EL5170ISZ

EL5170, EL5370

100MHz Differential Twisted-Pair Drivers

FN7309
Rev 10.00
August 14, 2015

The EL5170 and EL5370 are single and triple high bandwidth amplifiers with a fixed gain of 2. They are primarily targeted for applications such as driving twisted-pair lines in component video applications. The inputs signal can be in either single-ended or differential form but the outputs are always in differential form.

The output common mode level for each channel is set by the associated V_{REF} pin, which have a -3dB bandwidth of over 70MHz. Generally, these pins are grounded but can be tied to any voltage reference.

All outputs are short circuit protected to withstand temporary overload condition.

The EL5170 and EL5370 are specified for operation over the full -40°C to +85°C temperature range.

Features

- Fully differential inputs and outputs
- Differential input range ±2.3V typ.
- 100MHz 3dB bandwidth at fixed gain of 2
- 1100V/µs slew rate
- Single 5V or dual ±5V supplies
- 50mA maximum output current
- Low power - 7.4mA per channel
- Pb-free available (RoHS compliant)

Applications

- Twisted-pair drivers
- Differential line drivers
- VGA over twisted-pairs
- ADSL/HDSL drivers
- Single ended to differential amplification
- Transmission of analog signals in a noisy environment

Pin Descriptions

EL5170	EL5370	PIN NAME	PIN FUNCTION
1		IN+	Non-inverting input
2	1	$\overline{EN}$	$\overline{Enable}$
3		IN-	Inverting input
4		REF	Reference input, sets common-mode output voltage
5		OUT-	Inverting output
6		VS+	Positive supply
7		VS-	Negative supply
8		OUT+	Non-inverting output
	2, 6, 10	INP1, INP2, INP3	Non-inverting inputs
	3, 7, 11	INN1, INN2, INN3	Inverting inputs
	4, 8, 12	REF1, REF2, REF3	Reference input, sets common-mode output voltage
	14, 17, 23	OUT3B, OUT2B, OUT1B	Inverting outputs
	21	VSP	Positive supply
	20	VSN	Negative supply
	15, 18, 24	OUT3, OUT2, OUT1	Non-inverting outputs
	5, 9, 13, 16, 19, 22	NC	No connects; grounded for best crosstalk performance

NOTES:

1. Add "-T*" suffix for tape and reel. Please refer to TB347 for details on reel specifications.
2. These Intersil Pb-free plastic packaged products employ special Pb-free material sets, molding compounds/die attach materials, and 100% matte tin plate plus anneal (e3 termination finish, which is RoHS compliant and compatible with both SnPb and Pb-free soldering operations). Intersil Pb-free products are MSL classified at Pb-free peak reflow temperatures that meet or exceed the Pb-free requirements of IPC/JEDEC J STD-020.
3. For Moisture Sensitivity Level (MSL), please see device information page for EL5170, EL5370. For more information on MSL please see tech brief TB363.

Absolute Maximum Ratings (T_A = +25°C)

Supply Voltage (V_S+ to V_S-) 12.6V
Supply Voltage Rate-of-rise (dV/dT) 1V/µs

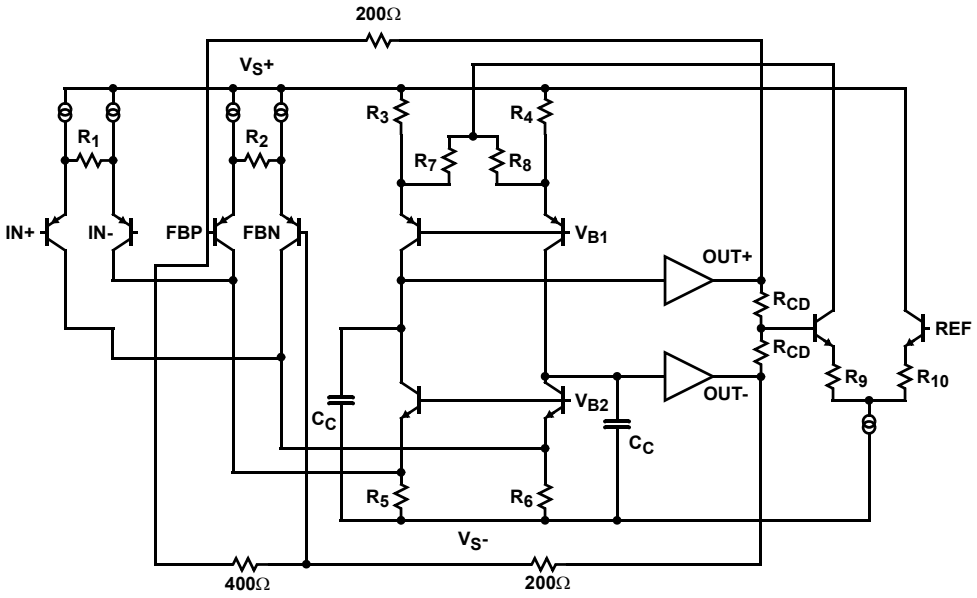
Simplified Schematic



Description of Operation and Application Information

Product Description

The EL5170 and EL5370 are wide bandwidth, low power and single/differential ended to differential output amplifiers. They have a fixed gain of 2. The EL5170 is a single channel differential amplifier. The EL5370 is a triple channel differential amplifier. The EL5170 and EL5370 have a -3dB bandwidth of 100MHz while driving a 200Ω differential load. The EL5170 and EL5370 are available with a power-down feature to reduce the power while the amplifiers are disabled.

Input, Output and Supply Voltage Range

The EL5170 and EL5370 have been designed to operate with a single supply voltage of 5V to 10V or split supplies with its total voltage from 5V to 10V. The amplifiers have an input common mode voltage range from -4.5V to 3.4V for ±5V supply. The differential mode input range (DMIR) between the two inputs is from -2.3V to +2.3V. The input voltage range at the REF pin is from -3.3V to 3.8V. If the input common mode or differential mode signal is outside the above-specified ranges, it will cause the output signal to become distorted.

The output of the EL5170 and EL5370 can swing from -3.3V to 3.6V at 200Ω differential load at ±5V supply. As the load resistance becomes lower, the output swing is reduced.

Differential and Common Mode Gain Settings

As shown in the “Simplified Schematic” on page 8, since the feedback resistors R_F and the gain resistor are integrated with 200Ω and 400Ω, the EL5170 and EL5370 have a fixed gain of 2. The common mode gain is always one.

Driving Capacitive Loads and Cables

The EL5170 and EL5370 can drive 75pF differential capacitor in parallel with 200Ω differential load with less than 3.5dB of peaking. If less peaking is desired in applications, a small series resistor (usually between 5Ω to 50Ω) can be placed in series with each output to eliminate most peaking. However, this will reduce the gain slightly.

When used as a cable driver, double termination is always recommended for reflection-free performance. For those applications, a back-termination series resistor at the amplifier’s output will isolate the amplifier from the cable and allow extensive capacitive drive. However, other applications may have high capacitive loads without a back-termination resistor. Again, a small series resistor at the output can help to reduce peaking.

Disable/Power-Down

The EL5170 and EL5370 can be disabled and their outputs placed in a high impedance state. The turn-off time is about 1µs and the turn-on time is about 200ns. When disabled, the amplifier’s supply current is reduced to 2µA for I_S+ and 120µA for I_S- typically, thereby effectively eliminating the power consumption. The amplifier’s power-down can be controlled by standard CMOS signal levels at the ENABLE pin. The applied logic signal is relative to V_S+ pin. Letting the $\overline{EN}$ pin float or applying a signal that is less than 1.5V below V_S+ will enable the amplifier. The amplifier will be disabled when the signal at $\overline{EN}$ pin is above V_S+ -0.5V.

Output Drive Capability

The EL5170 and EL5370 have internal short circuit protection. Its typical short circuit current is ±80mA. If the output is shorted indefinitely, the power dissipation could easily increase such that the part will be destroyed. Maximum reliability is maintained if the output current never exceeds ±60mA. This limit is set by the design of the internal metal interconnect.

Power Dissipation

With the high output drive capability of the EL5170 and EL5370 it is possible to exceed the +125°C absolute maximum junction temperature under certain load current conditions. Therefore, it is important to calculate the maximum junction temperature for the application to determine if the load conditions or package types need to be modified for the amplifier to remain in the safe operating area.

The maximum power dissipation allowed in a package is determined according to Equation 1:

$$PD_{MAX} = \frac{T_{JMAX} - T_{AMAX}}{\Theta_{JA}} \quad \text{(EQ. 1)}$$

Where:

T_{JMAX} = Maximum junction temperature

T_{AMAX} = Maximum ambient temperature

θ_{JA} = Thermal resistance of the package

The maximum power dissipation actually produced by an IC is the total quiescent supply current times the total power supply voltage, plus the power in the IC due to the load, or as expressed in Equation 2:

$$PD = i \times \left(V_{STOT} \times I_{SMAX} + (V_{STOT} - \Delta V_O) \times \frac{\Delta V_O}{R_{LD}} \right) \quad \text{(EQ. 2)}$$

Where:

V_{STOT} = Total supply voltage = V_S+ - V_S-

I_{SMAX} = Maximum quiescent supply current per channel

ΔV_O = Maximum differential output voltage of the application

R_{LD} = Differential load resistance

I_{LOAD} = Load current

i = Number of channels

By setting the two PD_{MAX} equations equal to each other, we can solve the output current and R_{LOAD} to avoid the device overheat.

Power Supply Bypassing and Printed Circuit Board Layout

As with any high frequency device, a good printed circuit board layout is necessary for optimum performance. Lead lengths should be as sort as possible. The power supply pin must be well bypassed to reduce the risk of oscillation. For normal single supply operation, where the V_S- pin is connected to the ground plane, a single 4.7µF tantalum capacitor in parallel with a 0.1µF ceramic capacitor from V_S+ to GND will suffice. This same capacitor combination should be placed at each supply pin to ground if split supplies are to be used. In this case, the V_S- pin becomes the negative supply rail.

For good AC performance, parasitic capacitance should be kept to minimum. Use of wire wound resistors should be avoided because of their additional series inductance. Use of sockets should also be avoided if possible. Sockets add parasitic inductance and capacitance that can result in compromised performance. Minimizing parasitic capacitance at the amplifier's inverting input pin is very important. The feedback resistor should be placed very close to the inverting input pin. Strip line design techniques are recommended for the signal traces.

Typical Applications
