, Method A117, and measured at −40°C, +25°C, +85°C, and +125°C.
[3] The data retention lifetime equivalent is at a junction temperature (T_J) of 85°C as per JEDEC Standard 22, Method A117. Data retention lifetime decreases with junction temperature.
[5] These times do not include thermal settling and internal filter response times (330 Hz bandwidth), which may affect overall accuracy.
[6] The sync input clock functions below the specified minimum value, at reduced performance levels.

TIMING SPECIFICATIONS

T_A = 25°C, VCC = 5 V, unless otherwise noted.

Table 2.

Parameter	Description	Normal Mode (SMPL_PRD ≤ 0x09)			Low Power Mode (SMPL_PRD ≥ 0x0A)			Burst Read			Unit
		Min[1]	Typ	Max	Min[1]	Typ	Max	Min[1]	Typ	Max	
f_{SCLK}	Serial clock	0.01		2.0	0.01		0.3	0.01		1.0	MHz
t_{STALL}	Stall period between data	9			75			$1/f_{SCLK}$			µs

TIMING DIAGRAMS

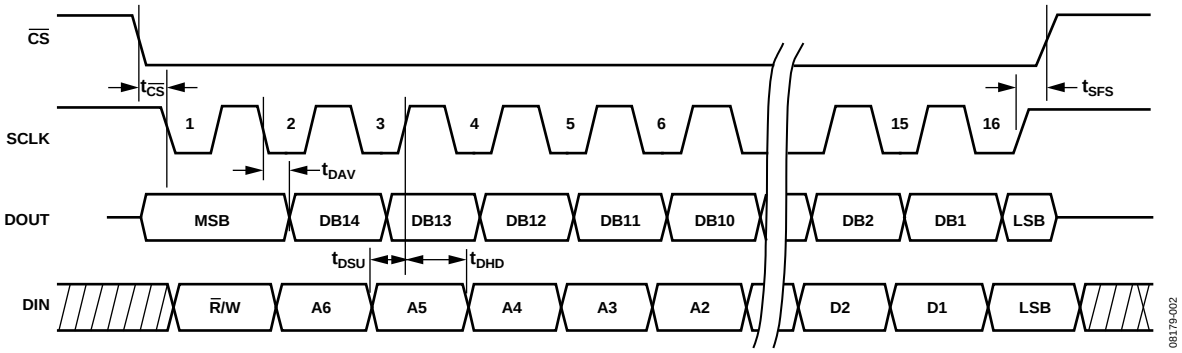

Figure 2. SPI Timing and Sequence

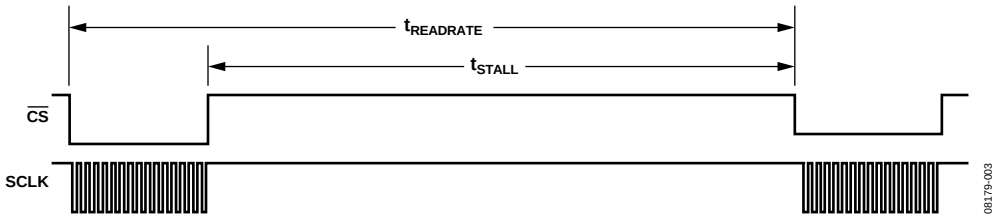

Figure 3. Stall Time and Data Rate

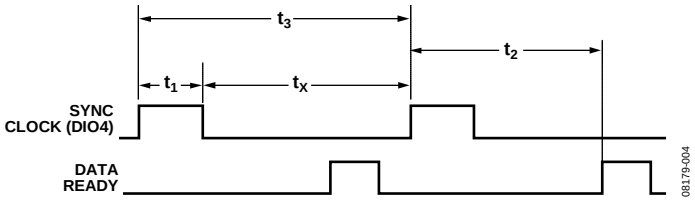

Figure 4. Input Clock Timing Diagram

ABSOLUTE MAXIMUM RATINGS

Table 3.

Parameter	Rating
Acceleration	
Any Axis, Unpowered	2000 *g*
Any Axis, Powered	2000 *g*
VCC to GND	−0.3 V to +6.0 V
Digital Input Voltage to GND	−0.3 V to +5.3 V
Digital Output Voltage to GND	−0.3 V to VCC + 0.3 V
Analog Input to GND	−0.3 V to +3.6 V
Operating Temperature Range	−40°C to +105°C
Storage Temperature Range	−65°C to +125°C[1, 2]

[1] Extended exposure to temperatures outside the specified temperature range of −40°C to +105°C can adversely affect the accuracy of the factory calibration. For best accuracy, store the parts within the specified operating range of −40°C to +105°C.
[2] Although the device is capable of withstanding short-term exposure to 150°C, long-term exposure threatens internal mechanical integrity.

Stresses at or above those listed under Absolute Maximum Ratings may cause permanent damage to the product. This is a stress rating only; functional operation of the product at these or any other conditions above those indicated in the operational section of this specification is not implied. Operation beyond the maximum operating conditions for extended periods may affect product reliability.

Table 4. Package Characteristics

Package Type	θ_{JA}	θ_{JC}	Device Weight
24-Lead Module	39.8°C/W	14.2°C/W	16 grams

ESD CAUTION

ESD (electrostatic discharge) sensitive device. Charged devices and circuit boards can discharge without detection. Although this product features patented or proprietary protection circuitry, damage may occur on devices subjected to high energy ESD. Therefore, proper ESD precautions should be taken to avoid performance degradation or loss of functionality.

PIN CONFIGURATION AND FUNCTION DESCRIPTIONS

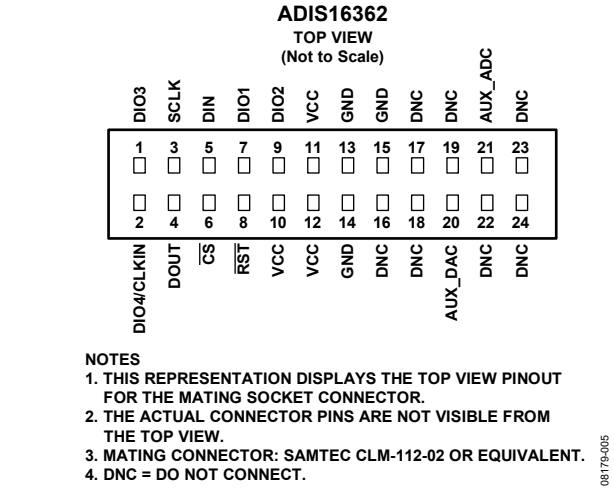

Figure 5. Pin Configuration

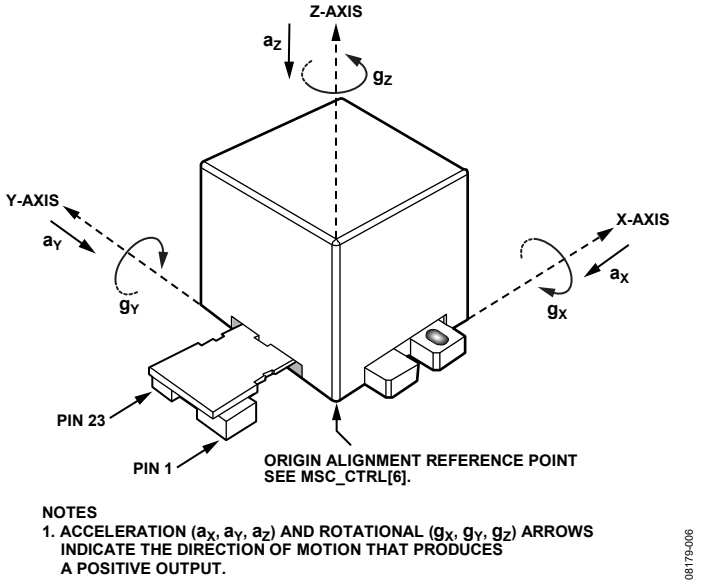

Figure 6. Axial Orientation

Table 5. Pin Function Descriptions

Pin No.	Mnemonic	Type[1]	Description
1	DIO3	I/O	Configurable Digital Input/Output.
2	DIO4/CLKIN	I/O	Configurable Digital Input/Output or Sync Clock Input.
3	SCLK	I	SPI Serial Clock.
4	DOUT	O	SPI Data Output. Clocks output on SCLK falling edge.
5	DIN	I	SPI Data Input. Clocks input on SCLK rising edge.
6	$\overline{CS}$	I	SPI Chip Select.
7, 9	DIO1, DIO2	I/O	Configurable Digital Input/Output.
8	$\overline{RST}$	I	Reset.
10, 11, 12	VCC	S	Power Supply.
13, 14, 15	GND	S	Power Ground.
16, 17, 18, 19, 22, 23, 24	DNC	N/A	Do Not Connect.
20	AUX_DAC	O	Auxiliary, 12-Bit DAC Output.
21	AUX_ADC	I	Auxiliary, 12-Bit ADC Input.

[1] I/O is input/output, I is input, O is output, S is supply, N/A is not applicable.

TYPICAL PERFORMANCE CHARACTERISTICS

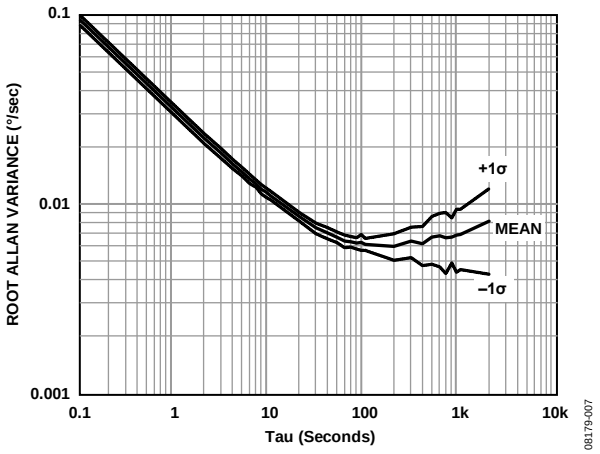

Figure 7. Gyroscope Allan Variance

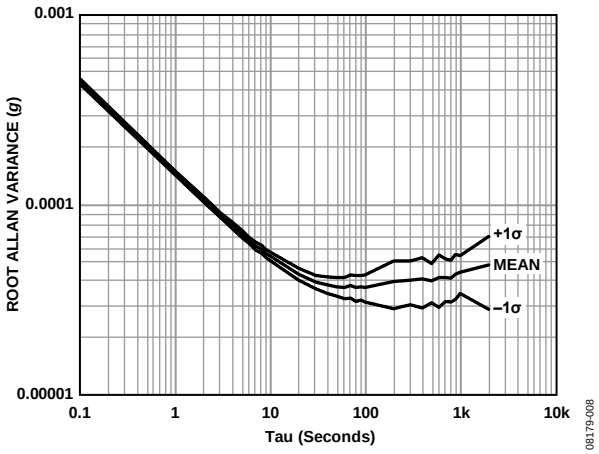

Figure 8. Accelerometer Allan Variance

THEORY OF OPERATION

BASIC OPERATION

The ADIS16362 is an autonomous sensor system that starts up after it has a valid power supply voltage and begins producing inertial measurement data at the factory default sample rate setting of 819.2 SPS. After each sample cycle, the sensor data is loaded into the output registers, and DIO1 pulses high, which provides a new data ready control signal for driving system-level interrupt service routines. In a typical system, a master processor accesses the output data registers through the SPI interface, using the connection diagram shown in Figure 9. Table 6 provides a generic functional description for each pin on the master processor. Table 7 describes the typical master processor settings that are normally found in a configuration register and used for communicating with the ADIS16362.

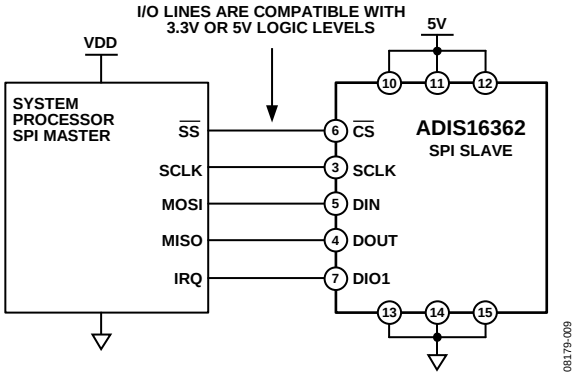

Figure 9. Electrical Connection Diagram

Table 6. Generic Master Processor Pin Names and Functions

Pin Name	Function
$\overline{SS}$	Slave select
IRQ	Interrupt request
MOSI	Master output, slave input
MISO	Master input, slave output
SCLK	Serial clock

Table 7. Generic Master Processor SPI Settings

Processor Setting	Description
Master	The ADIS16362 operates as a slave
SCLK Rate ≤ 2 MHz[1]	Normal mode, SMPL_PRD[7:0] ≤ 0x09
SPI Mode 3	CPOL = 1 (polarity), CHPA = 1 (phase)
MSB First Mode	Bit sequence
16-Bit Mode	Shift register/data length

[1] For burst read, SCLK rate ≤ 1 MHz. For low power mode, SCLK rate ≤ 300 kHz.

The user registers provide addressing for all input/output operations on the SPI interface. Each 16-bit register has two 7-bit addresses: one for its upper byte and one for its lower byte. Table 8 lists the lower byte address for each register, and Figure 10 shows the generic bit assignments.

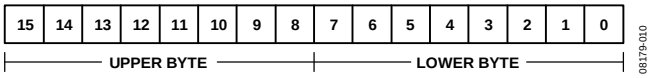

Figure 10. Generic Register Bit Assignments

READING SENSOR DATA

Although the ADIS16362 produces data independently, it operates as a SPI slave device that communicates with system (master) processors using the 16-bit segments displayed in Figure 11. Individual register reads require two of these 16-bit sequences. The first 16-bit sequence provides the read command bit ($\overline{R}/W = 0$) and the target register address (A6 to A0). The second sequence transmits the register contents (D15 to D0) on the DOUT line. For example, if DIN = 0x0A00, the contents of XACCL_OUT are shifted out on the DOUT line during the next 16-bit sequence.

The SPI operates in full-duplex mode, which means that the master processor can read the output data from DOUT while using the same SCLK pulses to transmit the next target address on DIN.

DEVICE CONFIGURATION

The user register memory map (see Table 8) identifies configuration registers with either a W or R/W. Configuration commands also use the bit sequence shown in Figure 11. If the MSB = 1, the last eight bits (DC7 to DC0) in the DIN sequence are loaded into the memory address associated with the address bits (A6 to A0). For example, if DIN = 0xA11F, 0x1F is loaded into Address 0x21 (XACCL_OFF, upper byte) at the conclusion of the data frame.

The master processor initiates the backup function by setting GLOB_CMD[3] = 1 (DIN = 0xBE08). This command copies the user registers into their assigned flash memory locations and requires the power supply to stay within its normal operating range for the entire 50 ms process. The FLASH_CNT register provides a running count of these events for monitoring the long-term reliability of the flash memory.

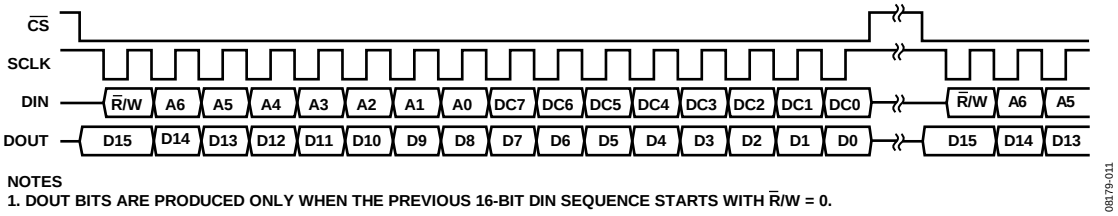

Figure 11. SPI Communication Bit Sequence

MEMORY MAP

[1] Each register contains two bytes. The address of the lower byte is displayed. The address of the upper byte is equal to the address of the lower byte plus 1.

BURST READ DATA COLLECTION

Burst read data collection is a process-efficient method for collecting data from the ADIS16362. In burst read, all output registers are clocked out on DOUT, 16 bits at a time, in sequential data cycles (each separated by one SCLK period). To start a burst read sequence, set DIN = 0x3E00. The contents of each output register are then shifted out on DOUT, starting with SUPPLY_OUT and ending with AUX_ADC (see Figure 13). The addressing sequence shown in Table 8 determines the order of the outputs in burst read.

OUTPUT DATA REGISTERS

Each output data register uses the format in Figure 12 and Table 9. Figure 6 shows the positive direction for each inertial sensor. The ND bit is equal to 1 when the register contains unread data. The EA bit is high when any error/alarm flag in the DIAG_STAT register is equal to 1.

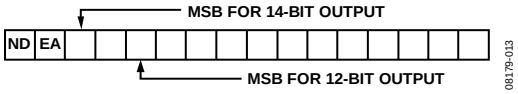

Figure 12. Output Register Bit Assignments

Table 9. Output Data Register Formats

Register	Bits	Scale	Reference
SUPPLY_OUT	12	2.418 mV	See Table 10
XGYRO_OUT[1]	14	0.05°/sec	See Table 11

CALIBRATION

Manual Bias Calibration

The bias offset registers in Table 15 and Table 16 provide a manual adjustment function for the output of each sensor. For example, if XGYRO_OFF = 0x1FF6 (DIN = 0x9B1F, 0x9AF6), the XGYRO_OUT offset shifts by −10 LSBs, or −0.125°/sec.

Table 15. XGYRO_OFF, YGYRO_OFF, ZGYRO_OFF Bit Descriptions

Bit	Description (Default = 0x0000)
[15:13]	Not used.
[12:0]	Data bits. Twos complement, 0.0125°/sec per LSB. Typical adjustment range = ±50°/sec.

Table 16. XACCL_OFF, YACCL_OFF, ZACCL_OFF Bit Descriptions

Bit	Description (Default = 0x0000)
[15:12]	Not used.
[11:0]	Data bits. Twos complement, 0.333 m*g*/LSB. Typical adjustment range = ±0.3 *g*.

Gyroscope Automatic Bias Null Calibration

Set GLOB_CMD[0] = 1 (DIN = 0xBE01) to execute the automatic bias null calibration function. This function measures all three gyroscope output registers and then loads each gyroscope offset register with the opposite value to provide a quick bias calibration. All sensor data is then reset to 0, and the flash memory is updated automatically within 50 ms (see Table 17).

Gyroscope Precision Automatic Bias Null Calibration

Set GLOB_CMD[4] = 1 (DIN = 0xBE10) to execute the precision automatic bias null calibration function. This function takes the sensor offline for 30 sec while it collects a set of data and calculates more accurate bias correction factors for each gyroscope. After this function is executed, the newly calculated correction factor is loaded into the gyroscope offset registers, all sensor data is reset to 0, and the flash memory is updated automatically within 50 ms (see Table 17).

Restoring Factory Calibration

Set GLOB_CMD[1] = 1 (DIN = 0xBE02) to execute the factory calibration restore function. This function resets each user calibration register to 0x0000 (see Table 15 and Table 16), resets all sensor data to 0, and automatically updates the flash memory within 50 ms (see Table 17).

Linear Acceleration Bias Compensation (Gyroscope)

Set MSC_CTRL[7] = 1 (DIN = 0xB486) to enable correction for low frequency acceleration influences on gyroscope bias. Note that the DIN sequence also preserves the factory default condition for the data ready function (see Table 22).

OPERATIONAL CONTROL

Global Commands

The GLOB_CMD register provides trigger bits for several useful functions. Setting the assigned bit to 1 starts each operation, which returns the bit to 0 after completion. For example, set GLOB_CMD[7] = 1 (DIN = 0xBE80) to execute a software reset, which stops the sensor operation and runs the device through its start-up sequence. This sequence includes loading the control registers with their respective flash memory locations prior to producing new data. Reading the GLOB_CMD register (DIN = 0x3E00) starts the burst read sequence.

Table 17. GLOB_CMD Bit Descriptions

Bit	Description
[15:8]	Not used
[7]	Software reset command
[6:5]	Not used
[4]	Precision autonull command
[3]	Flash update command
[2]	Auxiliary DAC data latch
[1]	Factory calibration restore command
[0]	Autonull command

Internal Sample Rate

The SMPL_PRD register provides discrete sample rate settings using the bit assignments in Table 18 and the following equation:

$$t_S = t_B \times (N_S + 1)$$

For example, when SMPL_PRD[7:0] = 0x0A, the sample rate is 149 SPS.

Table 18. SMPL_PRD Bit Descriptions

Bit	Description (Default = 0x0001)
[15:8]	Not used
[7]	Time base (t_B)
	0 = 0.61035 ms, 1 = 18.921 ms
[6:0]	Increment setting (N_S)
	Internal sample period = $t_S = t_B \times (N_S + 1)$

The default sample rate setting of 819.2 SPS preserves the sensor bandwidth and provides optimal performance. For systems that value slower sample rates, keep the internal sample rate at 819.2 SPS. Use the programmable filter (SENS_AVG) to reduce the bandwidth, which helps to prevent aliasing. The data ready function (MSC_CTRL) can drive an interrupt routine that uses a counter to help ensure data coherence at the reduced rates.

Power Management

Setting SMPL_PRD ≥ 0x0A also sets the sensor to low power mode. For systems that require lower power dissipation, in-system characterization helps users to quantify the associated performance trade-offs. In addition to sensor performance, this mode affects SPI data rates (see Table 2). Set SLP_CNT[8] = 1 (DIN = 0xBB01) to start the indefinite sleep mode, which requires a $\overline{CS}$ assertion (high to low), reset, or power cycle to wake up. Use SLP_CNT[7:0] to put the device into sleep mode for a specified period. For example, SLP_CNT[7:0] = 0x64 (DIN = 0xBA64) puts the ADIS16362 to sleep for 50 sec.

Table 19. SLP_CNT Bit Descriptions

Bit	Description
[15:9]	Not used
[8]	Indefinite sleep mode; set to 1
[7:0]	Programmable sleep time bits, 0.5 sec/LSB

Sensor Bandwidth

The signal chain for each MEMS sensor has several filter stages, which shape their frequency response. Figure 14 provides a block diagram for both gyroscope and accelerometer signal paths. Table 20 provides additional information for digital filter configuration.

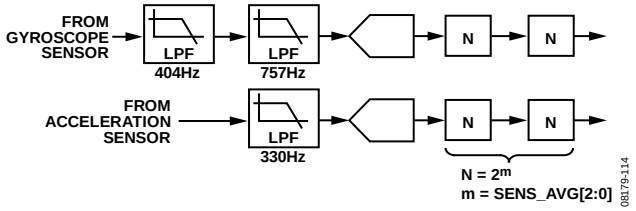

Figure 14. MEMS Analog and Digital Filters

Digital Filtering

The N blocks in Figure 14 are part of the programmable low-pass filter, which provides additional noise reduction on the inertial sensor outputs. This filter contains two cascaded averaging filters that provide a Bartlett window, FIR filter response (see Figure 15). For example, set SENS_AVG[2:0] = 100 (DIN = 0xB804) to set each stage to 16 taps. When used with the default sample rate of 819.2 SPS, this value reduces the sensor bandwidth to approximately 16 Hz.

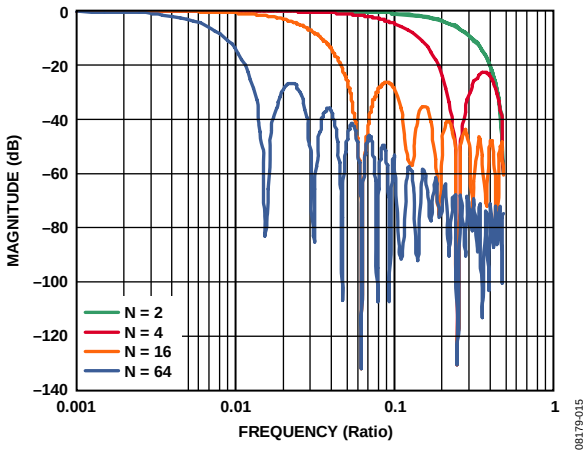

Figure 15. Bartlett Window, FIR Filter Frequency Response (Phase Delay = N Samples)

Dynamic Range

The SENS_AVG[10:8] bits provide three dynamic range settings for this gyroscope. The lower dynamic range settings (±75°/sec and ±150°/sec) limit the minimum filter tap sizes to maintain resolution. For example, set SENS_AVG[10:8] = 010 (DIN = 0xB902) for a measurement range of ±150°/sec. Because this setting can influence the filter settings, program SENS_AVG[10:8] and then SENS_AVG[2:0] if more filtering is required.

Table 20. SENS_AVG Bit Descriptions

Bit	Description
[15:11]	Not used
[10:8]	Measurement range (sensitivity) selection
	100 = ±300°/sec (default condition)
	010 = ±150°/sec, filter taps ≥ 4 (Bits[2:0] ≥ 0x02)
	001 = ±75°/sec, filter taps ≥ 16 (Bits[2:0] ≥ 0x04)
[7:3]	Not used
[2:0]	Number of taps in each stage, N = 2^M

INPUT/OUTPUT FUNCTIONS

General-Purpose I/O

DIO1, DIO2, DIO3, and DIO4 are configurable, general-purpose I/O lines that serve multiple purposes according to the following control register priority: MSC_CTRL, ALM_CTRL, and GPIO_CTRL. For example, set GPIO_CTRL = 0x080C (DIN = 0xB308, and then 0xB20C) to configure DIO1 and DIO2 as inputs and DIO3 and DIO4 as outputs, with DIO3 set low and DIO4 set high.

In this configuration, read GPIO_CTRL (DIN = 0x3200). The digital state of DIO1 and DIO2 is in GPIO_CTRL[9:8].

Table 21. GPIO_CTRL Bit Descriptions

Bit	Description
[15:12]	Not used
[11]	General-Purpose I/O Line 4 (DIO4) data level
[10]	General-Purpose I/O Line 3 (DIO3) data level
[9]	General-Purpose I/O Line 2 (DIO2) data level
[8]	General-Purpose I/O Line 1 (DIO1) data level
[7:4]	Not used
[3]	General-Purpose I/O Line 4 (DIO4) direction control (1 = output, 0 = input)
[2]	General-Purpose I/O Line 3 (DIO3) direction control (1 = output, 0 = input)
[1]	General-Purpose I/O Line 2 (DIO2) direction control (1 = output, 0 = input)
[0]	General-Purpose I/O Line 1 (DIO1) direction control (1 = output, 0 = input)

Input Clock Configuration

The input clock function allows for external control oversampling in the ADIS16362. Set GPIO_CTRL[3] = 0 (DIN = 0x0B200) and SMPL_PRD[7:0] = 0x00 (DIN = 0xB600) to enable this function. See Table 2 and Figure 4 for timing information.

Data Ready I/O Indicator

The factory default sets DIO1 as a positive data ready indicator signal. The MSC_CTRL[2:0] bits provide configuration options for changing the default. For example, set MSC_CTRL[2:0] = 100 (DIN = 0xB404) to change the polarity of the data ready signal on DIO1 for interrupt inputs that require negative logic inputs for activation. The pulse width is between 100 µs and 200 µs over all conditions.

Table 22. MSC_CTRL Bit Descriptions

Bit	Description
[15:12]	Not used
[11]	Memory test (cleared upon completion) (1 = enabled, 0 = disabled)
[10]	Internal self-test enable (cleared upon completion) (1 = enabled, 0 = disabled)
[9]	Manual self-test, negative stimulus (1 = enabled, 0 = disabled)
[8]	Manual self-test, positive stimulus (1 = enabled, 0 = disabled)
[7]	Linear acceleration bias compensation for gyroscopes (1 = enabled, 0 = disabled)
[6]	Linear accelerometer origin alignment (1 = enabled, 0 = disabled)
[5:3]	Not used
[2]	Data ready enable (1 = enabled, 0 = disabled)
[1]	Data ready polarity (1 = active high, 0 = active low)
[0]	Data ready line select (1 = DIO2, 0 = DIO1)

Auxiliary DAC

The 12-bit AUX_DAC line can drive its output to within 5 mV of the ground reference when it is not sinking current. As the output approaches 0 V, the linearity begins to degrade (~100 LSB beginning point). As the sink current increases, the nonlinear range increases. The DAC latch command moves the values of the AUX_DAC register into the DAC input register, enabling both bytes to take effect at the same time.

Table 23. AUX_DAC Bit Descriptions

Bit	Description
[15:12]	Not used
[11:0]	Data bits, scale factor = 0.8059 mV/LSB Offset binary format, 0 V = 0 LSB

Table 24. Setting AUX_DAC = 1 V

DIN	Description
0xB0D9	AUX_DAC[7:0] = 0xD9 (217 LSB).
0xB104	AUX_DAC[15:8] = 0x04 (1024 LSB).
0xBE04	GLOB_CMD[2] = 1. Move values into the DAC input register, resulting in a 1 V output level.

DIAGNOSTICS

Self-Test

The self-test function allows the user to verify the mechanical integrity of each MEMS sensor. It applies an electrostatic force to each sensor element, which results in mechanical displacement that simulates a response to actual motion. Table 1 lists the expected response for each sensor, which provides pass/fail criteria. Set MSC_CTRL[10] = 1 (DIN = 0xB504) to run the internal self-test routine, which exercises all inertial sensors, measures each response, makes pass/fail decisions, and reports them to error flags in the DIAG_STAT register. MSC_CTRL[10] resets itself to 0 after completing the routine. The MSC_CTRL[9:8] bits provide manual control over the self-test function for investigation of potential failures. Table 25 outlines an example test flow for using this option to verify the x-axis gyroscope function.

Table 25. Manual Self-Test Example Sequence

DIN	Description
0xB601	SMPL_PRD[7:0] = 0x01, sample rate = 819.2 SPS
0xB904	SENS_AVG[15:8] = 0x04, gyro range = ±300°/sec
0xB802	SENS_AVG[7:0] = 0x02, four-tap averaging filter
	Delay = 50 ms
0x0400	Read XGYRO_OUT
0xB502	MSC_CTRL[9] = 1, gyroscope negative self-test
	Delay = 50 ms
0x0400	Read XGYRO_OUT
	Determine whether the bias in the gyroscope output changed according to the self-test response specified in Table 1
0xB501	MSC_CTRL[9:8] = 01, gyroscope/accelerometer positive self-test
	Delay = 50 ms
0x0400	Read XGYRO_OUT
	Determine whether the bias in the gyroscope output changed according to the self-test response specified in Table 1
0xB500	MSC_CTRL[15:8] = 0x00

Zero motion provides results that are more reliable. The settings in Table 25 are flexible and allow for optimization around speed and noise influence. For example, using fewer filtering taps decreases delay times but increases the possibility of noise influence.

Memory Test

Setting MSC_CTRL[11] = 1 (DIN = 0xB508) performs a checksum verification of the flash memory locations. The pass/fail result is loaded into DIAG_STAT[6].

Status

The error flags provide indicator functions for common system level issues. All of the flags are cleared (set to 0) after each DIAG_STAT register read cycle. If an error condition remains, the error flag returns to 1 during the next sample cycle. The DIAG_STAT[1:0] bits do not require a read of this register to return to 0. If the power supply voltage goes back into range, these two flags are cleared automatically.

Table 26. DIAG_STAT Bit Descriptions

Bit	Description
[15]	Z-axis accelerometer self-test failure (1 = fail, 0 = pass)
[14]	Y-axis accelerometer self-test failure (1 = fail, 0 = pass)
[13]	X-axis accelerometer self-test failure (1 = fail, 0 = pass)
[12]	Z-axis gyroscope self-test failure (1 = fail, 0 = pass)
[11]	Y-axis gyroscope self-test failure (1 = fail, 0 = pass)
[10]	X-axis gyroscope self-test failure (1 = fail, 0 = pass)
[9]	Alarm 2 status (1 = active, 0 = inactive)
[8]	Alarm 1 status (1 = active, 0 = inactive)
[7]	Not used
[6]	Flash test, checksum flag (1 = fail, 0 = pass)
[5]	Self-test diagnostic error flag (1 = fail, 0 = pass)
[4]	Sensor overrange (1 = fail, 0 = pass)
[3]	SPI communication failure (1 = fail, 0 = pass)
[2]	Flash update failure (1 = fail, 0 = pass)
[1]	Power supply > 5.25 V (1 = power supply > 5.25 V, 0 = power supply ≤ 5.25 V)
[0]	Power supply < 4.75 V (1 = power supply < 4.75 V, 0 = power supply ≥ 4.75 V)

Alarm Registers

The alarm function provides monitoring for two independent conditions. The ALM_CTRL register provides control inputs for data source, data filtering (prior to comparison), static comparison, dynamic rate-of-change comparison, and output indicator configurations. The ALM_MAGx registers establish the trigger threshold and polarity configurations. Table 30 gives an example of how to configure a static alarm. The ALM_SMPLx registers provide the numbers of samples to use in the dynamic rate-of-change configuration. The period equals the number in the ALM_SMPLx register multiplied by the sample period time, which is established by the SMPL_PRD register. See Table 31 for an example of how to configure the sensor for this type of function.

Table 27. ALM_MAG1, ALM_MAG2 Bit Descriptions

Bit	Description
[15]	Comparison polarity (1 = greater than, 0 = less than)
[14]	Not used
[13:0]	Data bits that match the format of the trigger source selection

Table 30. Alarm Configuration Example 1

DIN	Description
0xAF55, 0xAE17	ALM_CTRL = 0x5517 Alarm 1 input = XACCL_OUT Alarm 2 input = XACCL_OUT Static level comparison, filtered data DIO2 output indicator, positive polarity
0xA785, 0xA6DE	ALM_MAG1 = 0x85DE Alarm 1 is true if XACCL_OUT > +0.5 *g*
0xA93A, 0xA822	ALM_MAG2 = 0x3A22 Alarm 2 is true if XACCL_OUT < −0.5 *g*

Table 31. Alarm Configuration Example 2

DIN	Description
0xAF76, 0xAE87	ALM_CTRL = 0x7687 Alarm 1 input = YACCL_OUT Alarm 2 input = ZACCL_OUT Rate-of-change comparison, unfiltered data DIO2 output indicator, positive polarity
0xB601	SMPL_PRD = 0x0001 Sample rate = 819.2 SPS
0xAA08	ALM_SMPL1 = 0x0008 Alarm 1 rate-of-change period = 9.77 ms
0xAC50	ALM_SMPL2 = 0x0050 Alarm 2 rate-of-change period = 97.7 ms
0xA785, 0xA6DE	ALM_MAG1 = 0x85DE Alarm 1 is true if XACCL_OUT > +0.5 *g*
0xA93A, 0xA822	ALM_MAG2 = 0x3A22 Alarm 2 is true if XACCL_OUT < −0.5 *g*

PRODUCT IDENTIFICATION

Table 32 provides a summary of the registers that identify the product: PROD_ID, which identifies the product type; LOT_ID1 and LOT_ID2, the 32-bit lot identification code; and SERIAL_NUM, which displays the 12-bit serial number. All four registers are two bytes in length. When using the SERIAL_NUM value to calculate the serial number, mask off the upper four bits and convert the remaining 12 bits to a decimal number.

Table 32. Identification Registers

Register Name	Address	Description
LOT_ID1	0x52	Lot Identification Code 1
LOT_ID2	0x54	Lot Identification Code 2
PROD_ID	0x56	Product identification = 0x3FEA (hexadecimal number for 16,362)
SERIAL_NUM	0x58	Serial number, 0 to 4095

APPLICATIONS INFORMATION

INSTALLATION/HANDLING

For ADIS16362 installation, use the following two-step process:

1. Secure the baseplate using machine screws.
2. Press the connector into its mate.

For removal,

1. Gently pry the connector from its mate using a small slot screwdriver.
2. Remove the screws and lift the part up.

Never attempt to unplug the connector by pulling on the plastic case or baseplate. Although the flexible connector is very reliable in normal operation, it can break when subjected to unreasonable handling. When broken, the flexible connector cannot be repaired. The AN-1041 Application Note provides more information about developing an appropriate mechanical interface design.

GYROSCOPE BIAS OPTIMIZATION

The factory calibration addresses initial bias errors along with temperature-dependent bias behaviors. Installation and certain environmental conditions can introduce modest bias errors. The precision autonull command (GLOB_CMD[4]) provides a simple predeployment method for correcting these errors to an accuracy of approximately 0.008°/sec, using an average of 30 sec. Averaging the sensor output data for 100 sec can provide incremental performance gains, as well. Controlling device rotation, power supply, and temperature during these averaging times helps to ensure optimal accuracy during this process. Refer to the AN-1041 Application Note for more information about optimizing performance.

INPUT ADC CHANNEL

The AUX_ADC register provides access to the auxiliary ADC input channel. The ADC is a 12-bit successive approximation converter that has an input circuit equivalent to the one shown in Figure 16. The maximum input is 3.3 V. The ESD protection diodes can handle 10 mA without causing irreversible damage. The on resistance (R1) of the switch has a typical value of 100 Ω. The sampling capacitor, C2, has a typical value of 16 pF.

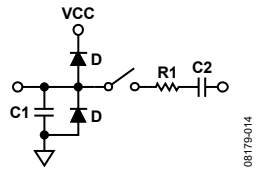

Figure 16. Equivalent Analog Input Circuit (Conversion Phase: Switch Open, Track Phase: Switch Closed)

ADIS16IMU2/PCBZ

The ADIS16IMU2/PCBZ accessories provide a simplified method for connecting the ADIS16362 to an embedded processor platform or to the EVAL-ADIS2 evaluation system.

Figure 17 provides the pin assignments for J1 on the ADIS16IMU2/PCBZ breakout board.

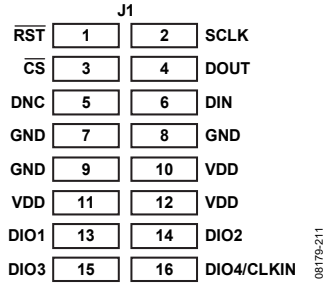

Figure 17. J1 Pin Assignments for the ADIS16IMU2/PCBZ

The C1 and C2 locations on the ADIS16IMU2/PCBZ provide users with the pads to install capacitance across VDD and GND, which Figure 9 recommends for best performance.

PC-BASED EVALUATION TOOLS

The EVAL-ADIS2 supports PC-based evaluation of the ADIS16362. Refer to the *EVAL-ADIS2 Evaluation System Wiki Guide* for more information on connecting the ADIS16362 to the EVAL-ADIS2 system.

X-RAY SENSITIVITY

Exposure to high dose rate X-rays, such as those in production systems that inspect solder joints in electronic assemblies, may affect accelerometer bias errors. For optimal performance, avoid exposing the ADIS16362 to this type of inspection.
