- The relay is designed to monitor undervoltage (HRN3-80), phase loss, sequence and asymmetry in 3-phase network.
- Power supply from monitored circuit.
- **HRN3-80:** Monitors the drop below the lower voltage level (Umin).
- **HRN3-80:** The lower level of Umin is set in % of the selected range.
- Wide range of monitored voltage 208 – 480 V.
- Adjustable time delay (to eliminate short-term voltage drops).
- Measures true root mean square value of the voltage - TRUE RMS.
- Adjustable level of asymmetry with the option to turn it off.

Function

Undervoltage:

After connecting the device to the supply voltage, both LEDs on the panel will flash briefly.

If 3-phase voltage is connected to the monitoring relay and all conditions are met (correct voltage level, phase sequence and asymmetry), the output contact closes after the time delay t_1 elapsed.

During the time delay, the green „LED Un“ flashes, at the end of the delay „LED Un“ lights up continuously (OK state).

When the voltage drops below the lower level „Umin“ (HRN3-80 only), after the time delay t_2 has elapsed the green and red LEDs are lit. The output contact is open (fault state).

During the time delay t_2 , the red „LED S“ flashes quickly.

If the phase sequence is incorrect when the power supply is connected, after the time delay t_1 has elapsed the green and red LED flashes quickly. The output contact is open (fault state).

During the time delay t_1 , the green „LED Un“ flashes.

When the set phase asymmetry is exceeded, after the time delay t_2 has elapsed the green LED is lit and the red LED flashes briefly. The output contact is open (fault state).

During the time delay t_2 , the red „LED S“ flashes quickly.

In the event of phase failure, the output contact opens without a time delay t_2 (fault state), the green and red LEDs are lit.

The return from the fault state to the OK state occurs without a time delay.
