### GENERAL DESCRIPTION

The [ADG726/ADG732](#) are monolithic, complementary metal oxide semiconductor (CMOS) 32-channel and dual 16-channel analog multiplexers. The [ADG732](#) switches one of 32 inputs (S1 to S32) to a common output, D, as determined by the 5-bit binary address lines A0, A1, A2, A3, and A4. The [ADG726](#) switches one of 16 inputs as determined by the 4-bit binary address lines A0, A1, A2, and A3.

On-chip latches facilitate microprocessor interfacing. The [ADG726](#) may also be configured for differential operation by tying  $\overline{CSA}$  and  $\overline{CSB}$  together. An  $\overline{EN}$  input is used to enable or disable the devices. When disabled, all channels are switched off.

These multiplexers are designed on an enhanced submicron process that provides low power dissipation yet gives high switching speed, very low on resistance, and leakage currents. They operate from a single supply of +1.8 V to +5.5 V and a ±2.5 V dual supply, making them ideally suited to a variety of applications. On resistance is in the region of a few ohms and is

closely matched between switches and very flat over the full signal range. These devices can operate equally well as either multiplexers or demultiplexers and have an input signal range that extends to the supplies. In the off condition, signal levels up to the supplies are blocked. All channels exhibit break-before-make switching action, preventing momentary shorting when switching channels.

The [ADG726/ADG732](#) are available in a 48-lead LFCSP or a 48-lead TQFP. For functionally equivalent devices with serial interface, see the [ADG725/ADG731](#).

### PRODUCT HIGHLIGHTS

- +1.8 V to +5.5 V single- or ±2.5 V dual-supply operation. These devices are specified and guaranteed with +5 V ± 10%, +3 V ± 10% single-supply, and ±2.5 V ± 10% dual-supply rails.
- An on resistance of 4 Ω.
- Guaranteed break-before-make switching action.
- 48-lead LFCSP package or 48-lead TQFP package.

<sup>1</sup> See Figure 3.

<sup>2</sup> All input signals are specified with t<sub>r</sub> = t<sub>f</sub> = 1 ns (10% to 90% of V<sub>DD</sub>).

<sup>3</sup> Guaranteed by design and characterization, not production tested.

Figure 3. Timing Diagram

Figure 3 shows the timing sequence for latching the switch address and enable inputs. The latches are level sensitive; therefore, while  $\overline{WR}$  is held low, the latches are transparent and the switches respond to changing the address and enable the inputs.

Input data is latched on the rising edge of  $\overline{WR}$ . The ADG726 has two  $\overline{CS}$  inputs. This enables the device to be used either as a dual 16-to-1 channel multiplexer or a differential 16-channel multiplexer. If a differential output is required, tie  $\overline{CSA}$  and  $\overline{CSB}$  together.
