
Features

- Direct Supply from the Mains
- Current Consumption ≤ 0.5 mA
- Very Few External Components
- Full-wave Drive – No DC Current Component in the Load Circuit
- Negative Output Current Pulse Typically 100 mA – Short-circuit Protected
- Simple Power Control
- Ramp Generator
- Reference Voltage

Applications

- Full-wave Power Control
- Temperature Regulation
- Power Blinking Switch

Description

The integrated circuit, T2117, is designed as a zero-voltage switch in bipolar technology. It is used to control resistive loads at mains by a triac in zero-crossing mode. A ramp generator allows power control function by period group control, whereas full-wave logic guarantees that full mains cycles are used for load switching.

Pin Configuration

Figure 2. Pinning DIP8/SO8

Pin Description

Pin	Symbol	Function
1	RAMP	Ramp output
2	CRAMP	Ramp capacitor
3	POSIN	Non-inverting comparator input
4	NEGIN	Inverting comparator input
5	VS	Supply voltage
6	OUTPUT	Trigger pulse output
7	GND	Ground
8	VSYNC	Voltage synchronization

General Description

The integrated circuit T2117 is a triac controller for zero-crossing mode. It is designed to control power in switching resistive loads of mains supplies.

Information regarding synchronous supply is provided at pin 8 via resistor R_{Sync} . To avoid a DC load on the mains, the full-wave logic guarantees that complete mains cycles are used for load switching.

A fire pulse is released when the inverting input of the comparator is negative (pin 4) with respect to the non-inverting input (pin 3) and internal reference voltage. A ramp generator with freely selectable duration can be performed by capacitor C_2 at pin 2. The ramp function is used for open-loop control (Figure 4), but also for applications with proportional band regulation (Figure 11 on page 9). Ramp voltage available at capacitor C_2 is decoupled across the emitter follower at pin 1. To maintain the lamp flicker specification, the ramp duration is adjusted according to the controlling load. One can use internal reference voltage for simple applications. In that case, pin 3 is inactive and connected to pin 7 (GND), see Figure 13 on page 11.

Figure 3. Pin 1 Internal Network

Figure 4. Threshold Voltage of the Ramp at $V_S = -8.8\text{ V}$

Triac Firing Current (Pulse)

This depends on the triac requirement. It can be limited by the gate series resistance which is calculated as follows:

$$R_{Gmax} \approx \frac{7.5 \text{ V} - V_{Gmax}}{I_{Gmax}} - 36 \Omega$$

$$I_P = \frac{I_{Gmax}}{T} \times t_p$$

where:

V_G = Gate voltage

I_{Gmax} = Maximum gate current

I_p = Average gate current

t_p = Firing pulse width

T = Mains period duration

Firing Pulse Width t_p

This depends on the latching current of the triac and its load current. The firing pulse width is determined by the zero-crossing detection which can be influenced by the synchronous resistance, R_{sync} , (see Figure 6 on page 5).

$$t_p = \frac{2}{\omega} \arcsin\left(\frac{I_L \times V_M}{P \sqrt{2}}\right)$$

where

I_L = Latching current of the triac

V_M = Mains supply, effective

P = Load power

The total current consumption is influenced by the firing pulse width which can be calculated as follows:

$$R_{sync} = \frac{V_M \sqrt{2} \sin\left(\omega \times \frac{t_p}{2}\right) - 0.6 \text{ V}}{3.5 \times 10^{-5} \text{ A}} - 49 \text{ k}\Omega$$

Figure 5. Output Pulse Width

Figure 6. Synchronization Resistance

Supply Voltage

The T2117 contains a voltage limiting function and can be connected with the mains supply via the diode D_1 and the resistor R_1 . The supply voltage between pin 5 and 7 is limited to a typical value of 9.5 V.

The series resistance R_1 can be calculated as follows (Figure 7 on page 6 and Figure 8 on page 6):

$$R_{1max} = 0.85 \frac{V_{Mmin} - V_{Smax}}{2 I_{tot}}; P_{(R1)} = \frac{(V_M - V_S)^2}{2 R_1}$$

$$I_{tot} = I_S + I_P + I_x$$

where

- V_M = Mains voltage
- V_S = Limiting voltage of the IC
- I_{tot} = Total current consumption
- I_S = Current requirement of the IC (without load)
- I_x = Current requirement of other peripheral components
- $P_{(R1)}$ = Power dissipation at R_1

Figure 7. Maximum Resistance of R_1

Absolute Maximum Ratings

Stresses beyond those listed under “Absolute Maximum Ratings” may cause permanent damage to the device. This is a stress rating only and functional operation of the device at these or any other conditions beyond those indicated in the operational sections of this specification is not implied. Exposure to absolute maximum rating conditions for extended periods may affect device reliability.

Parameters	Pin	Symbol	Value	Unit
Supply current	5	$-I_S$	30	mA
Synchronous current	8	I_{sync}	5	mA
Output current ramp generator	1	I_O	3	mA
Input voltages	1, 3, 4, 6	$-V_I$	$\leq V_S$	V
	2	$-V_I$	2 to V_S	V
	8	$\pm V_I$	≤ 7.3	V
Power dissipation $T_{amb} = 45^\circ\text{C}$ $T_{amb} = 100^\circ\text{C}$		P_{tot}	400	mW
		P_{tot}	125	mW
Junction temperature		T_j	125	$^\circ\text{C}$
Operating ambient temperature range		T_{amb}	0 to 100	$^\circ\text{C}$
Storage temperature range		T_{stg}	-40 to +125	$^\circ\text{C}$

Thermal Resistance

Parameters	Symbol	Value	Unit
Junction ambient SO8	R_{thJA}	200	K/W
Junction ambient DIP8	R_{thJA}	110	K/W

Electrical Characteristics

$-V_S = 8.8\text{ V}$, $T_{amb} = 25^\circ\text{C}$, reference point pin 7, unless otherwise specified

Parameters	Test Conditions	Pin	Symbol	Min.	Typ.	Max.	Unit
Supply-voltage limitation	$-I_S = 1\text{ mA}$	5	$-V_S$	9.0	9.5	10.0	V
	$-I_S = 10\text{ mA}$		$-V_S$	9.1	9.6	10.1	V
Supply current		5	$-I_S$			500	μA
Voltage limitation	$I_g = \pm 1\text{ mA}$	8	$\pm V_I$	7.7	8.2	8.7	V
Synchronization current		8	$\pm I_{sync}$	0.12			mA
Zero detector		8	$\pm I_{sync}$		35		μA
