# Product Overview

---

ESP32-S3-PICO-1 is a System-in-Package (SiP) device that is based on ESP32-S3 with integrated 2.4 GHz Wi-Fi and Bluetooth® Low Energy (Bluetooth LE). It integrates an 8 MB SPI flash and an up to 8 MB SPI PSRAM.

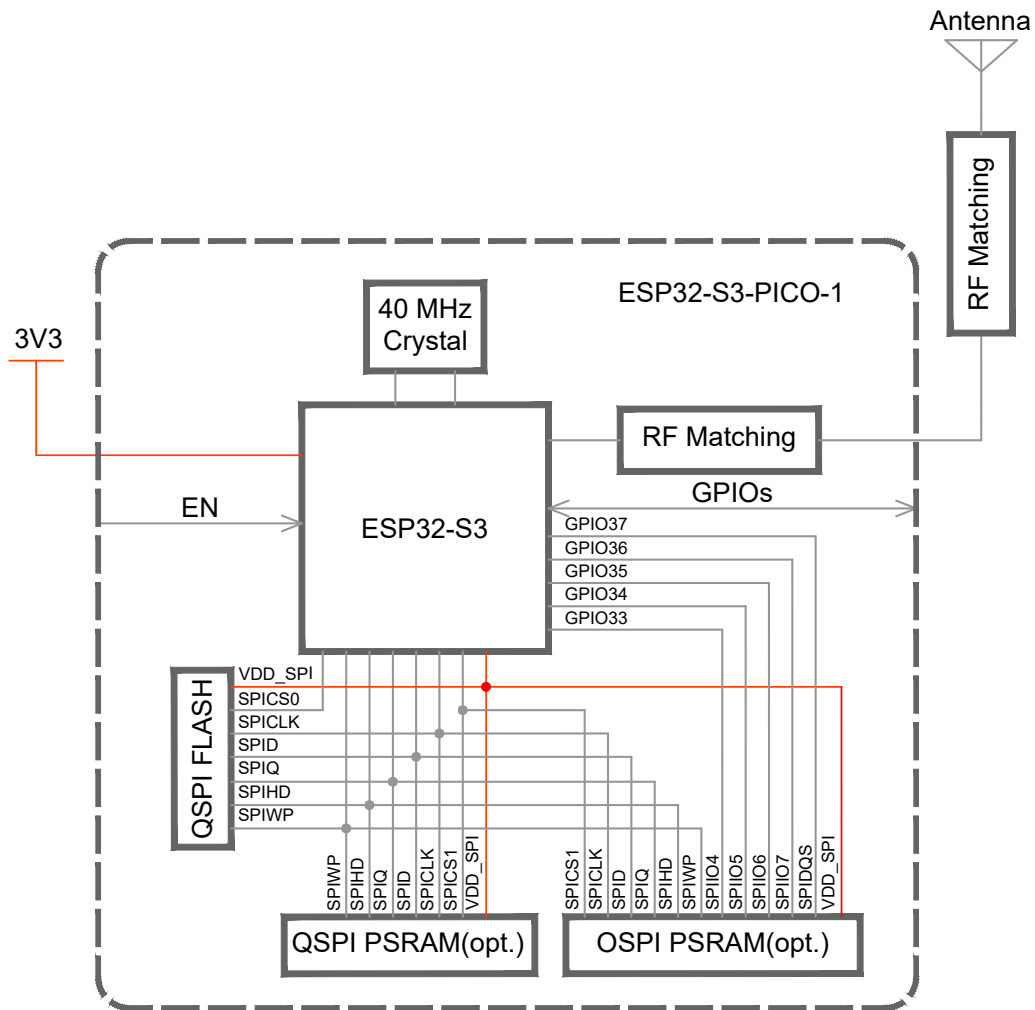

ESP32-S3-PICO-1 provides complete Wi-Fi and Bluetooth® functionalities and is designed with the TSMC low-power 40 nm technology. It seamlessly integrates all peripheral components, including a crystal oscillator, decoupling capacitors, SPI flash/PSRAM, and RF matching links, within a single package. As a result, there is no need for additional peripheral components, simplifying the soldering and testing processes. It also streamlines the supply chain and enhances control and management efficiency.

With its ultra-small size, robust performance, and low-energy consumption, ESP32-S3-PICO-1 is well suited for any space-limited or battery-operated applications, such as wearable electronics, medical equipment, sensors and other IoT products.

At the core of ESP32-S3-PICO-1 is the ESP32-S3 chip, a low-power MCU-based system on a chip (SoC) with integrated 2.4 GHz Wi-Fi and Bluetooth® Low Energy (Bluetooth LE). It consists of high-performance dual-core microprocessor (Xtensa® 32-bit LX7), a low-power coprocessor, a Wi-Fi baseband, a Bluetooth LE baseband, RF module, and numerous peripherals. For more details on ESP32-S3, please refer to [ESP32-S3 Series Datasheet](#).

## 2.3 Strapping Pins

At each startup or reset, the ESP32-S3-PICO-1 requires some initial configuration parameters, such as in which boot mode to load the SiP, voltage of flash memory, etc. These parameters are passed over via the strapping pins. After reset, the strapping pins operate as regular IO pins.

The parameters controlled by the given strapping pins at SiP reset are as follows:

- **Chip boot mode** – GPIO0 and GPIO46
- **VDD\_SPI voltage** – GPIO45
- **ROM messages printing** – GPIO46
- **JTAG signal source** – GPIO3

GPIO0, GPIO45, and GPIO46 are connected to the chip's internal weak pull-up/pull-down resistors at chip reset. These resistors determine the default bit values of the strapping pins. Also, these resistors determine the bit values if the strapping pins are connected to an external high-impedance circuit.

**Table 2-2. Default Configuration of Strapping Pins**

Strapping Pin	Default Configuration	Bit Value
GPIO0	Pull-up	1
GPIO3	Floating	–
GPIO45	Pull-down	0
GPIO46	Pull-down	0

To change the bit values, the strapping pins should be connected to external pull-down/pull-up resistances. If the ESP32-S3-PICO-1 is used as a device by a host MCU, the strapping pin voltage levels can also be controlled by the host MCU.

All strapping pins have latches. At system reset, the latches sample the bit values of their respective strapping pins and store them until the chip is powered down or shut down. The states of latches cannot be changed in any other way. It makes the strapping pin values available during the entire chip operation, and the pins are freed up to be used as regular IO pins after reset.

Regarding the timing requirements for the strapping pins, there are such parameters as *setup time* and *hold time*. For more information, see Table 2-3 and Figure 2-2.

**Table 2-3. Description of Timing Parameters for the Strapping Pins**

Parameter	Description	Min (ms)
$t_{SU}$	<i>Setup time</i> is the time reserved for the power rails to stabilize before the CHIP_PU pin is pulled high to activate the chip.	0
$t_H$	<i>Hold time</i> is the time reserved for the chip to read the strapping pin values after CHIP_PU is already high and before these pins start operating as regular IO pins.	3

Figure 2-2. Visualization of Timing Parameters for the Strapping Pins

### 2.3.1 Chip Boot Mode Control

GPIO0 and GPIO46 control the boot mode after the reset is released. See Table 2-4 Chip Boot Mode Control.

Table 2-4. Chip Boot Mode Control

Boot Mode	GPIO0	GPIO46
Default Configuration	1 (Pull-up)	0 (Pull-down)
<b>SPI Boot</b> (default)	1	Any value
<b>Download Boot</b>	0	0
Invalid combination <sup>1</sup>	0	1

<sup>1</sup> This combination triggers unexpected behavior and should be avoided.

### 2.3.2 VDD\_SPI Voltage Control

The required VDD\_SPI voltage for ESP32-S3-PICO-1 can be found in Table 1-1 Comparison.

Depending on the value of EFUSE\_VDD\_SPI\_FORCE, the voltage can be controlled in two ways.

Table 2-5. VDD\_SPI Voltage Control

EFUSE_VDD_SPI_FORCE	GPIO45	eFuse <sup>1</sup>	Voltage	VDD_SPI power source <sup>2</sup>

		1	3.3 V	VDD3P3_RTC via $R_{SPI}$

<sup>1</sup> eFuse: EFUSE\_VDD\_SPI\_TIEH

<sup>2</sup> See [ESP32-S3 Series Datasheet](#) > Section *Power Scheme*

### 2.3.3 ROM Messages Printing Control

During boot process the messages by the ROM code can be printed to:

- (Default) UART and USB Serial/JTAG controller.
- USB Serial/JTAG controller.
- UART.

The ROM messages printing to UART or USB Serial/JTAG controller can be respectively disabled by configuring registers and eFuse. For detailed information, please refer to [ESP32-S3 Technical Reference Manual](#) > Chapter *Chip Boot Control*.

### 2.3.4 JTAG Signal Source Control

The strapping pin GPIO3 can be used to control the source of JTAG signals during the early boot process. This pin does not have any internal pull resistors and the strapping value must be controlled by the external circuit that cannot be in a high impedance state.

As Table 2-6 shows, GPIO3 is used in combination with EFUSE\_DIS\_PAD\_JTAG, EFUSE\_DIS\_USB\_JTAG, and EFUSE\_STRAP\_JTAG\_SEL.

## 3 Electrical Characteristics

### 3.1 Absolute Maximum Ratings

Stresses above those listed in Table 3-1 *Absolute Maximum Ratings* may cause permanent damage to the device. These are stress ratings only and normal operation of the device at these or any other conditions beyond those indicated in Section 3.2 *Recommended Power Supply Characteristics* is not implied. Exposure to absolute-maximum-rated conditions for extended periods may affect device reliability.

Table 3-1. Absolute Maximum Ratings

Parameter	Description	Min	Max	Unit
VDDA, VDD3P3, VDD3P3_RTC, VDD3P3_CPU, VDD_SPI	Allowed input voltage	-0.3	3.6	V
$I_{output}^1$	Cumulative IO output current	—	1500	mA
$T_{STORE}$	Storage temperature	-40	150	°C

<sup>1</sup> The product proved to be fully functional after all its IO pins were pulled high while being connected to ground for 24 consecutive hours at ambient temperature of 25 °C.

### 3.2 Recommended Power Supply Characteristics

## 3.6 Current Consumption

### 3.6.1 RF Current Consumption in Active Mode

The current consumption measurements are taken with a 3.3 V supply at 25 °C of ambient temperature at the RF port. All transmitters' measurements are based on a 100% duty cycle.

**Table 3-7. Current Consumption for Wi-Fi (2.4 GHz) in Active Mode**

Work Mode	RF Condition	Description	Peak (mA)
Active (RF working)	TX	802.11b, 1 Mbps, DSSS @ 20.0dBm	350

The content below is excerpted from *Section Power Consumption in Other Modes* in [ESP32-S3 Series Datasheet](#).

### 3.6.2 Current Consumption in Other Modes

Please note that since the SiP has in-package PSRAM, the current consumption might be higher compared to the measurements below.

<sup>1</sup> Current consumption when all peripheral clocks are **disabled**.

<sup>2</sup> Current consumption when all peripheral clocks are **enabled**. In practice, the current consumption might be different depending on which peripherals are enabled.

<sup>3</sup> In Modem-sleep mode, Wi-Fi is clock gated, and the current consumption might be higher when accessing flash. For a flash rated at 80 Mbit/s, in SPI 2-line mode the consumption is 10 mA.

Table 3-9. Current Consumption in Low-Power Modes

Work mode	Description	Typ ( $\mu\text{A}$ )
Light-sleep <sup>1</sup>	VDD_SPI and Wi-Fi are powered down, and all GPIOs are high-impedance.	240
Deep-sleep	RTC memory and RTC peripherals are powered up.	8
	RTC memory is powered up. RTC peripherals are powered down.	7
Power off	CHIP_PU is set to low level. The SiP is shut down.	1

<sup>1</sup> In Light-sleep mode, all related SPI pins are pulled up. Please add corresponding PSRAM consumption values, e.g., 140  $\mu\text{A}$  for 8 MB 8-line PSRAM (3.3 V) and 40  $\mu\text{A}$  for 2 MB 4-line PSRAM (3.3 V).

# 4 Schematics

This is the reference designs of ESP32-S3-PICO-1.

Figure 4-1. ESP32-S3-PICO-1 Schematics

# 5 Peripheral Schematics

This is the typical application circuit of ESP32-S3-PICO-1 connected with peripheral components (for example, power supply, antenna, reset button, JTAG interface, and UART interface).

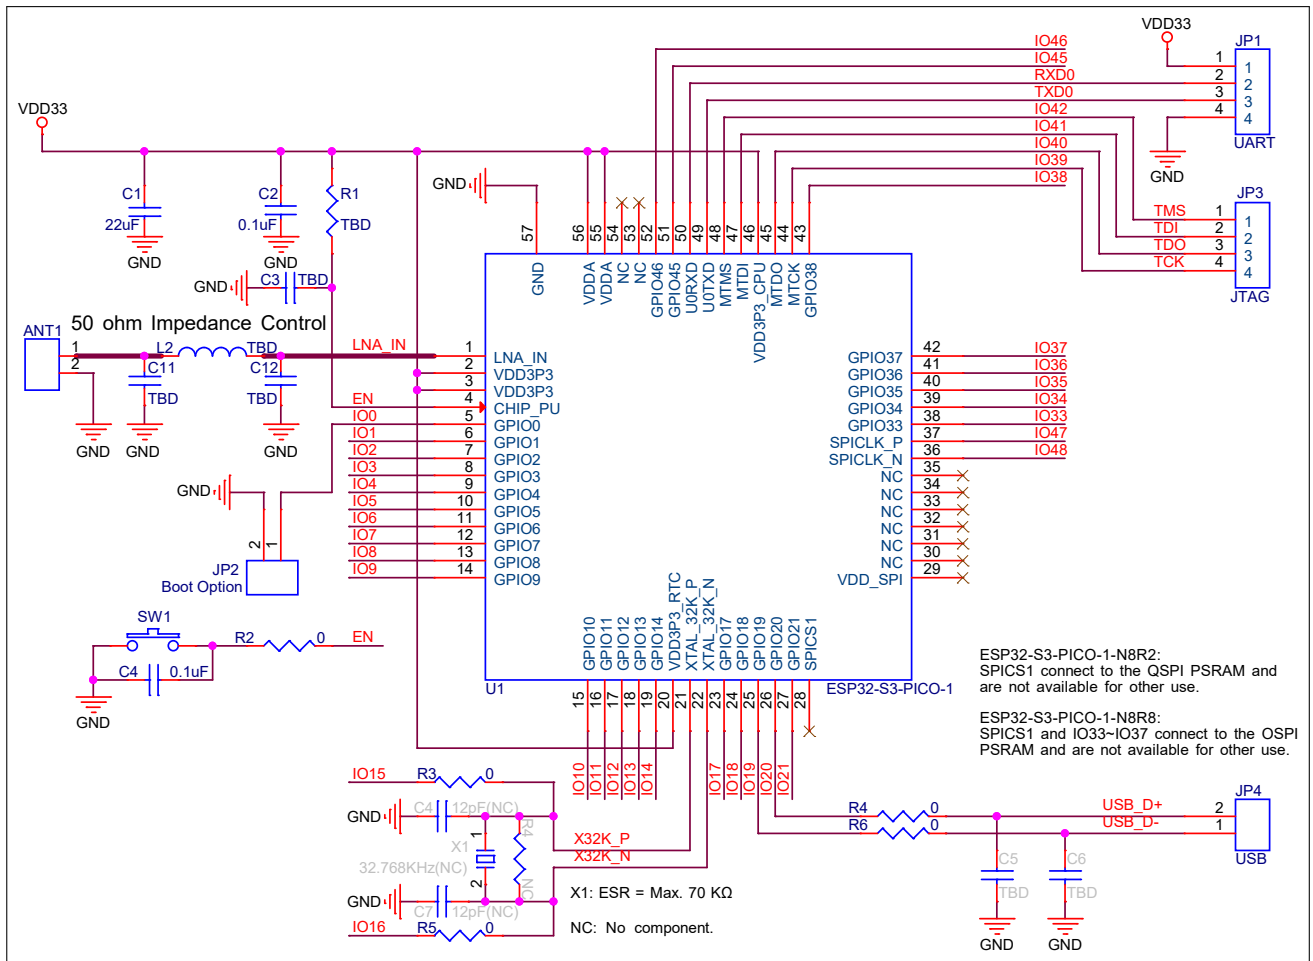

Figure 5-1. ESP32-S3-PICO-1 Peripheral Schematics

To ensure that the power supply to ESP32-S3-PICO-1 is stable during power-up, it is advised to add an RC delay circuit at the CHIP\_PU pin. The recommended setting for the RC delay circuit is usually  $R = 10\text{ k}\Omega$  and  $C = 1\text{ }\mu\text{F}$ . However, specific parameters should be adjusted based on the power-up timing of the SiP and the power-up and reset sequence timing of the chip. For ESP32-S3's power-up and reset sequence timing diagram, please refer to [ESP32-S3 Series Datasheet](#) > Section Power Supply.

## 7 Product Handling

### 7.1 Storage Conditions

The products sealed in moisture barrier bags (MBB) should be stored in a non-condensing atmospheric environment of  $< 40\text{ }^{\circ}\text{C}$  and  $/90\%\text{RH}$ . The SiP is rated at the moisture sensitivity level (MSL) of 3.

After unpacking, the SiP must be soldered within 168 hours with the factory conditions  $25\pm 5\text{ }^{\circ}\text{C}$  and  $/60\%\text{RH}$ . If the above conditions are not met, the SiP needs to be baked.

### 7.2 Reflow Profile

Solder the SiP in a single reflow.

Figure 7-1. Reflow Profile

### 7.3 Ultrasonic Vibration

Avoid exposing Espressif SiPs to vibration from ultrasonic equipment, such as ultrasonic welders or ultrasonic cleaners. This vibration may induce resonance in the in-SiP crystal and lead to its malfunction or even failure. As a consequence, **the SiP may stop working or its performance may deteriorate.**
