Single-ended Output Terminations

The singled-ended outputs of the ICS 932S422 default to a drive strength of 2 loads. The REF clocks can be turned down to 1-load strength via the SMBus. Suggested termination resistors are as follows for transmission lines with $Z_o = 50$ ohms:

| | |
|---|-----------------------------------|
| Single-ended outputs at 2-load strength (Power up default for all single-ended outputs) | Driving 1 load, $R_s = 33$ ohms |
| | Driving 2 loads, $R_s = 7.5$ ohms |
| Single-ended outputs at 1-load strength (REF clock only) | Driving 1 load, $R_s = 22$ ohms |

PD, Power Down

PD is an asynchronous active high input used to shut off all clocks cleanly prior to system power down. When PD is asserted, all clocks will be driven low before turning off the VCO. All clocks will start without glitches when PD is

| PD | CPU | CPU # | SRC | SRC# | PCIF/PCI | USB | REF | Note |
|----|-------------------|--------|-------------------|--------|----------|-------|-----------|------|
| 1 | Normal | Normal | Normal | Normal | 33MHz | 48MHz | 14.318MHz | 1 |
| 0 | Iref * 2 or Float | Float | Iref * 2 or Float | Float | Low | Low | Low | 1 |

Notes:

1. Refer to SMBus Byte 4 for additional information.

PD Assertion

PD should be sampled low by 2 consecutive CPU# rising edges before stopping clocks. All single ended clocks will be held low on their next high to low transition.

All differential clocks will be held high on the next high to low transition of the complimentary clock. If the control register determining to drive mode is set to 'tri-state', the differential pair will be stopped in tri-state mode, undriven.

When the drive mode corresponding to the CPU or SRC clock of interest is set to '0' the true clock will be driven high at 2 x Iref and the complementary clock will be tristated. If the control register is programmed to '1' both clocks will be tristated. See SMBus Byte 4 for additional information.

CPU, SRC and PCI Divider Ratios

REF Drive Strength Functionality

| Byte6, bit 4 | Byte 10, bit 1 | Byte 10, bit 0 | REF1 | REF0 |
|--------------|----------------|----------------|------|------|
| 0 | X | X | 1x | 1x |

| 1 | 1 | 1 | 2x | 2x |

PD De-assertion

The time from the de-assertion of PD or until power supply ramps to get stable clocks will be less than 1.8ms. If the drive mode control bit for PD tristate is programmed to '1' the stopped differential pair must first be driven high to a minimum of 200mV in less than 300µs of PD deassertion.
