i.MX 93 Applications Processors Data Sheet for Commercial Products

Rev. 7 — 12 February 2026

Product data sheet

- For functional characteristics and the programming model, see *i.MX 93 Applications Processor Reference Manual* (IMX93RM).

1 i.MX 93 introduction

The i.MX 93 family represents NXP’s latest power-optimized processors for smart home, building control, contactless HMI, IoT edge, Automotive, and Industrial applications.

The i.MX 93 includes powerful dual Arm® Cortex®-A55 processors with speeds up to 1.7 GHz integrated with a NPU that accelerates machine learning inference. A general-purpose Arm® Cortex®-M33 running up to 250 MHz is for real-time and low-power processing. Robust control networks are possible via CAN-FD interface. Also, dual 1 Gbps Ethernet controllers, one supporting Time Sensitive Networking (TSN), drive gateway applications with low latency.

The i.MX 93 Commercial qualified part is particularly useful for applications such as:

- Home automation
- Smart home hub/hue bridge
- Audio sounder-bar
- Smart doorbell
- Smart lock
- Smart thermostat
- Smart docking station

Table 1. Features

Subsystem	Features
Cortex®-A55 MPCore platform	Two Cortex®-A55 processors operating up to 1.7 GHz <ul style="list-style-type: none"> • 32 KB L1 Instruction Cache • 32 KB L1 Data Cache • 64 KB per-core L2 cache • Media Processing Engine (MPE) with Arm® Neon™ technology supporting the Advanced Single Instruction Multiple Data architecture • Floating Point Unit (FPU) with support of the Arm® VFPv4-D16 architecture
	Supports of 64-bit Arm® v8.2-A architecture
	256 KB cluster L3 cache
	Parity/ECC protection on L1 cache, L2 cache, and TLB RAMs
Cortex®-M33 core platform	<ul style="list-style-type: none"> • Stand by monitoring with Cortex®-A55 and other high-power modules power gated
	Cortex®-M33 CPU operating up to 250 MHz <ul style="list-style-type: none"> • Supports FPU • Supports MPU • Supports NVIC • Supports FPB • Supports DWT and ITM

Table continues on the next page...

Table 1. Features ...continued

Subsystem	Features
	<ul style="list-style-type: none"> • Two-way set-associative 16 KB System Cache with parity support • Two-way set-associative 16 KB Code Cache with parity support • 256 KB tightly coupled memory (TCM)
Neural Processing Unit (NPU)	<p>Neural Network performance (256 MACs operating up to 1.0 GHz and 2 OPS/MAC)</p> <ul style="list-style-type: none"> • NPU targets 8-bit and 16-bit integer RNN • Handles 8-bit weights
Image Sensor Interface (ISI)	<ul style="list-style-type: none"> • Standard pixel formats commonly used in many camera input protocols • Programmable resolutions up to 2K • Image processing for: <ul style="list-style-type: none"> — Supports one source of up to 2K horizontal resolution — Supports pixel rate up to 200 Mpixel/s • Image down scaling via decimation and bi-phase filtering • Color space conversion • Interlaced to progressive conversions
On-chip memory	Boot ROM (256 KB) for Cortex [®] -A55
	Boot ROM (256 KB) for Cortex [®] -M33
	On-chip RAM (640 KB)
External memory interface	<p>16-bit DRAM interface:</p> <ul style="list-style-type: none"> • LPDDR4X/LPDDR4 with inline ECC • Supports up to 2 Gbyte DDR memory space
	<p>Three Ultra Secure Digital Host Controller (uSDHC) interfaces:</p> <ul style="list-style-type: none"> • One eMMC 5.1 (8-bit) compliance with HS400 DDR signaling to support up to 400 MB/sec • One SDXC (4-bit, no eMMC5.1, with extended capacity) • One SDIO (4-bit, SD/SDIO 3.01 compliance with 200 MHz SDR signaling and up to 100 MB/sec)
	<p>FlexSPI Flash with support for XIP (for Cortex[®]-A55 in low-power mode) and support for either one Octal SPI or Quad SPI FLASH device. It also supports both Serial NOR and Serial NAND flash using the FlexSPI.</p>
Pixel Pipeline (PXP)	<ul style="list-style-type: none"> • BitBlit • Flexible image composition options—alpha, chroma key • Porter-Duff operation

Table continues on the next page...

Table 1. Features ...continued

Subsystem	Features
	<ul style="list-style-type: none"> • Image rotation (90°, 180°, 270°) • Image resize • Color space conversion • Multiple pixel format support (RGB, YUV444, YUV422, YUV420, YUV400) • Standard 2D-DMA operation
LCDIF Display Controller	<p>The LCDIF can drive any of three displays:</p> <ul style="list-style-type: none"> • MIPI DSI: up to 1920x1200p60 • LVDS Tx: up to 1366x768p60 or 1280x800p60 • Parallel display: up to 1366x768p60 or 1280x800p60
MIPI CSI-2 Interface	<p>One 2-lane MIPI CSI-2 camera input:</p> <ul style="list-style-type: none"> • Complaint with MIPI CSI-2 specification v1.3 and MIPI D-PHY specification v1.2 • Supports up to 2 Rx data lanes (plus 1 Rx clock lane) • Supports 80 Mbps – 1.5 Gbps per lane data rate in high speed operation • Supports 10 Mbps data rate in low power operation
MIPI DSI Interface	<p>One 4-lane MIPI DSI display with data supplied by the LCDIF</p> <ul style="list-style-type: none"> • Compliant with MIPI DSI specification v1.2 and MIPI D-PHY specification v1.2 • Capable of resolutions achievable with a 200 MHz pixel clock and active pixel rate of 140 Mpixel/s with 24-bit RGB. • Supports 80 Mbps—1.5 Gbps data rate per lane in high speed operation • Supports 10 Mbps data rate in low power operation
Audio	<ul style="list-style-type: none"> • Three SAI interfaces: <ul style="list-style-type: none"> — SAI1 supports 2 lanes TX and 1 lane RX — SAI2 supports 4 lanes TX and RX — SAI3 supports 1 lane TX and RX — SAI2 and SAI3 support glue-less switching between PCM and stereo DSD operation • One SPDIF supports raw capture mode that can save all the incoming bits into audio buffer • 24-bit PDM supports up to 8-microphones (4 lanes)
GPIO and input/output multiplexing	General-purpose input/output (GPIO) modules with interrupt capability
	Input/output multiplexing controller (IOMUXC) to provide centralized pad control
Power management	Temperature sensor with programmable trip points

Table continues on the next page...

Table 1. Features ...continued

Subsystem	Features
	Flexible power domain partitioning with internal power switches to support efficient power management
Connectivity	<p>Two USB 2.0 controllers and PHYs interfaces</p> <p>Two Controller Area Network (FlexCAN) modules, each optionally supporting flexible data-rate (FD)</p> <p>Two Improved Inter Integrated Circuit (I3C) modules</p> <p>Two 32-pin FlexIO modules</p> <p>Three Ultra Secure Digital Host Controller (uSDHC) interfaces</p> <p>Two Ethernet controllers (capable of simultaneous operation):</p> <ul style="list-style-type: none"> • One Gigabit Ethernet controller with support for Energy Efficient Ethernet (EEE), Ethernet AVB, and IEEE 1588 • One Gigabit Ethernet controller with support for TSN in addition to EEE, Ethernet AVB, and IEEE 1588 <p>Eight Low Power SPI (LPSPi) modules</p> <p>Eight Low Power I2C modules</p> <p>Eight Low Power Universal Asynchronous Receiver/Transmitter (LPUART) modules:</p> <ul style="list-style-type: none"> • Programmable baud rates up to 5 Mbps <p>One Analog-to-Digital Converter (SAR ADC) module</p> <ul style="list-style-type: none"> • 12-bit 4-channel with 1 MS/s
Security	<p>Trusted Resource Domain Controller (TRDC)</p> <ul style="list-style-type: none"> • Supports 16 domains <p>Arm® TrustZone® (TZ) architecture, including both Trustzone-A and Trustzone-M</p> <p>On-chip RAM (OCRAM) secure region protection using OCRAM controller</p> <p>EdgeLock® secure enclave</p> <p>Battery Backed Security Module (BBSM)</p> <ul style="list-style-type: none"> • Secure real-time clock (RTC)
System debug	<p>Arm® CoreSight™ debug and trace technology</p> <p>Embedded Trace FIFO (ETF) with 4 KB internal storage to provide trace buffering</p> <p>Unified trace capability for dual core Cortex®-A55 and Cortex®-M33 CPUs</p>

[1] Only support Low Drive mode

Figure 1 describes the part number nomenclature so that characteristics of a specific part number can be identified (for example, cores, frequency, temperature grade, fuse options, and silicon revision). The primary characteristic which describes which data sheet applies to a specific part is the temperature grade (junction) field.

- The i.MX 93 Applications Processors for Commercial Products Data Sheet (IMX93CEC) covers parts listed with a "D (Commercial temp)"
- The i.MX 93 Applications Processors for Industrial Products Data Sheet (IMX93IEC) covers parts listed with a "C (Industrial temp)"
- The i.MX 93 Applications Processors for Extended Industrial Products Data Sheet (IMX93XEC) covers parts listed with a "X (Extended Industrial temp)"
- The i.MX 93 Applications Processors for Automotive Products Data Sheet (IMX93AEC) covers parts listed with an "A (Automotive temp)"

Ensure to have the proper data sheet for specific part by verifying the temperature grade (junction) field and matching it to the proper data sheet. If there are any questions, visit the web page nxp.com/IMX or contact an NXP representative for details.

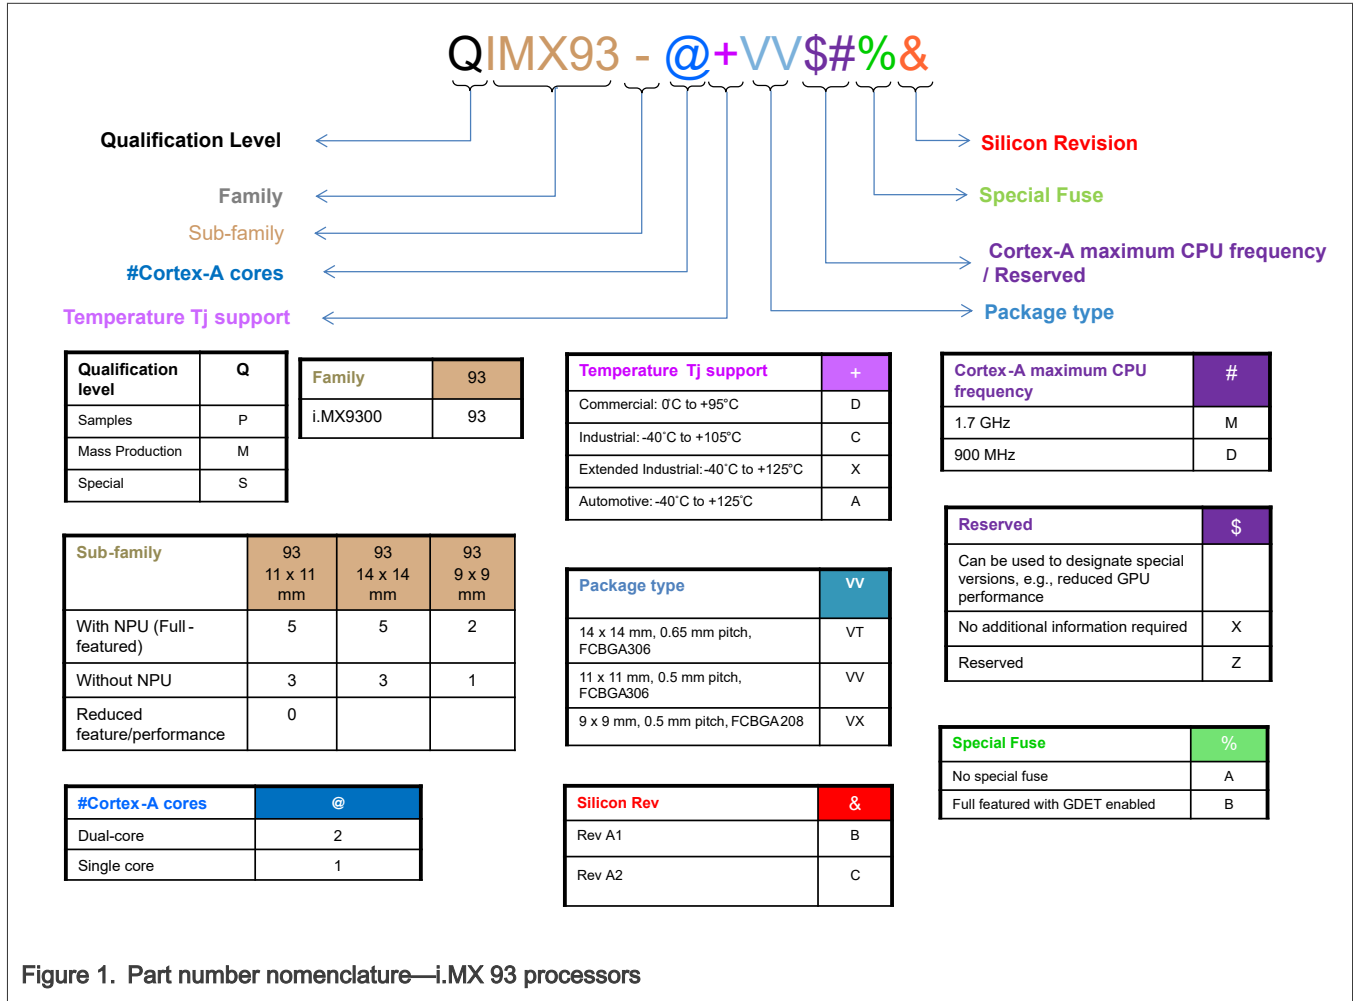

Figure 1. Part number nomenclature—i.MX 93 processors

2 Block diagram

Figure 2 shows the functional modules in the i.MX 93 processor system.^[1]

[1] Some modules shown in this block diagram are not offered on all derivatives. This block diagram may also show less modules than available in some derivatives. See Table 2 for details.

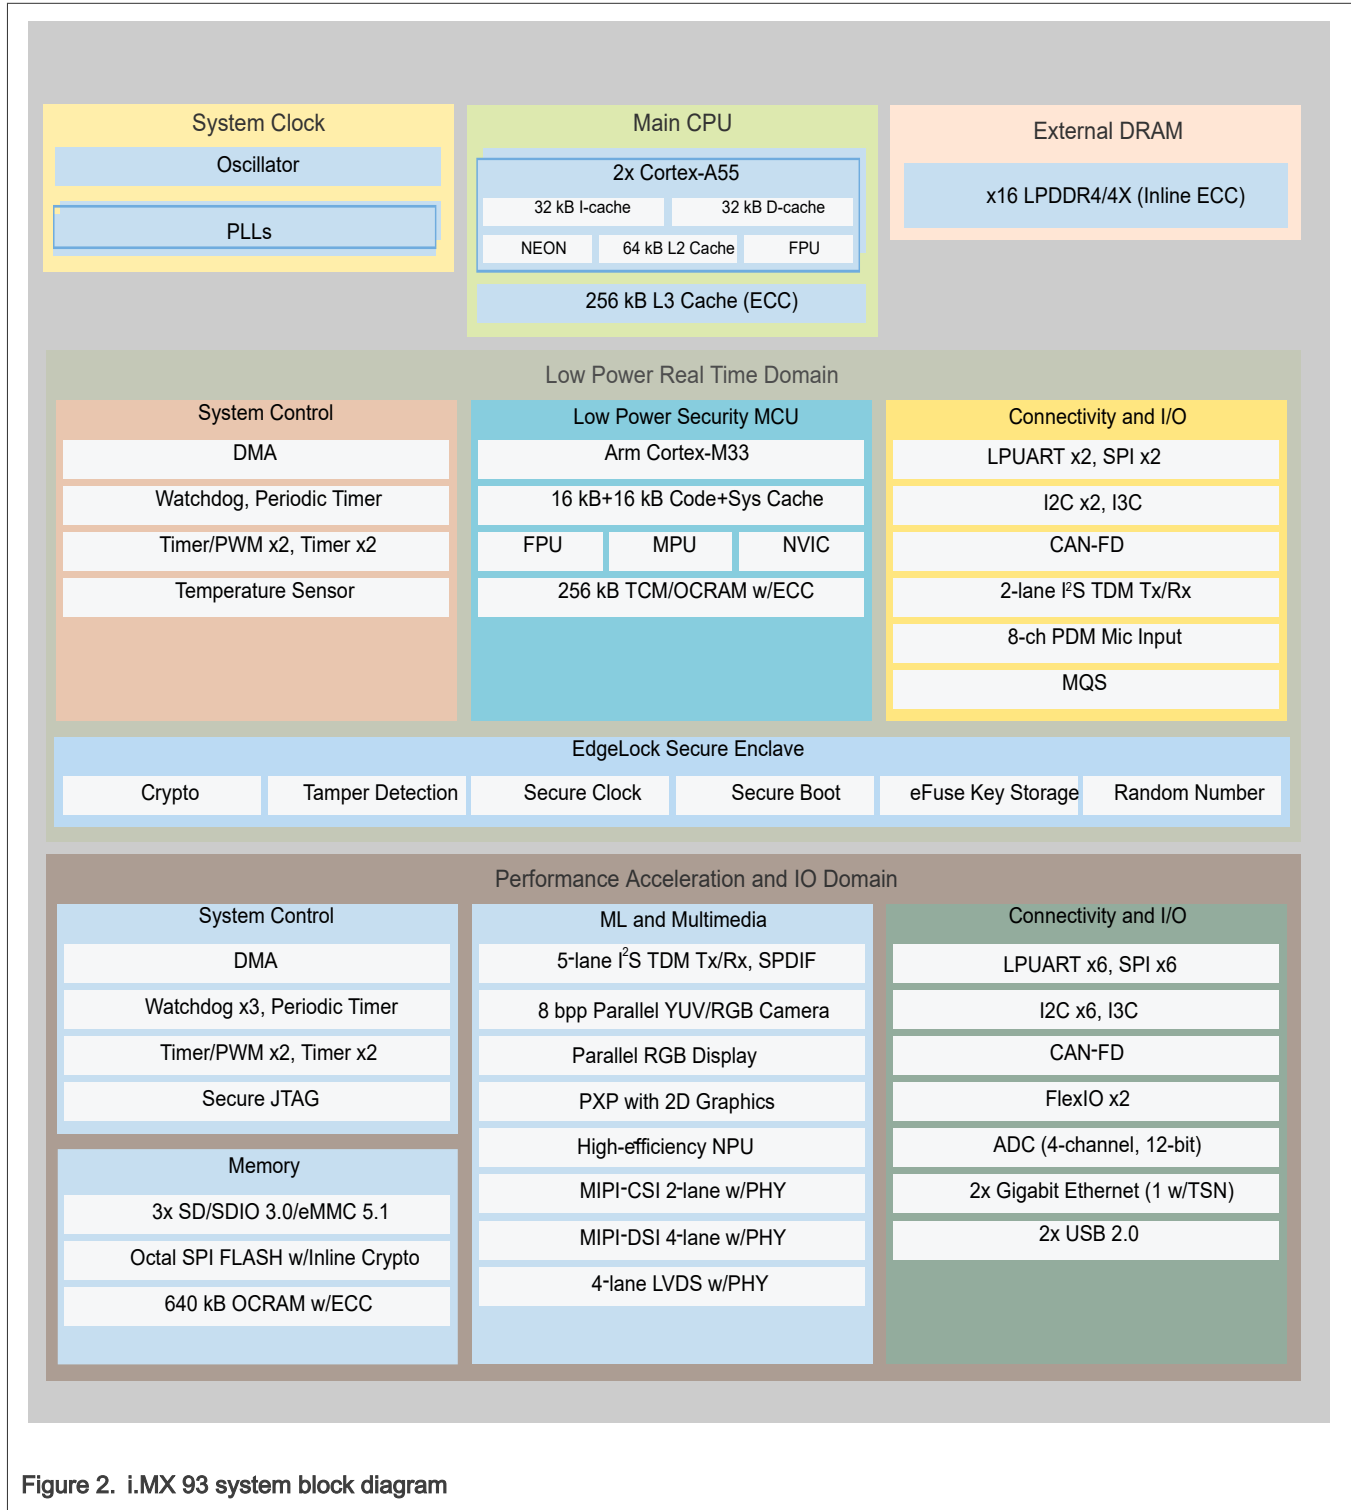

Figure 2. i.MX 93 system block diagram

3 Special signal considerations

Table 3 lists special signal considerations for the i.MX 93 processors. The signal names are listed in alphabetical order.

The package contact assignments can be found in [Package information and contact assignments](#). Signal descriptions are provided in the *i.MX 93 Reference Manual (IMX93RM)*.

Table 3. Special signal considerations

Signal Name	Remarks
CLKIN1/CLKIN2	CLKIN1 and CLKIN2 are input pins without internal pull-up and pull-down. An external 10K pull-down resistor is recommended if they are not used.
NC	These signals are No Connect (NC) and should be unconnected in the application.
ONOFF	A brief connection to GND in the OFF mode causes the internal power management state machine to change the state to ON. In the ON mode, a brief connection to GND generates an interrupt (intended to be a software-controllable power-down). A connection to GND for a period of time longer than the value configured in the BBNSM_CTRL[BTN_TIMEOUT] causes a forced OFF (PMIC_ON_REQ output “L”), as long as there is no pending RTC alarm event or tamper event.
POR_B	POR_B has no internal pull-up/down resistor, and requires external pull-up resistor to NVCC_BBSM_1P8. It is recommended that POR_B is properly handled during power up/down. Please see the EVK design for details.
RTC_XTALI/RTC_XTALO	To hit the exact oscillation frequency, the board capacitors must be reduced to account for the board and chip parasitics. The integrated oscillation amplifier is self-biasing, but relatively weak. Care must be taken to limit the parasitic leakage from RTC_XTALI and RTC_XTALO to either the power or the ground (> 100 MΩ). This de-biases the amplifier and reduces the start-up margin. If you want to feed an external low-frequency clock into RTC_XTALI, the RTC_XTALO pin must remain unconnected or driven by a complementary signal. The logic level of this forcing clock must not exceed the NVCC_BBSM_1P8 level and the frequency shall be < 50 kHz under the typical conditions.
XTALI_24M/XTALO_24M	The system requires 24 MHz on XTALI/XTALO. The crystal cannot be eliminated by an external 24 MHz oscillator. If this clock is used as a reference for USB, then there are strict frequency tolerance and jitter requirements. See Clock sources and relevant interface specifications chapters for details.

3.1 Unused input and output guidance

If a function of the i.MX 93 is not used, the I/Os and power rails of that function can be terminated to reduce overall board power. [Table 4](#) is recommended connectivities for LVDS and other digital I/Os. [Table 5](#) is recommended connectivities for MIPI. [Table 6](#) is recommended connectivities for USB.

Table 4. Unused function strapping recommendations

Function	Ball name	Recommendations if unused
ADC	ADC_IN0, ADC_IN1, ADC_IN2, ADC_IN3	Tie to ground
TAMPER	TAMPER0, TAMPER1	Tie to ground
LVDS	LVDS_CLK_P, LVDS_CLK_N, LVDS_Dx_P, LVDS_Dx_N	Not connected

Table continues on the next page...

Table 4. Unused function strapping recommendations ...continued

Function	Ball name	Recommendations if unused
	VDD_LVDS_1P8	Tie to ground through 10 K resistors without change
Digital I/O supplies	NVCC_GPIO, NVCC_WAKEUP, NVCC_AON, NVCC_SD2	Tie to ground through 10 KΩ resistors if entire bank is not used

Table 5. MIPI strapping recommendations

Function	Ball name	Recommendations
Only MIPI_CSI used	VDD_MIPI_0P8, VDD_MIPI_1P8	Supply
	MIPI_DSI1_CLK_P, MIPI_DSI1_CLK_N, MIPI_DSI1_Dx_P, MIPI_DSI1_Dx_N	Not connected
Only MIPI_DSI used	VDD_MIPI_0P8, VDD_MIPI_1P8	Supply
	MIPI_CSI1_CLK_P, MIPI_CSI1_CLK_N, MIPI_CSI1_Dx_P, MIPI_CSI1_Dx_N	Not connected
Neither MIPI_CSI nor MIPI_DSI used	VDD_MIPI_0P8, VDD_MIPI_1P8	Tie to ground
	MIPI_CSI1_CLK_P, MIPI_CSI1_CLK_N, MIPI_CSI1_Dx_P, MIPI_CSI1_Dx_N	Not connected
	MIPI_DSI1_CLK_P, MIPI_DSI1_CLK_N, MIPI_DSI1_Dx_P, MIPI_DSI1_Dx_N	Not connected
	MIPI_REXT	Tie to ground

Table 6. USB strapping recommendations

Function	Ball name	Recommendations
Only USB1 used	VDD_USB_3P3, VDD_USB_1P8, VDD_USB_0P8	Supply
	USB2_VBUS, USB2_D_P, USB2_D_N, USB2_ID, USB2_TXRTUNE	Not connected
Only USB2 used	VDD_USB_3P3, VDD_USB_1P8, VDD_USB_0P8	Supply
	USB1_VBUS, USB1_D_P, USB1_D_N, USB1_ID, USB1_TXRTUNE	Not connected
Neither USB1 nor USB2 used	VDD_USB_3P3, VDD_USB_1P8, VDD_USB_0P8	Tie to ground
	USB1_VBUS, USB1_D_P, USB1_D_N, USB1_ID, USB1_TXRTUNE	Not connected
	USB2_VBUS, USB2_D_P, USB2_D_N, USB2_ID, USB2_TXRTUNE	Not connected

4 Electrical characteristics

This section provides the device and module-level electrical characteristics for the i.MX 93 family of processors.

4.1 Chip-level conditions

This section provides the device-level electrical characteristics for the IC. See [Table 7](#) for a quick reference to the individual tables and sections.

Table 7. i.MX 93 chip-level conditions

For these characteristics, ...	Topic appears ...
Absolute maximum ratings	Absolute maximum ratings
Thermal resistance	Thermal resistance
Operating ranges	Operating ranges
Clock sources	Clock sources
Maximum supply currents	Maximum supply currents
Power modes	Power modes
Power supplies requirements and restrictions	Power supplies requirements and restrictions

4.1.1 Absolute maximum ratings

CAUTION

Stresses beyond those listed in the following table may reduce the operating lifetime or cause immediate permanent damage to the device. The table below does not imply functional operation beyond those indicated in the operating ranges and parameters table.

Table 8. Absolute maximum ratings

Parameter description	Symbol	Min	Max	Unit	Notes
Core supplies input voltages	VDD_SOC	-0.3	1.15	V	—
GPIO supply voltage	NVCC_GPIO, NVCC_WAKEUP, NVCC_AON	-0.3	3.8	V	—
I/O supply for SD2	NVCC_SD2	-0.3	3.8	V	—
DDR PHY supply voltage	VDD2_DDR	-0.3	1.575	V	—
DDR I/O supply voltage	VDDQ_DDR	-0.3	1.575	V	—
I/O supply and I/O Pre-driver supply for BBSM bank	NVCC_BBSM_1P8	-0.3	2.15	V	—
USB VBUS input detected	USB1_VBUS, USB2_VBUS	-0.3	3.95	V	—
Power for USB OTG PHY	VDD_USB_0P8	-0.3	1.15	V	—

Table continues on the next page...

Table 8. Absolute maximum ratings ...continued

Parameter description	Symbol	Min	Max	Unit	Notes
	VDD_USB_1P8	-0.3	2.15	V	—
	VDD_USB_3P3	-0.3	3.95	V	—
MIPI PHY supply voltage	VDD_MIPI_0P8	-0.3	1.15	V	—
	VDD_MIPI_1P8	-0.3	2.15	V	—
LVDS PHY supply voltage	VDD_LVDS_1P8	-0.3	2.15	V	—
Analog core supply voltage	VDD_ANA_0P8	-0.3	1.15	V	—
	VDD_ANAx_1P8	-0.3	2.15	V	[1]
Input/output voltage range [2]	V_{in}/V_{out}	-0.3	NVCC_XXX + 0.3	V	—
Storage temperature range	$T_{STORAGE}$	-40	150	°C	—

[1] VDD_ANAx_1P8 refers to VDD_ANA0_1P8, VDD_ANA1_1P8, and VDD_ANAVDET_1P8.

[2] Input and output voltages on the GPIO pins must remain within a minimum of -300 mV and a maximum of NVCC_XXX + 300 mV, where NVCC_XXX is the operational GPIO supply voltage at the SoC. These limits include any DC offsets from the driving device as well as any AC transients—such as overshoot or undershoot—occurring during signal switching.

Table 9. Electrostatic discharge and latch-up ratings

Parameter description		Rating	Reference	Comment
Electrostatic Discharge (ESD)	Human Body Model (HBM)	±1000 V	JS-001	—
	Charged Device Model (CDM)	±250 V	JS-002	—
Latch-up (LU)	Immunity level: • Class II @ 95 °C ambient temperature	A A	JESD78	—

4.1.2 Thermal resistance

4.1.2.1 11 x 11 mm FCBGA package thermal characteristics

Table 10 displays the 11 x 11 mm FCBGA package thermal resistance data.

Table 10. 11 x 11 mm FCBGA thermal resistance data

Rating	Board Type ^[1]	Symbol	Values	Unit
Junction to Ambient Thermal Resistance ^[2]	JESD51-9, 2s2p	$R_{\theta JA}$	22.5	°C/W
Junction-to-Top of Package	JESD51-9, 2s2p	Ψ_{JT}	0.1	°C/W

Table continues on the next page...

Table 10. 11 x 11 mm FCPBGA thermal resistance data ...continued

Rating	Board Type ^[1]	Symbol	Values	Unit
Thermal Characterization parameter ^[3]				
Junction to Case Thermal Resistance ^[3]	JESD51-9, 1s	R _{θJC}	6.4	°C/W

- [1] Thermal test board meets JEDEC specification for this package (JESD51-9). Test board has 40 vias under die shadow mapped according to BGA layout under die. Each via is 0.2 mm in diameter and connects top layer with the first buried plane layer.
- [2] Determined in accordance to JEDEC JESD51-2A natural convection environment. Thermal resistance data in this report is solely for a thermal performance comparison of one package to another in a standardized specified environment. It is not meant to predict the performance of a package in an application-specific environment.
- [3] Junction-to-Case thermal resistance determined using an isothermal cold plate. Case temperature refers to the package top side surface temperature.

4.1.2.2 9 x 9 mm FCBGA package thermal characteristics

Table 11 displays the 9 x 9 mm FCBGA package thermal resistance data.

Table 11. 9 x 9 mm FCPBGA thermal resistance data

Rating	Board Type ^[1]	Symbol	Values	Unit
Junction to Ambient Thermal Resistance ^[2]	JESD51-9, 2s2p	R _{θJA}	23.5	°C/W
Junction-to-Top of Package Thermal Characterization parameter ^[3]	JESD51-9, 2s2p	Ψ _{JT}	0.1	°C/W
Junction to Case Thermal Resistance ^[3]	JESD51-9, 1s	R _{θJC}	5.2	°C/W

- [1] Thermal test board meets JEDEC specification for this package (JESD51-9). Test board has 40 vias under die shadow mapped according to BGA layout under die. Each via is 0.2 mm in diameter and connects top layer with the first buried plane layer.
- [2] Determined in accordance to JEDEC JESD51-2A natural convection environment. Thermal resistance data in this report is solely for a thermal performance comparison of one package to another in a standardized specified environment. It is not meant to predict the performance of a package in an application-specific environment.
- [3] Junction-to-Case thermal resistance determined using an isothermal cold plate. Case temperature refers to the package top side surface temperature.

4.1.3 Power architecture

The i.MX power architecture is designed with the expectation that a dedicated PMIC supplies all required power rails, ensuring compliance with stringent power-up and power-down sequencing requirements. While discrete component-based implementations are technically viable, they typically lead to increased BOM cost, greater design complexity, and a larger PCB footprint. In contrast, the proposed PMIC solution is BOM-optimized, minimizes board area by integrating multiple power functions into a single package, and simplifies system design by providing a validated, production-tested power management solution that inherently meets the voltage and sequencing specifications of the i.MX platform.

NVCC_BBSM_1P8 must be powered first and stay until the last.

The digital logic inside chip will be supplied with VDD_SOC, which can be nominal or overdrive voltage or a "Low Drive" voltage.

The DRAM controller and PHY have multiple external power supplies:

Table 12. Power supplies of the DRAM controller and PHY

Power supplies	Modules
VDD_SOC	SoC synthesized DRAM controller digital logic
VDD_ANA_0P8	DRAM PLL and PHY digital logic
VDD_ANAx_1P8	DRAM PLL and PHY analog circuitry

Table continues on the next page...

Table 12. Power supplies of the DRAM controller and PHY...*continued*

Power supplies	Modules
VDD2_DDR	1.1 V DRAM PHY I/O supply
VDDQ_DDR	0.6 V DRAM PHY I/O supply for LPDDR4X

For all the integrated analog modules, their 1.8 V analog power will be supplied externally through power pads. These supplies are separated with other power pads on the package to keep them clean, but they can be directly shared with other power rails on the board to reduce the number of power supplies from the PMIC.

For the integrated LVDS PHY, MIPI PHY, and USB PHYs, their 3.3 V (where supported), 1.8 V, and digital power will be supplied externally through power pads. The powers to those PHYs are separated with other power pads on the package to keep them clean, but they can be directly shared with other power rails on the board to reduce the number of power supplies from the PMIC.

For BBSM/RTC, the 1.8 V I/O pre-driver supply and 1.8 V I/O pad supply will also be supplied externally. The BBSM_LP core digital domain logic is supplied by an internal LDO.

[Figure 3](#) is the power architecture diagram for the whole chip. Note that it only shows power supplies, and does not show capacitors that may be required for internal LDO regulators.

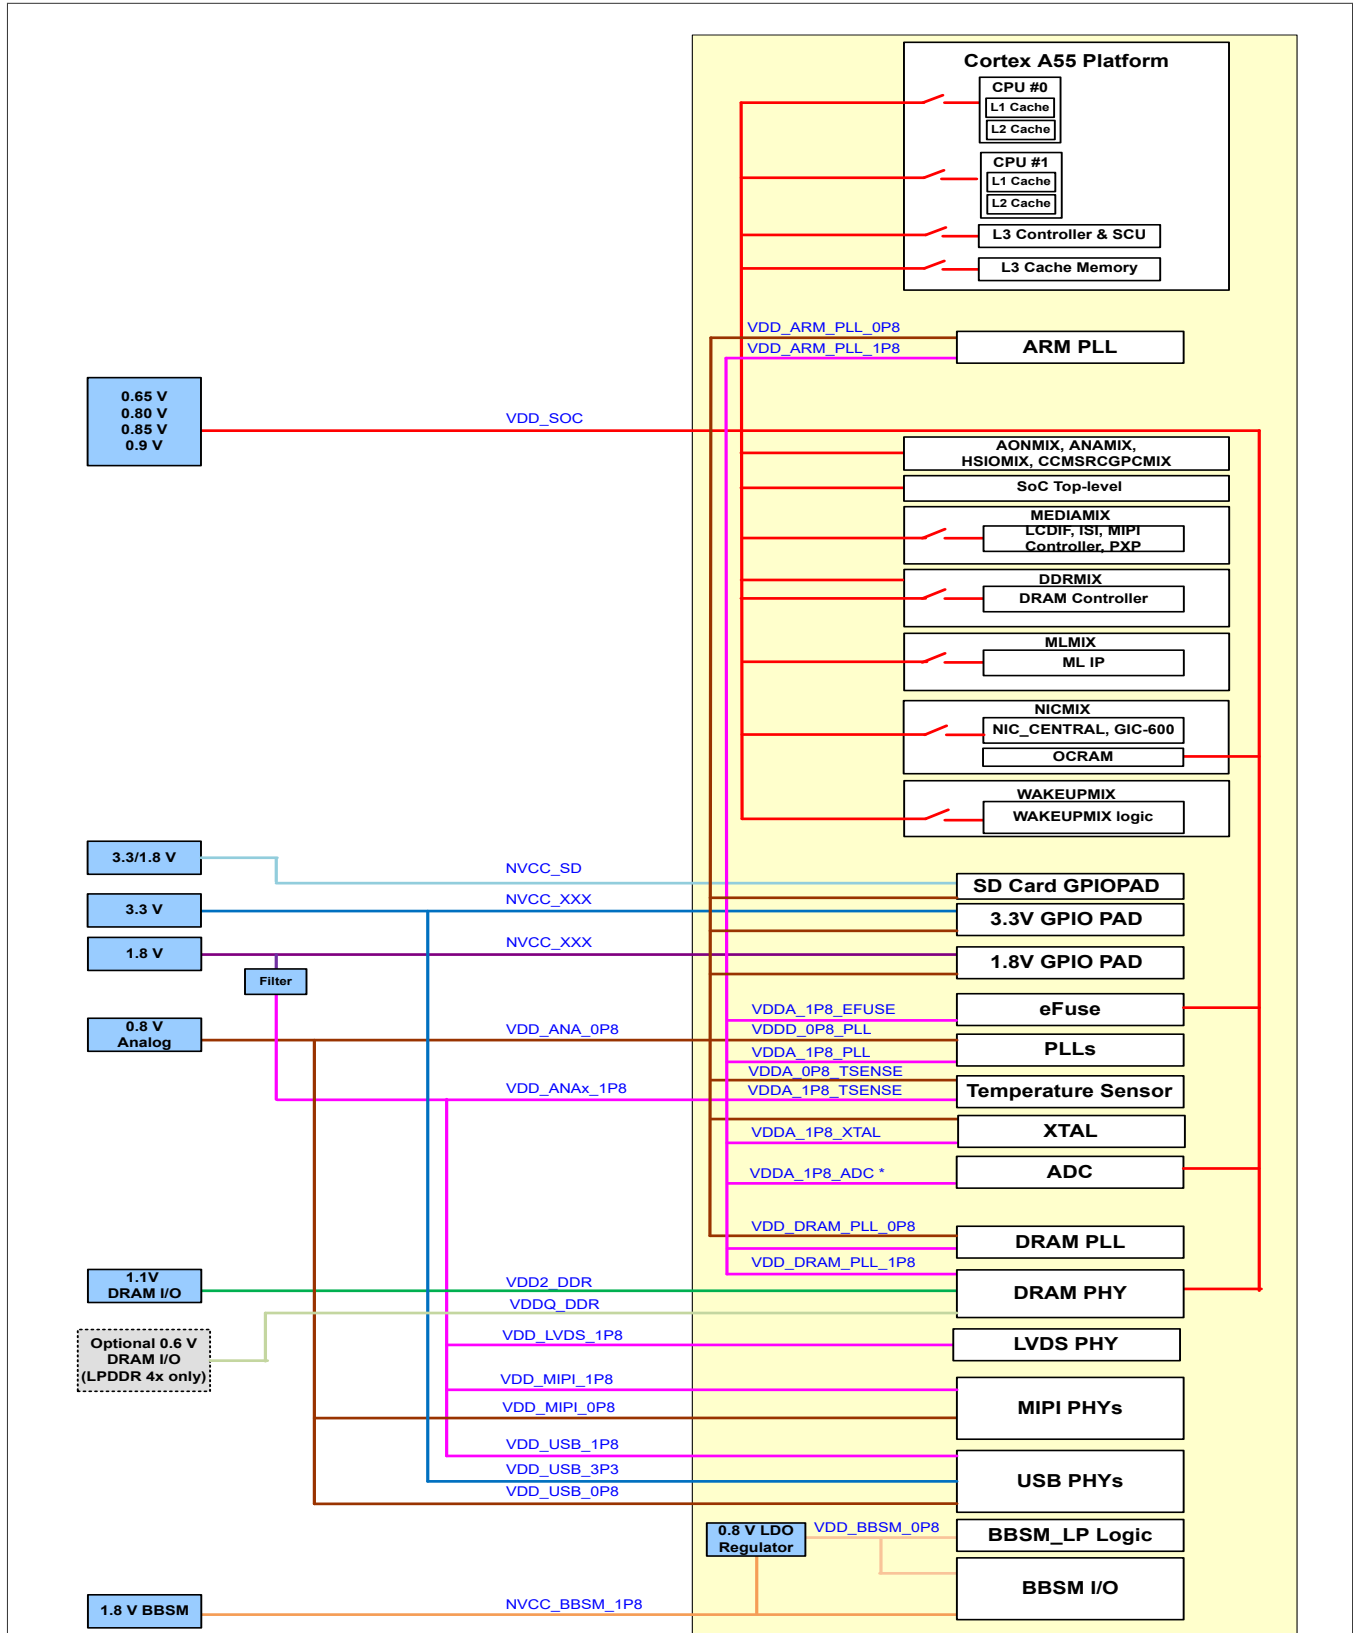

Figure 3. Power architecture of i.MX 93 family of processors

Note: If ADC is used, external voltage reference is recommended for VDD_ANAx_1P8 to improve the ADC ENOB.

4.1.4 Operating ranges

Table 13 provides the operating ranges of the i.MX 93 processors. For details on the chip's power structure, see the "Clock and Power Overview" chapter of the *i.MX 93 Reference Manual* (IMX93RM).

Table 13. Operating ranges

Parameter Description	Symbol	Min	Typ	Max ^[1]	Unit	Comment
Power supply for SoC logic and Arm core	VDD_SOC	0.85	0.90	0.95	V	Power supply for SoC, overdrive mode
		0.80	0.85	0.90	V	Power supply for SoC, nominal mode
		0.76	0.80	0.84	V	Power supply for SoC, low drive mode
		0.61	0.65	0.70	V	Power supply for SoC, suspend mode
Digital supply for PLLs, temperature sensor, LVCMOS I/O, MIPI, and USB PHYs	VDD_ANA_0P8	0.76	0.80	0.84	V	—
	VDD_MIPI_0P8					
	VDD_USB_0P8					
1.8 V supply for PLLs, eFuse, Temperature sensor, LVCMOS voltage detect reference, ADC, 24 MHz XTAL, LVDS, MIPI, and USB PHYs	VDD_ANAx_1P8	1.71	1.80	1.89	V	[2]
	VDD_LVDS_1P8					
	VDD_MIPI_1P8					
	VDD_USB_1P8					
3.3 V supply for USB PHY	VDD_USB_3P3	3.069	3.30	3.45	V	—
Voltage supply for DRAM PHY	VDD2_DDR	1.06	1.10	1.14	V	—
Voltage supply for DRAM PHY I/O	VDDQ_DDR	1.06	1.10	1.14	V	LPDDR4
		0.57	0.60	0.67	V	LPDDR4X
I/O supply and I/O pre-driver supply for GPIO in BBSM bank	NVCC_BBSM_1P8	1.62	1.80	1.98	V	—
Power supply for GPIO when it is in 1.8 V mode	NVCC_AON	1.62	1.80	1.98	V	—
	NVCC_SD2					
Power supply for GPIO when it is in 3.3 V mode	NVCC_GPIO	3.00	3.30	3.465	V	—
	NVCC_WAKEUP					

Table continues on the next page...

Table 13. Operating ranges ...continued

Parameter Description	Symbol	Min	Typ	Max ^[1]	Unit	Comment
Temperature Ranges						
Junction temperature —Commercial	T _j ^[3]	0	—	+95	°C	See the application note, i.MX 93 Product Lifetime Usage Estimates for information on product lifetime (power-on hours) for this processor.
Ambient temperature —Commercial	T _a	0	—	—		

[1] Applying the maximum voltage results in maximum power consumption and heat generation. NXP recommends a voltage set point = (V_{min} + the supply tolerance). This result in an optimized power/speed ratio.
 [2] VDD_ANAx_1P8 refers to VDD_ANA0_1P8, VDD_ANA1_1P8, and VDD_ANAVDET_1P8.
 [3] T_j minimum temperature supported at startup where T_j = T_a.

4.1.5 Maximum frequency of main modules

Table 14 provides the maximum frequency of main modules in the i.MX 93 of processors.

Table 14. Maximum frequency of main modules^[1]

Main modules	Frequency (Low Drive mode)	Frequency (Nominal mode)	Frequency (Overdrive mode)
EdgeLock [®] Secure Enclave	133 MHz	200 MHz	250 MHz
Cortex [®] -M33 core	133 MHz	200 MHz	250 MHz
Cortex [®] -A55 cores	0.9 GHz	1.4 GHz	1.7 GHz
DRAM	933 MHz	1400 MHz	1866 MHz
NPU	500 MHz	800 MHz	1000 MHz

[1] For more detailed information about clock, see Chapter Clock Controller Module (CCM) of *i.MX 93 Application Processor Estimated Power-on Hours*.

4.1.6 Clock sources

4.1.6.1 External clock sources

The i.MX 93 processor is designed to function with quartz crystals to generate the frequencies necessary for operation. 24 MHz for the main clock source and 32.768 kHz for the real time clock. External clock can be injected into RTC_XTALI if the frequency precision and jitter precision are sufficient.

The XTAL input is used to synthesize all of the clocks in the system with the RTC_XTAL input contribution to time keeping and low frequency operations.

Table 15 shows the interface frequency requirements.

Table 15. External input clock frequency

Parameter Description	Symbol	Min	Typ	Max	Unit
RTC_XTALI Oscillator ^[1]	f _{ckil}	—	32.768 ^[2]	—	kHz

[1] External oscillator or a crystal with internal oscillator amplifier.
 [2] Recommended nominal frequency is 32.768 kHz.

Table 16 shows the maximum frequency of external clock.

Table 16. Audio external clock frequency

Parameter Description	Symbol	Low drive mode	Nominal mode	Overdrive mode	Unit
EXT_CLK maximum frequency	$f_{\text{ext_clk}}$ ^[1]	133	200	200	MHz

[1] Audio EXT_CLK signal muxed on either pin SD2_VSELECT or PDM_BIT_STREAM1.

Table 17 shows the external input clock for OSC32K.

Table 17. RTC_OSC

	Symbol	Min	Typ	Max	Unit
Frequency	f	—	32.768	—	kHz
RTC_XTALI	V _{IH}	0.9 x NVCC_BBSM_1P8	—	NVCC_BBSIM_1P8	V
	V _{IL}	0	—	0.1 x NVCC_BBSM_1P8	V
	Duty cycle	45	—	55	%

For the case where an external clock is desired to be the source of the 32.768 kHz clock, the RTC_XTALI pin may be driven with the RTC_XTALO pin disconnected.

4.1.6.2 On-chip oscillators

An external 24 MHz crystal is used in conjunction with the integrated amplifier to form a crystal oscillator that is used as the reference clock for all frequency synthesis on the processor.

Table 18. 24M quartz specifications^[1]

Symbol	Parameter Description	Min	Typ	Max	Unit
fXTAL	Frequency	â€”	24	â€”	MHz
CLOAD	Cload	â€”	12	â€”	pF
DL	Drive level	â€”	â€”	100	ÂµW
ESR	ESR	â€”	â€”	120	â„¦

[1] An external 24 MHz crystal is used in conjunction with the integrated amplifier to form a crystal oscillator that is used as the reference clock for all frequency synthesis on the processor.

Table 19 shows 32K oscillator specifications.

Table 19. 32.768 kHz quartz specifications

Symbol	Parameter Description	Min	Typ	Max	Unit
fXTAL	Frequency (crystal mode) ^[1]	â€”	32.768	â€”	kHz
CLOAD	Cload	â€”	12.5	â€”	pF
ESR	ESR	â€”	â€”	90	Kâ„¦

[1] Actual working drive level is dependent on real design. Please contact crystal vendor for selecting drive level of crystal.

4.1.7 Maximum supply currents

Power consumption is highly dependent on the application. Estimating the maximum supply currents required for power supply design is difficult because the use cases that requires maximum supply current is not a realistic use cases.

To help illustrate the effect of the application on power consumption, data was collected while running commercial standard benchmarks that are designed to be compute and graphic intensive. The results provided are intended to be used as guidelines for power supply design.

Table 20. Maximum supply currents

Power rail	Max current	Unit
VDD_SOC	2700	mA
VDD_ANA_0P8	50	mA
VDD_ANAx_1P8 [1]	250	mA
NVCC_BBSM_1P8	2	mA
NVCC_GPIO, NVCC_WAKEUP, NVCC_AON	$I_{max} = N \times C \times V \times (0.5 \times F)$ Where: N—Number of IO pins supplied by the power line C—Equivalent external capacitive load V—IO voltage (0.5 x F)—Data change rate. Up to 0.5 of the clock rate (F). In this equation, I_{max} is in Amps, C in Farads, V in Volts, and F in Hertz.	
VDDQ_DDR	160	mA
VDD2_DDR	525	mA
VDD_MIPI_0P8 (for MIPI CSI-2 2-lane Rx PHY)	18	mA
VDD_MIPI_0P8 (for MIPI-DSI 4-lane Tx PHY)	33	mA
VDD_MIPI_1P8 (for MIPI CSI-2 2-lane Rx PHY)	2.5	mA
VDD_MIPI_1P8 (for MIPI-DSI 4-lane Tx PHY)	9.5	mA
VDD_USB_3P3 (for USB PHY)	25.2	mA
VDD_USB_1P8 (for USB PHY)	36.2	mA
VDD_USB_0P8 (for USB PHY)	22.2	mA
VDD_LVDS_1P8	Max dynamic current 45	mA

[1] VDD_ANAx_1P8 refers to VDD_ANA0_1P8, VDD_ANA1_1P8, and VDD_ANAVDET_1P8.

4.2 Power modes

This section introduces the power modes used in the i.MX 93.

4.2.1 Power mode definition

The i.MX 93 supports the following power modes:

- **RUN Mode:** All external power rails are on, the Cortex-A55 is active and running; other internal modules can be on/off based on application.
- **Low Power RUN Mode:** This mode is defined as a very low power run mode with all external power rails are on. In this mode, all the unnecessary power domain (MIX) can be off, except AONMIX and the internal modules required, such as OSC24M/PLL. Cortex-M33 CPU in AONMIX handles all the computing and data processing. Cortex-A55 is power down and DRAM can be in self-refresh/retention mode. All the modules in the AONMIX, such as SAI/CAN/LPUART, can be used directly. To use modules in other power domain, such as WAKEUPMIX, the user can turn on additional peripherals and related power by Cortex-M33 as needed. Additional low power modes are also supported, but do not have power characterized in the Data Sheet. See the Reference Manual for a full set of power management capabilities.
- **IDLE Mode:** This mode is defined as a mode, which the Cortex-A55 can automatically enter when there is no thread running and all high-speed devices are not active. The Cortex-A55 can be put into power gated state but with L3 data retained, DRAM and the bus clock are reduced. Most of the internal logic is clock gated, but still remains powered. Compared with RUN mode, all the external power rails from the PMIC remain the same and most of the modules still remain in their state, so the interrupt response in this mode is very small.
- **SUSPEND Mode:** This mode is defined as the most power saving mode where all the clocks are off (including the Cortex-M33 CPU), all the unnecessary power supplies are off and all power gateable portions of the SoC are power gated. The Cortex-A55 CPU are fully power gated, all internal digital logic and analog circuit that can be powered down will be off, and all PHYs are power gated. DRAM is set at self-refresh/retention mode. VDD_SOC (and related digital supply) voltage is reduced to the "Suspend mode" voltage. The exit time from this mode will be much longer than IDLE, but the power consumption will also be much lower.
- **BBSM Mode:** This mode is also called RTC mode. Only the power for the BBSM domain remains on to keep RTC and BBSM logic alive.
- **OFF Mode:** All power rails are off.

Note:

Beyond the modes defined here, additional options can be configured in software, such as to adjust clock frequencies or gate clocks through the CCM programming model, or to adjust on-die power-gating through the SRC or GPC programming model, or to adjust the voltage supplied to the VDD_SOC supply as per [Operating ranges](#) in the Data Sheet.

[Table 21](#) summarizes the external power supply states in all the power modes.

Table 21. The power supply states

Power rail	OFF	BBSM	SUSPEND (Analog on)	IDLE	RUN/LP RUN
NVCC_BBSM_1P8	OFF	ON	ON	ON	ON
VDD_SOC	OFF	OFF	ON	ON	ON
VDD2_DDR VDDQ_DDR	OFF	OFF	ON	ON	ON
NVCC_<XXX>	OFF	OFF	ON	ON	ON

Table continues on the next page...

Table 21. The power supply states ...continued

Power rail	OFF	BBSM	SUSPEND (Analog on)	IDLE	RUN/LP RUN
VDD_ANA_0P8 VDD_MIPI_0P8 VDD_USB_0P8	OFF	OFF	ON	ON	ON
VDD_ANAx_1P8 VDD_LVDS_1P8 VDD_MIPI_1P8 VDD_USB_1P8 VDD_USB_3P3	OFF	OFF	ON	ON	ON

4.2.2 Low power modes

The state of each module in the IDLE, SUSPEND, and BBSM mode are defined in the [Table 22](#).

Table 22. Low power mode definition

	IDLE	SUSPEND	BBSM
CCM LPM mode	WAIT	STOP	N/A
Arm Cortex®-A55 CPU0	OFF	OFF	OFF
Arm Cortex®-A55 CPU1	OFF	OFF	OFF
Shared L3 cache	ON	OFF	OFF
Display	OFF	OFF	OFF
DRAM controller and PHY	ON	OFF	OFF
ARM_PLL	OFF	OFF	OFF
DRAM_PLL	OFF	OFF	OFF
SYSTEM_PLL 1/2/3	ON	OFF	OFF
XTAL	ON	OFF	OFF
RTC	ON	ON	ON
External DRAM device	Self-Refresh	Self-Refresh	OFF
USB PHY	In Low Power State	OFF	OFF
DRAM clock	266 MHz	OFF	OFF

Table continues on the next page...

Table 22. Low power mode definition ...continued

	IDLE	SUSPEND	BBSM
NOC clock	133 MHz	OFF	OFF
AXI clock	133 MHz	OFF	OFF
Module clocks	ON as needed	OFF	OFF
EdgeLock® Secure Enclave	ON	ON	ON
GPIO Wakeup	Yes	Yes	OFF
RTC Wakeup	Yes	Yes	Yes
USB remote wakeup	Yes	No ^[1]	No
Other wakeup source	Yes	No ^[2]	No
WAKEUPMIX	ON	OFF ^[3]	OFF
MLMIX	ON	OFF	OFF
NICMIX	ON as needed	OFF	OFF

[1] USB remote wakeup can be "Yes" if required.
 [2] Other wakeup source can be "Yes" if required.
 [3] WAKEUPMIX can be "ON" if required.

Note:

- Automatic enter self-refresh when there is no DRAM access.
- Put into self-refresh mode by software before entering low power mode.
- Turn off externally by PMIC when PMIC_STBY_REQ signal is asserted.
- Remote wakeup can be supported if the USB PHY power is on in this mode.

4.2.3 Chip power in different Low Power modes

Table 23 shows power consumption in different LP modes.

Table 23. Chip power in different LP modes

Mode	Supply	Voltage (V)	Power (mW) ^[1]
BBSM	NVCC_BBSM_1P8	1.8	0.14
SUSPEND	NVCC_GPIO, NVCC_SD2	3.3	2.65
	NVCC_WAKEUP ^[2]	1.8	1.20
	VDDQ_DDR	0.6	< 0.01
	VDD2_DDR	1.1	0.25

Table continues on the next page...

Table 23. Chip power in different LP modes ...continued

Mode	Supply	Voltage (V)	Power (mW) ^[1]
	VDD_ANA*_1P8	1.8	1.85
	VDD_ANA_0P8	0.8	0.40
	VDD_MIPI_0P8	0.8	0.65
	VDD_USB_0P8	0.8	0.45
	VDD_USB_3P3	3.3	0.25
	VDD_SOC	0.65	7.40
	Total ^[3]	—	15.1

[1] All the power numbers defined in the table are at 25°C. Use case dependent.

[2] To achieve this low power consumption values for I/O power rails in SUSPEND mode, it is recommended to configure the IOMUX of those pins to GPIO input and change the PAD control settings to pull-up or pull-down depends on the board design before entering SUSPEND mode.

[3] Sum of the listed supply rails.

4.3 Power supplies requirements and restrictions

The system design must comply with power-up sequence, power-down sequence, and steady state guidelines as described in this section to guarantee the reliable operation of the device. Any deviation from these sequences may result in the following situations:

- Excessive current during power-up phase
- Prevention of the device from booting
- Irreversible damage to the processor (worst-case scenario)

Figure 4 illustrates an example about power sequence of i.MX 93 processors.

Figure 4. The power sequence of i.MX 93 processors

Note: POR_B must be asserted whenever VDD_SOC is powered down, but NVCC_BBSM_1P8 is powered up (when the processor is in BBSM mode).

4.3.1 Power-up sequence

The power-up sequence of i.MX 93 is defined as follows:

1. Turn on NVCC_BBSM_1P8
2. [The SoC will assert PMIC_ON_REQ at this point in time.]
3. Turn on VDD_SOC digital voltage supplies.
4. Turn on all VDD*_0P8 analog, PHY, and PLL supplies.
5. Turn on all remaining 1.8 V supplies. This includes VDD*_1P8 analog, PHY, PLL supplies, and any 1.8 V NVCC_XXX I/O supplies.
6. Turn on DDR I/O supplies.
7. Turn on 3.3 V supplies. This includes all 3.3 V NVCC_XXX I/O supplies and VDD_USB_3P3. [This 3.3 V supply step may be simultaneous with either the 1.8 V or the DDR supplies if desired.]
8. POR_B release (it should be asserted during the entire power-up sequence.)

4.3.2 Power-down sequence

The power-down sequence of i.MX 93 is defined as follows:

- Turn off NVCC_BBSM_1P8 last
- Turn off VDD_SOC after the other (non-BBSM) power rails or at the same time as other (non-BBSM) rails.
- No sequence for other power rails during power down.

4.4 PLL electrical characteristics

Table 24 shows the PLL electrical parameters.

Table 24. PLL electrical parameters

PLL type	Parameter	Value
AUDIO_PLL1	Clock output range	Up to 650 MHz
	Reference clock	24 MHz
	Lock time	50 μ s
	Jitter	$\pm 1\%$ of output period, ≥ 50 ps
VIDEO_PLL1	Clock output range	Up to 594 MHz
	Reference clock	24 MHz
	Lock time	50 μ s
SYS_PLL1	Clock output range	312.5 MHz — 1 GHz
	Reference clock	24 MHz
	Lock time	70 μ s
ARM_PLL	Clock output range	800 MHz — 1700 MHz
	Reference clock	24 MHz
	Lock time	70 μ s
DRAM_PLL1	Clock output range	400 MHz — 1000 MHz
	Reference clock	24 MHz
	Lock time	50 μ s

4.5 I/O DC parameters

This section includes the DC parameters of the following I/O types:

- General Purpose I/O (GPIO)
- Double Data Rate I/O (DDR) for LPDDR4 and LPDDR4X modes
- LVDS I/O

4.5.1 General purpose I/O (GPIO) DC parameters

Table 25 shows DC parameters for GPIO pads. The parameters Table 25 are guaranteed per the operating ranges in Table 13, unless otherwise noted.

Table 25. GPIO DC parameters

Parameter	Symbol	Test Conditions	Min	Typ	Max	Unit
High-level output voltage	$V_{OH(1.8V)}$	DSE = X1, IOH = 1.1 mA DSE = X6, IOH = 6.6 mA	0.8 x NVCC_xxx	—	NVCC_xxx	V
	$V_{OH(3.3V)}$	DSE = X1, IOH = 2 mA DSE = X4, IOH = 8 mA	0.8 x NVCC_xxx	—	NVCC_xxx	V
Low-level output voltage	$V_{OL(1.8V)}$	DSE = X1, IOL = 1.1 mA DSE = X6, IOL = 6.6 mA	0	—	0.2 x NVCC_xxx	V
	$V_{OL(3.3V)}$	DSE = X1, IOL = 2 mA DSE = X4, IOL = 8 mA	0	—	0.2 x NVCC_xxx	V
Low-level input voltage	V_{IL}	NVCC_xxx = 1.65 - 3.465 V; Temp = -40 to 125°C	0	—	0.3 x NVCC_xxx	V
High-level input voltage	V_{IH}	NVCC_xxx = 1.65 - 3.465 V; Temp = -40 to 125°C	0.7 x NVCC_xxx	—	NVCC_xxx	V
Pull-down resistor	Rpd3.3v	NVCC_xxx = 3.0 - 3.465 V; Temp = -40 to 125°C	24	43	87	KΩ
Pull-up resistor	Rpu3.3v		18	37	72	KΩ
Pull-down resistor	Rpd1.8v	NVCC_xxx = 1.65 - 1.95 V; Temp = -40 to 125°C	13	23	48	KΩ
Pull-up resistor	Rpu1.8v		12	22	49	KΩ

Note: For GPIO pads, when the supplies are ramp-up or/and below operating level, the pad state values are undefined.

Note: For PHY pads, the PAD state values are undefined before POR_B is asserted.

Table 26. Additional leakage parameters

Parameter	Symbol	Condition	Min	Max	Unit
Leakage high	I _{IH}	Non-PHY I/O, 1.65 V - 3.465 V, Temp = -40°C to 125°C pad = VDDIO ^[1]	-5	5	μA
Leakage low	I _{IL}	Non-PHY I/O, 1.65 V - 3.465 V, Temp = -40°C to 125°C pad = VSS ^[1]	-5	5	

[1] This specification does not apply to PHY, ANALOG, TAMPER0, TAMPER1 I/Os, PMIC_ON_REQ, and PMIC_STBY_REQ.

4.5.2 DDR I/O DC electrical characteristics

The DDR I/O pads support LPDDR4/LPDDR4X operational modes. The Double Data Rate Controller (DDRC) is compliant with JEDEC-compliant SDRAMs.

DDRC operation is contingent upon the board's DDR design adherence to the DDR design and layout requirements stated in the hardware development guide for the i.MX 93 application processors.

4.5.3 LVDS DC parameters

The LVDS interface complies with TIA/EIA 644-A standard. See TIA/EIA STANDARD 644-A, "Electrical Characteristics of Low Voltage Differential Signaling (LVDS) Interface Circuits" for details.

Table 27 shows the Low Voltage Differential Signaling (LVDS) DC parameters.

Table 27. LVDS DC Characteristics

Parameter	Symbol	Test Conditions	Min	Typ	Max	Unit
Output Differential Voltage	V_{OD}	$R_{load} = 100 \Omega$ between Pad P and Pad N	250	350	450	mV
Output High Voltage	V_{OH}	$R_{load} = 100 \Omega$ between Pad P and Pad N	1.25	—	1.6	V
Output Low Voltage	V_{OL}	$R_{load} = 100 \Omega$ between Pad P and Pad N	0.9	—	1.25	V
Offset common mode Voltage	V_{CM}	—	1.125	1.2	1.375	V
Tri-state I/O supply current	$I_{cc-ovdd}$	$V_{IN} = OVDD^{[1]}$ or 0	0.016	—	1700	nA
Tri-state core supply current	$I_{cc-vddi}$	$V_{IN} = VDDI$ or 0	—	—	1500	
Power Supply current	I_{cc}	$V_{IN} = OVDD$ or 0 $R_{load} = 100 \Omega$	—	—	5	mA

[1] OVDD is the I/O supply voltage.

4.6 I/O AC parameters

This section includes the AC parameters of the following I/O types:

- General Purpose I/O (GPIO)
- LVDS I/O

The GPIO load circuit and output transition time waveforms are shown in Figure 5 and Figure 6.

Figure 5. Load circuit for output

Figure 6. Output transition time waveform

4.6.1 General purpose I/O (GPIO) AC parameters

Table 28. General purpose I/O (GPIO) AC parameters

Symbol	Description	Min	Typ	Max	Unit	Condition

tR	TX rise time	1870	—	2950	ps	Slew rate FSEL1 = 11b, Fast Slew Rate (1.62 V, 1.8 V, 1.98 V), Drive strength X2
tF	TX fall time	1900	—	3310	ps	Slew rate FSEL1 = 11b, Fast Slew Rate (3 V, 3.3 V, 3.465 V), Drive strength X2
tR	TX rise time	774	—	1930	ps	Slew rate FSEL1 = 11b, Fast Slew Rate (3 V, 3.3 V, 3.465 V), Drive strength X3
tF	TX fall time	719	—	2070	ps	Slew rate FSEL1 = 11b, Fast Slew Rate (3 V, 3.3 V, 3.465 V), Drive strength X3
tR	TX rise time	598	—	1360	ps	Slew rate FSEL1 = 11b, Fast Slew Rate (3 V, 3.3 V, 3.465 V), Drive strength X4
tF	TX fall time	490	—	1590	ps	Slew rate FSEL1 = 11b, Fast Slew Rate (3 V, 3.3 V, 3.465 V), Drive strength X4

4.6.2 DDR I/O AC electrical characteristics

The DDR I/O pads support LPDDR4/LPDDR4X operational modes. The DDRC is compliant with JEDEC-compliant SDRAMs. DDRC operation is contingent upon the board's DDR design adherence to the DDR design and layout requirements stated in the hardware development guide for the i.MX 93 application processor.

4.6.3 LVDS AC Parameters

The differential output transition time waveform is shown in [Figure 7](#).

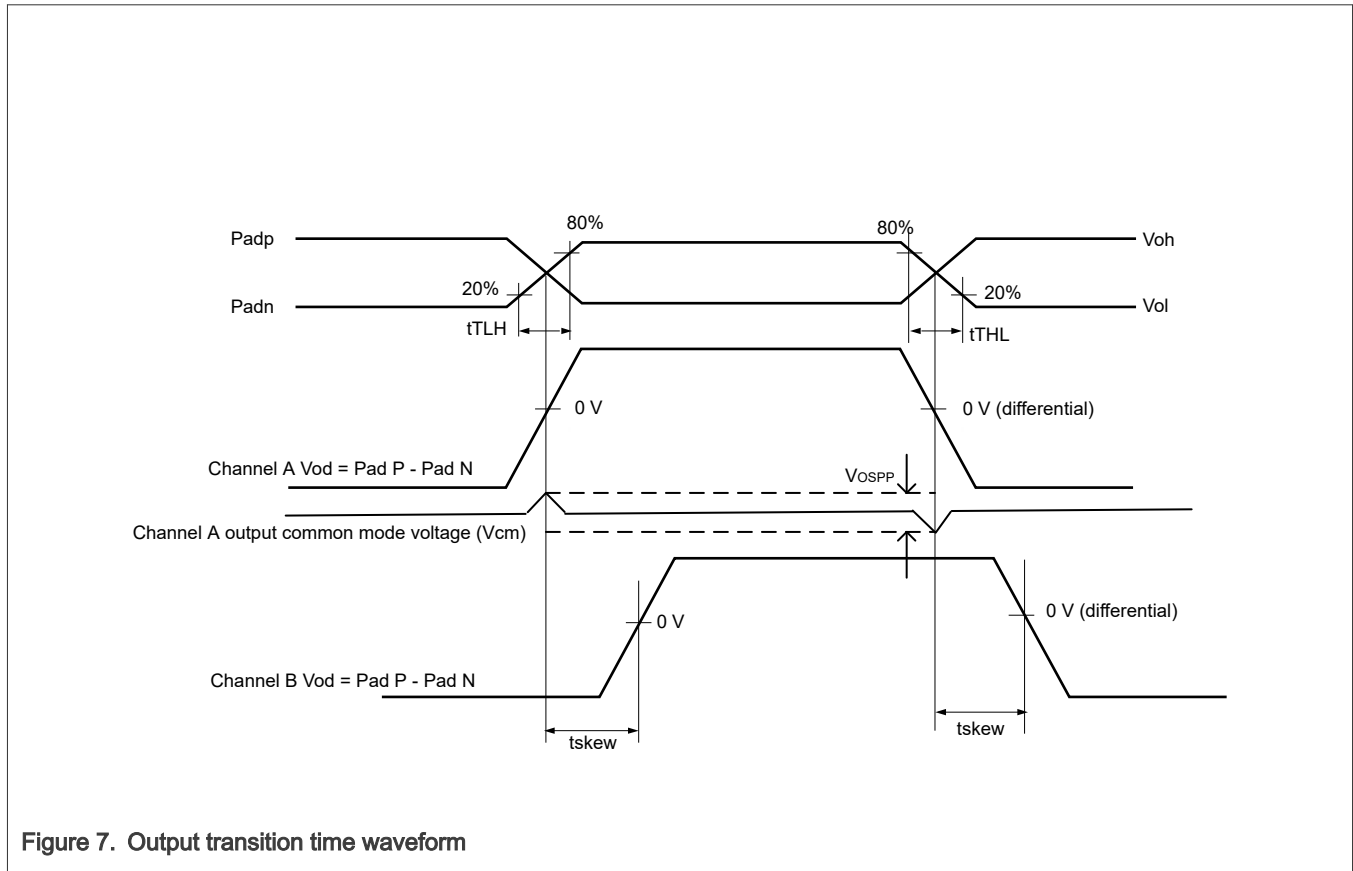

Figure 7. Output transition time waveform

[Table 29](#) shows the AC parameters of LVDS.

Table 29. LVDS AC parameters

Parameter	Symbol	Test Conditions	Min	Typ	Max	Unit
Lane skew ^[1]	t_{Skew}	$R_{load} = 100 \Omega$ $C_{load} = 2 \text{ pF}$	—	0.25 ^[2]	—	ns
Transition Low to High time ^[3]	t_{TLH}		—	—	0.3	Unit Interval (UI) ^[4]
Transition High to Low time	t_{THL}		—	—	0.3	
Operating data rate ^[5]	f	—	—	—	560	Mbps
Offset peak to peak voltage imbalance	V_{ospp}	—	—	—	150	mV
Tri-state I/O supply current	$I_{cc-ovdd}$	$V_{IN} = OVDD$ or 0	0.016	—	1700	nA
Tri-state core supply current	$I_{cc-vddi}$	$V_{IN} = VDDI$ or 0	—	—	1500	
Power Supply current	I_{cc}	$V_{IN} = OVDD$ or 0 $R_{load} = 100 \Omega$	—	—	5	mA

[1] t_{Skew} is the differential time at $V_{od} = 0$ voltage between different channel.

[2] This is typical maximum absolute delay between any two channels.

[3] Measurement levels are 20–80% from output voltage.

- [4] This value is dependent on Operating data rate.
- [5] This is the maximum bit rate that defined by supported display types.

4.7 Differential I/O output buffer impedance

The Differential CCM interface is designed to be compatible with TIA/EIA 644-A standard. See, TIA/EIA STANDARD 644-A, *Electrical Characteristics of Low Voltage Differential Signaling (LVDS) Interface Circuits* (2001) for details.

4.7.1 DDR I/O output impedance

DDR output driver and ODT impedances are controlled across PVT using ZQ calibration procedure with a 120 ohm $\pm 1\%$ resistor to ground. Programmable drive strength and ODT impedance targets available in the NXP DDR tool are detailed in the device IBIS model. Impedance deviation (calibration accuracy) is $\pm 10\%$ (Maximum/Minimum impedance) across PVT.

4.8 System modules timing

This section contains the timing and electrical parameters for the modules in each i.MX 93 processor.

4.8.1 Reset timing parameters

Figure 8 shows the reset timing and Table 30 lists the timing parameters.

Figure 8. Reset timing diagram

Table 30. Reset timing parameters

ID	Parameter	Min	Max	Unit
CC1	Duration of POR_B to be qualified as valid. Note: POR_B rise/fall times must be 400 μ s or less.	1	—	RTC_XTALI cycle

4.8.2 WDOG Reset timing parameters

Figure 9 shows the WDOG reset timing and Table 31 lists the timing parameters.

Figure 9. WDOGx_B timing diagram

Table 31. WDOGx_B timing parameters

ID	Parameter	Min	Max	Unit
CC3	Duration of WDOG1_B Assertion	1	—	RTC_XTALI cycle

Note: RTC_XTALI is approximately 32 kHz. RTC_XTALI cycle is one period or approximately 30 μ s.

Note: *WDOGx_B* output signals (for each one of the Watchdog modules) do not have dedicated pins, but are muxed out through the IOMUX. See the IOMUXC chapter of the i.MX 93 Applications Processor Reference Manual (IMX93RM) for detailed information.

4.8.3 JTAG timing parameters

Figure 10 depicts the JTAG test clock input timing. Figure 11 depicts the JTAG boundary scan timing. Figure 12 depicts the JTAG test access port. Signal parameters are listed in Table 32.

The DSE[5:0] = 001111 and FSEL1[1:0] = 11 are required drive settings to meet the timing.

Figure 10. Test Clock Input Timing Diagram

Figure 11. Boundary system (JTAG) timing diagram

Figure 12. Test Access Port Timing Diagram

Table 32. JTAG Timing^{[1],[2]}

ID	Parameter	All Frequencies		Unit
		Min	Max	
SJ0	JTAG_TCK frequency of operation ^{[3],[4]}	—	50	MHz
SJ1	JTAG_TCK cycle time in crystal mode	20	—	ns
SJ2	JTAG_TCK clock pulse width measured at V _M ^[5]	10	—	ns
SJ3	JTAG_TCK rise and fall times	—	3	ns
SJ4	Boundary scan input data set-up time	15	—	ns
SJ5	Boundary scan input data hold time	15	—	ns
SJ6	JTAG_TCK low to output data valid	—	600	ns
SJ7	JTAG_TCK low to output high impedance	—	600	ns
SJ8	JTAG_TMS, JTAG_TDI data set-up time	5	—	ns
SJ9	JTAG_TMS, JTAG_TDI data hold time	5	—	ns
SJ10	JTAG_TCK low to JTAG_TDO data valid	—	14	ns
SJ11	JTAG_TCK low to JTAG_TDO high impedance	—	14	ns
SJ14	JTAG_TCK low to JTAG_TDO data invalid	1	—	ns

[1] Input timing assumes an input signal slew rate of 3 ns (20%/80%).
 [2] Output timing valid for maximum external load CL = 25 pF, which is assumed to be a 10 pF load at the end of a 50 Ω, unterminated, 5-inch microstrip trace on standard FR4 (3.3 pF/inch), (25 pF total with margin). For best signal integrity, the series resistance of the transmission line can be equal to the selected R_{DS(on)} of the I/O pad output driver.
 [3] T_{DC} = target frequency of JTAG
 [4] 50 MHz frequency is for the JTAG debug interface. For boundary scan, the maximum TCK frequency is 10 MHz.
 [5] V_M = mid-point voltage

4.8.4 SWD timing parameters

The DSE[5:0] = 001111 and FSEL1[1:0] = 11 are required drive settings to meet the timing.

Figure 13 depicts the SWD timing.

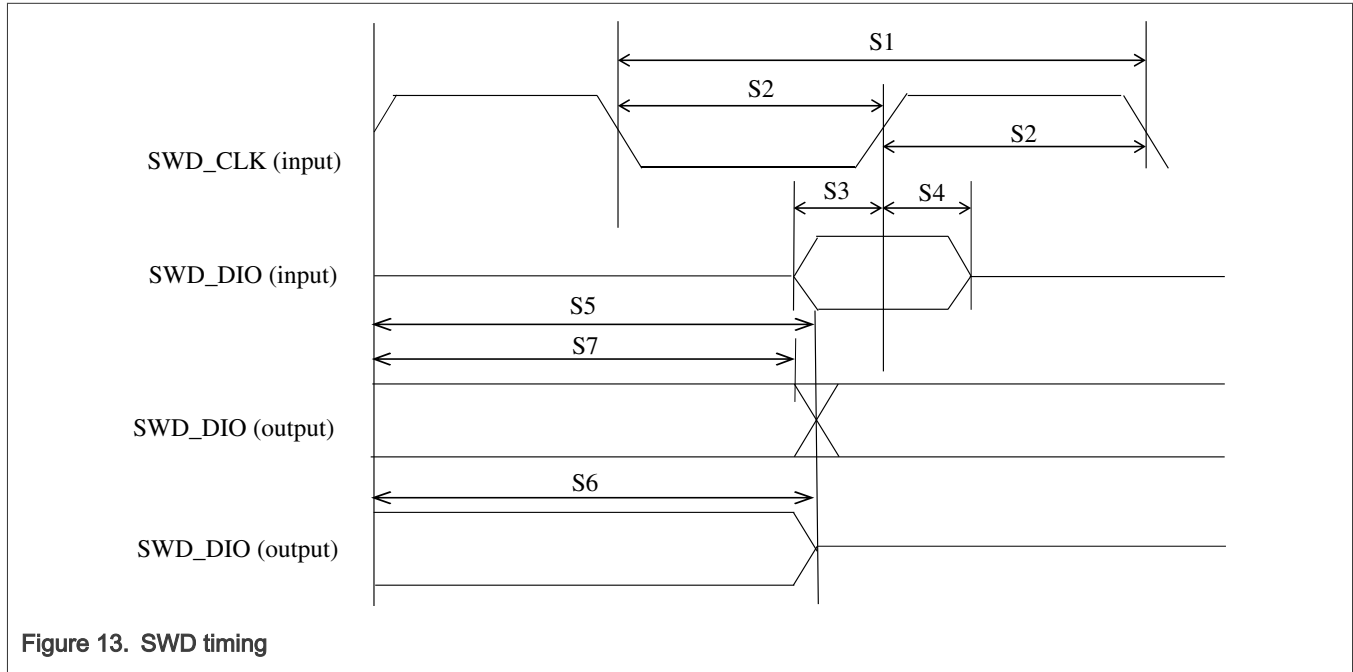

Figure 13. SWD timing

Table 33 lists SWD timing parameters.

Table 33. SWD timing parameters^{[1],[2]}

Symbol	Description	Min	Max	Unit
S0	SWD_CLK frequency	—	50	MHz
S1	SWD_CLK cycle time	20	—	ns
S2	SWD_CLK pulse width	10	—	ns
S3	Input data setup time	5	—	ns
S4	Input data hold time	5	—	ns
S5	Output data valid time	—	14	ns
S6	Output high impedance time	—	14	ns
S7	Output data invalid time	0	—	ns

[1] Input timing assumes an input signal slew rate of 3 ns (20%/80%).

[2] Timing valid for maximum external load CL = 25 pF, which is assumed to be a 10 pF load at the end of a 50 Ω, unterminated, 5-inch microstrip trace on standard FR4 (3.3 pF/inch), (25 pF total with margin). For best signal integrity, the series resistance in the transmission line can be equal to the selected R_{DS(on)} of the I/O pad output.

4.8.5 DDR SDRAM-specific parameters (LPDDR4/LPDDR4X)

The i.MX 93 Family of processors have been designed and tested to work with JEDEC JESD209—compliant LPDDR4/LPDDR4X memory.

- JEDEC LPDDR4 Specification JESD209-4B, February 2017
- JEDEC LPDDR4X Specification JESD209-4-1, January 2017

Timing diagrams and tolerances required to work with these memories are specified in the respective documents and are not reprinted here.

Meeting the necessary timing requirements for a DDR memory system is highly dependent on the components chosen and the design layout of the system as a whole. NXP cannot cover in this document all the requirements needed to achieve a design that meets full system performance over temperature, voltage, and part variation; PCB trace routing, PCB dielectric material, number of routing layers used, placement of bulk/decoupling capacitors on critical power rails, VIA placement, GND and Supply planes layout, and DDR controller/PHY register settings all are factors affecting the performance of the memory system. Consult the hardware user guide for this device and NXP validated design layouts for information on how to properly design a PCB for best DDR performance. NXP strongly recommends duplicating an NXP validated design as much as possible in the design of critical power rails, placement of bulk/decoupling capacitors and DDR trace routing between the processor and the selected DDR memory. All supporting material is readily available on the device web page on <https://www.nxp.com/products/processors-and-microcontrollers/arm-processors/i-mx-applications-processors/i-mx-9-processors:IMX9-PROCESSORS>.

Processors that demonstrate full DDR performance on NXP validated designs, but do not function on customer designs, are not considered marginal parts. A report detailing how the returned part behaved on an NXP validated system will be provided to the customer as closure to a customer's reported DDR issue. Customers bear the responsibility of properly designing the Printed Circuit Board, correctly simulating and modeling the designed DDR system, and validating the system under all expected operating conditions (temperatures, voltages) prior to releasing their product to market.

Table 34. i.MX 93 DRAM controller supported SDRAM configurations

Parameter	LPDDR4/LPDDR4X
Number of Controllers	1
Number of Channels	1
Number of Chip Selects	2
Bus Width	16-bit
Maximum supported data rate	
• Low drive mode	1866 MT/s
• Nominal drive mode	2880 MT/s
• Overdrive mode	3733 MT/s ^[1]

[1] For 9 x 9 mm package, the maximum data rate of LPDDR4x/LPDDR4 is 3200 MT/s.

4.8.5.1 Clock/data/command/address pin allocations

These processors use generic names for clock, data, and command address bus; see [Table 107](#) for details about mapping of clock, data, and command address signals of LPDDR4/LPDDR4X modes.

4.9 Display and graphics

The following sections provide information on display and graphic interfaces.

4.9.1 MIPI D-PHY electrical characteristics

4.9.1.1 MIPI HS-TX specifications

Table 35. MIPI high-speed transmitter DC specifications

Symbol	Parameter	Min	Typ	Max	Unit
$V_{CMTX}^{[1]}$	High Speed Transmit Static Common Mode Voltage	150	200	250	mV
$ \Delta V_{CMTX} _{(1,0)}$	V_{CMTX} mismatch when Output is Differential-1 or Differential-0	—	—	5	mV
$ V_{OD} ^1$	High Speed Transmit Differential Voltage	140	200	270	mV
$ \Delta V_{OD} $	V_{OD} mismatch when Output is Differential-1 or Differential-0	—	—	14	mV
V_{OHHS}^1	High Speed Output High Voltage	—	—	360	mV
Z_{OS}	Single Ended Output Impedance	40	50	62.5	Ω
ΔZ_{OS}	Single Ended Output Impedance Mismatch	—	—	10	%

[1] Value when driving into load impedance anywhere in the Z_{ID} range.

Table 36. MIPI high-speed transmitter AC specifications

Symbol	Parameter	Min	Typ	Max	Unit
$\Delta V_{CMTX(HF)}$	Common-level variations above 450 MHz	—	—	15	mVRMS
$\Delta V_{CMTX(LF)}$	Common-level variation between 50-450 MHz	—	—	25	mVPEAK
t_R and $t_F^{[1]}$	Rise Time and Fall Time (20% to 80%)	100	—	0.35 x UI	ps

[1] UI is the long-term average unit interval.

4.9.1.2 MIPI HS-RX specifications

Table 37. MIPI high-speed receiver DC specifications

Symbol	Parameter	Min	Typ	Max	Unit
V_{IDTH}	Differential input high voltage threshold	—	—	70	mV
V_{IDTL}	Differential input low voltage threshold	-70	—	—	mV
V_{IHHS}	Single ended input high voltage	—	—	460	mV
V_{ILHS}	Single ended input low voltage	-40	—	—	mV
V_{CMRXDC}	Input common mode voltage	70	—	330	mV
Z_{ID}	Differential input impedance	80	100	125	Ω

Table 38. MIPI high-speed receiver AC specifications

Symbol	Parameter	Min	Typ	Max	Unit
$\Delta V_{CMRX(HF)}$ ^[1]	Common mode interference beyond 450 MHz	—	—	50	mV
$\Delta V_{CMRX(LF)}$	Common mode interference between 50 and 450 MHz	-25	—	25	mV
C_{CM}	Common mode termination	—	—	60	pF

[1] $\Delta V_{CMRX(HF)}$ is the peak amplitude of a sine wave superimposed on the receiver inputs.

4.9.1.3 MIPI LP-TX specifications

Table 39. MIPI low-power transmitter DC specifications

Symbol	Parameter	Min	Typ	Max	Unit
V_{OH} ^[1]	Thevenin Output High Level	1.1	1.2	1.3	V
V_{OL}	Thevenin Output Low Level	-50	—	50	mV
Z_{OLP} ^[2]	Output Impedance of Low Power Transmitter	110	—	—	Ω

[1] This specification can only be met when limiting the core supply variation from 1.1 V till 1.3 V.

[2] Although there is no specified maximum for ZOLP, the LP transmitter output impedance ensures the TRLP/TFLP specification is met.

Table 40. MIPI low-power transmitter AC specifications

Symbol	Parameter	Min	Typ	Max	Unit
T_{RLP}/T_{FLP} ^[1]	15% to 85% Rise Time and Fall Time	—	—	25	ns
T_{REOT} ^{1,[2],[3]}	30% to 85% Rise Time and Fall Time	—	—	35	ns
$T_{LP-PULSE-TX}$ ^[4]	Pulse width of the LP exclusive-OR clock: First LP exclusive-OR clock pulse after Stop state or last pulse before Stop state	40	—	—	ns
	Pulse width of the LP exclusive-OR clock: All other pulses	20	—	—	ns
$T_{LP-PER-TX}$	Period of the LP exclusive-OR clock	90	—	—	ns
$\delta V / \delta t_{SR}$ ^{1,[5],[6],[7]}	Slew Rate @ CLOAD= 0 pF	25	—	500	mV/ns
	Slew Rate @ CLOAD= 5 pF	25	—	300	mV/ns
	Slew Rate @ CLOAD= 20 pF	25	—	250	mV/ns
	Slew Rate @ CLOAD= 70 pF	25	—	150	mV/ns
C_{LOAD}	Load Capacitance	0	—	70	pF

[1] C_{LOAD} includes the low equivalent transmission line capacitance. The capacitance of TX and RX are assumed to always be < 10 pF. The distributed line capacitance can be up to 50 pF for a transmission line with 2 ns delay.

[2] The rise-time of TREOT starts from the HS common-level at the moment of the differential amplitude drops below 70 mV, due to stopping the differential drive.

[3] With an additional load capacitance CCM between 0 to 60 pF on the termination center tap at RX side of the lane.

[4] This parameter value can be lower than TLPX due to differences in rise vs. fall signal slopes and trip levels and mismatches between Dp and Dn LP transmitters. Any LP exclusive-OR pulse observed during HS EoT (transition from HS level to LP-11) is glitch behavior as described in Low-Power Receiver section.

[5] When the output voltage is between 15% and below 85% of the fully settled LP signal levels.

[6] Measured as average across any 50 mV segment of the output signal transition.

[7] This value represents a corner point in a piecewise linear curve.

4.9.1.4 MIPI LP-RX specifications

Table 41. MIPI low power receiver DC specifications

Symbol	Parameter	Min	Typ	Max	Unit
V_{IH}	Logic 1 input voltage	740	—	—	mV
V_{IL}	Logic 0 input voltage, not in ULP state	—	—	550	mV
$V_{IL-ULPS}$	Logic 0 input voltage, ULP state	—	—	300	mV
V_{HYST}	Input hysteresis	25	—	—	mV

Table 42. MIPI low power receiver AC specifications

Symbol	Parameter	Min	Typ	Max	Unit
$e_{SPIKE}^{[1],[2]}$	Input pulse rejection	—	—	300	V.ps
$T_{MIN-RX}^{[3]}$	Minimum pulse width response	20	—	—	ns
V_{INT}	Peak Interference amplitude	—	—	200	mV
f_{INT}	Interference frequency	450	—	—	MHz

[1] Time-voltage integration of a spike above V_{IL} when in LP-0 state or below V_{IH} when in LP-1 state.

[2] An impulse below this value will not change the receiver state.

[3] An input pulse greater than this value shall toggle the output.

4.9.1.5 MIPI LP-CD specifications

Table 43. MIPI contention detector DC specifications

Symbol	Parameter	Min	Typ	Max	Unit
V_{IHCD}	Logic 1 contention threshold	450	—	—	mV
V_{ILCD}	Logic 0 contention threshold	—	—	200	mV

4.9.2 LCD Controller (LCDIF) timing parameters

The DSE[5:0] = 001111 and FSEL1[1:0] = 11 are required drive settings to meet the timing.

Figure 14 shows the LCDIF timing and Table 44 lists the timing parameters.

Figure 14. LCD timing

Table 44. LCD timing parameters^{[1][2]}

ID	Parameter	Symbol	Min	Max	Unit
L1	LCD pixel clock frequency ^[3]	tCLK(LCD)	—	80	MHz
L2	LCD pixel clock high (falling edge capture)	tCLKH(LCD)	5	—	ns
L3	LCD pixel clock low (rising edge capture)	tCLKL(LCD)	5	—	ns
L4	LCD pixel clock high to data valid (falling edge capture)	td(CLKH-DV)	-1.5	1.5	ns
L5	LCD pixel clock low to data valid (rising edge capture)	td(CLKL-DV)	-1.5	1.5	ns
L6	LCD pixel clock high to control signal valid (falling edge capture)	td(CLKH-CTRLV)	-1.5	1.5	ns
L7	LCD pixel clock low to control signal valid (rising edge capture)	td(CLKL-CTRLV)	-1.5	1.5	ns

[1] Output timing valid for maximum external load CL = 25 pF, which is assumed to be a 10 pF load at the end of a 50 ohm, unterminated, 5-inch microstrip trace on standard FR4 (3.3 pF/inch), (25 pF total with margin). For best signal integrity, the series resistance in the transmission line should be equal to the selected RDSO of the I/O pad output driver.

[2] Input timing assumes an input signal slew rate of 3 ns (20%/80%).

[3] The maximum frequency supported is 56 MHz when NVCC_xxxx operating at 3.3 V.

4.10 Audio

This section provides information about audio subsystem.

4.10.1 SAI switching specifications

This section provides the AC timings for the SAI in Controller (clocks driven) and Target (clocks input) modes. All timings are given for non inverted serial clock polarity (SAI_TCR2[BCP] = 0, SAI_RCR2[BCP] = 0) and non inverted frame sync (SAI_TCR4[FSP] = 0, SAI_RCR4[FSP] = 0). If the polarity of the clock and/or the frame sync have been inverted, all the timings remain valid by inverting the clock signal (SAI_BCLK) and/or the frame sync (SAI_FS) shown in the figures below.

The DSE[5:0] = 001111 and FSEL1[1:0] = 11 are required drive settings to meet the timing.

For the 50 MHz BCLK operation, the BCLK and SYNC must always be in the same direction as the data (source synchronous):

- SAI transmitter must be in asynchronous mode with BCLK and SYNC configuration as outputs
- SAI receiver must be:
 - In asynchronous mode with BCLK and SYNC configuration as inputs
 - In synchronous mode with SAI_RCR2[BCI] = 1

Table 45. Controller mode SAI timing (50 MHz)^{[1][2][3]}

Num	Characteristic	Min	Max	Unit
S1	SAI_MCLK cycle time	20	—	ns
S2	SAI_MCLK pulse width high/low	40%	60%	MCLK period
S3	SAI_BCLK cycle time	20	—	ns
S4	SAI_BCLK pulse width high/low	40%	60%	BCLK period
S5	SAI_BCLK to SAI_FS output valid	—	3	ns
S6	SAI_BCLK to SAI_FS output invalid	-2	—	ns
S7	SAI_BCLK to SAI_TXD valid	—	3	ns
S8	SAI_BCLK to SAI_TXD invalid	-2	—	ns
S9	SAI_RXD/SAI_FS input setup before SAI_BCLK	3	—	ns
S10	SAI_RXD/SAI_FS input hold after SAI_BCLK	2	—	ns

[1] To achieve 50 MHz for BCLK operation, clock must be set in feedback mode.

[2] Input timing assumes an input signal slew rate of 3 ns (20%/80%).

[3] Output timing valid for maximum external load CL = 25 pF, which is assumed to be a 10 pF load at the end of a 50 ohm. Unterminated, 5-inch microstrip trace on standard FR4 (3.3 pF/inch), (25 pF total with margin). For best signal integrity, the series resistance in the transmission line should be equal to the selected RDSO_N of the I/O pad output driver.

Table 46. Controller mode SAI timing (25 MHz)^{[1][2]}

Num	Characteristic	Min	Max	Unit
S1	SAI_MCLK cycle time	40	—	ns
S2	SAI_MCLK pulse width high/low	40%	60%	MCLK period
S3	SAI_BCLK cycle time	40	—	ns
S4	SAI_BCLK pulse width high/low	40%	60%	BCLK period
S5	SAI_BCLK to SAI_FS output valid	—	3	ns
S6	SAI_BCLK to SAI_FS output invalid	-2	—	ns
S7	SAI_BCLK to SAI_TXD valid	—	3	ns
S8	SAI_BCLK to SAI_TXD invalid	-2	—	ns
S9	SAI_RXD/SAI_FS input setup before SAI_BCLK	8	—	ns
S10	SAI_RXD/SAI_FS input hold after SAI_BCLK	0	—	ns

[1] Input timing assumes an input signal slew rate of 3 ns (20%/80%).

[2] Output timing valid for maximum external load CL = 25 pF, which is assumed to be a 10 pF load at the end of a 50 ohm. Unterminated, 5-inch microstrip trace on standard FR4 (3.3 pF/inch), (25 pF total with margin). For best signal integrity, the series resistance in the transmission line should be equal to the selected RDSO_N of the I/O pad output driver.

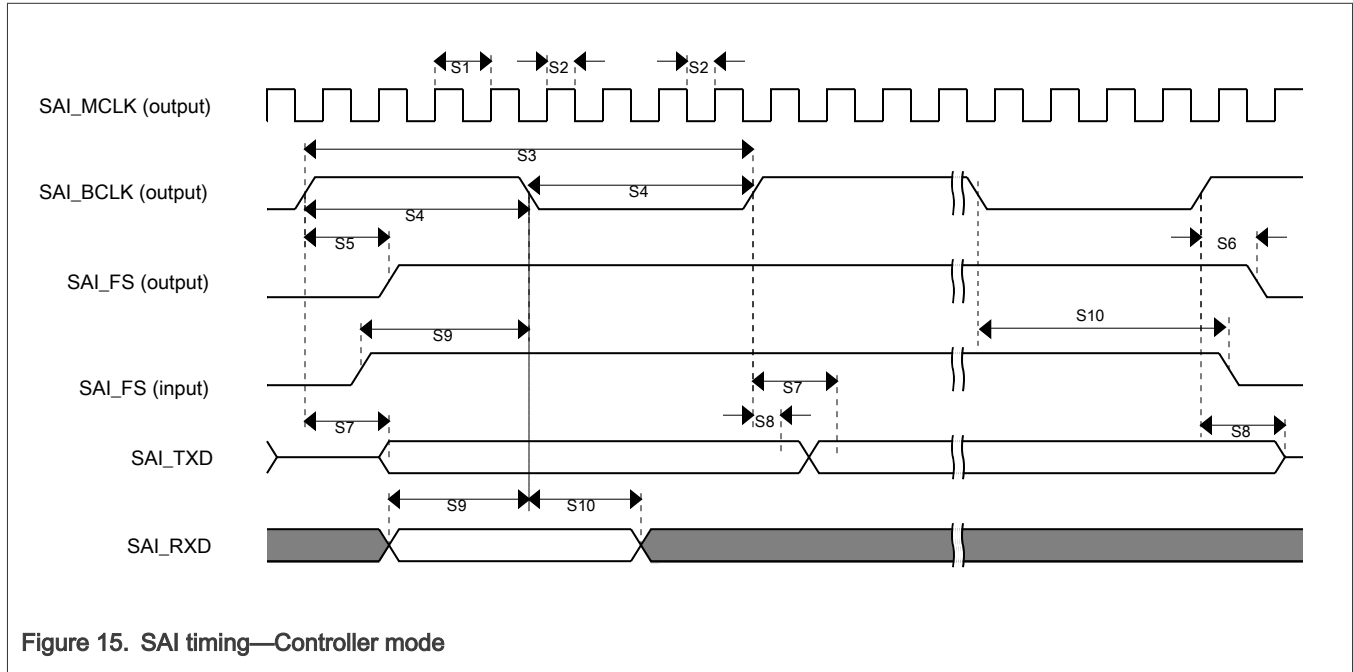

Figure 15. SAI timing—Controller mode

Table 47. Target mode SAI timing (25 MHz)^{[1][2]}

Num	Characteristic	Min	Max	Unit
S11	SAI_BCLK cycle time (input)	40	—	ns
S12	SAI_BCLK pulse width high/low (input)	40%	60%	BCLK period
S13	SAI_FS input setup before SAI_BCLK	3	—	ns
S14	SAI_FS input hold after SAI_BCLK	2	—	ns
S15	SAI_BCLK to SAI_TXD/SAI_FS output valid	—	9	ns
S16	SAI_BCLK to SAI_TXD/SAI_FS output invalid	0	—	ns
S17	SAI_RXD setup before SAI_BCLK	3	—	ns
S18	SAI_RXD hold after SAI_BCLK	2	—	ns
S19	SAI_FS input assertion to SAI_TXD output valid ^[3]	—	25	ns

[1] Input timing assumes an input signal slew rate of 3 ns (20%/80%).
 [2] Output timing valid for maximum external load CL = 25 pF, which is assumed to be a 10 pF load at the end of a 50 ohm. Underterminated, 5-inch microstrip trace on standard FR4 (3.3 pF/inch), (25 pF total with margin). For best signal integrity, the series resistance in the transmission line should be equal to the selected RDSON of the I/O pad output driver.
 [3] Applies to first bit in each frame and only if the TCR4[FSE] bit is clear.

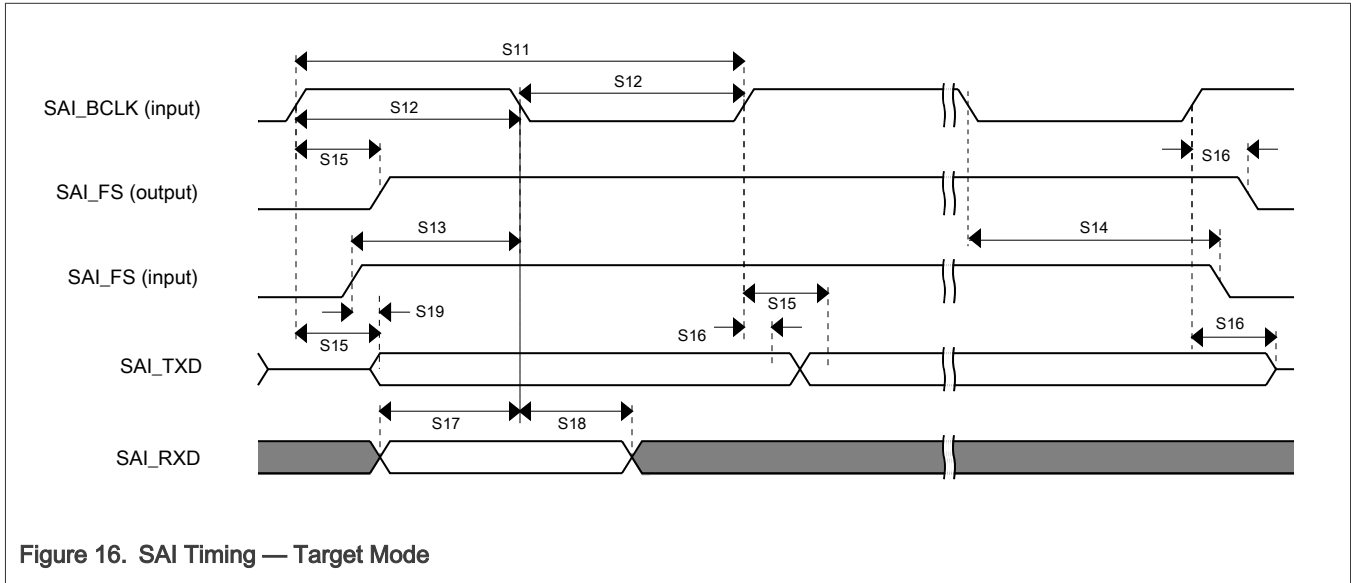

Figure 16. SAI Timing — Target Mode

4.10.2 SPDIF timing parameters

The Sony/Philips Digital Interconnect Format (SPDIF) data is sent using the bi-phase marking code. When encoding, the SPDIF data signal is modulated by a clock that is twice the bit rate of the data signal.

Table 48 and Figure 17 and Figure 18 show SPDIF timing parameters for the Sony/Philips Digital Interconnect Format (SPDIF), including the timing of the modulating Rx clock (SPDIF_SR_CLK) for SPDIF in Rx mode and the timing of the modulating Tx clock (SPDIF_ST_CLK) for SPDIF in Tx mode.

The DSE[5:0] = 001111 and FSEL1[1:0] = 11 are required drive settings to meet the timing.

Table 48. SPDIF timing parameters

Parameter	Symbol	Timing Parameter Range		Unit
		Min	Max	
SPDIF_IN Skew: asynchronous inputs, no specs apply	—	—	0.7	ns
SPDIF_OUT output (Load = 50 pf)	—	—	1.5	ns
• Skew	—	—	24.2	
• Transition rising	—	—	31.3	
• Transition falling	—	—		
SPDIF_OUT output (Load = 30 pf)	—	—	1.5	ns
• Skew	—	—	13.6	
• Transition rising	—	—	18.0	
• Transition falling	—	—		
Modulating Rx clock (SPDIF_SR_CLK) period	srckp	40.0	—	ns
SPDIF_SR_CLK high period	srckph	16.0	—	ns

Table continues on the next page...

Table 48. SPDIF timing parameters ...continued

Parameter	Symbol	Timing Parameter Range		Unit
		Min	Max	
SPDIF_SR_CLK low period	srckpl	16.0	—	ns
Modulating Tx clock (SPDIF_ST_CLK) period	stclkp	40.0	—	ns
SPDIF_ST_CLK high period	stclkph	16.0	—	ns
SPDIF_ST_CLK low period	stckpl	16.0	—	ns

Figure 17. SPDIF_SR_CLK timing diagram

Figure 18. SPDIF_ST_CLK timing diagram

4.10.3 PDM Microphone interface timing parameters

Note: These timing requirements apply only if the clock divider is enabled ($PDM_CTRL2[CLKDIV] = 0$), otherwise there are no special timing requirements.

The PDM microphones must meet the setup and hold timing requirements shown in the following table. The "k" factor value in Table 49 depends on the selected quality mode as shown in Table 50.

Table 49. PDM timing parameters

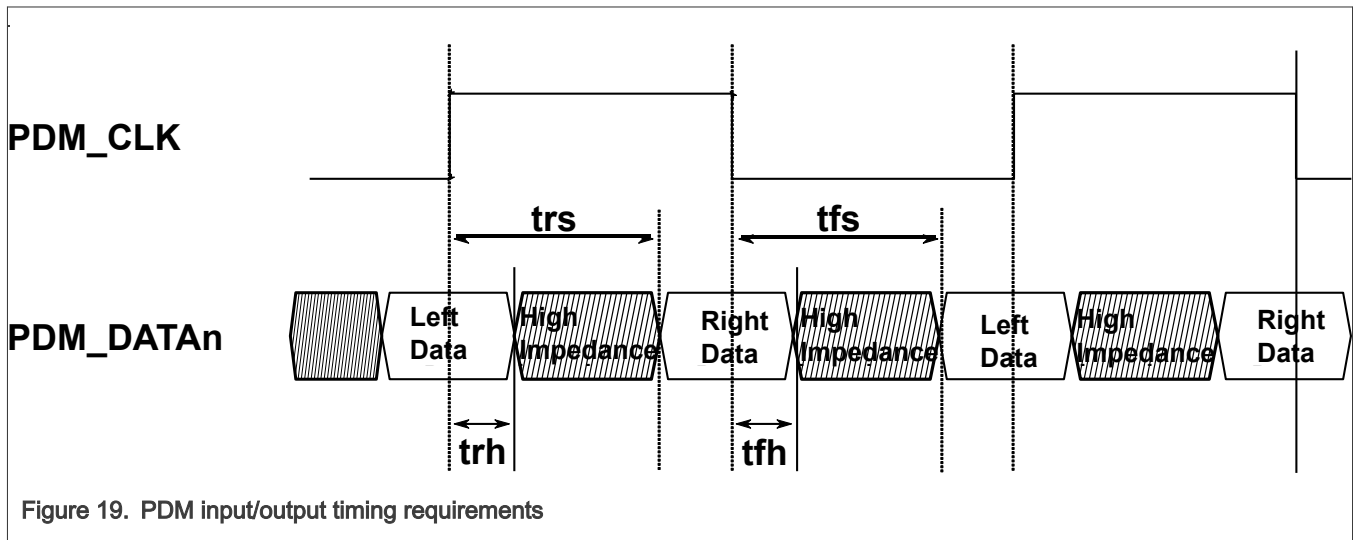

Parameter	Value
trs, tfs	$\leq \frac{\text{floor}(k \times \text{CLKDIV}) - 1}{@ (\text{moduleNickname})_CLK_ROOTrate}$
	[1]
trh, tfh	≥ 0

[1] Depending on K value, user must make sure floor (K x CLKDIV) > 1 to avoid timing problems.

Table 50. K factor value

Quality factor	K factor
High Quality	1/2
Medium Quality, Very Low Quality 0	1
Low Quality, Very Low Quality 1	2
Very Low Quality 2	4

Figure 19 illustrates the timing requirements for the PDM.

4.10.4 Medium Quality Sound (MQS) electrical specifications

Medium quality sound (MQS) is used to generate medium quality audio via a standard GPIO in the pinmux, allowing the user to connect stereo speakers or headphones to a power amplifier without an additional DAC chip. Two outputs are asynchronous PWM pulses and their maximum frequency is 1/32 x mclk_frequency.

Table 51. MQS specifications

Symbol	Description	Min	Typ	Max	Unit
$f_{mclk}^{[1][2]}$	Bit clock is used to generate the mclk.	—	24.576	66.5	MHz

[1] Frequency of mclk depends on software settings.

Please see [General purpose I/O \(GPIO\) AC parameters](#) for other electrical parameters.

[2] The maximum frequency supported is 56 MHz when NVCC_xxxx operating at 3.3 V.

4.11 Analog

The following sections introduce the timing and electrical parameters about analog interfaces of i.MX 93 processors.

4.11.1 12-bit ADC electrical specifications

All ADC channels meet the 12-bit single-ended accuracy specifications.

Table 52. ADC electrical specifications

Symbol	Description	Min	Typ	Max	Unit	Notes
V _{ADIN}	Input voltage	V _{GND}	—	V _{DDA}	V	[1]
f _{AD_CK}	ADC clock frequency	20	—	80	MHz	—
C _{sample}	Sample cycles	5.5	—	—	Cycle	—
C _{compare}	Fixed compare cycles	—	58	—	Cycle	—
C _{conversion}	Conversion cycles	C _{conversion} = C _{sample} + C _{compare}			Cycle	—
C _{AD_INPUT}	ADC input capacitance	—	—	7	pF	[2]
R _{AD_INPUT}	ADC input series resistance	—	—	1.25	KΩ	—
DNL	ADC differential nonlinearity	—	±2	—	LSB	[3]
INL	ADC integral nonlinearity	—	±6	—	LSB	[3]
R _{AS}	Analog source resistance	—	—	5	KΩ	—
Bandgap	Output voltage ready time for bandgap	—	1	—	μs	[4]
ENOB	Effective number of bits: Single-ended mode (11 x 11 mm package, PWM)	—	9.8	—	bit	[5],[6],[7],[8]
	Effective number of bits: Single-ended mode (11 x 11 mm package, PFM)	—	9.4	—		
	Effective number of bits: Single-ended mode (9 x 9 mm package, PWM)	—	9.2	—		
	Effective number of bits: Single-ended mode (9 x 9 mm package, PFM)	—	8.5	—		
	Effective number of bits: Single-ended mode (14 x 14 mm package, PWM)	—	10.5	—		
	Effective number of bits: Single-ended mode (14 x 14 mm package, PFM)	—	10.1	—		

[1] On or off channels
 [2] ADC component plus pad capacitance (~ 2 pF)
 [3] After calibration
 [4] Based on simulation test
 [5] Noise on the ADC reference voltage (VDD_ANA1P8) will result in performance loss of the ADC proportional to the noise present.
 [6] Input data used for test is 1 kHz sine wave.
 [7] Measured at VREFH = 1.8 V and pwrsel = 2.

[8] ENOB can be lower than shown, if an ADC channel corrupts other ADC channels through capacitive coupling. This coupling may be dominated by board parasitics. Care must be taken not to corrupt the desired channel being measured. This coupling becomes worse at higher analog frequencies and with switching waveforms due to the harmonic content.

Figure 20. Sample time vs R_{AS}

4.11.2 12-bit ADC input impedance equivalent circuit diagram

There is an additional R_{IOMUX} of 350 Ω (from 295 Ω to 405 Ω) resistance if an input goes through the MUX inside the IO and C_P of 2.5 pF as shown in Figure 21.

To calculate the sample request time, using the following equation where R_{ADCtotal} = R_{ADIN} + R_{IOMUX}, R_{IOMUX} = 350 Ω, C_P = 2.5 pF and B = 11 for 1/4 LSB settling.

$$T_{\text{smp_req}} = B [R_{AS} (C_{AS} + C_P + C_{ADIN}) + (R_{AS} + R_{ADCtotal}) C_{ADIN}]$$

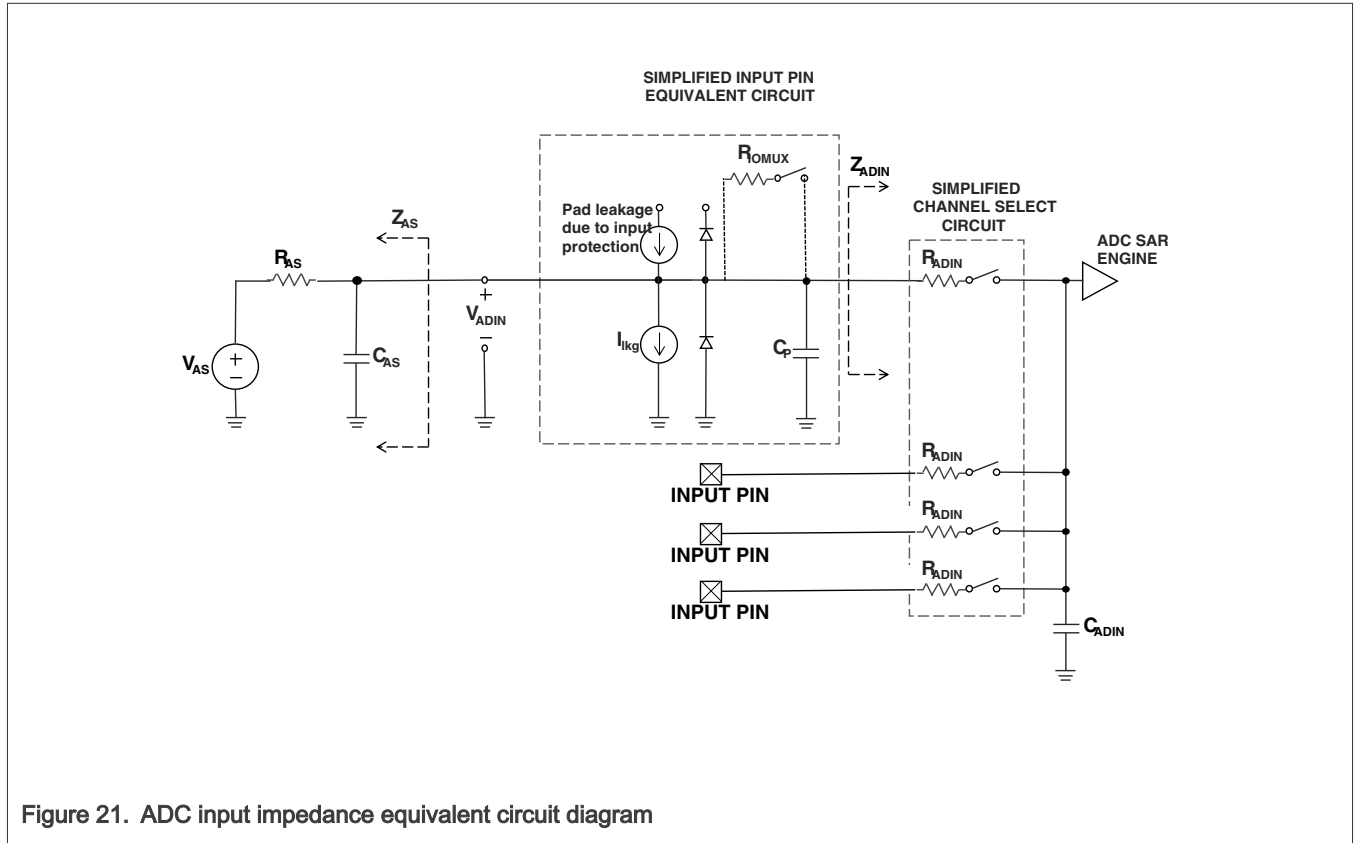

Figure 21. ADC input impedance equivalent circuit diagram

4.12 External peripheral interface parameters

The following subsections provide information on external peripheral interfaces.

4.12.1 Ultra-high-speed SD/SDIO/MMC host interface (uSDHC) AC timing

This section describes the electrical information of the uSDHC, which includes SD/eMMC5.1 (single data rate) timing, eMMC5.1/SD3.0 (dual data rate) timing and SDR50/SDR104 AC timing.

The DSE[5:0] = 001111 and FSEL1[1:0] = 11 are required drive settings to meet the timing.

4.12.1.1 SD3.0/eMMC5.1 (single data rate) AC timing

Figure 22 depicts the timing of SD3.0/eMMC5.1, and Table 53 lists the SD3.0/eMMC5.1 timing characteristics.

Figure 22. SD3.0/eMMC5.1 (SDR) timing

Table 53. SD3.0/eMMC5.1 (SDR) interface timing specification^{[1],[2]}

ID	Parameter	Symbols	Min	Max	Unit
Card Input Clock					
SD1	Clock Frequency (Low Speed)	$f_{PP}^{[3]}$	0	400	kHz
	Clock Frequency (SD/SDIO Full Speed/High Speed)	$f_{PP}^{[4]}$	0	25/50	MHz
	Clock Frequency (MMC Full Speed/High Speed)	$f_{PP}^{[5]}$	0	20/52	MHz
	Clock Frequency (Identification Mode)	f_{OD}	100	400	kHz
SD2	Clock Low Time	t_{WL}	7	—	ns
SD3	Clock High Time	t_{WH}	7	—	ns
SD4	Clock Rise Time	t_{TLH}	—	3	ns
SD5	Clock Fall Time	t_{THL}	—	3	ns
uSDHC Output/Card Inputs SD_CMD, SDx_DATAx (Reference to CLK)					
SD6	uSDHC Output Delay	t_{OD}	-6.6	3.6	ns
uSDHC Input/Card Outputs SD_CMD, SDx_DATAx (Reference to CLK)					
SD7	uSDHC Input Setup Time	t_{ISU}	2.5	—	ns
SD8	uSDHC Input Hold Time ^[6]	t_{IH}	1.5	—	ns

[1] Input timing assumes an input signal slew rate of 3 ns (20%/80%).
 [2] Output timing valid for maximum external load $CL = 25$ pF, which is assumed to be a 10 pF load at the end of a 50 ohm, unterminated, 5-inch microstrip trace on standard FR4 (3.3 pF/inch), (25 pF total with margin). For best signal integrity, the series resistance in the transmission line should be equal to the selected RDSO of the I/O pad output driver.
 [3] In Low-Speed mode, card clock must be lower than 400 kHz, voltage ranges from 2.7 to 3.6 V.
 [4] In Normal (Full) -Speed mode for SD/SDIO card, clock frequency can be any value between 0 – 25 MHz. In High-speed mode, clock frequency can be any value between 0 – 50 MHz.
 [5] In Normal (Full) -Speed mode for MMC card, clock frequency can be any value between 0 – 20 MHz. In High-speed mode, clock frequency can be any value between 0 – 52 MHz.
 [6] To satisfy hold timing, the delay difference between clock input and cmd/data input must not exceed 2 ns.

4.12.1.2 SD3.0/eMMC5.1 (dual data rate) AC timing

Figure 23 depicts the timing of SD3.0/eMMC5.1 (DDR). Table 54 lists the SD3.0/eMMC5.1 (DDR) timing characteristics. Be aware that only DATA is sampled on both edges of the clock (not applicable to CMD).

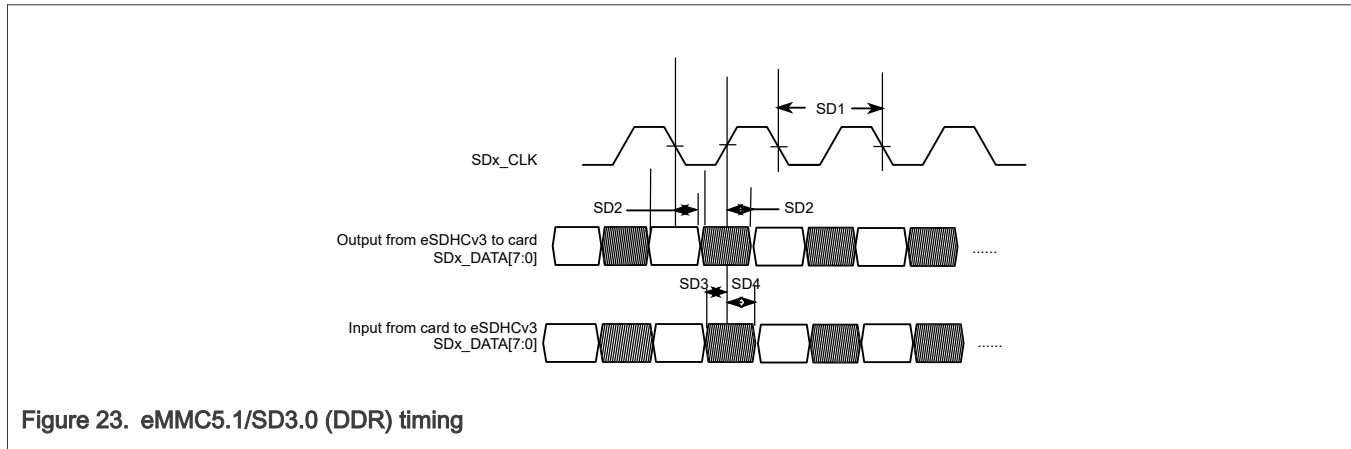

Figure 23. eMMC5.1/SD3.0 (DDR) timing

Table 54. SD3.0/eMMC5.1 (DDR) interface timing specification^{[1],[2]}

ID	Parameter	Symbols	Min	Max	Unit
Card Input Clock					
SD1	Clock Frequency (eMMC5.1 DDR)	f_{PP}	0	52	MHz
SD1	Clock Frequency (SD3.0 DDR)	f_{PP}	0	50	MHz
uSDHC Output / Card Inputs SD_CMD, SDx_DATAx (Reference to CLK)					
SD2	uSDHC Output Delay	t_{OD}	2.8	6.8	ns
uSDHC Input / Card Outputs SD_CMD, SDx_DATAx (Reference to CLK)					
SD3	uSDHC Input Setup Time	t_{ISU}	2.4	—	ns
SD4	uSDHC Input Hold Time	t_{IH}	1.5	—	ns

[1] Input timing assumes an input signal slew rate of 3 ns (20%/80%).

[2] Output timing valid for maximum external load CL = 25 pF, which is assumed to be a 10 pF load at the end of a 50 ohm, unterminated, 5-inch microstrip trace on standard FR4 (3.3 pF/inch), (25 pF total with margin). For best signal integrity, the series resistance in the transmission line should be equal to the selected RDSO of the I/O pad output driver.

4.12.1.3 HS400 DDR AC timing

Figure 24 depicts the timing of HS400 mode, Table 55 and Table 56 list the HS400 timing characteristics. Be aware that only data is sampled on both edges of the clock (not applicable to CMD). The CMD input/output timing for HS400 mode is the same as CMD input/output timing for SDR104 mode. Check SD5, SD6, and SD7 parameters in Table 59 and Table 60 for HS400 mode.

Figure 24. HS400 timing

Table 55. HS400 interface timing specification (Nominal and Overdrive mode)^{[1],[2]}

ID	Parameter	Symbols	Min	Max	Unit
Card Input Clock					
SD1	Clock frequency	f_{PP}	0	200	MHz
SD2	Clock low time	t_{CL}	2.2	—	ns
SD3	Clock high time	t_{CH}	2.2	—	ns
uSDHC Output/Card Inputs DAT (Reference to SCK)					
SD4	Output skew from Data of edge of SCK	t_{OSkew1}	0.45	—	ns
SD5	Output skew from SCK to Data of edge	t_{OSkew2}	0.45	—	ns
uSDHC Input/Card Outputs DAT (Reference to Strobe)					
SD6	uSDHC input skew	t_{RQ}	—	0.45	ns
SD7	uSDHC hold skew	t_{RQH}	—	0.45	ns

[1] Input timing assumes an input signal slew rate of 1 ns (20%/80%).

[2] Output timing valid for maximum external load $CL = 15$ pF, which is assumed to be a 8 pF load at the end of a 50 ohm, unterminated, 2-inch microstrip trace on standard FR4 (3.3 pF/inch). For best signal integrity, the series resistance of the transmission line should be matched closely to the RD_{SON} of the I/O pad output driver.

Table 56. HS400 interface timing specification (Low drive mode)^{[1],[2]}

ID	Parameter	Symbols	Min	Max	Unit
Card Input Clock					
SD1	Clock frequency	f_{PP}	0	133	MHz

Table continues on the next page...

SD6	uSDHC Input Setup Time	t_{ISU}	2.4	—	ns
SD7	uSDHC Input Hold Time	t_{IH}	1.5	—	ns
uSDHC Input/Card Outputs SD_CMD, SDx_DATAx in SDR104 (Reference to CLK)^[3]					
SD8	uSDHC Input Data Window	t_{ODW}	$0.5 \times t_{CLK}$	—	ns

[1] Input timing assumes an input signal slew rate of 1 ns (20%/80%).

[2] Output timing valid for maximum external load $CL = 15$ pF, which is assumed to be a 8 pF load at the end of a 50 ohm, unterminated, 2-inch microstrip trace on standard FR4 (3.3 pF/inch). For best signal integrity, the series resistance of the transmission line should be matched closely to the R_{DSO}n of the I/O pad output driver.

[3] Data window in SDR100 mode is variable.

4.12.1.6 Bus operation condition for 3.3 V and 1.8 V signaling

Signaling level of SD/eMMC4.5/5.0/5.1 can be 1.8 V or 3.3 V depending on the working mode. The DC parameters for NVCC_SD2 supplies are identical to those shown in [General purpose I/O \(GPIO\) DC parameters](#).

4.12.1.7 uSDHC supported modes

For SD:

- All SD 3.0 protocols are supported at full speeds on all three SDHC interfaces. This includes DS, HS, SDR12, SDR25, SDR50, SDR104, and DDR50.
- The maximum supported SDR frequency is 200 MHz which is covered in SDR104 mode, and maximum DDR frequency is 50 MHz as a part of DDR50 mode.

For eMMC:

- eMMC HS400 is only supported on SDHC1 as that is the only one with 8-bit interface.
- eMMC HS200 is supported on all three SDHC interfaces because this protocol supports both 4-bit mode and 8-bit mode, which can work on SDHC2 and SDHC3.
- eMMC High Speed DDR, High Speed SDR, and less than or equal to 26 MHz MMC legacy protocols are also supported on all three SDHC interfaces.

- The maximum supported SDR frequency is 200 MHz which is covered in HS200 mode, and the maximum DDR frequency is 200 MHz as a part of HS400 mode.

uSDHC3 supports up to SDR104 (200 MHz) on primary SD3_* pins, but when it is multiplexing on GPIO_IO[27:22], below are the modes supported:

- eMMC High Speed DDR, High Speed SDR, and less than or equal to 26 MHz MMC legacy protocols are supported.
- SDR50 (100 MHz) and SDR104 (200 MHz) modes are NOT supported.
- eMMC HS400 and HS200 modes are NOT supported
- The maximum supported SDR and DDR frequency is 50 and 52 MHz

If IO is supplied by 3.3 V, the maximum supported SDR/DDR frequency is 50/52 MHz

4.12.2 Ethernet controller (ENET) AC electrical specifications

Ethernet supports the following key features:

- Support ENET AVB
- Support IEEE 1588
- Support Energy Efficient Ethernet (EEE)
- 1.8 V/3.3 V RMI operation, 1.8 V RGMII operation

The following sections introduce the ENET AC electrical specifications.

4.12.2.1 ENET2 signal mapping

The following timing specs are defined at the chip I/O pin and must be translated appropriately to arrive at timing specs/constraints for the physical interface.

Table 61. ENET2 signal mapping^[1]

Pad name	RGMII	Alt mode	RMII	Alt mode	Direction
ENET2_MDC	RGMII_MDC	Alt 0	RMII_MDC	Alt 0	O
ENET2_MDIO	RGMII_MDIO	Alt 0	RMII_MDIO	Alt 0	I/O
ENET2_TXC	RGMII_TXC	Alt 0	RMII_TX_ER	Alt 1	O
ENET2_TX_CTL	RGMII_TX_CTL	Alt 0	RMII_TX_EN	Alt 0	O
ENET2_TD0	RGMII_TD0	Alt 0	RMII_TD0	Alt 0	O
ENET2_TD1	RGMII_TD1	Alt 0	RMII_TD1	Alt 0	O
ENET2_TD2	RGMII_TD2	Alt 0	RMII_REF_CLK ^[2]	Alt 1	I/O
ENET2_TD3	RGMII_TD3	Alt 0	—	Alt 0	O
ENET2_RXC	RGMII_RXC	Alt 0	RMII_RX_ER	Alt 1	I
ENET2_RX_CTL	RGMII_RX_CTL	Alt 0	RMII_CRSDV	Alt 0	I
ENET2_RD0	RGMII_RD0	Alt 0	RMII_RD0	Alt 0	I

Table continues on the next page...

Table 61. ENET2 signal mapping^{[1]...continued}

Pad name	RGMII	Alt mode	RMII	Alt mode	Direction
ENET2_RD1	RGMII_RD1	Alt 0	RMII_RD1	Alt 0	I
ENET2_RD2	RGMII_RD2	Alt 0	—	Alt 0	I
ENET2_RD3	RGMII_RD3	Alt 0	—	Alt 0	I

[1] ENET1 is Ethernet QoS with TSN, while ENET2 is Ethernet MAC.
 [2] The signal can be either input or output.

4.12.2.2 RMII mode timing

In RMII mode, enet1.RMII_CLK is used as the REF_CLK, which is a 50 MHz ± 50 ppm continuous reference clock.

Figure 27 shows RMII mode timings. Table 62 describes the timing parameters (M16–M21) shown in the figure.

Figure 27. RMII mode signal timing diagram

Table 62. RMII signal timing^{[1],[2],[3]}

ID	Characteristic	Min.	Max.	Unit
M16	ENET_CLK pulse width high	35%	65%	RMII_REF_CLK period
M17	RMII_REF_CLK pulse width low	35%	65%	RMII_REF_CLK period
M18	RMII_REF_CLK to ENET0_TXD[1:0], ENET_TX_EN invalid	2	—	ns
M19	RMII_REF_CLK to ENET0_TXD[1:0], ENET_TX_EN valid	—	14	ns
M20	ENET_RX_DATA[1:0], ENET_CRS_DV, ENET_RX_ER to RMII_REF_CLK setup	4	—	ns
M21	RMII_REF_CLK to ENET_RX_DATA[1:0], ENET_CRS_DV, ENET_RX_ER hold	2	—	ns

[1] The timings assume the following configuration: DSE[5:0] = 001111 and FSEL1[1:0] = 11.
 [2] Input timing assumes an input signal slew rate of 3 ns (20%/80%).

[3] Output timing valid for maximum external load CL = 25 pF, which is assumed to be a 10 pF load at the end of a 50 ohm, unterminated, 5-inch microstrip trace on standard FR4 (3.3 pF/inch), (25 pF total with margin). For best signal integrity, the series resistance in the transmission line should be equal to the selected RDSO of the I/O pad output driver.

4.12.2.3 MII serial management channel timing (ENET_MDIO and ENET_MDC)

The MDC frequency is designed to be equal to or less than 2.5 MHz to be compatible with the IEEE 802.3 MII specification.

Figure 28 shows MII asynchronous input timings. Table 63 describes the timing parameters (M10–M15) shown in the figure.

Figure 28. MII serial management channel timing diagram

Table 63. MII serial management channel timing^{[1],[2],[3]}

ID	Characteristic	Min.	Max.	Unit
M10	ENET_MDC falling edge to ENET_MDIO output invalid (min. propagation delay)	-1.5	—	ns
M11	ENET_MDC falling edge to ENET_MDIO output valid (max. propagation delay)	—	13	ns
M12	ENET_MDIO (input) to ENET_MDC rising edge setup	13	—	ns
M13	ENET_MDIO (input) to ENET_MDC rising edge hold	0	—	ns
M14	ENET_MDC pulse width high	40%	60%	ENET_MDC period
M15	ENET_MDC pulse width low	40%	60%	ENET_MDC period

[1] The timings assume the following configuration: DSE[5:0] = 001111 and FSEL1[1:0] = 11.

[2] Input timing assumes an input signal slew rate of 3 ns (20%/80%).

[3] Output timing valid for maximum external load CL = 25 pF, which is assumed to be a 10 pF load at the end of a 50 ohm, unterminated, 5-inch microstrip trace on standard FR4 (3.3 pF/inch), (25 pF total with margin). For best signal integrity, the series resistance in the transmission line should be equal to the selected RDSO of the I/O pad output driver.

4.12.2.4 RGMII signal switching specifications

The following timing specifications meet the requirements for RGMII interfaces for a range of transceiver devices.

Table 64. RGMII signal switching specifications^{[1],[2],[3],[4]}

Symbol	Description	Min.	Max.	Unit
T_{cyc}	Clock cycle duration	7.2	8.8	ns
T_{skewT}	Data to clock output skew at transmitter	-500	500	ps
T_{skewR}	Data to clock input skew at receiver	1	2.6	ns
Duty_G	Duty cycle for Gigabit	45	55	%
Duty_T	Duty cycle for 10/100T	40	60	%

- [1] The timings assume the following configuration: DSE[5:0] = 001111 and FSEL1[1:0] = 11.
- [2] Measured as defined in *EIA/JESD 8-6 1995* with a timing threshold voltage of $VDDQ/2$.
- [3] Output timing valid for maximum external load $CL = 15\text{ pF}$, which is assumed to be a 8 pF load at the end of a 50 ohm , unterminated, 2-inch microstrip trace on standard FR4 (3.3 pF/inch). For best signal integrity, the series resistance in the transmission line should be matched closely to the selected $RDSON$ of the I/O pad output driver.
- [4] RGMII timing specifications are only valid for 1.8 V nominal I/O pad supply voltage.

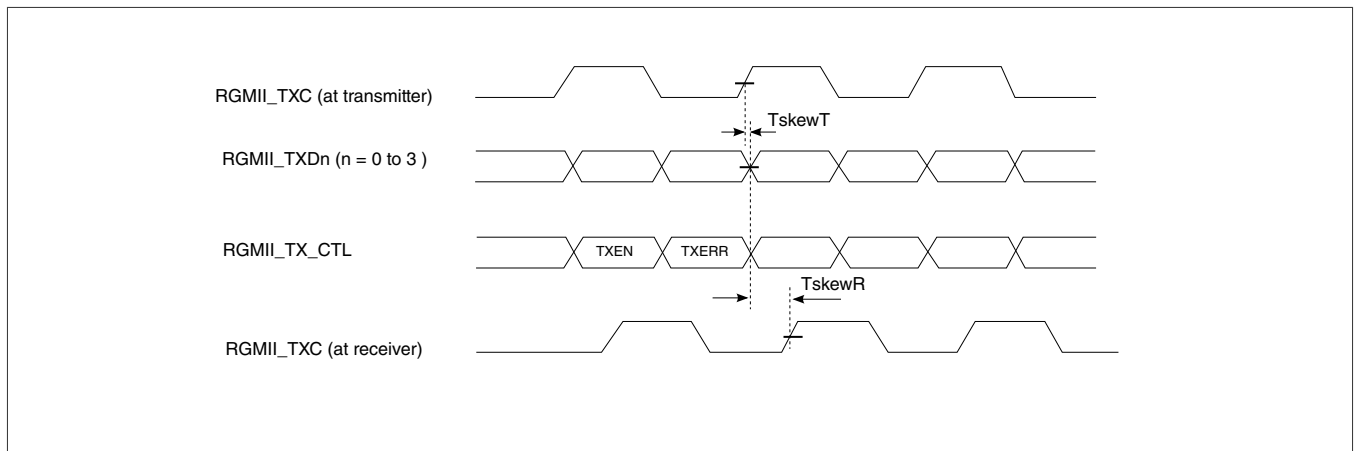

Figure 29. RGMII transmit signal timing diagram original

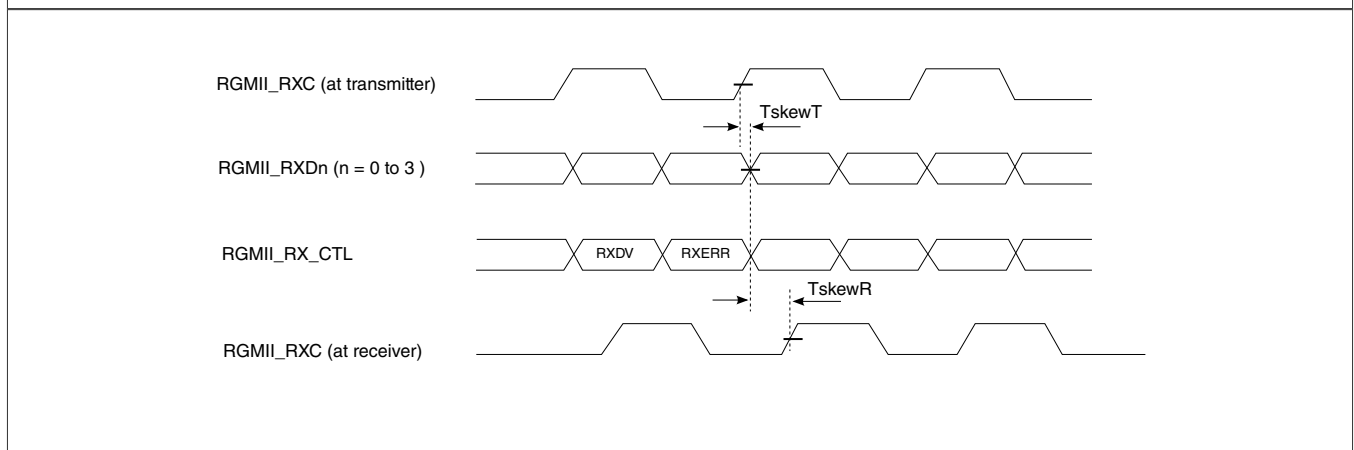

Figure 30. RGMII receive signal timing diagram original

4.12.3 Ethernet Quality-of-Service (QoS) electrical specifications

Ethernet QoS supports the following Time Sensitive Networking (TSN) features:

- 802.1Qbv Enhancements to Scheduling Traffic

- 802.1Qbu Frame preemption
- Time based Scheduling
- 1.8 V/3.3 V RMIi operation, 1.8 V RGMII operation

4.12.3.1 Ethernet QOS signal mapping

The following timing specs are defined at the chip I/O pin and must be translated appropriately to arrive at timing specs/constraints for the physical interface.

Table 65. ENET QOS signal mapping^[1]

Pad name	RGMII	Alt mode	RMII	Alt mode	Direction
ENET1_MDC	RGMII_MDC	Alt 0	RMII_MDC	Alt 0	O
ENET1_MDIO	RGMII_MDIO	Alt 0	RMII_MDIO	Alt 0	I/O
ENET1_TXC	RGMII_TXC	Alt 0	RMII_TX_ER	Alt 1	O
ENET1_TX_CTL	RGMII_TX_CTL	Alt 0	RMII_TX_EN	Alt 0	O
ENET1_TD0	RGMII_TD0	Alt 0	RMII_TD0	Alt 0	O
ENET1_TD1	RGMII_TD1	Alt 0	RMII_TD1	Alt 0	O
ENET1_TD2	RGMII_TD2	Alt 0	RMII_REF_CLK ^[2]	Alt 1	I/O
ENET1_TD3	RGMII_TD3	Alt 0	—	Alt 0	O
ENET1_RXC	RGMII_RXC	Alt 0	RMII_RX_ER	Alt 1	I
ENET1_RX_CTL	RGMII_RX_CTL	Alt 0	RMII_CRD_DV	Alt 0	I
ENET1_RD0	RGMII_RD0	Alt 0	RMII_RD0	Alt 0	I
ENET1_RD1	RGMII_RD1	Alt 0	RMII_RD1	Alt 0	I
ENET1_RD2	RGMII_RD2	Alt 0	—	Alt 0	I
ENET1_RD3	RGMII_RD3	Alt 0	—	Alt 0	I

[1] ENET1 is Ethernet QoS with TSN, while ENET2 is Ethernet MAC.

[2] The signal can be either input or output.

4.12.3.2 RMII mode timing

In RMII mode, enet1.RMII_CLK is used as the REF_CLK, which is a 50 MHz ± 50 ppm continuous reference clock.

Figure 31 shows RMII mode timings. Table 66 describes the timing parameters (M16–M21) shown in the figure.

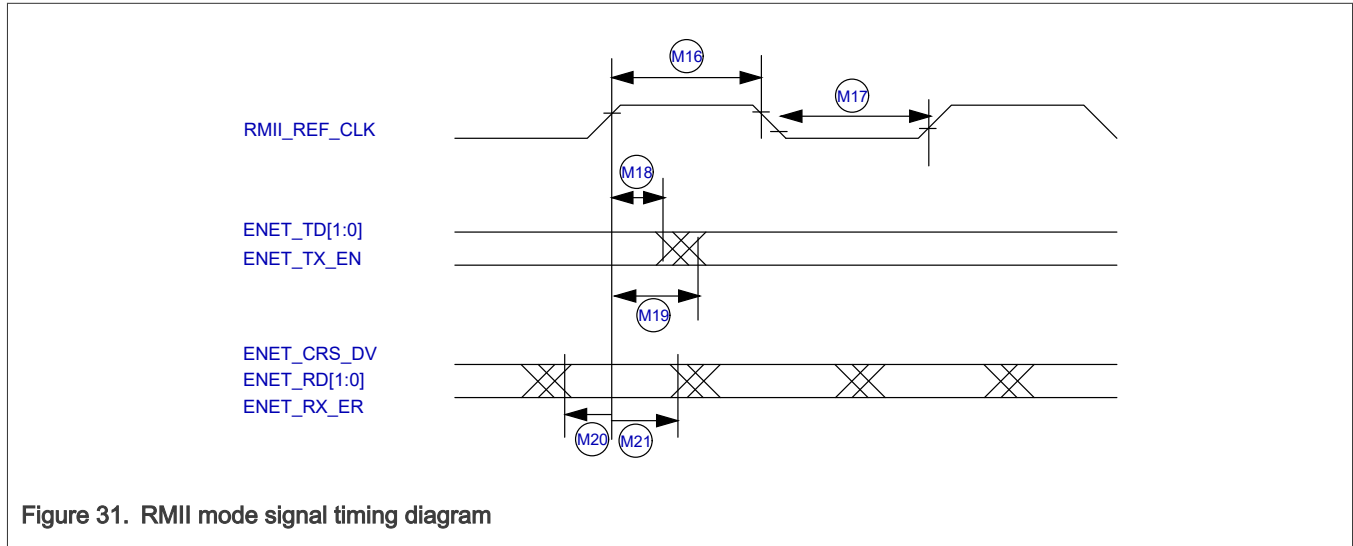

Figure 31. RMI mode signal timing diagram

Table 66. RMI signal timing^{[1],[2],[3]}

ID	Characteristic	Min.	Max.	Unit
M16	ENET_CLK pulse width high	35%	65%	RMI_REF_CLK period
M17	RMI_REF_CLK pulse width low	35%	65%	RMI_REF_CLK period
M18	RMI_REF_CLK to ENET0_TXD[1:0], ENET_TX_EN invalid	2	—	ns
M19	RMI_REF_CLK to ENET0_TXD[1:0], ENET_TX_EN valid	—	14	ns
M20	ENET_RX_DATA[1:0], ENET_CRD[1:0], ENET_RX_ER to RMI_REF_CLK setup	4	—	ns
M21	RMI_REF_CLK to ENET_RX_DATA[1:0], ENET_CRD[1:0], ENET_RX_ER hold	2	—	ns

[1] The timings assume the following configuration: DSE[5:0] = 001111 and FSEL1[1:0] = 11.

[2] Input timing assumes an input signal slew rate of 3 ns (20%/80%).

[3] Output timing valid for maximum external load CL = 25 pF, which is assumed to be a 10 pF load at the end of a 50 ohm, unterminated, 5-inch microstrip trace on standard FR4 (3.3 pF/inch), (25 pF total with margin). For best signal integrity, the series resistance in the transmission line should be equal to the selected RDSON of the I/O pad output driver.

4.12.3.3 MII serial management channel timing (ENET_MDIO and ENET_MDC)

The MDC frequency is designed to be equal to or less than 2.5 MHz to be compatible with the IEEE 802.3 MII specification.

Figure 32 shows MII asynchronous input timings. Table 67 describes the timing parameters (M10–M15) shown in the figure.

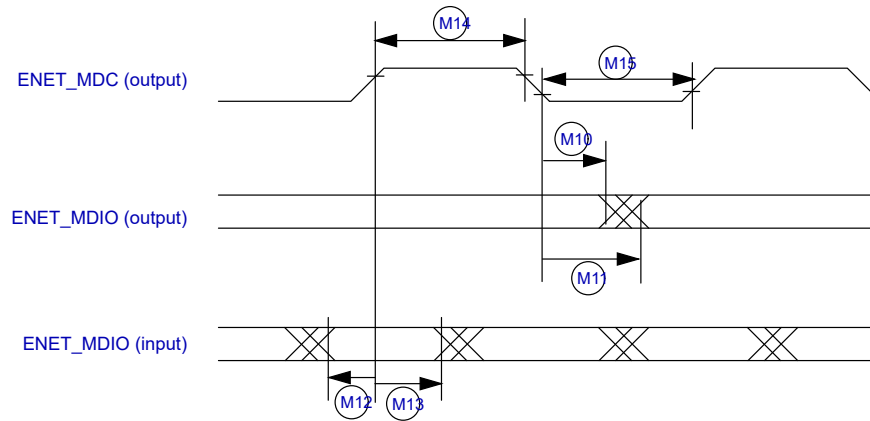

Figure 32. MII serial management channel timing diagram

Table 67. MII serial management channel timing^{[1],[2],[3]}

ID	Characteristic	Min.	Max.	Unit
M10	ENET_MDC falling edge to ENET_MDIO output invalid (min. propagation delay)	-1.5	—	ns
M11	ENET_MDC falling edge to ENET_MDIO output valid (max. propagation delay)	—	13	ns
M12	ENET_MDIO (input) to ENET_MDC rising edge setup	13	—	ns
M13	ENET_MDIO (input) to ENET_MDC rising edge hold	0	—	ns
M14	ENET_MDC pulse width high	40%	60%	ENET_MDC period
M15	ENET_MDC pulse width low	40%	60%	ENET_MDC period

[1] The timings assume the following configuration: DSE[5:0] = 001111 and FSEL1[1:0] = 11.

[2] Input timing assumes an input signal slew rate of 3 ns (20%/80%).

[3] Output timing valid for maximum external load CL = 25 pF, which is assumed to be a 10 pF load at the end of a 50 ohm. Underterminated, 5-inch microstrip trace on standard FR4 (3.3 pF/inch), (25 pF total with margin). For best signal integrity, the series resistance in the transmission line should be equal to the selected RDSO of the I/O pad output driver.

4.12.3.4 RGMII signal switching specifications

The following timing specifications meet the requirements for RGMII interfaces for a range of transceiver devices.

Table 68. RGMII signal switching specifications^{[1],[2],[3],[4]}

Symbol	Description	Min.	Max.	Unit
T _{cyc}	Clock cycle duration	7.2	8.8	ns
T _{skewT}	Data to clock output skew at transmitter	-500	500	ps
T _{skewR}	Data to clock input skew at receiver	1	2.6	ns

Table continues on the next page...

Table 68. RGMII signal switching specifications^{[1],[2],[3],[4]}...continued

Symbol	Description	Min.	Max.	Unit
Duty_G	Duty cycle for Gigabit	45	55	%
Duty_T	Duty cycle for 10/100T	40	60	%

- [1] The timings assume the following configuration: DSE[5:0] = 001111 and FSEL1[1:0] = 11.
- [2] Measured as defined in *EIA/JESD 8-6 1995* with a timing threshold voltage of $V_{DDQ}/2$.
- [3] Output timing valid for maximum external load $CL = 15\text{ pF}$, which is assumed to be a 8 pF load at the end of a 50 ohm , unterminated, 2-inch microstrip trace on standard FR4 (3.3 pF/inch). For best signal integrity, the series resistance in the transmission line should be matched closely to the selected R_{DSOn} of the I/O pad output driver.
- [4] RGMII timing specifications are only valid for 1.8 V nominal I/O pad supply voltage.

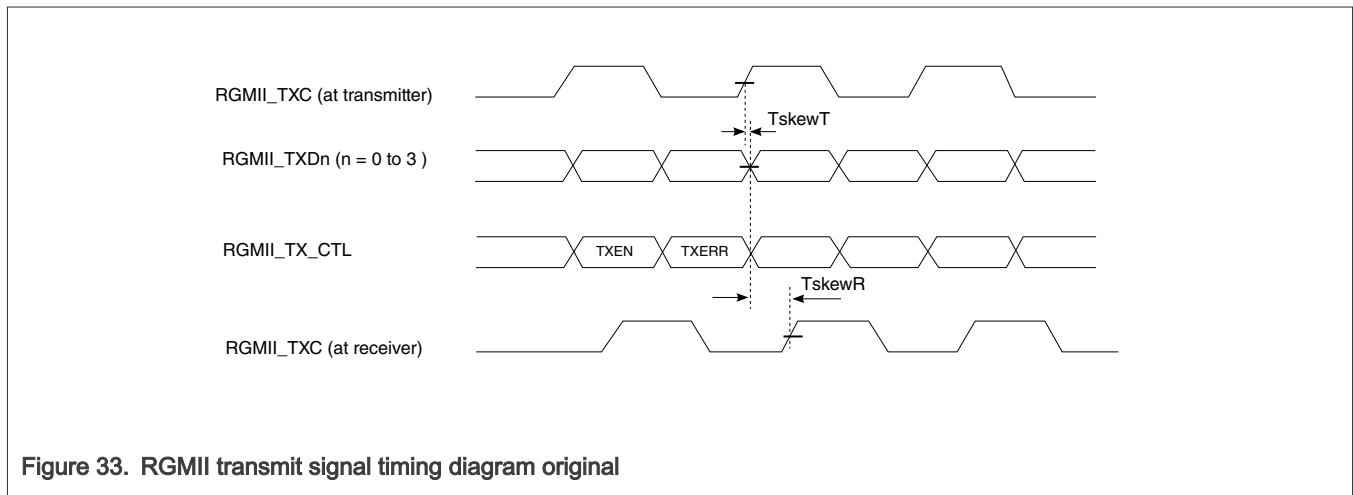

Figure 33. RGMII transmit signal timing diagram original

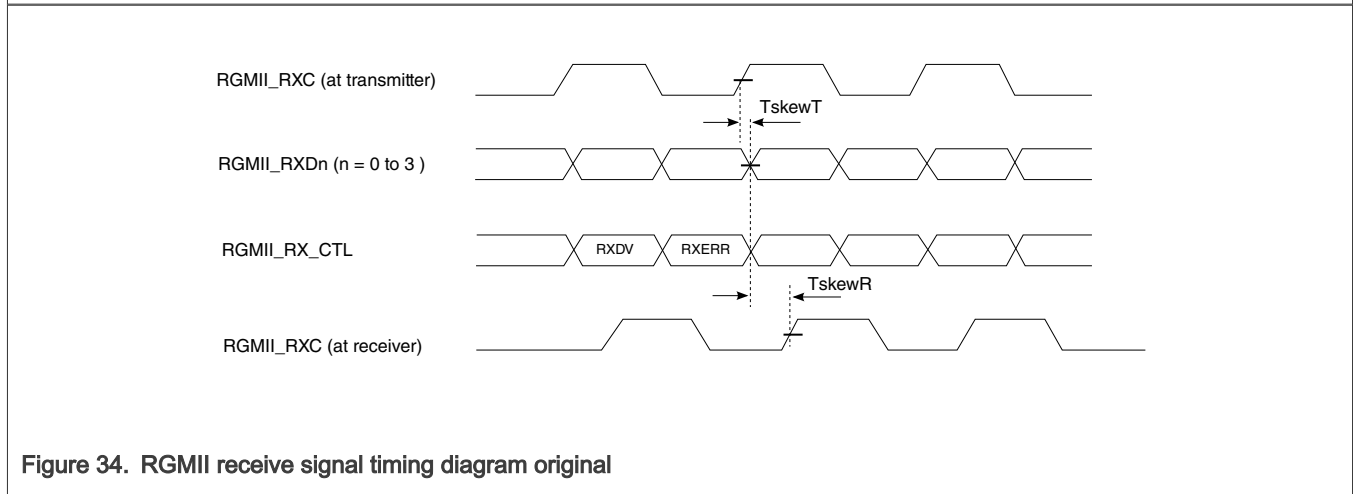

Figure 34. RGMII receive signal timing diagram original

4.12.4 LPSPi timing parameters

The Low Power Serial Peripheral Interface (LPSPi) provides a synchronous serial bus with Controller and Peripheral operations. Many of the transfer attributes are programmable. The following tables provide timing characteristics for classic LPSPi timing modes.

All timing is shown with respect to 20% V_{DD} and 80% V_{DD} thresholds, unless noted, as well as input signal transitions of 3 ns and a 25 pF maximum load on all LPSPi pins.

The DSE[5:0] = 001111 and FSEL1[1:0] = 11 are required drive settings to meet the timing.

Table 69. LPSPI Controller mode timing^{[1],[2]}

Number	Symbol	Description	Min.	Max.	Units	Note
1	f _{SCK}	Frequency of LPSPI clock ^[3]	—	30	MHz	[4]
			—	60	MHz	[5]
2	t _{SCK}	SCK period	2 x t _{periph}	—	ns	[6]
3	t _{Lead}	Enable lead time	1	—	t _{periph}	—
4	t _{Lag}	Enable lag time	1	—	t _{periph}	—
5	t _{WSCK}	Clock (SCK) high or low time	t _{SCK} / 2 - 3	t _{SCK} / 2 + 3	ns	—
6	t _{SU}	Data setup time (inputs)	8	—	ns	[7],[8]
7	t _{HI}	Data hold time (inputs)	0	—	ns	[7]
8	t _V	Data valid (after SCK edge)	—	2.5	ns	—
9	t _{HO}	Data hold time (outputs)	-2.5	—	ns	—

- [1] Input timing assumes an input signal slew rate of 3 ns (20%/80%).
- [2] Output timing valid for maximum external load CL = 25 pF, which is assumed to be a 10 pF load at the end of a 50 ohm. Unterminated, 5-inch microstrip trace on standard FR4 (3.3 pF/inch), (25 pF total with margin). For best signal integrity, the series resistance in the transmission line should be equal to the selected RDSO of the I/O pad output driver.
- [3] The maximum frequency supported is 56 MHz when NVCC_XXXX operating at 3.3 V.
- [4] The clock driver in the LPSPI module for f_{periph} must guaranteed this limit is not exceeded.
- [5] In Controller loopback mode when LPSPI_CFR1[SAMPLE] bit is 1.
- [6] f_{periph} = Functional clock / (2 ^ PRESCALE) and t_{periph} = 1 / f_{periph}
- [7] If LPSPI_CFR1[SAMPLE] bit is 1, the data setup time (inputs) / data hold time (inputs) specifications are same with the one in Peripheral mode.
- [8] For 3.3 V I/O supply, t_{SU} (Data setup time) parameter value is 9 ns in LPSPI Controller mode.

Figure 35. LPSPI Controller mode timing (CPHA = 0)

Table 70. LPSPi Peripheral mode timing^{[1],[2]}

Number	Symbol	Description	Min.	Max.	Units	Note
1	f _{SCK}	Frequency of LPSPi clock	0	30	MHz	—
2	t _{SCK}	SCK period	2 × t _{periph}	—	ns	[3]
3	t _{Lead}	Enable lead time	1	—	t _{periph}	—
4	t _{Lag}	Enable lag time	1	—	t _{periph}	—
5	t _{W SCK}	Clock (SCK) high or low time	t _{SCK} / 2 - 5	t _{SCK} / 2 + 5	ns	—
6	t _{SU}	Data setup time (inputs)	3	—	ns	—
7	t _{HI}	Data hold time (inputs)	3	—	ns	—
8	t _a	Peripheral access time	—	20	ns	[4]
9	t _{dis}	Peripheral MISO disable time	—	20	ns	[5]
10	t _V	Data valid (after SCK edge)	—	8	ns	[6]
11	t _{HO}	Data hold time (outputs)	0	—	ns	—

[1] Input timing assumes an input signal slew rate of 3 ns (20%/80%).
 [2] Output timing valid for maximum external load CL = 25 pF, which is assumed to be a 10 pF load at the end of a 50 ohm. Unterminated, 5-inch microstrip trace on standard FR4 (3.3 pF/inch), (25 pF total with margin). For best signal integrity, the series resistance in the transmission line should be equal to the selected RDSON of the I/O pad output driver.
 [3] f_{periph} = Functional clock / (2 ^ PRESCALE) and t_{periph} = 1 / f_{periph}
 [4] Time to data active from high-impedance state
 [5] Hold time to high-impedance state
 [6] When operating at 3.3 V I/O supply, this parameter value is 9 ns.

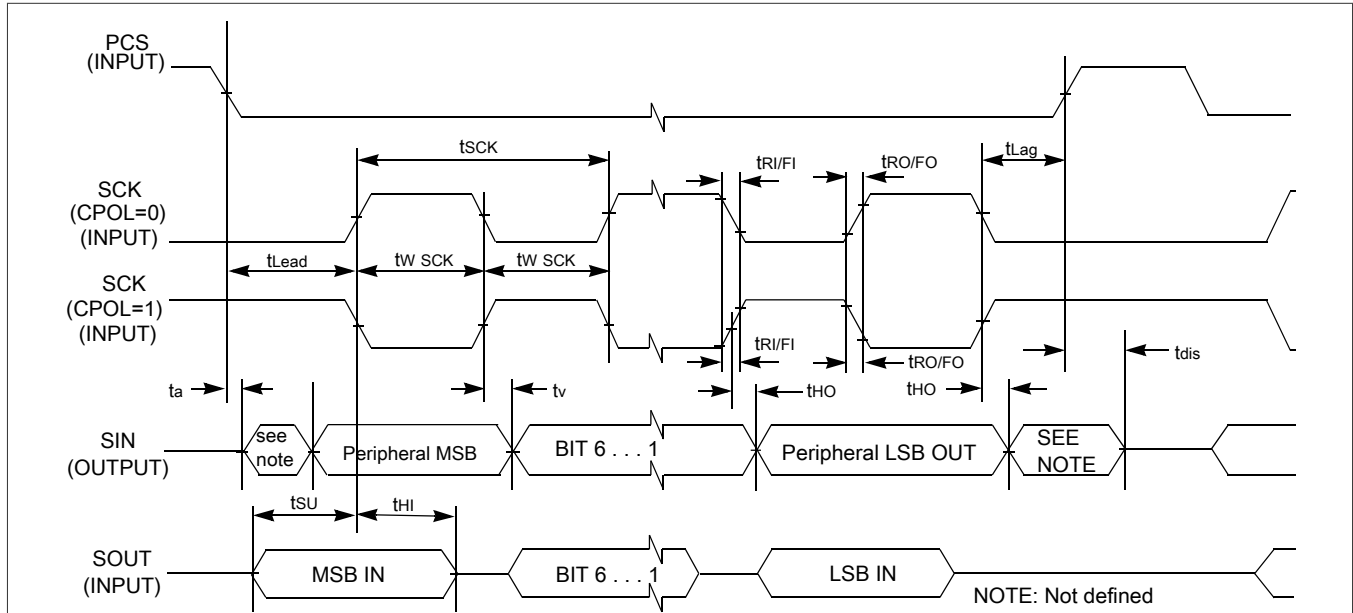

Figure 37. LPSPI Peripheral mode timing (CPHA = 0)

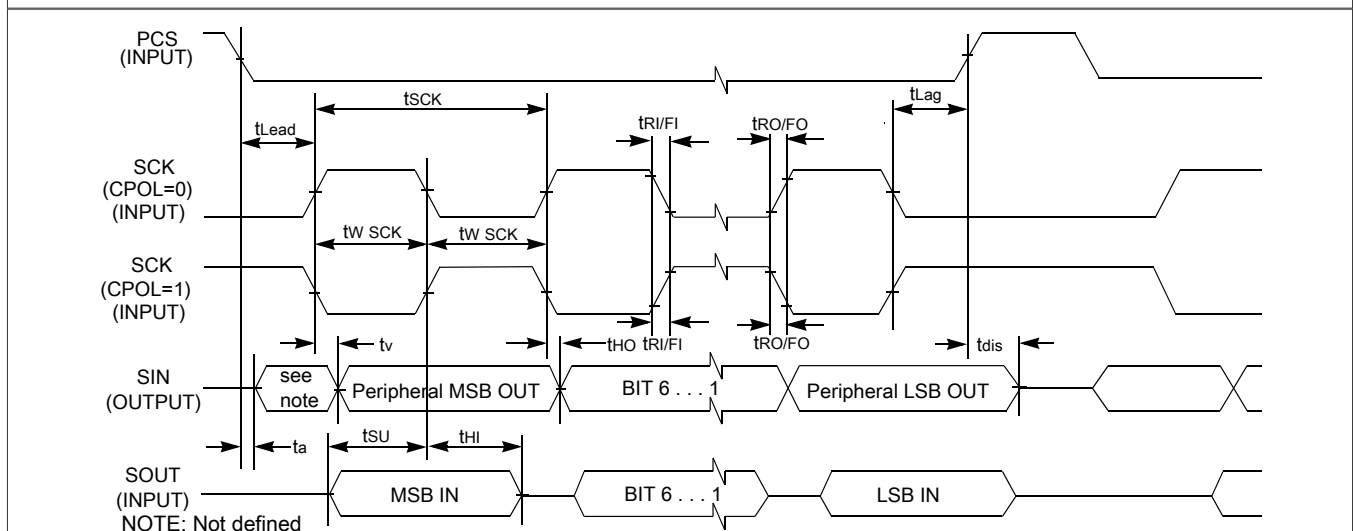

Figure 38. LPSPI Peripheral mode timing (CPHA = 1)

4.12.5 LPI2C timing parameters

LPI2C is a low-power Inter-Integrated Circuit (I2C) module that supports an efficient interface to an I2C bus as a controller and/or as a target.

Table 71. LPI2C module timing parameters^[1]

Symbol	Description		Min	Max	Unit	Notes
f _{SCL}	SCL clock frequency	Standard mode (Sm)	0	100	kHz	[2]
		Fast mode (Fm)	0	400		

Table continues on the next page...

Table 71. LPI2C module timing parameters^[1] ...continued

Symbol	Description	Min	Max	Unit	Notes
	Fast mode Plus (Fm+)	0	1000		
	High speed mode (Hs-mode)	0	3400		
	Ultra Fast mode (UFm)	0	5000		

[1] For more details, see *UM10204 I2C-bus specification and user manual*.

[2] Standard, Fast, Fast+, and Ultra Fast modes are supported; High speed mode (HS) in target mode.

4.12.6 Improved Inter-Integrated Circuit Interface (I3C) specifications

Unless otherwise specified, I3C specifications are timed to/from the V_{IH} and/or V_{IL} signal points.

The DSE[5:0] = 001111 and FSEL1[1:0] = 11 are required drive settings to meet the timing.

4.12.6.1 I3C Push-Pull Timing Parameters for SDR Mode

I3C interface is not supported on GPIO-Standard-plus pad type for 5 V operation. Measurements are with maximum output load of 30 pF, input transition of 1 ns.

Table 72. I3C Push-Pull Timing Parameters for SDR Mode

Symbol	Description	Min	Typ	Max	Unit	Condition
fSCL	SCL Clock Frequency	0.01	12.5	12.9	MHz	F _{SCL} = 1 / (tDIG_L + tDIG_H)
tDIG_L	SCL Clock Low Period ^{[1][2]}	32	—	—	ns	—
tDIG_H	SCL Clock High Period ^[1]	32	—	—	ns	—
tSCO	Clock in to Data Out for Slave ^[3] ^[4]	—	—	12	ns	—
tCR	SCL Clock Rise Time ^[5]	—	—	150e06 * 1 / fSCL (capped at 60)	ns	—
tCF	SCL Clock Fall Time ^[5]	—	—	150e06 * 1 / fSCL (capped at 60)	ns	—
tHD_PP	SDA Signal Data Hold in Push-Pull Mode, Slave ^[6]	1	—	—	—	Applicable for slave and master loopback modes
tSU_PP	SDA Signal Data Setup in Push-Pull Mode	3	—	N/A	ns	Applicable for slave and master loopback modes.

[1] tDIG_L and tDIG_H are the clock Low and High periods as seen at the receiver end of the I3C Bus using V_{IL} and V_{IH} (see Figure 30)

[2] As both edges are used, the hold time needs to be satisfied for the respective edges; i.e., tCF + 3 for falling edge clocks, and tCR + 3 for rising edge clocks.

[3] Devices with more than 12ns of tSCO delay shall set the limitation bit in the BCR, and shall support the GETMXDS CCC to allow the Master to read this value and adjust computations accordingly. For purposes of system design and test conformance, this parameter should be considered together with pad delay, bus capacitance, propagation delay, and clock triggering points.

[4] Pad delay based on 90 Ω / 4 mA driver and 50 pF load. Note that Master may be a Slave in a multi-Master system, and thus shall also adhere to this requirement

- [5] The clock maximum rise/fall time is capped at 60 ns. For lower frequency rise and fall the maximum value is limited at 60 ns, and is not dependent upon the clock frequency.
- [6] t_{HD_PP} is a Hold time parameter for Push-Pull Mode that has a different value for Master mode vs. Slave mode. In SDR Mode the Hold time parameter is referred to as t_{HD_SDR} .

Figure 40. Target out timing

Figure 41. Controller SDR timing

4.12.7 CAN network AC electrical specifications

The Controller Area Network (CAN) module is a communication controller implementing the CAN protocol according to the CAN with Flexible Data rate (CAN FD) protocol and the CAN 2.0B protocol specification. The processor has two CAN modules available. Tx and Rx ports for both modules are multiplexed with other I/O pins. See the IOMUXC chapter of the device reference manual to see which pins expose Tx and Rx pins; these ports are named CAN_TX and CAN_RX, respectively.

The DSE[5:0] = 001111 and FSEL1[1:0] = 11 are required drive settings to meet the timing.

Please see [General purpose I/O \(GPIO\) AC parameters](#) for timing parameters.

Table 73. CAN-FD electrical specifications

Parameters	FlexCAN (Classical and FD)	Unit
Maximum Baud Rate	8/8	Mbps
TXD Rise time wcs	4/4	ns
TXD Fall time wcs	4/4	ns
RXD Rise time wcs	4/4	ns
RXD Fall time wcs	4/4	ns
TXD	3.3/3.3	V
RXD	3.3/3.3	V
Internal delay wcs	100/50	ns
TX PAD delay wcs	25/25	ns
RX PAD delay wcs	10/10	ns
TX routing delay wcs	5/5	ns
RX routing delay wcs	5/5	ns
Transceiver loop delay wcs	250/250	ns
Total loop delay	395/345	ns

4.12.8 Timer/Pulse width modulator (TPM) timing parameters

This section describes the output timing parameters of the TPM.

The DSE[5:0] = 001111 and FSEL1[1:0] = 11 are required drive settings to meet the timing.

[Figure 42](#) depicts the timing of the PWM, and [Table 74](#) lists the TPM timing parameters.

Figure 42. TPM timing

Table 74. TPM output timing parameters

ID	Parameter	Min	Max	Unit
	PWM Module Clock Frequency	0	83.3	MHz
P1	PWM output pulse width high	12	—	ns
P2	PWM output pulse width low	12	—	ns

4.12.9 FlexSPI timing parameters

The FlexSPI interface can work in SDR or DDR modes. FlexSPI_n_MCR0[RXCLKSRC] = 0 and FlexSPI_n_MCR0[RXCLKSRC] = 1 configurations are supported when I/O is supplied by 3.3 V and 1.8 V, while FlexSPI_n_MCR0[RXCLKSRC] = 3 configuration is supported when I/O is supplied by 1.8 V only.

Input timing assumes an input signal slew rate of 1 ns (20%/80%) and Output timing valid for maximum external load CL = 15 pF, which is assumed to be a 8 pF load at the end of a 50 ohm, un-terminated, 2-inch microstrip trace on standard FR4 (3.3 pF/inch). For best signal integrity, the series resistance of the transmission line should be matched closely to the selected RDSON of the I/O pad output driver.

The DSE[5:0] = 001111 and FSEL1[1:0] = 11 are required drive settings to meet the timing.

4.12.9.1 FlexSPI input/read timing

There are three sources for the internal sample clock of FlexSPI read data:

- Dummy read strobe generated by FlexSPI controller and looped back internally (FlexSPI_n_MCR0[RXCLKSRC] = 0x0)
- Dummy read strobe generated by FlexSPI controller and looped back through the DQS pad (FlexSPI_n_MCR0[RXCLKSRC] = 0x1)
- Read strobe provided by memory device and input from DQS pad (FlexSPI_n_MCR0[RXCLKSRC] = 0x3)

The following sections describe input signal timing for each of these three internal sample clock sources.

4.12.9.1.1 SDR mode with FlexSPI_n_MCR0[RXCLKSRC] = 0x0, 0x1

Table 75. FlexSPI input timing in SDR mode where FlexSPI_n_MCR0[RXCLKSRC] = 0X0 (Nominal and Overdrive mode)

Symbol	Parameter	Min	Max	Unit
—	Frequency of operation ^[1]	—	66	MHz
F1	Setup time for incoming data	6	—	ns
F2	Hold time for incoming data	0	—	ns

[1] The maximum frequency supported is 56 MHz when NVCC_xxxx operating at 3.3 V.

Table 76. FlexSPI input timing in SDR mode where FlexSPI_n_MCR0[RXCLKSRC] = 0X0 (Low drive mode)

Symbol	Parameter	Min	Max	Unit
—	Frequency of operation	—	50	MHz
F1	Setup time for incoming data	7	—	ns
F2	Hold time for incoming data	0	—	ns

Table 77. FlexSPI input timing in SDR mode where FlexSPI_n_MCR0[RXCLKSRC] = 0X1 (Nominal and Overdrive mode)
[1]

Symbol	Parameter	Min	Max	Unit
—	Frequency of operation ^[2]	—	166	MHz
F1	Setup time for incoming data	1	—	ns
F2	Hold time for incoming data	1	—	ns

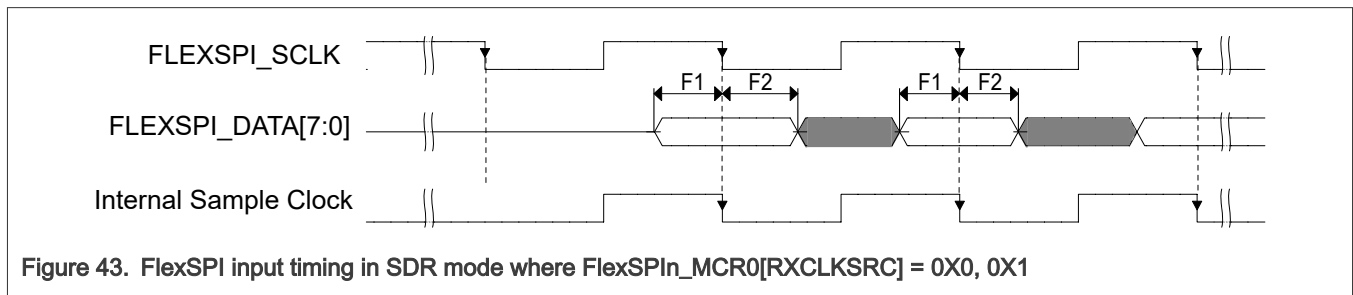

[1] These timing specifications are valid only for 1.8 V nominal I/O pad supply voltage. For 3.3 V I/O supply, see [Table 78](#).

[2] The maximum frequency supported is 56 MHz when NVCC_xxxx operating at 3.3 V.

Table 78. FlexSPI input timing in SDR mode where FlexSPI_n_MCR0[RXCLKSRC] = 0X1 (Low drive mode)

Symbol	Parameter	Min	Max	Unit
—	Frequency of operation ^[1]	—	100	MHz
F1	Setup time for incoming data	2	—	ns
F2	Hold time for incoming data	1	—	ns

[1] The maximum frequency supported is 56 MHz when NVCC_xxxx operating at 3.3 V.

Note:

Timing shown is based on the memory generating read data on the SCK falling edge, and FlexSPI controller sampling read data on the falling edge.

4.12.9.1.2 SDR mode with FlexSPI_n_MCR0[RXCLKSRC] = 0x3

There are two cases when the memory provides both read data and the read strobe in SDR mode:

- A1—Memory generates both read data and read strobe on SCK rising edge (or falling edge)

- A2—Memory generates read data on SCK falling edge and generates read strobe on SCK rising edge

Note: In this mode, it is only working under 1.8 V.

Table 79. FlexSPI input timing in SDR mode where FlexSPIn_MCR0[RXCLKSRC] = 0x3 (case A1) (Nominal and Overdrive mode)

Symbol	Parameter	Min	Max	Unit
—	Frequency of operation	—	200	MHz
T _{SCKD}	Time from SCK to data valid	—	—	ns
T _{SCKDQS}	Time from SCK to DQS	—	—	ns
T _{SCKD} - T _{SCKDQS}	Time delta between T _{SCKD} and T _{SCKDQS}	-0.6	0.6	ns

Table 80. FlexSPI input timing in SDR mode where FlexSPIn_MCR0[RXCLKSRC] = 0x3 (case A1) (Low drive mode)

Symbol	Parameter	Min	Max	Unit
—	Frequency of operation	—	133	MHz
T _{SCKD}	Time from SCK to data valid	—	—	ns
T _{SCKDQS}	Time from SCK to DQS	—	—	ns
T _{SCKD} - T _{SCKDQS}	Time delta between T _{SCKD} and T _{SCKDQS}	-2	2	ns

Figure 44. FlexSPI input timing in SDR mode where FlexSPIn_MCR0[RXCLKSRC] = 0X3 (case A1)

Note: Timing shown is based on the memory generating read data and read strobe on the SCK rising edge. The FlexSPI controller samples read data on the DQS falling edge.

Table 81. FlexSPI input timing in SDR mode where FlexSPIn_MCR0[RXCLKSRC] = 0x3 (case A2) (Nominal and Overdrive mode)

Symbol	Parameter	Value		Unit
		Min	Max	
—	Frequency of operation	—	200	MHz
T _{SCKD}	Time from SCK to data valid	—	—	ns
T _{SCKDQS}	Time from SCK to DQS	—	—	ns
T _{SCKD} - T _{SCKDQS}	Time delta between T _{SCKD} and T _{SCKDQS}	-0.6	0.6	ns

Table 82. FlexSPI input timing in SDR mode where FlexSPI_n_MCR0[RXCLKSRC] = 0x3 (case A2) (Low drive mode)

Symbol	Parameter	Value		Unit
		Min	Max	
—	Frequency of operation	—	133	MHz
T _{SCKD}	Time from SCK to data valid	—	—	ns
T _{SCKDQS}	Time from SCK to DQS	—	—	ns
T _{SCKD} - T _{SCKDQS}	Time delta between T _{SCKD} and T _{SCKDQS}	-2	2	ns

Figure 45. FlexSPI input timing in SDR mode where FlexSPI_n_MCR0[RXCLKSRC] = 0X3 (case A2)

Note:

Timing shown is based on the memory generating read data on the SCK falling edge and read strobe on the SCK rising edge. The FlexSPI controller samples read data on a half cycle delayed DQS falling edge.

4.12.9.1.3 DDR mode with FlexSPI_n_MCR0[RXCLKSRC] = 0x0, 0x1

Table 83. FlexSPI input timing in DDR mode where FlexSPI_n_MCR0[RXCLKSRC] = 0x0 (Nominal, Overdrive, and Low drive mode)

Symbol	Parameter	Min	Max	Unit

T _{SCKD} - T _{SCKDQS}	Time delta between T _{SCKD} and T _{SCKDQS}	-0.9	0.9	ns

4.12.9.2 FlexSPI output/write timing

The following sections describe output signal timing for the FlexSPI controller including control signals and data outputs.

4.12.9.2.1 SDR mode

Table 88. FlexSPI output timing in SDR mode (Nominal and Overdrive mode)^[1]

Symbol	Parameter	Min	Max	Unit
—	Frequency of operation ^[2]	—	200	MHz
T _{ck}	SCK clock period	5	—	ns
T _{DVO}	Output data valid time	—	0.6	ns
T _{DHO}	Output data hold time	-0.6	—	ns
T _{CSS}	Chip select output setup time ^[3]	(T _{CSS} + 0.5) x T _{ck} - 0.6	—	ns
T _{CSH}	Chip select output hold time ^[3]	(T _{CSH} x T _{ck}) - 0.6	—	ns

[1] These timing specifications are valid only for 1.8 V nominal I/O pad supply voltage. For 3.3 V I/O supply, see Table 89

[2] The maximum frequency supported is 56 MHz when NVCC_XXXX operating at 3.3 V.

[3] T_{CSS} and T_{CSH} are configured by the FlexSPIn_FLSHxCR1 register. See i.MX 93 Applications Processor Reference Manual (IMX93RM) for more details.

Table 89. FlexSPI output timing in SDR mode (Low drive mode)

Symbol	Parameter	Min	Max	Unit
—	Frequency of operation ^[1]	—	133 ^[2]	MHz
T _{ck}	SCK clock period	7.5	—	ns
T _{DVO}	Output data valid time	—	2	ns
T _{DHO}	Output data hold time	-2	—	ns
T _{CSS}	Chip select output setup time	(T _{CSS} + 0.5) x T _{ck} - 2	—	ns
T _{CSH}	Chip select output hold time ^[3]	(T _{CSH} x T _{ck}) - 2	—	ns

- [1] The maximum frequency supported is 56 MHz when NVCC_XXXX operating at 3.3 V.
- [2] The actual maximum frequency supported is limited by the FlexSPI_n_MCR0[RXCLKSRC] configuration used, see the FlexSPI SDR input timing specifications.
- [3] T_{CSS} and T_{CSH} are configured by the FlexSPI_n_FLSHAXCR1 register. See i.MX 93 Applications Processor Reference Manual (IMX93RM) for more details.

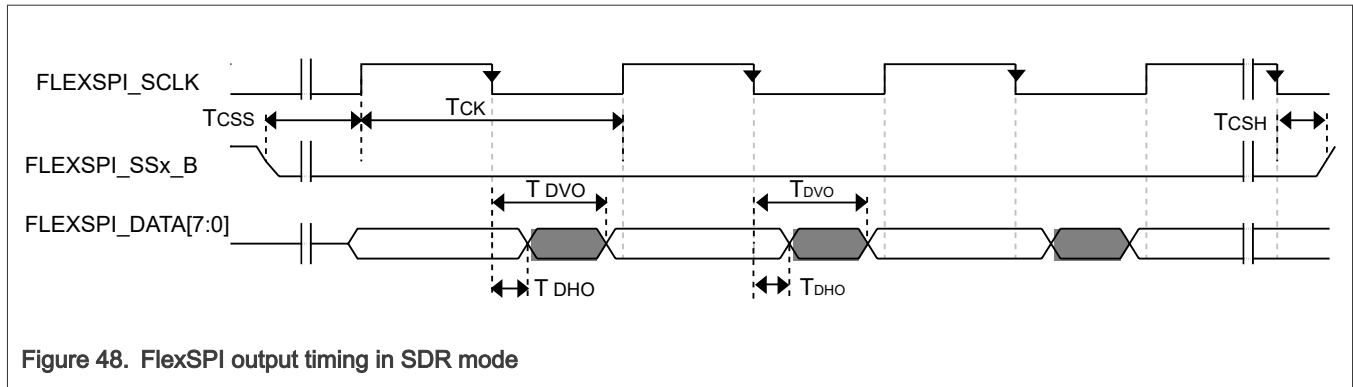

Figure 48. FlexSPI output timing in SDR mode

4.12.9.2.2 DDR mode

Table 90. FlexSPI output timing in DDR mode (Nominal and Overdrive mode)^[1]

Symbol	Parameter	Min	Max	Unit
—	Frequency of operation ^[2]	—	200	MHz
T _{ck}	SCK clock period	5	—	ns
T _{DVO}	Output data valid time	—	1.815	ns
T _{DHO}	Output data hold time	0.615	—	ns
T _{CSS}	Chip select output setup time	(T _{CSS} + 0.5) x T _{ck} - 0.6	—	ns
T _{CSH}	Chip select output hold time ^[3]	(T _{CSH} + 0.5) x T _{ck} - 0.6	—	ns

- [1] These timing specifications are valid only for 1.8 V nominal IO pad supply voltage. see Table 91
- [2] The maximum frequency supported is 56 MHz when NVCC_XXXX operating at 3.3 V.
- [3] T_{CSS} and T_{CSH} are configured by the FlexSPI_n_FLSHAXCR1 register. See i.MX 93 Applications Processor Reference Manual (IMX93RM) for more details.

Table 91. FlexSPI output timing in DDR mode (Low drive mode)

Symbol	Parameter	Min	Max	Unit
—	Frequency of operation ^[1]	—	133 ^[2]	MHz
T _{ck}	SCK clock period	7.5	—	ns
T _{DVO}	Output data valid time	—	2.75	ns
T _{DHO}	Output data hold time	0.9	—	ns
T _{CSS}	Chip select output setup time ^[3]	(T _{CSS} + 0.5) x T _{ck} - 0.9	—	ns

Table continues on the next page...

Table 91. FlexSPI output timing in DDR mode (Low drive mode) ...continued

Symbol	Parameter	Min	Max	Unit
T _{CSH}	Chip select output hold time ^[3]	(T _{CSH} + 0.5) x T _{ck} - 0.9	—	ns

[1] The maximum frequency supported is 56 MHz when NVCC_xxxx operating at 3.3 V.
 [2] The actual maximum frequency supported is limited by the FlexSPI_n_MCR0[RXCLKSRC] configuration used, see the FlexSPI DDR input timing specifications.
 [3] T_{CS} and T_{CSH} are configured by the FlexSPI_n_FLSHAxCR1 register. See i.MX 93 Applications Processor Reference Manual (IMX93RM) for more details.

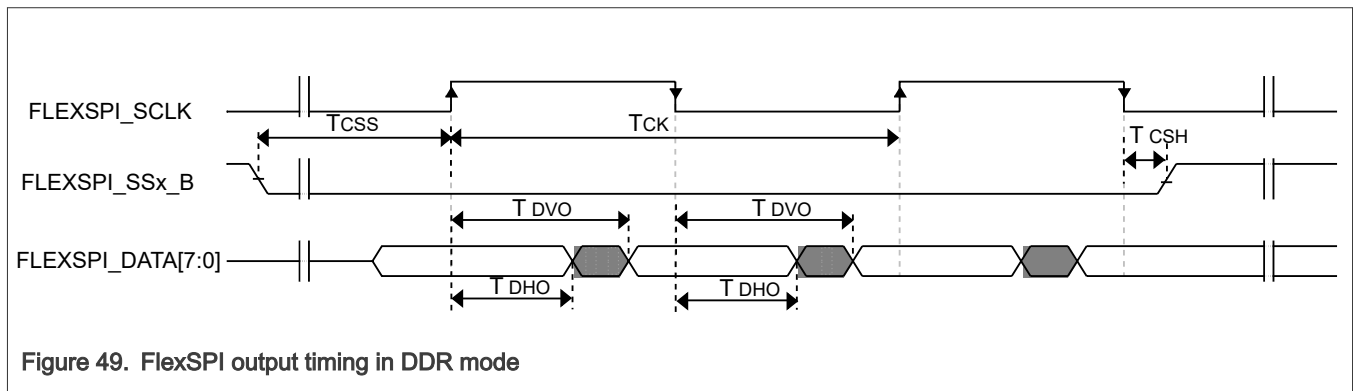

Figure 49. FlexSPI output timing in DDR mode

4.12.10 LPUART I/O configuration and timing parameters

See [General purpose I/O \(GPIO\) AC parameters](#).

4.12.11 Flexible I/O controller (FlexIO) electrical specifications

The DSE[5:0] = 001111 and FSEL1[1:0] = 11 are required drive settings to meet the timing.

Table 92 shows FlexIO timing specifications.

Table 92. FlexIO timing specifications^{[1],[2]}

Symbol	Descriptions	Min	Typ	Max	Unit	Notes
t _{ODS}	Output delay skew between any two FlexIO_Dx pins configured as outputs that toggle on same internal clock cycle	0	—	12	ns	[3]
t _{IDS}	Input delay skew between any two FlexIO_Dx pins configured as inputs that are sampled on the same internal clock cycle	0	—	12	ns	[3]

[1] Input timing assumes an input signal slew rate of 3 ns (20%/80%).
 [2] Output timing valid for maximum external load CL = 25 pF, which is assumed to be a 10 pF load at the end of a 50 ohm. Unterminated, 5-inch microstrip trace on standard FR4 (3.3 pF/inch), (25 pF total with margin). For best signal integrity, the series resistance in the transmission line should be equal to the selected RDSON of the I/O pad output driver.
 [3] Assume pins muxed on same VDD_IO domain with same load.

4.12.12 USB PHY parameters

The USB PHY parameters meet the electrical compliance requirements listed as following:

- *Universal Serial Bus Revision 2.0 Specification* (including ECNs and errata), *On-The-Go and Embed-ded Host Supplement to the Universal Serial Bus Revision 2.0 Specification* (including ECNs and errata)

4.12.12.1 Pad/Package/Board connections

The USBx_VBUS pin cannot directly connect to the 5 V VBUS voltage on the USB2.0 link.

Each USBx_VBUS pin must be isolated by an external 30 KΩ 1% precision resistor.

The USB 2.0 PHY uses USBx_TXRTUNE and an external resistor to calibrate the USBx_DP/DN 45 Ω source impedance. The external resistor value is 200 Ω 1% precision on each of USBx_TXRTUNE pad to ground.

5 Boot mode configuration

This section provides information on boot mode configuration pins allocation and boot devices interfaces allocation.

i.MX 93 supports three different boot modes:

- Normal Boot Mode
- Boot from Internal Fuse Mode
- Serial Download Boot Mode

Three different boot modes can be either selected via different boot mode pins or overridden by fuses.

i.MX 93 has two kinds of boot type:

- Single Boot: Cortex[®]-A55 core is in charge of loading all containers and images, while Cortex[®]-M33 core is doing nothing except waiting Cortex[®]-M33 firmware is loaded and available during boot.
- Low Power Boot (LPB): only Cortex[®]-M33 core is running after POR. Cortex[®]-A55 core cannot be triggered by Cortex[®]-M33 firmware.

For detailed boot mode configuration, see the "Fuse Map" and the "System Boot" chapter in *i.MX 93 Reference Manual (IMX93RM)*.

5.1 Boot mode configuration pins

There are four boot mode pins used to select boot mode.

Table 93. Fuses and associated pins used for boot

BOOT_MODE[3:0]	Function
x000	Boot from Internal Fuses
0001	Serial Download (USB1)
0010	uSDHC1 8-bit eMMC 5.1
0011	uSDHC2 4-bit SD 3.0
0100	FlexSPI Serial NOR
0101	FlexSPI Serial NAND 2K
0110	Reserved
0111	Reserved
1000	LPB: Boot from Internal Fuses

Table continues on the next page...

Table 93. Fuses and associated pins used for boot ...continued

BOOT_MODE[3:0]	Function
1001	LPB: Serial Downloader (USB1)
1010	LPB: uSDHC1 8-bit 1.8 V eMMC 5.1
1011	LPB: uSDHC2 4-bit SD 3.0
1100	LPB: FlexSPI Serial NOR
1101	LPB: FlexSPI Serial NAND 2K
1110	Reserved
1111	Reserved

- HW samples the boot CFG pins before ROM starts, these pins should be mapped to Boot CFG pins by default.
- Once HW samples the boot CFG pins and stores the boot CFG in CMC register, the register should be latched. The register value is no more changes and reflecting the pins status.

Additional boot options are also supported for both Normal Boot Mode and Internal Fuse mode:

- All boot modes support for a range of speeds, timings, and protocol formats;
- eMMC and SD boot can be supported from any USDHC instance 1 or 2;
- Serial NOR boot supports for 1-bit, 4-bit, and 8-bit mode;
- Serial NAND boot supports for 1-bit, 4-bit, and 8-bit mode (8-bit Serial NAND)

BOOT_MODE pins are multiplexed over other functional pins. The functional I/O that are multiplexed with these pins must be selected subject to two criteria:

- Functional I/O must not be used if they are inputs to the SoC, which could potentially be constantly driven by external components. Such functional mode driving may interfere with the need for the board to pull these pins a certain way while POR is asserted.
- Functional I/O must not be used if they are outputs of the SoC, which will be connected to components on the board that may misinterpret the signals as valid signals if they are toggled (such as, the board drives them while POR is asserted).

5.2 Boot device interface allocation

i.MX 93 supports three kinds of boot devices:

- Primary Boot Device

The primary boot device is selected by Boot Config pins if boot mode is the Normal Boot or Internal Fuses Boot. The valid primary boot device options are SD/eMMC/FlexSPI NOR/FlexSPI NAND. The valid options also depend on the Boot Type and other fuses configuration.

- Recovery Boot Device

After failure of booting from Primary Boot Device, i.MX 93 tries to boot from another boot source. The recovery boot device is only from SPI1/2/3/4.

- Serial Download Boot Device

Both Cortex[®]-M33 and Cortex[®]-A55 support serial download mode via USB1.

The following tables list the interfaces that can be used by the boot process in accordance with the specific boot mode configuration. The tables also describe the interface’s specific modes and IOMUXC allocation, which are configured during boot when appropriate.

Table 94. Boot through FlexSPI

Signal name	PAD name	ALT

7 Revision history

Table 108 provides a revision history for this data sheet.

Table 108. i.MX 93 Data Sheet document revision history

Document ID	Release date	Description
IMX93CEC v.7	12 Feb 2026	<ul style="list-style-type: none"> • Added note in DDR mode • Added note in SDR mode • Updated Table 25 • Updated Table 28 • Updated footnote information for "Vin/Vout" in Table 8 • Added note in SDR mode with FlexSPIn_MCR0[RXCLKSRC] = 0x0, 0x1 • Added note in DDR mode with FlexSPIn_MCR0[RXCLKSRC] = 0x0, 0x1 • Updated "DRAM_CAx_C to DRAM_CAx_A" in DDR pin function list section. • Updated features information for Audio in Table 1

Table continues on the next page...

Table 108. i.MX 93 Data Sheet document revision history...continued

Document ID	Release date	Description
		<ul style="list-style-type: none"> • Updated LVDS Ball name in Table 4 • Replace the text from "The power architecture of i.MX93 is defined based on the assumption that a PMIC is used to supply all the power rails to the SoC. The SoC can be powered from discrete parts rather than a PMIC, but a discrete-based solution is not necessarily BOM cost-optimized." to "The i.MX power architecture is designed with the expectation that a dedicated PMIC supplies all required power rails, ensuring compliance with stringent power-up and power-down sequencing requirements. While discrete component-based implementations are technically viable, they typically lead to increased BOM cost, greater design complexity, and a larger PCB footprint. In contrast, the proposed PMIC solution is BOM-optimized, minimizes board area by integrating multiple power functions into a single package, and simplifies system design by providing a validated, production-tested power management solution that inherently meets the voltage and sequencing specifications of the i.MX platform." in Power architecture section. • Updated Figure 3
IMX93CEC v.6.1	07 July 2025	<ul style="list-style-type: none"> • Removed the I/O pin information from Ordering information • Updated the Package type in Figure 1 • Removed Section 14 x 14 mm package information
IMX93CEC v.6.0	04 June 2025	<ul style="list-style-type: none"> • Updated Ordering information • Updated Figure 1 • Updated the descriptions about DRAM and LPUART, and ADC in Table 1; Removed FlexIO from Table 1 • Added LPDDR4 in Figure 2; updated ADC and LPUART in Figure 2 • Updated the description about ONOFF and XTALI_24/XTALO_24M in Table 3 • Added Table 12 • Updated Table 16 • Updated Table 28 • Updated the description of DDR SDRAM-specific parameters (LPDDR4/LPDDR4X) and Clock/data/command/address pin allocations • Added a footnote in Table 44 • Added a footnote in Table 51 • Updated the unit of C_{sample}, $C_{compare}$, and $C_{conversion}$ to cycle in Table 52; removed the maximum value of $C_{compare}$ and second ADC clock in Table 52; added ENOB values in Table 52 • Removed Table. ADC electrical specifications ($VREFH = VDD_ANAx_1p8$ and $VADIN_{max} \leq VREFH$) • Added a footnote in Table 69 • Updated Table 72

The power supply states Added footnotes in Table 23. Low power mode definition Added Table 24. Chip power in different LP modes Updated Table 26. GPIO DC parameters, Table 27. Additional leakage parameters, and Table 28 Updated the operating frequency in Table 30. LVDS AC parameters Updated ENOB values in Table 54. ADC electrical specifications ($VREFTH = VDDA_ANAx_1P8$ and $VADIN_{max} \leq VREFH$) Updated Section 4.12.9, FlexSPI timing parameters Update the signal name of RMII_RX_ER in Table 63. ENET2 signal mapping and Table 67. ENET QOS signal mapping Updated the naming of ENET_CLK to RMII_REF_CLK, ENET_TD, and ENET_RD in Section 4.12.2.2, RMII mode timing Removed USB 3.0 information from Section 4.12.12, USB PHY parameters Updated power group in 11 x 11 mm supplies contact assignments and functional contact assignments and 9 x 9 mm supplies contact assignments and functional contact assignments
Rev. 2	08/2023	<ul style="list-style-type: none"> Updated the term "Consumer" to "Commercial" Updated JTAG pin description in Table 1 Updated Table 2. Ordering information

Table continues on the next page...

Table 108. i.MX 93 Data Sheet document revision history...continued

Document ID	Release date	Description
		<ul style="list-style-type: none"> • Updated remarks in Table 4. Special signal considerations • Added ADC and TAMPER pin information in Table 5. Unused function strapping recommendations • Updated Table 11. 11 x 11 mm FCPBGA thermal resistance data • Updated NVCC_BBSM_1P8 description in Section 4.1.3, Power architecture • Updated descriptions in Section 4.1.6.1, External clock sources • Updated Figure 7, "Output transition time waveform" • Updated Table 26. GPIO DC parameters and Table 27. Additional leakage parameters • Removed JTAG_TRST information from Section 4.8.3, JTAG timing parameters • Updated Table 63. ENET2 signal mapping and Table 67. ENET QOS signal mapping • Updated footnotes of Table 69 and Table 70 • Updated Table 98. Fuses and associated pins used for boot • Updated power group in 11 x 11 mm supplies contact assignments and functional contact assignments and 9 x 9 mm supplies contact assignments and functional contact assignments
Rev. 1	04/2023	<ul style="list-style-type: none"> • Initial version

Data sheet status

Document status ^{[1][2]}	Product status ^[3]	Definition
Objective [short] data sheet	Development	This document contains data from the objective specification for product development.
Preliminary [short] data sheet	Qualification	This document contains data from the preliminary specification.
Product [short] data sheet	Production	This document contains the product specification.

[1] Please consult the most recently issued document before initiating or completing a design.

[2] The term 'short data sheet' is explained in section "Definitions".

[3] The product status of device(s) described in this document may have changed since this document was published and may differ in case of multiple devices. The latest product status information is available on the Internet at URL <https://www.nxp.com>.

Definitions

Draft — A draft status on a document indicates that the content is still under internal review and subject to formal approval, which may result in modifications or additions. NXP Semiconductors does not give any representations or warranties as to the accuracy or completeness of information included in a draft version of a document and shall have no liability for the consequences of use of such information.

Short data sheet — A short data sheet is an extract from a full data sheet with the same product type number(s) and title. A short data sheet is intended for quick reference only and should not be relied upon to contain detailed and full information. For detailed and full information see the relevant full data sheet, which is available on request via the local NXP Semiconductors sales office. In case of any inconsistency or conflict with the short data sheet, the full data sheet shall prevail.

Product specification — The information and data provided in a Product data sheet shall define the specification of the product as agreed between NXP Semiconductors and its customer, unless NXP Semiconductors and customer have explicitly agreed otherwise in writing. In no event however, shall an agreement be valid in which the NXP Semiconductors product is deemed to offer functions and qualities beyond those described in the Product data sheet.

Disclaimers

Limited warranty and liability — Information in this document is believed to be accurate and reliable. However, NXP Semiconductors does not give any representations or warranties, expressed or implied, as to the accuracy or completeness of such information and shall have no liability for the consequences of use of such information. NXP Semiconductors takes no responsibility for the content in this document if provided by an information source outside of NXP Semiconductors.

In no event shall NXP Semiconductors be liable for any indirect, incidental, punitive, special or consequential damages (including - without limitation - lost profits, lost savings, business interruption, costs related to the removal or replacement of any products or rework charges) whether or not such damages are based on tort (including negligence), warranty, breach of contract or any other legal theory.

Notwithstanding any damages that customer might incur for any reason whatsoever, NXP Semiconductors' aggregate and cumulative liability towards customer for the products described herein shall be limited in accordance with the Terms and conditions of commercial sale of NXP Semiconductors.

Right to make changes — NXP Semiconductors reserves the right to make changes to information published in this document, including without limitation specifications and product descriptions, at any time and without notice. This document supersedes and replaces all information supplied prior to the publication hereof.

Suitability for use — NXP Semiconductors products are not designed, authorized or warranted to be suitable for use in life support, life-critical or safety-critical systems or equipment, nor in applications where failure or malfunction of an NXP Semiconductors product can reasonably be expected to result in personal injury, death or severe property or environmental damage. NXP Semiconductors and its suppliers accept no liability for inclusion and/or use of NXP Semiconductors products in such equipment or applications and therefore such inclusion and/or use is at the customer's own risk.

Applications — Applications that are described herein for any of these products are for illustrative purposes only. NXP Semiconductors makes no representation or warranty that such applications will be suitable for the specified use without further testing or modification.

Customers are responsible for the design and operation of their applications and products using NXP Semiconductors products, and NXP Semiconductors accepts no liability for any assistance with applications or customer product design. It is customer's sole responsibility to determine whether the NXP Semiconductors product is suitable and fit for the customer's applications and products planned, as well as for the planned application and use of customer's third party customer(s). Customers should provide appropriate design and operating safeguards to minimize the risks associated with their applications and products.

NXP Semiconductors does not accept any liability related to any default, damage, costs or problem which is based on any weakness or default in the customer's applications or products, or the application or use by customer's third party customer(s). Customer is responsible for doing all necessary testing for the customer's applications and products using NXP Semiconductors products in order to avoid a default of the applications and the products or of the application or use by customer's third party customer(s). NXP does not accept any liability in this respect.

Limiting values — Stress above one or more limiting values (as defined in the Absolute Maximum Ratings System of IEC 60134) will cause permanent damage to the device. Limiting values are stress ratings only and (proper) operation of the device at these or any other conditions above those given in the Recommended operating conditions section (if present) or the Characteristics sections of this document is not warranted. Constant or repeated exposure to limiting values will permanently and irreversibly affect the quality and reliability of the device.

Terms and conditions of commercial sale — NXP Semiconductors products are sold subject to the general terms and conditions of commercial sale, as published at <https://www.nxp.com/profile/terms>, unless otherwise agreed in a valid written individual agreement. In case an individual agreement is concluded only the terms and conditions of the respective agreement shall apply. NXP Semiconductors hereby expressly objects to applying the customer's general terms and conditions with regard to the purchase of NXP Semiconductors products by customer.

No offer to sell or license — Nothing in this document may be interpreted or construed as an offer to sell products that is open for acceptance or the grant, conveyance or implication of any license under any copyrights, patents or other industrial or intellectual property rights.

Quick reference data — The Quick reference data is an extract of the product data given in the Limiting values and Characteristics sections of this document, and as such is not complete, exhaustive or legally binding.

Export control — This document as well as the item(s) described herein may be subject to export control regulations. Export might require a prior authorization from competent authorities.

Suitability for use in non-automotive qualified products — Unless this document expressly states that this specific NXP Semiconductors product is automotive qualified, the product is not suitable for automotive use. It is neither qualified nor tested in accordance with automotive testing or application requirements. NXP Semiconductors accepts no liability for inclusion and/or use of non-automotive qualified products in automotive equipment or applications.

In the event that customer uses the product for design-in and use in automotive applications to automotive specifications and standards, customer (a) shall use the product without NXP Semiconductors' warranty of the product for such automotive applications, use and specifications, and (b) whenever customer uses the product for automotive applications beyond NXP Semiconductors' specifications such use shall be solely at customer's own risk, and (c) customer fully indemnifies NXP Semiconductors for any liability, damages or failed product claims resulting from customer design and use of the product for automotive applications beyond NXP Semiconductors' standard warranty and NXP Semiconductors' product specifications.

HTML publications — An HTML version, if available, of this document is provided as a courtesy. Definitive information is contained in the applicable document in PDF format. If there is a discrepancy between the HTML document and the PDF document, the PDF document has priority.

Translations — A non-English (translated) version of a document, including the legal information in that document, is for reference only. The English version shall prevail in case of any discrepancy between the translated and English versions.

Security — Customer understands that all NXP products may be subject to unidentified vulnerabilities or may support established security standards or specifications with known limitations. Customer is responsible for the design and operation of its applications and products throughout their lifecycles to reduce the effect of these vulnerabilities on customer's applications and products. Customer's responsibility also extends to other open and/or proprietary technologies supported by NXP products for use in customer's applications. NXP accepts no liability for any vulnerability. Customer should regularly check security updates from NXP and follow up appropriately.

Customer shall select products with security features that best meet rules, regulations, and standards of the intended application and make the ultimate design decisions regarding its products and is solely responsible for compliance with all legal, regulatory, and security related requirements concerning its products, regardless of any information or support that may be provided by NXP.

NXP has a Product Security Incident Response Team (PSIRT) (reachable at PSIRT@nxp.com) that manages the investigation, reporting, and solution release to security vulnerabilities of NXP products.

NXP B.V. — NXP B.V. is not an operating company and it does not distribute or sell products.
