

## DESCRIPTION

Demonstration circuits 566A-A, -B and -C, feature the easy to use, rail-to-rail input and output LTC6910 series of Low Noise Programmable Gain Amplifier (PGA) parts. The inverting gain is set by changing the positions of three onboard jumpers: G0, G1 and G2 to set the 3-bit programming code. Demo Circuit 566A-A is for the LTC6910-1 with gains of 0, 1, 2, 5, 10, 20, 50, 100 V/V. Demo Circuit 566A-B is for the LTC6910-2 with gains of 1, 2, 4, 8, 16, 32, and 64 V/V. Demo Circuits 566A-C is for the LTC6910-3 with gains of 1, 2, 3, 4, 5, 6 and 7 V/V.

All three-demo boards have input jumpers to select between AC or DC coupling of the input, and a jumper to select operation with a single or dual supply. Typical applications include data acquisition systems, dynamic gain changing, automatic ranging circuits and automatic gain control. The LTC6910 family can op-

erate from single or split supplies from 2.7V to 10.5V total between V+ and V-.

**Design files for this circuit board are available. Call the LTC factory.**

**Table 1. Performance Summary (T<sub>A</sub> = 25°C)**

PARAMETER	CONDITION	VALUE
Supply Voltage Range	V+ to V-	2.7V to 10.5V
Gain Accuracy	Gain Dependent (see Data Sheet)	Typical ±0.05dB at Gain = 1 and ±0.4 dB at Gain = 100
Slew Rate	V <sub>S</sub> = ±2.5V, V <sub>OUT</sub> = ±1.4V	12V/μs
	V <sub>S</sub> = ±5V, V <sub>OUT</sub> = ±1.4V	16V/μs

Figure 4. Proper Measurement Equipment Setup

## QUICK START PROCEDURE

The 566 family of Demonstration boards allow for easy evaluation of the performance of the LTC6910 series of PGAs. Refer to Figure 4 for proper measurement equipment setup and follow the procedure given below:

1. Place jumpers in the following positions:

### Supply Jumper:

**SINGLE** for Single Supply

**DUAL** for Dual Supply

### Input Jumper (IN):

**DC** for DC Coupling

**AC** for AC Coupling

$$f_{-3dB} = 1/(2\pi C_7 R_{INPUT})$$

$C_7 = 10\mu\text{F}$ ,  $R_{INPUT}$  is the nominal input impedance and depends on the gain setting, see Table 2, 3, or 4.

The jumper settings given in this procedure set the gain to a value of  $-1$  (the LTC6910-X is an inverting amplifier), for other gain values refer to Gain Table 2, 3 or 4 which matches the Demo Circuit, 566-A, -B, or -C. To set the gain to a value of  $-1$  set:

**G0:** Set to **Logic 1**

**G1:** Set to **Logic 0**

**G2:** Set to **Logic 0**

2. With the power off, connect the input power supply to V+, V- and AGND as required.

**NOTE:** Make sure that the input voltage does not exceed 11V total between V+ and V-.

3. Set a function generator to output a 1kHz 1V<sub>p-p</sub> signal.
4. Set the input jumper to give the desired input coupling, AC or DC.

## DIGITALLY CONTROLLED PROGRAMMABLE GAIN AMPLIFIER

5. Turn on the power supply and connect the signal generator to the IN BNC, or turrets as shown in Figure 4.
6. Monitor the output (BNC or test point) with an oscilloscope to observe a 1kHz 1V<sub>p-p</sub> signal.
7. Using Tables 2, 3 or 4 set the gain as desired and set the input to within the nominal linear input range. Example: For a dual 5V supply operation and a gain equal to five, the input to an LTC6910-1 should be set equal to or less than 2V<sub>p-p</sub> (see Table 2).

**Table 2. DC566A–A Gain Settings And Properties LTC6910-1**

G2	G1	G0	NOMINAL VOLTAGE GAIN		NOMINAL LINEAR INPUT RANGE (V <sub>p-p</sub> )			NOMINAL INPUT IMPEDANCE (K $\Omega$ )
