CMOS Static RAM 16K (2K x 8-Bit)

IDT6116SA
IDT6116LA

Features

- **High-speed access and chip select times**
  - *Military: 20/25/35/45/55/70/90/120/150ns (max.)*
  - *Industrial: 20/25/35/45ns (max.)*
  - *Commercial: 15/20/25/35/45ns (max.)*
- **Low-power consumption**
- **Battery backup operation**
  - *2V data retention voltage (LA version only)*
- **Produced with advanced CMOS high-performance technology**
- **CMOS process virtually eliminates alpha particle soft-error rates**
- **Input and output directly TTL-compatible**
- **Static operation: no clocks or refresh required**
- **Available in ceramic and plastic 24-pin DIP, 24-pin Thin Dip, 24-pin SOIC and 24-pin SOJ**
- **Military product compliant to MIL-STD-833, Class B**

Description

The IDT6116SA/LA is a 16,384-bit high-speed static RAM organized as 2K x 8. It is fabricated using IDT's high-performance, high-reliability CMOS technology.

Access times as fast as 15ns are available. The circuit also offers a reduced power standby mode. When $\overline{CS}$ goes HIGH, the circuit will automatically go to, and remain in, a standby power mode, as long as $\overline{CS}$ remains HIGH. This capability provides significant system level power and cooling savings. The low-power (LA) version also offers a battery backup data retention capability where the circuit typically consumes only 1µW to 4µW operating off a 2V battery.

All inputs and outputs of the IDT6116SA/LA are TTL-compatible. Fully static asynchronous circuitry is used, requiring no clocks or refreshing for operation.

The IDT6116SA/LA is packaged in 24-pin 600 and 300 mil plastic or ceramic DIP, 24-lead gull-wing SOIC, and 24-lead J-bend SOJ providing high board-level packing densities.

Military grade product is manufactured in compliance to the latest version of MIL-STD-883, Class B, making it ideally suited to military temperature applications demanding the highest level of performance and reliability.

NOTES:
1. Stresses greater than those listed under ABSOLUTE MAXIMUM RATINGS may cause permanent damage to the device. This is a stress rating only and functional operation of the device at these or any other conditions above those indicated in the operational sections of this specification is not implied. Exposure to absolute maximum rating conditions for extended periods may affect reliability.
2. V_{TERM} must not exceed V_{CC} +0.5V.

2. –55°C to +125°C temperature range only.
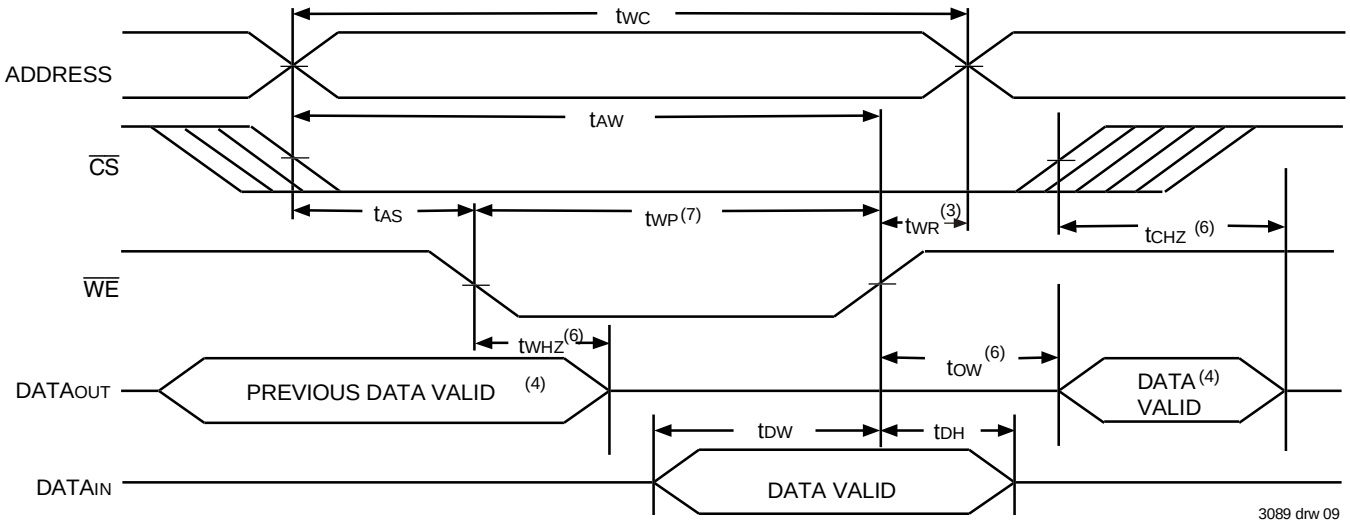
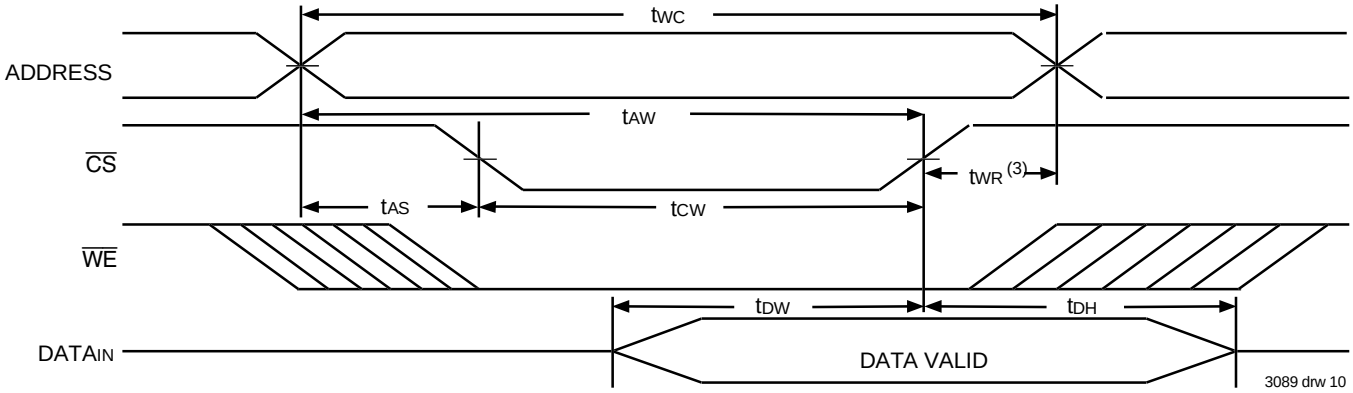
3. This parameter guaranteed with AC Load (Figure 2) by device characterization, but is not production tested.
4. The specification for t_{DH} must be met by the device supplying write data to the RAM under all operation conditions. Although t_{DH} and t_{OW} values will vary over voltage and temperature, the actual t_{DH} will always be smaller than the actual t_{OW}.

Timing Waveform of Write Cycle No. 1 ($\overline{WE}$ Controlled Timing)(1,2,5,7)



Timing Waveform of Write Cycle No. 2 ($\overline{CS}$ Controlled Timing)(1,2,3,5,7)



NOTES:
1. $\overline{WE}$ or $\overline{CS}$ must be HIGH during all address transitions.
2. A write occurs during the overlap of a LOW $\overline{CS}$ and a LOW $\overline{WE}$.
3. t_{WR} is measured from the earlier of $\overline{CS}$ or $\overline{WE}$ going HIGH to the end of the write cycle.
4. During this period, the I/O pins are in the output state and the input signals must not be applied.
5. If the $\overline{CS}$ LOW transition occurs simultaneously with or after the $\overline{WE}$ LOW transition, the outputs remain in the high-impedance state.
6. Transition is measured ±500mV from steady state.
7. $\overline{OE}$ is continuously HIGH. If $\overline{OE}$ is LOW during a $\overline{WE}$ controlled write cycle, the write pulse width must be the larger of t_{WP} or (t_{WHZ} + t_{DW}) to allow the I/O drivers to turn off and data to be placed on the bus for the required t_{DW}. If $\overline{OE}$ is HIGH during a $\overline{WE}$ controlled write cycle, this requirement does not apply and the write pulse is the specified t_{WP}. For a $\overline{CS}$ controlled write cycle, $\overline{OE}$ may be LOW with no degradation to t_{CW}.
