Thermal Resistance

Altera follows JEDEC JESD51 series standards to provide thermal resistances. The purpose of the JESD51 standards is to compare the thermal performance of various packages under standardized test conditions. While standardized thermal resistances can help compare the relative thermal performance of different packages, they cannot apply directly to the many specific applications because JESD51 test conditions may not match a specific application. Several factors affect the thermal performance of a device in a user's application. These include power dissipation in the component; airflow velocity, direction and turbulence level; power in adjacent components; two-sided vs. one-sided active component mounting; printed circuit board (PCB) orientation & construction; and adjacent boards and their power dissipation. It may be necessary to test or model specific applications. This testing and modeling of a component user's specific applications is the user's responsibility.

Table 26 through Table 43 provide θ_{JA} (junction-to-ambient thermal resistance) and θ_{JC} (junction-to-case thermal resistance) values for the Altera device families. Altera reserves the right to make changes to thermal resistances without notice in the future.

Table 25 lists the mature Altera devices and the associated table locations.

Altera is transitioning to an industry-standard copper lid for its thermally enhanced BGA and thermally enhanced Flip Chip FBGA package offerings.

For more information, refer to *Process Change Notice PCN0214*.

This change affects the APEX 20KE, APEX 20KC, APEX II, Mercury, and Excalibur device families. Therefore, two thermal resistance specifications are provided for devices affected by this change. The older packages are identified as using the aluminum silicon carbide (AlSiC) lid, while the newer packages are identified as using the copper (Cu) lid.

Thermally enhanced BGA and thermally enhanced Flip Chip FBGA packages offered in the newer Altera families, including Stratix and Stratix GX, were introduced using an industry-standard Cu lid. Therefore, these device specifications include only a single thermal resistance specification.

Contact Altera if you need typical +/– values of A dimensions for thermal analysis. The max numbers are provided for physical layout.

Note to Table 37:

(1) "fin" is an extra heat sink that customers can add to the device. Several vendors make heat sinks, and they all have different sizes. Altera performed the thermal calculations in Table 37 using the following fin specifications: width: 0.25 mm; height: 7.0 mm; pitch: 1.5 mm; base thickness: 0.5 mm.
