

**THE DATASHEET OF  
ICS853111AYLFT**

# LOW SKEW, 1-TO-10, DIFFERENTIAL-TO-LVPECL/ECL FANOUT BUFFER

ICS853111A

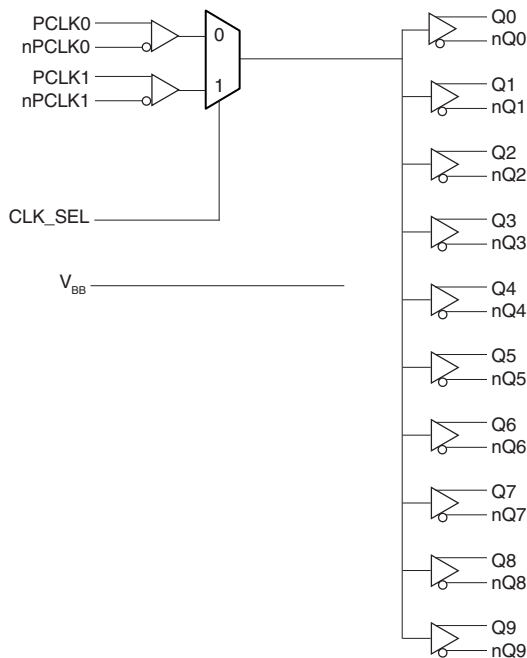

## GENERAL DESCRIPTION

 The ICS853111A is a low skew, high performance 1-to-10 Differential-to-2.5V/3.3V LVPECL/ECL Fanout Buffer and a member of the HiPerClockS™ family of High Performance Clock Solutions from IDT. The ICS853111A is characterized to operate from either a 2.5V, 3.3V or a 5V power supply. Guaranteed output and part-to-part skew characteristics make the ICS853111A ideal for those clock distribution applications demanding well defined performance and repeatability.

## FEATURES

- Ten differential LVPECL outputs
- Two selectable differential LVPECL PCLK/nPCLK clock inputs
- PCLK, nPCLK pairs can accept the following differential input levels: LVPECL, LVDS, CML, SSTL
- Maximum output frequency: >3GHz
- Translates any single ended input signal to 3.3V LVPECL levels with resistor bias on nPCLK input
- Additive phase jitter, RMS: <0.3ps (typical)
- Output skew: 23ps (typical)
- Part-to-part skew: 85ps (typical)
- Propagation delay: 705ps (typical)
- LVPECL mode operating voltage supply range:  $V_{CC} = 2.375V$  to  $5.25V$ ,  $V_{EE} = 0V$
- ECL mode operating voltage supply range:  $V_{CC} = 0V$ ,  $V_{EE} = -5.25V$  to  $-2.375V$
- $-40^{\circ}C$  to  $85^{\circ}C$  ambient operating temperature
- Available in both standard (RoHS 5) and lead-free (RoHS 6) packages

TABLE 1. PIN DESCRIPTIONS

Number	Name	Type		Description
1	V <sub>CC</sub>	Power		Positive supply pin.
2	CLK_SEL	Input	Pulldown	Clock select input. When HIGH, selects PCLK1, nPCLK1 inputs. When LOW, selects PCLK0, nPCLK0 inputs. LVCMOS / LVTTTL interface levels.
3	PCLK0	Input	Pulldown	Non-inverting differential clock input.
4	nPCLK0	Input	Pullup/Pulldown	Inverting differential LVPECL clock input. V <sub>CC</sub> /2 default when left floating.
5	V <sub>BB</sub>	Output		Bias voltage.
6	PCLK1	Input	Pulldown	Non-inverting differential clock input.
7	nPCLK1	Input	Pullup/Pulldown	Inverting differential LVPECL clock input. V <sub>CC</sub> /2 default when left floating.
8	V <sub>EE</sub>	Power		Negative supply pin.
9, 16, 25, 32	V <sub>CCO</sub>	Power		Output supply pins.
10, 11	nQ9, Q9	Output		Differential output pair. LVPECL interface levels.
12, 13	nQ8, Q8	Output		Differential output pair. LVPECL interface levels.
14, 15	nQ7, Q7	Output		Differential output pair. LVPECL interface levels.
17, 18	nQ6, Q6	Output		Differential output pair. LVPECL interface levels.
19, 20	nQ5, Q5	Output		Differential output pair. LVPECL interface levels.
21, 22	nQ4, Q4	Output		Differential output pair. LVPECL interface levels.
23, 24	nQ3, Q3	Output		Differential output pair. LVPECL interface levels.
26, 27	nQ2, Q2	Output		Differential output pair. LVPECL interface levels.
28, 29	nQ1, Q1	Output		Differential output pair. LVPECL interface levels.
30, 31	nQ0, Q0	Output		Differential output pair. LVPECL interface levels.

NOTE: Pullup and Pulldown refer to internal input resistors. See Table 2, Pin Characteristics, for typical values.

TABLE 2. PIN CHARACTERISTICS

Symbol	Parameter	Test Conditions	Minimum	Typical	Maximum	Units

$t_R/t_F$	Output Rise/Fall Time 20% to 80%	85	200	315	100	200	285	85	200	315	ps

All parameters are measured  $\leq 1GHz$  unless otherwise noted.

NOTE 1: Measured from the differential input crossing point to the differential output crossing point.

NOTE 2: Defined as skew between outputs at the same supply voltage and with equal load conditions.

Measured at the output differential cross points.

NOTE 3: Defined as skew between outputs on different devices operating at the same supply voltages and with equal load conditions. Using the same type of inputs on each device, the outputs are measured at the differential cross points.

NOTE 4: This parameter is defined in accordance with JEDEC Standard 65.

## ADDITIVE PHASE JITTER

The spectral purity in a band at a specific offset from the fundamental compared to the power of the fundamental is called the ***dBc Phase Noise***. This value is normally expressed using a Phase noise plot and is most often the specified plot in many applications. Phase noise is defined as the ratio of the noise power present in a 1Hz band at a specified offset from the fundamental frequency to the power value of the fundamental. This ratio is expressed in decibels (dBm) or a ratio of the power in the 1Hz

band to the power in the fundamental. When the required offset is specified, the phase noise is called a ***dBc*** value, which simply means dBm at a specified offset from the fundamental. By investigating jitter in the frequency domain, we get a better understanding of its effects on the desired application over the entire time record of the signal. It is mathematically possible to calculate an expected bit error rate given a phase noise plot.

As with most timing specifications, phase noise measurements has issues relating to the limitations of the equipment. Often the noise floor of the equipment is higher than the noise floor of the device. This is illustrated above. The device meets the noise floor

of what is shown, but can actually be lower. The phase noise is dependent on the input source and measurement equipment.

## APPLICATION INFORMATION

### WIRING THE DIFFERENTIAL INPUT TO ACCEPT SINGLE ENDED LVCMOS LEVELS

Figure 2A shows how the differential input can be wired to accept single ended levels. The reference voltage  $V_{REF} \approx V_{CC}/2$  is generated by the bias resistors R1, R2 and C1. This bias circuit should be located as close as possible to the input pin. The ratio

of R1 and R2 might need to be adjusted to position the  $V_{REF}$  in the center of the input voltage swing. For example, if the input clock swing is only 2.5V and  $V_{CC} = 3.3V$ ,  $V_{REF}$  should be 1.25V and  $R2/R1 = 0.609$ .

FIGURE 2A. SINGLE ENDED SIGNAL DRIVING DIFFERENTIAL INPUT

### WIRING THE DIFFERENTIAL INPUT TO ACCEPT SINGLE ENDED LVPECL LEVELS

Figure 2B shows an example of the differential input that can be wired to accept single ended LVPECL levels. The reference voltage level  $V_{BB}$  generated from the device is connected to the

negative input. The C1 capacitor should be located as close as possible to the input pin.

FIGURE 2B. SINGLE ENDED LVPECL SIGNAL DRIVING DIFFERENTIAL INPUT

## LVPECL CLOCK INPUT INTERFACE

The PCLK /nPCLK accepts LVPECL, CML, SSTL and other differential signals. Both  $V_{\text{SWING}}$  and  $V_{\text{OH}}$  must meet the  $V_{\text{PP}}$  and  $V_{\text{CMR}}$  input requirements. Figures 3A to 3E show interface examples for the HiPerClockS PCLK/nPCLK input driven by the most common driver types. The input interfaces suggested

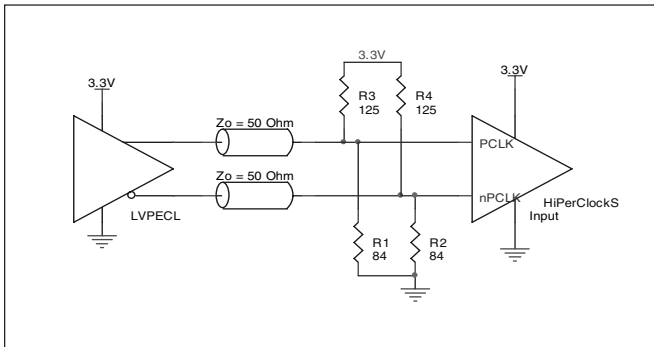

here are examples only. If the driver is from another vendor, use their termination recommendation. Please consult with the vendor of the driver component to confirm the driver termination requirements.

## RECOMMENDATIONS FOR UNUSED INPUT AND OUTPUT PINS

### INPUTS

#### PCLK/nPCLK INPUTS

For applications not requiring the use of a differential input, both the PCLK and nPCLK pins can be left floating. Though not required, but for additional protection, a 1k $\Omega$  resistor can be tied from PCLK to ground.

#### LVC MOS CONTROL PINS

All control pins have internal pull-ups or pull-downs; additional resistance is not required but can be added for additional protection. A 1k $\Omega$  resistor can be used.

### OUTPUTS

#### LVPECL OUTPUTS

All unused LVPECL outputs can be left floating. We recommend that there is no trace attached. Both sides of the differential output pair should either be left floating or terminated.

## TERMINATION FOR 3.3V LVPECL OUTPUTS

The clock layout topology shown below is a typical termination for LVPECL outputs. The two different layouts mentioned are recommended only as guidelines.

FOUT and nFOUT are low impedance follower outputs that generate ECL/LVPECL compatible outputs. Therefore, terminating resistors (DC current path to ground) or current sources must be used for functionality. These outputs are designed to drive 50 $\Omega$  transmission lines. Matched imped-

ance techniques should be used to maximize operating frequency and minimize signal distortion. *Figures 4A and 4B* show two different layouts which are recommended only as guidelines. Other suitable clock layouts may exist and it would be recommended that the board designers simulate to guarantee compatibility across all printed circuit and clock component process variations.

FIGURE 4A. LVPECL OUTPUT TERMINATION

FIGURE 4B. LVPECL OUTPUT TERMINATION

**TERMINATION FOR 2.5V LVPECL OUTPUT**

Figure 5A and Figure 5B show examples of termination for 2.5V LVPECL driver. These terminations are equivalent to terminating 50Ω to  $V_{cc} - 2V$ . For  $V_{cc} = 2.5V$ , the  $V_{cc} - 2V$  is very close to ground

level. The R3 in Figure 5B can be eliminated and the termination is shown in Figure 5C.

FIGURE 5A. 2.5V LVPECL DRIVER TERMINATION EXAMPLE

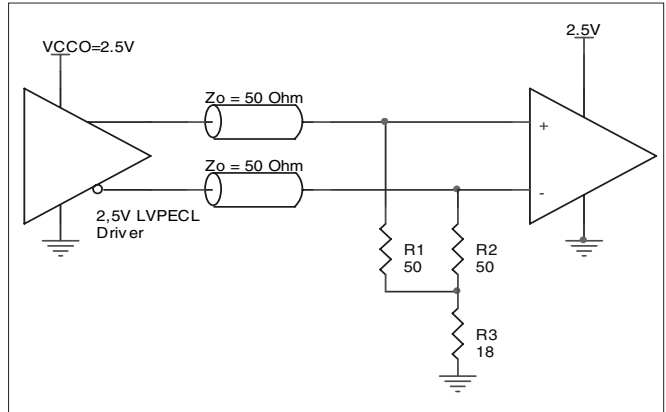

FIGURE 5B. 2.5V LVPECL DRIVER TERMINATION EXAMPLE

FIGURE 5C. 2.5V LVPECL TERMINATION EXAMPLE

**TERMINATION FOR 5V LVPECL OUTPUT**

This section shows examples of 5V LVPECL output termination. Figure 6A shows standard termination for 5V LVPECL. The termination requires matched load of 50Ω resistors pull down to

$V_{cc} - 2V = 3V$  at the receiver. Figure 6B shows Thevenin equivalence of Figure 6A. In actual application where the 3V DC power supply is not available, this approach is normally used.

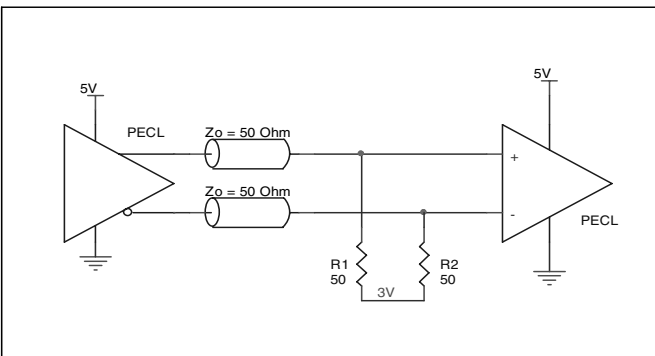

FIGURE 6A. STANDARD 5V LVPECL OUTPUT TERMINATION

FIGURE 6B. 5V LVPECL OUTPUT TERMINATION EXAMPLE

**SCHEMATIC EXAMPLE**

This application note provides general design guide using ICS853111A LVPECL buffer. *Figure 7* shows a schematic example of the ICS853111A LVPECL clock buffer. In this

example, the input is driven by an LVPECL driver. CLK\_SEL is set at logic low to select PCLK0/nPCLK0 input.

**FIGURE 7. EXAMPLE ICS853111A LVPECL CLOCK OUTPUT BUFFER SCHEMATIC**

## POWER CONSIDERATIONS

This section provides information on power dissipation and junction temperature for the ICS853111A. Equations and example calculations are also provided.

### 1. Power Dissipation.

The total power dissipation for the ICS853111A is the sum of the core power plus the power dissipated in the load(s). The following is the power dissipation for  $V_{CC} = 5.25V$ , which gives worst case results.

**NOTE:** Please refer to Section 3 for details on calculating power dissipated in the load.

- Power (core)<sub>MAX</sub> =  $V_{CC\_MAX} * I_{EE\_MAX} = 5.25V * 85mA = 446.3mW$
- Power (outputs)<sub>MAX</sub> = **30.94mW/Loaded Output pair**  
If all outputs are loaded, the total power is  $10 * 30.94mW = 309.4mW$

$$\text{Total Power}_{\_MAX} \text{ (3.8V, with all outputs switching)} = 446.3mW + 309.4mW = 755.7mW$$

### 2. Junction Temperature.

Junction temperature,  $T_j$ , is the temperature at the junction of the bond wire and bond pad and directly affects the reliability of the device. The maximum recommended junction temperature for HiPerClockS™ devices is 125°C.

The equation for  $T_j$  is as follows:  $T_j = \theta_{JA} * Pd\_total + T_A$

$T_j$  = Junction Temperature

$\theta_{JA}$  = junction-to-Ambient Thermal Resistance

$Pd\_total$  = Total Device Power Dissipation (example calculation is in section 1 above)

$T_A$  = Ambient Temperature

In order to calculate junction temperature, the appropriate junction-to-ambient thermal resistance  $\theta_{JA}$  must be used. Assuming a moderate air flow of 200 linear feet per minute and a multi-layer board, the appropriate value is 42.1°C/W per Table 6 below.

Therefore,  $T_j$  for an ambient temperature of 70°C with all outputs switching is:

$$70^\circ C + 0.547W * 42.1^\circ C/W = 93^\circ C. \text{ This is well below the limit of } 125^\circ C.$$

This calculation is only an example.  $T_j$  will obviously vary depending on the number of loaded outputs, supply voltage, air flow, and the type of board (single layer or multi-layer).

**TABLE 6. THERMAL RESISTANCE  $\theta_{JA}$  FOR 32-PIN LQFP FORCED CONVECTION**

$\theta_{JA}$ by Velocity (Linear Feet per Minute)			
	0	200	500
Single-Layer PCB, JEDEC Standard Test Boards	67.8°C/W	55.9°C/W	50.1°C/W
Multi-Layer PCB, JEDEC Standard Test Boards	47.9°C/W	42.1°C/W	39.4°C/W

**NOTE:** Most modern PCB designs use multi-layered boards. The data in the second row pertains to most designs.

### 3. Calculations and Equations.

The purpose of this section is to derive the power dissipated into the load.

LVPECL output driver circuit and termination are shown in *Figure 8*.

**FIGURE 8. LVPECL DRIVER CIRCUIT AND TERMINATION**

To calculate worst case power dissipation into the load, use the following equations which assume a 50Ω load, and a termination voltage of  $V_{CCO} - 2V$ .

- For logic high,  $V_{OUT} = V_{OH\_MAX} = V_{CCO\_MAX} - 0.935V$

$$(V_{CCO\_MAX} - V_{OH\_MAX}) = 0.935V$$

- For logic low,  $V_{OUT} = V_{OL\_MAX} = V_{CCO\_MAX} - 1.67V$

$$(V_{CCO\_MAX} - V_{OL\_MAX}) = 1.67V$$

$$Pd\_H = [(V_{OH\_MAX} - (V_{CCO\_MAX} - 2V))/R_L] * (V_{CCO\_MAX} - V_{OH\_MAX}) = [(2V - (V_{CCO\_MAX} - V_{OH\_MAX}))/R_L] * (V_{CCO\_MAX} - V_{OH\_MAX}) = [(2V - 0.935V)/50\Omega] * 0.935V = 19.92mW$$

$$Pd\_L = [(V_{OL\_MAX} - (V_{CCO\_MAX} - 2V))/R_L] * (V_{CCO\_MAX} - V_{OL\_MAX}) = [(2V - (V_{CCO\_MAX} - V_{OL\_MAX}))/R_L] * (V_{CCO\_MAX} - V_{OL\_MAX}) = [(2V - 1.67V)/50\Omega] * 1.67V = 11.02mW$$

$$\text{Total Power Dissipation per output pair} = Pd\_H + Pd\_L = 30.94mW$$

## RELIABILITY INFORMATION

TABLE 8  $\theta_{JA}$  vs. AIR FLOW TABLE FOR 32 LEAD LQFP

	$\theta_{JA}$ by Velocity (Linear Feet per Minute)		
	0	200	500
Single-Layer PCB, JEDEC Standard Test Boards	67.8°C/W	55.9°C/W	50.1°C/W
Multi-Layer PCB, JEDEC Standard Test Boards	47.9°C/W	42.1°C/W	39.4°C/W

**NOTE:** Most modern PCB designs use multi-layered boards. The data in the second row pertains to most designs.

### TRANSISTOR COUNT

The transistor count for ICS853111A is: 1340

Pin compatible with MC100EP111 and MC100LVEP111

PACKAGE OUTLINE AND DIMENSIONS - Y SUFFIX FOR 32 LEAD LQFP

TABLE 10. ORDERING INFORMATION

Part/Order Number	Marking	Package	Shipping Packaging	Temperature
853111AY	ICS853111AY	32 Lead LQFP	tray	-40°C to 85°C
853111AYT	ICS853111AY	32 Lead LQFP	1000 tape & reel	-40°C to 85°C
853111AYLF	ICS853111AYL	32 Lead "Lead-Free" LQFP	tray	-40°C to 85°C
853111AYFT	ICS853111AYL	32 Lead ""Lead-Free"" LQFP	1000 tape & reel	-40°C to 85°C

NOTE: Parts that are ordered with an "LF" suffix to the part number are the Pb-Free configuration and are RoHS compliant.

While the information presented herein has been checked for both accuracy and reliability, Integrated Device Technology, Incorporated (IDT) assumes no responsibility for either its use or for infringement of any patents or other rights of third parties, which would result from its use. No other circuits, patents, or licenses are implied. This product is intended for use in normal commercial and industrial applications. Any other applications such as those requiring high reliability or other extraordinary environmental requirements are not recommended without additional processing by IDT. IDT reserves the right to change any circuitry or specifications without notice. IDT does not authorize or warrant any IDT product for use in life support devices or critical medical instruments.

## REVISION HISTORY SHEET

Rev	Table	Page	Description of Change	Date
A		11 13 & 14	Corrected Figure 5C. Power Considerations - corrected Power(outputs) <sub>MAX</sub> from 30.2mW to 30.94mW, and revised Junction Temperature and Worst Case Power Dissipation equations.	10/31/03
B	T4A T4D T5	1 3 4 5 7 11 13 & 14	Features section - increased voltage range to 5.25V. Power Supply table - increased maximum V <sub>CC</sub> to 5.25V. Added 5V LVPECL DC Characteristics table. AC Characteristics table - increased V <sub>EE</sub> range to -5.25V to 2.375V, and V <sub>CC</sub> to 2.375V to 5.25V. Corrected Output Load AC Test Circuit Diagram, V <sub>EE</sub> range from "-1.8V to -0.375V" to "-3.25V to -0.375V". LVPECL clock Input Interface - added another CML driver diagram. Power Considerations - changed Power(core) <sub>max</sub> from 3.8V to 5.25V and recalculated equations.	4/28/04
B		3	Absolute Maximum Ratings, corrected Supply Voltage & Negative Supply Voltage from 4.6V & -4.6V to 6V & -6V.	5/14/04
B	T10	17	Ordering Information Table - added lead-free marking to part number. Updated datasheets.	7/6/07
C	T4B T4C, T4D T4E	3 4 5 12	LVPECL 3.3V DC Characteristics Table - corrected I <sub>IH</sub> max. from 150μA to 200μA; and I <sub>IL</sub> min. from -150μA to -200μA. LVPECL DC Characteristics Tables - corrected I <sub>IH</sub> max. from 150μA to 200μA; and I <sub>IL</sub> min. from -150μA to -200μA. ECL DC Characteristics Table - corrected I <sub>IH</sub> max. from 150μA to 200μA; and I <sub>IL</sub> min. from -150μA to -200μA. Added <i>Termination for 5V LVPECL Output</i> section.	10/25/07
