The USB controller maintains a frame counter. If the target Device is a full-speed device, the USB controller automatically sends an **SOF** packet at the start of each frame and increments the frame counter. If the target Device is a low-speed device, a **K** state is transmitted on the bus to act as a *keep-alive* to stop the low-speed device from going into **SUSPEND** mode.

After the **SOF** packet has been transmitted, the USB Host controller cycles through all the configured endpoints looking for active transactions. An active transaction is defined as a receive endpoint for

which the REQPKT bit is set or a transmit endpoint for which the TXRDY bit and/or the FIFONE bit is set.

An isochronous or interrupt transaction is started if the transaction is found on the first scheduler cycle of a frame and if the interval counter for that endpoint has counted down to zero. As a result, only one interrupt or isochronous transaction occurs per endpoint every *n* frames, where *n* is the interval set via the **USB Host Transmit Interval Endpoint *n* (USBTXINTERVAL<sub>n</sub>)** or **USB Host Receive Interval Endpoint *n* (USBRXINTERVAL<sub>n</sub>)** register for that endpoint.

An active bulk transaction starts immediately, provided sufficient time is left in the frame to complete the transaction before the next SOF packet is due. If the transaction must be retried (for example, because a NAK was received or the target Device did not respond), then the transaction is not retried until the transaction scheduler has first checked all the other endpoints for active transactions. This process ensures that an endpoint that is sending a lot of NAKs does not block other transactions on the bus. The controller also allows the user to specify a limit to the length of time for NAKs to be received from a target Device before the endpoint times out.

### 18.3.2.5 USB Hubs

The following setup requirements apply to the USB Host controller only if it is used with a USB hub. When a full- or low-speed Device is connected to the USB controller via a USB 2.0 hub, details of the hub address and the hub port also must be recorded in the corresponding **USB Receive Hub Address Endpoint *n* (USBRXHUBADDR<sub>n</sub>)** and **USB Receive Hub Port Endpoint *n* (USBRXHUBPORT<sub>n</sub>)** or the **USB Transmit Hub Address Endpoint *n* (USBTXHUBADDR<sub>n</sub>)** and **USB Transmit Hub Port Endpoint *n* (USBTXHUBPORT<sub>n</sub>)** registers. In addition, the speed at which the Device operates (full or low) must be recorded in the **USB Type Endpoint 0 (USBTTYPE0)** (endpoint 0), **USB Host Configure Transmit Type Endpoint *n* (USBTXTYPE<sub>n</sub>)**, or **USB Host Configure Receive Type Endpoint *n* (USBRXTYPE<sub>n</sub>)** registers for each endpoint that is accessed by the Device.

For hub communications, the settings in these registers record the current allocation of the endpoints to the attached USB Devices. To maximize the number of Devices supported, the USB Host controller allows this allocation to be changed dynamically by simply updating the address and speed information recorded in these registers. Any changes in the allocation of endpoints to Device functions must be made following the completion of any on-going transactions on the endpoints affected.

### 18.3.2.6 Babble

The USB Host controller does not start a transaction until the bus has been inactive for at least the minimum inter-packet delay. The controller also does not start a transaction unless it can be finished before the end of the frame. If the bus is still active at the end of a frame, then the USB Host controller assumes that the target Device to which it is connected has malfunctioned, and the USB controller suspends all transactions and generates a babble interrupt.

### 18.3.2.7 Host SUSPEND

If the SUSPEND bit in the **USBPOWER** register is set, the USB Host controller completes the current transaction then stops the transaction scheduler and frame counter. No further transactions are started and no SOF packets are generated.

To exit SUSPEND mode, set the RESUME bit and clear the SUSPEND bit. While the RESUME bit is set, the USB Host controller generates RESUME signaling on the bus. After 20 ms, the RESUME bit must be cleared, at which point the frame counter and transaction scheduler start. The Host supports the detection of a remote wake-up.

#### 18.3.2.8 USB RESET

If the RESET bit in the **USBPOWER** register is set, the USB Host controller generates USB RESET signaling on the bus. The RESET bit must be set for at least 20 ms to ensure correct resetting of the target Device. After the CPU has cleared the bit, the USB Host controller starts its frame counter and transaction scheduler.

#### 18.3.2.9 Connect/Disconnect

A session is started by setting the SESSION bit in the **USB Device Control (USBDEVCTL)** register, enabling the USB controller to wait for a Device to be connected. When a Device is detected, a connect interrupt is generated. The speed of the Device that has been connected can be determined by reading the **USBDEVCTL** register where the FSDEV bit is set for a full-speed Device, and the LSDEV bit is set for a low-speed Device. The USB controller must generate a RESET to the Device, and then the USB Host controller can begin Device enumeration. If the Device is disconnected while a session is in progress, a disconnect interrupt is generated.

### 18.3.3 OTG Mode

To conserve power, the USB On-The-Go (OTG) supplement allows VBUS to only be powered up when required and to be turned off when the bus is not in use. VBUS is always supplied by the A device on the bus. The USB OTG controller determines whether it is the A device or the B device by sampling the ID input from the PHY. This signal is pulled Low when an A-type plug is sensed (signifying that the USB OTG controller should act as the A device) but taken High when a B-type plug is sensed (signifying that the USB controller is a B device). Note that when switching between OTG A and OTG B, the USB controller retains all register contents.

#### 18.3.3.1 Starting a Session

When the USB OTG controller is ready to start a session, the SESSION bit must be set in the **USBDEVCTL** register. The USB OTG controller then enables ID pin sensing. The ID input is either taken Low if an A-type connection is detected or High if a B-type connection is detected. The DEV bit in the **USBDEVCTL** register is also set to indicate whether the USB OTG controller has adopted the role of the A device or the B device. The USB OTG controller also provides an interrupt to indicate that ID pin sensing has completed and the mode value in the **USBDEVCTL** register is valid. This interrupt is enabled in the **USBIDVIM** register, and the status is checked in the **USBIDVISC** register. As soon as the USB controller has detected that it is on the A side of the cable, it must enable VBUS power within 100ms or the USB controller reverts to Device mode.

If the USB OTG controller is the A device, then the USB OTG controller enters Host mode (the A device is always the default Host), turns on VBUS, and waits for VBUS to go above the VBUS Valid threshold, as indicated by the VBUS bit in the **USBDEVCTL** register going to 0x3. The USB OTG controller then waits for a peripheral to be connected. When a peripheral is detected, a Connect interrupt is signaled and either the FSDEV or LSDEV bit in the **USBDEVCTL** register is set, depending whether a full-speed or a low-speed peripheral is detected. The USB controller then issues a RESET to the connected Device. The SESSION bit in the **USBDEVCTL** register can be cleared to end a session. The USB OTG controller also automatically ends the session if babble is detected or if VBUS drops below session valid.

**Note:** The USB OTG controller may not remain in Host mode when connected to high-current devices. Some devices draw enough current to momentarily drop VBUS below the VBUS-valid level causing the controller to drop out of Host mode. The only way to get back into Host mode is to allow VBUS to go below the Session End level. In this situation, the device is causing VBUS to drop repeatedly and pull VBUS back low the next time VBUS is enabled.

In addition, the USB OTG controller may not remain in Host mode when a device is told that it can start using its active configuration. At this point the device starts drawing more current and can also drop VBUS below VBUS valid.

If the USB OTG controller is the B device, then the USB OTG controller requests a session using the session request protocol defined in the USB On-The-Go supplement, that is, it first discharges VBUS. Then when VBUS has gone below the Session End threshold (VBUS bit in the **USBDEVCTL** register goes to 0x0) and the line state has been a single-ended zero for > 2 ms, the USB OTG controller pulses the data line, then pulses VBUS. At the end of the session, the SESSION bit is cleared either by the USB OTG controller or by the application software. The USB OTG controller then causes the PHY to switch out the pull-up resistor on D+, signaling the A device to end the session.

### 18.3.3.2 Detecting Activity

When the other device of the OTG setup wishes to start a session, it either raises VBUS above the Session Valid threshold if it is the A device, or if it is the B device, it pulses the data line then pulses VBUS. Depending on which of these actions happens, the USB controller can determine whether it is the A device or the B device in the current setup and act accordingly. If VBUS is raised above the Session Valid threshold, then the USB controller is the B device. The USB controller sets the SESSION bit in the **USBDEVCTL** register. When RESET signaling is detected on the bus, a RESET interrupt is signaled, which is interpreted as the start of a session.

The USB controller is in Device mode as the B device is the default mode. At the end of the session, the A device turns off the power to VBUS. When VBUS drops below the Session Valid threshold, the USB controller detects this drop and clears the SESSION bit to indicate that the session has ended, causing a disconnect interrupt to be signaled. If data line and VBUS pulsing is detected, then the USB controller is the A device. The controller generates a SESSION REQUEST interrupt to indicate that the B device is requesting a session. The SESSION bit in the **USBDEVCTL** register must be set to start a session.

### 18.3.3.3 Host Negotiation

When the USB controller is the A device, ID is Low, and the controller automatically enters Host mode when a session starts. When the USB controller is the B device, ID is High, and the controller automatically enters Device mode when a session starts. However, software can request that the USB controller become the Host by setting the HOSTREQ bit in the **USBDEVCTL** register. This bit can be set either at the same time as requesting a Session Start by setting the SESSION bit in the **USBDEVCTL** register or at any time after a session has started. When the USB controller next enters SUSPEND mode and if the HOSTREQ bit remains set, the controller enters Host mode and begins host negotiation (as specified in the USB On-The-Go supplement) by causing the PHY to disconnect the pull-up resistor on the D+ line, causing the A device to switch to Device mode and connect its own pull-up resistor. When the USB controller detects this, a Connect interrupt is generated and the RESET bit in the **USBPOWER** register is set to begin resetting the A device. The USB controller begins this reset sequence automatically to ensure that RESET is started as required within 1 ms of the A device connecting its pull-up resistor. The main processor should wait at least 20 ms, then clear the RESET bit and enumerate the A device.

When the USB OTG controller B device has finished using the bus, the USB controller goes into SUSPEND mode by setting the SUSPEND bit in the **USBPOWER** register. The A device detects this and either terminates the session or reverts to Host mode. If the A device is USB OTG controller, it generates a Disconnect interrupt.

### 18.3.4 DMA Operation

The USB peripheral provides an interface connected to the  $\mu$ DMA controller with separate channels for 3 transmit endpoints and 3 receive endpoints. Software selects which endpoints to service with the  $\mu$ DMA channels using the **USB DMA Select (USBDMASEL)** register. The  $\mu$ DMA operation of the USB is enabled through the **USBTXCSRHn** and **USBRXCSRHn** registers, for the TX and RX channels respectively. When  $\mu$ DMA operation is enabled, the USB asserts a  $\mu$ DMA request on the enabled receive or transmit channel when the associated FIFO can transfer data. When either FIFO can transfer data, the burst request for that channel is asserted. The  $\mu$ DMA channel must be configured to operate in Basic mode, and the size of the  $\mu$ DMA transfer must be restricted to whole multiples of the size of the USB FIFO. Both read and write transfers of the USB FIFOs using  $\mu$ DMA must be configured in this manner. For example, if the USB endpoint is configured with a FIFO size of 64 bytes, the  $\mu$ DMA channel can be used to transfer 64 bytes to or from the endpoint FIFO. If the number of bytes to transfer is less than 64, then a programmed I/O method must be used to copy the data to or from the FIFO.

If the DMAMOD bit in the **USBTXCSRHn/USBRXCSRHn** register is clear, an interrupt is generated after every packet is transferred, but the  $\mu$ DMA continues transferring data. If the DMAMOD bit is set, an interrupt is generated only when the entire  $\mu$ DMA transfer is complete. The interrupt occurs on the USB interrupt vector. Therefore, if interrupts are used for USB operation and the  $\mu$ DMA is enabled, the USB interrupt handler must be designed to handle the  $\mu$ DMA completion interrupt.

Care must be taken when using the  $\mu$ DMA to unload the receive FIFO as data is read from the receive FIFO in 4 byte chunks regardless of value of the MAXLOAD field in the **USBRXCSRHn** register. The RXRDY bit is cleared as follows.

**Table 18-3. Remainder (MAXLOAD/4)**

| Value | Description        |
|-------|--------------------|
| 0     | MAXLOAD = 64 bytes |
| 1     | MAXLOAD = 61 bytes |
| 2     | MAXLOAD = 62 bytes |
| 3     | MAXLOAD = 63 bytes |

**Table 18-4. Actual Bytes Read**

| Value | Description |
|-------|-------------|
| 0     | MAXLOAD     |
| 1     | MAXLOAD+3   |
| 2     | MAXLOAD+2   |
| 3     | MAXLOAD+1   |

**Table 18-5. Packet Sizes That Clear RXRDY**

| Value | Description                              |
|-------|------------------------------------------|
| 0     | MAXLOAD, MAXLOAD-1, MAXLOAD-2, MAXLOAD-3 |
| 1     | MAXLOAD                                  |
| 2     | MAXLOAD, MAXLOAD-1                       |
| 3     | MAXLOAD, MAXLOAD-1, MAXLOAD-2            |

To enable DMA operation for the endpoint receive channel, the DMAEN bit of the **USBRXCSRHn** register should be set. To enable DMA operation for the endpoint transmit channel, the DMAEN bit of the **USBTXCSRHn** register must be set.

See “Micro Direct Memory Access (μDMA)” on page 332 for more details about programming the μDMA controller.

## 18.4 Initialization and Configuration

To use the USB Controller, the peripheral clock must be enabled via the **RCGC2** register (see page 283). In addition, the clock to the appropriate GPIO module must be enabled via the **RCGC2** register in the System Control module (see page 283). To find out which GPIO port to enable, refer to Table 23-4 on page 1178. Configure the PMCN fields in the **GPIOPCTL** register to assign the USB signals to the appropriate pins (see page 433 and Table 23-5 on page 1187).

The initial configuration in all cases requires that the processor enable the USB controller and USB controller's physical layer interface (PHY) before setting any registers. The next step is to enable the USB PLL so that the correct clocking is provided to the PHY. To ensure that voltage is not supplied to the bus incorrectly, the external power control signal, USB0EPEN, should be negated on start up by configuring the USB0EPEN and USB0PFLT pins to be controlled by the USB controller and not exhibit their default GPIO behavior.

**Note:** When used in OTG mode, USB0VBUS and USB0ID do not require any configuration as they are dedicated pins for the USB controller and directly connect to the USB connector's VBUS and ID signals. If the USB controller is used as either a dedicated Host or Device, the DEVMODTG and DEVMOD bits in the **USB General-Purpose Control and Status (USBGPCS)** register can be used to connect the USB0VBUS and USB0ID inputs to fixed levels internally, freeing the PB0 and PB1 pins for GPIO use. For proper self-powered Device operation, the VBUS value must still be monitored to assure that if the Host removes VBUS, the self-powered Device disables the D+/D- pull-up resistors. This function can be accomplished by connecting a standard GPIO to VBUS.

### 18.4.1 Pin Configuration

When using the Device controller portion of the USB controller in a system that also provides Host functionality, the power to VBUS must be disabled to allow the external Host controller to supply power. Usually, the USB0EPEN signal is used to control the external regulator and should be negated to avoid having two devices driving the USB0VBUS power pin on the USB connector.

When the USB controller is acting as a Host, it is in control of two signals that are attached to an external voltage supply that provides power to VBUS. The Host controller uses the USB0EPEN signal to enable or disable power to the USB0VBUS pin on the USB connector. An input pin, USB0PFLT, provides feedback when there has been a power fault on VBUS. The USB0PFLT signal can be configured to either automatically negate the USB0EPEN signal to disable power, and/or it can generate an interrupt to the interrupt controller to allow software to handle the power fault condition. The polarity and actions related to both USB0EPEN and USB0PFLT are fully configurable in the USB controller. The controller also provides interrupts on Device insertion and removal to allow the Host controller code to respond to these external events.

### 18.4.2 Endpoint Configuration

To start communication in Host or Device mode, the endpoint registers must first be configured. In Host mode, this configuration establishes a connection between an endpoint register and an endpoint on a Device. In Device mode, an endpoint must be configured before enumerating to the Host controller.

In both cases, the endpoint 0 configuration is limited because it is a fixed-function, fixed-FIFO-size endpoint. In Device and Host modes, the endpoint requires little setup but does require a software-based state machine to progress through the setup, data, and status phases of a standard control transaction. In Device mode, the configuration of the remaining endpoints is done once before enumerating and then only changed if an alternate configuration is selected by the Host controller. In Host mode, the endpoints must be configured to operate as control, bulk, interrupt or isochronous mode. Once the type of endpoint is configured, a FIFO area must be assigned to each endpoint. In the case of bulk, control and interrupt endpoints, each has a maximum of 64 bytes per transaction. Isochronous endpoints can have packets with up to 1023 bytes per packet. In either mode, the maximum packet size for the given endpoint must be set prior to sending or receiving data.

Configuring each endpoint's FIFO involves reserving a portion of the overall USB FIFO RAM to each endpoint. The total FIFO RAM available is 4 Kbytes with the first 64 bytes reserved for endpoint 0. The endpoint's FIFO must be at least as large as the maximum packet size. The FIFO can also be configured as a double-buffered FIFO so that interrupts occur at the end of each packet and allow filling the other half of the FIFO.

If operating as a Device, the USB Device controller's soft connect must be enabled when the Device is ready to start communications, indicating to the Host controller that the Device is ready to start the enumeration process. If operating as a Host controller, the Device soft connect must be disabled and power must be provided to VBUS via the USB0EPEN signal.

## 18.5 Register Map

Table 18-6 on page 914 lists the registers. All addresses given are relative to the USB base address of 0x4005.0000. Note that the USB controller clock must be enabled before the registers can be programmed (see page 283). There must be a delay of 3 system clocks after the USB module clock is enabled before any USB module registers are accessed.

**Table 18-6. Universal Serial Bus (USB) Controller Register Map**

| Offset | Name     | Type | Reset       | Description                   | See page |
|--------|----------|------|-------------|-------------------------------|----------|
| 0x000  | USBFADDR | R/W  | 0x00        | USB Device Functional Address | 926      |
| 0x001  | USBPOWER | R/W  | 0x20        | USB Power                     | 927      |
| 0x002  | USBTXIS  | RO   | 0x0000      | USB Transmit Interrupt Status | 930      |
| 0x004  | USBRXIS  | RO   | 0x0000      | USB Receive Interrupt Status  | 932      |
| 0x006  | USBTXIE  | R/W  | 0xFFFF      | USB Transmit Interrupt Enable | 934      |
| 0x008  | USBRXIE  | R/W  | 0xFFFE      | USB Receive Interrupt Enable  | 936      |
| 0x00A  | USBIS    | RO   | 0x00        | USB General Interrupt Status  | 938      |
| 0x00B  | USBIE    | R/W  | 0x06        | USB Interrupt Enable          | 941      |
| 0x00C  | USBFRAME | RO   | 0x0000      | USB Frame Value               | 944      |
| 0x00E  | USBEPIDX | R/W  | 0x00        | USB Endpoint Index            | 945      |
| 0x00F  | USBTEST  | R/W  | 0x00        | USB Test Mode                 | 946      |
| 0x020  | USBFIFO0 | R/W  | 0x0000.0000 | USB FIFO Endpoint 0           | 948      |
| 0x024  | USBFIFO1 | R/W  | 0x0000.0000 | USB FIFO Endpoint 1           | 948      |

**Table 18-6. Universal Serial Bus (USB) Controller Register Map (continued)**

| Offset | Name           | Type | Reset       | Description                                            | See page |
|--------|----------------|------|-------------|--------------------------------------------------------|----------|
| 0x028  | USBFIFO2       | R/W  | 0x0000.0000 | USB FIFO Endpoint 2                                    | 948      |
| 0x02C  | USBFIFO3       | R/W  | 0x0000.0000 | USB FIFO Endpoint 3                                    | 948      |
| 0x030  | USBFIFO4       | R/W  | 0x0000.0000 | USB FIFO Endpoint 4                                    | 948      |
| 0x034  | USBFIFO5       | R/W  | 0x0000.0000 | USB FIFO Endpoint 5                                    | 948      |
| 0x038  | USBFIFO6       | R/W  | 0x0000.0000 | USB FIFO Endpoint 6                                    | 948      |
| 0x03C  | USBFIFO7       | R/W  | 0x0000.0000 | USB FIFO Endpoint 7                                    | 948      |
| 0x040  | USBFIFO8       | R/W  | 0x0000.0000 | USB FIFO Endpoint 8                                    | 948      |
| 0x044  | USBFIFO9       | R/W  | 0x0000.0000 | USB FIFO Endpoint 9                                    | 948      |
| 0x048  | USBFIFO10      | R/W  | 0x0000.0000 | USB FIFO Endpoint 10                                   | 948      |
| 0x04C  | USBFIFO11      | R/W  | 0x0000.0000 | USB FIFO Endpoint 11                                   | 948      |
| 0x050  | USBFIFO12      | R/W  | 0x0000.0000 | USB FIFO Endpoint 12                                   | 948      |
| 0x054  | USBFIFO13      | R/W  | 0x0000.0000 | USB FIFO Endpoint 13                                   | 948      |
| 0x058  | USBFIFO14      | R/W  | 0x0000.0000 | USB FIFO Endpoint 14                                   | 948      |
| 0x05C  | USBFIFO15      | R/W  | 0x0000.0000 | USB FIFO Endpoint 15                                   | 948      |

## 18.6 Register Descriptions

The LM3S5791 USB controller has On-The-Go (OTG) capabilities as specified in the USB0 bit field in the **DC6** register (see page 256).

**OTG B /  
Device**

This icon indicates that the register is used in OTG B or Device mode. Some registers are used for both Host and Device mode and may have different bit definitions depending on the mode.

**OTG A /  
Host**

This icon indicates that the register is used in OTG A or Host mode. Some registers are used for both Host and Device mode and may have different bit definitions depending on the mode. The USB controller is in OTG B or Device mode upon reset, so the reset values shown for these registers apply to the Device mode definition.

**OTG**

This icon indicates that the register is used for OTG-specific functions such as ID detection and negotiation. Once OTG negotiation is complete, then the USB controller registers are used according to their Host or Device mode meanings depending on whether the OTG negotiations made the USB controller OTG A (Host) or OTG B (Device).

OTG B /  
Device

Register 1: USB Device Functional Address (USBFADDR), offset 0x000

**USBFADDR** is an 8-bit register that contains the 7-bit address of the Device part of the transaction. When the USB controller is being used in Device mode (the HOST bit in the **USBDEVCTL** register is clear), this register must be written with the address received through a SET\_ADDRESS command, which is then used for decoding the function address in subsequent token packets.

**Important:** See the section called “Setting the Device Address” on page 905 for special considerations when writing this register.

**Register 2: USB Power (USBPOWER), offset 0x001**

**OTG A /  
Host**

**USBPOWER** is an 8-bit register used for controlling SUSPEND and RESUME signaling and some basic operational aspects of the USB controller.

**Register 3: USB Transmit Interrupt Status (USBTXIS), offset 0x002****Important:** This register is read-sensitive. See the register description for details.**OTG A /  
Host**

**USBTXIS** is a 16-bit read-only register that indicates which interrupts are currently active for endpoint 0 and the transmit endpoints 1–15. The meaning of the EPn bits in this register is based on the mode of the device. The EP1 through EP15 bits always indicate that the USB controller is sending data; however, in Host mode, the bits refer to OUT endpoints; while in Device mode, the bits refer to IN endpoints. The EP0 bit is special in Host and Device modes and indicates that either a control IN or control OUT endpoint has generated an interrupt.

**OTG B /  
Device**

**Note:** Bits relating to endpoints that have not been configured always return 0. Note also that all active interrupts are cleared when this register is read.

**Register 5: USB Transmit Interrupt Enable (USBTXIE), offset 0x006****OTG A /  
Host**

**USBTXIE** is a 16-bit register that provides interrupt enable bits for the interrupts in the **USBTXIS** register. When a bit is set, the USB interrupt is asserted to the interrupt controller when the corresponding interrupt bit in the **USBTXIS** register is set. When a bit is cleared, the interrupt in the **USBTXIS** register is still set but the USB interrupt to the interrupt controller is not asserted. On reset, all interrupts are enabled.

**Register 8: USB Interrupt Enable (USBIE), offset 0x00B**

OTG A /  
Host

**USBIE** is an 8-bit register that provides interrupt enable bits for each of the interrupts in **USBIS**. At reset interrupts 1 and 2 are enabled in Device mode.

OTG B /

**Register 11: USB Test Mode (USBTEST), offset 0x00F**

**OTG A /  
Host**

**USBTEST** is an 8-bit register that is primarily used to put the USB controller into one of the four test modes for operation described in the *USB 2.0 Specification*, in response to a SET FEATURE: USBTESTMODE command. This register is not used in normal operation.

**OTG B /  
Device**

**Note:** Only one of these bits should be set at any time.

**OTG A / Host Mode****USB Test Mode (USBTEST)**

Base 0x4005.0000  
Offset 0x00F  
Type R/W, reset 0x00

| Bit/Field | Name   | Type | Reset | Description     |
|-----------|--------|------|-------|-----------------|
| 7         | FORCEH | R/W  | 0     | Force Host Mode |

**Value Description**

- 1 Forces the USB controller to enter Host mode when the SESSION bit is set, regardless of whether the USB controller is connected to any peripheral. The state of the USB0DP and USB0DM signals is ignored. The USB controller then remains in Host mode until the SESSION bit is cleared, even if a Device is disconnected. If the FORCEH bit remains set, the USB controller re-enters Host mode the next time the SESSION bit is set.

- 0 No effect.

While in this mode, status of the bus connection may be read using the DEV bit of the **USBDEVCTL** register. The operating speed is determined from the FORCEFS bit.

---

**Important:** This register is read-sensitive. See the register description for details.

---

**OTG A /  
Host**

These 32-bit registers provide an address for CPU access to the FIFOs for each endpoint. Writing to these addresses loads data into the Transmit FIFO for the corresponding endpoint. Reading from these addresses unloads data from the Receive FIFO for the corresponding endpoint.

**OTG B /  
Device**

Transfers to and from FIFOs may be 8-bit, 16-bit or 32-bit as required, and any combination of accesses is allowed provided the data accessed is contiguous. All transfers associated with one packet must be of the same width so that the data is consistently byte-, halfword- or word-aligned. However, the last transfer may contain fewer bytes than the previous transfers in order to complete an odd-byte or odd-word transfer.

Depending on the size of the FIFO and the expected maximum packet size, the FIFOs support either single-packet or double-packet buffering (see the section called “Single-Packet Buffering” on page 903). Burst writing of multiple packets is not supported as flags must be set after each packet is written.

Following a STALL response or a transmit error on endpoint 1–15, the associated FIFO is completely flushed.

**Register 28: USB Device Control (USBDEVCTL), offset 0x060**

**OTG A /  
Host**

**USBDEVCTL** is an 8-bit register used for controlling and monitoring the USB VBUS line. If the PHY is suspended, no PHY clock is received and the VBUS is not sampled. In addition, in Host mode, **USBDEVCTL** provides the status information for the current operating mode (Host or Device) of the USB controller. If the USB controller is in Host mode, this register also indicates if a full- or low-speed Device has been connected.

**Register 29: USB Transmit Dynamic FIFO Sizing (USBTXFIFOSZ), offset 0x062****Register 30: USB Receive Dynamic FIFO Sizing (USBRXFIFOSZ), offset 0x063****OTG A /  
Host**

These 8-bit registers allow the selected TX/RX endpoint FIFOs to be dynamically sized. **USBEPIDX** is used to configure each transmit endpoint's FIFO size.

**Register 144: USB Maximum Transmit Data Endpoint 15 (USBTXMAXP15), offset 0x1F0**

**OTG A /  
Host**

The **USBTXMAXPn** 16-bit register defines the maximum amount of data that can be transferred through the transmit endpoint in a single operation.

**OTG B /  
Device**

Bits 10:0 define (in bytes) the maximum payload transmitted in a single transaction. The value set can be up to 1024 bytes but is subject to the constraints placed by the *USB Specification* on packet sizes for bulk, interrupt and isochronous transfers in full-speed operation.

The total amount of data represented by the value written to this register must not exceed the FIFO size for the transmit endpoint, and must not exceed half the FIFO size if double-buffering is required.

If this register is changed after packets have been sent from the endpoint, the transmit endpoint FIFO must be completely flushed (using the FLUSH bit in **USBTXCSRLn**) after writing the new value to this register.

**Note:** **USBTXMAXPn** must be set to an even number of bytes for proper interrupt generation in  $\mu$ DMA Basic Mode.

|   |       |     |   |             |
|---|-------|-----|---|-------------|
| 7 | NAKTO | R/W | 0 | NAK Timeout |
|---|-------|-----|---|-------------|

Value Description

0 No timeout.

1 Indicates that endpoint 0 is halted following the receipt of NAK responses for longer than the time set by the **USBNAKLMT** register.

Software must clear this bit to allow the endpoint to continue.

|   |        |     |   |               |
|---|--------|-----|---|---------------|
| 6 | STATUS | R/W | 0 | STATUS Packet |
|---|--------|-----|---|---------------|

Value Description

0 No transaction.

1 Initiates a STATUS stage transaction. This bit must be set at the same time as the TXRDY or REQPKT bit is set.

Setting this bit ensures that the DT bit is set in the **USBCSRH0** register so that a DATA1 packet is used for the STATUS stage transaction. This bit is automatically cleared when the STATUS stage is over.

|   |        |     |   |                |
|---|--------|-----|---|----------------|
| 5 | REQPKT | R/W | 0 | Request Packet |
|---|--------|-----|---|----------------|

Value Description

0 No request.

1 Requests an IN transaction.

This bit is cleared when the RXRDY bit is set.

| Bit/Field | Name  | Type | Reset | Description |
|-----------|-------|------|-------|-------------|
| 0         | FLUSH | R/W  | 0     | Flush FIFO  |

## Value Description

|   |                                                                                                                                        |
|---|----------------------------------------------------------------------------------------------------------------------------------------|
| 0 | No effect.                                                                                                                             |
| 1 | Flushes the next packet to be transmitted/read from the endpoint 0 FIFO. The FIFO pointer is reset and the TXRDY/RXRDY bit is cleared. |

This bit is automatically cleared after the flush is performed.

**Important:** This bit should only be set when TXRDY/RXRDY is set. At other times, it may cause data to be corrupted.

## Value Description

|   |                                                                                                                                        |
|---|----------------------------------------------------------------------------------------------------------------------------------------|
| 0 | No effect.                                                                                                                             |
| 1 | Flushes the next packet to be transmitted/read from the endpoint 0 FIFO. The FIFO pointer is reset and the TXRDY/RXRDY bit is cleared. |

This bit is automatically cleared after the flush is performed.

**Important:** This bit should only be set when TXRDY/RXRDY is set. At other times, it may cause data to be corrupted.

Register 147: USB Receive Byte Count Endpoint 0 (USBCOUNT0), offset 0x108

OTG A /  
Host

**USBCOUNT0** is an 8-bit read-only register that indicates the number of received data bytes in the endpoint 0 FIFO. The value returned changes as the contents of the FIFO change and is only valid while the RXRDY bit is set.

OTG B /

OTG A /  
Host

Register 149: USB NAK Limit (USBNAKLMT), offset 0x10B

**USBNAKLMT** is an 8-bit register that sets the number of frames after which endpoint 0 should time out on receiving a stream of NAK responses. (Equivalent settings for other endpoints can be made through their **USBTXINTERVALn** and **USBRXINTERVALn** registers.)

The number of frames selected is  $2^{(m-1)}$  (where  $m$  is the value set in the register, with valid values of 2–16). If the Host receives NAK responses from the target for more frames than the number represented by the limit set in this register, the endpoint is halted.

**Note:** A value of 0 or 1 disables the NAK timeout function.

**OTG A /  
Host**

The **USBRXMAXP<sub>n</sub>** is a 16-bit register which defines the maximum amount of data that can be transferred through the selected receive endpoint in a single operation.

**OTG B /  
Device**

Bits 10:0 define (in bytes) the maximum payload transmitted in a single transaction. The value set can be up to 1024 bytes but is subject to the constraints placed by the *USB Specification* on packet sizes for bulk, interrupt and isochronous transfers in full-speed operations.

The total amount of data represented by the value written to this register must not exceed the FIFO size for the receive endpoint, and must not exceed half the FIFO size if double-buffering is required.

**Note:** **USBRXMAXPn** must be set to an even number of bytes for proper interrupt generation in  $\mu$ DMA Basic mode.

| Bit/Field | Name | Type | Reset | Description |
|-----------|------|------|-------|-------------|
|-----------|------|------|-------|-------------|

|   |        |     |   |            |
|---|--------|-----|---|------------|
| 7 | AUTOCL | R/W | 0 | Auto Clear |
|---|--------|-----|---|------------|

Value Description

0 No effect.

1 Enables the RXRDY bit to be automatically cleared when a packet of **USBXRMAXPn** bytes has been unloaded from the receive FIFO. When packets of less than the maximum packet size are unloaded, RXRDY must be cleared manually. Care must be taken when using  $\mu$ DMA to unload the receive FIFO as data is read from the receive FIFO in 4 byte chunks regardless of the value of the MAXLOAD field in the **USBXRMAXPn** register, see "DMA Operation" on page 912.

|   |        |     |   |              |
|---|--------|-----|---|--------------|
| 6 | AUTORQ | R/W | 0 | Auto Request |
|---|--------|-----|---|--------------|

Value Description

0 No effect.

1 Enables the REQPKT bit to be automatically set when the RXRDY bit is cleared.

**Note:** This bit is automatically cleared when a short packet is received.

|   |       |     |   |                    |
|---|-------|-----|---|--------------------|
| 5 | DMAEN | R/W | 0 | DMA Request Enable |
|---|-------|-----|---|--------------------|

Value Description

0 Disables the  $\mu$ DMA request for the receive endpoint.1 Enables the  $\mu$ DMA request for the receive endpoint.

**Note:** 3 TX and 3 RX endpoints can be connected to the  $\mu$ DMA module. If this bit is set for a particular endpoint, the DMAARX, DMABRX, or DMACRX field in the **USB DMA Select (USBDMASEL)** register must be programmed correspondingly.

|   |        |    |   |           |
|---|--------|----|---|-----------|
| 4 | PIDERR | RO | 0 | PID Error |
|---|--------|----|---|-----------|

Value Description

0 No error.

1 Indicates a PID error in the received packet of an isochronous transaction.

This bit is ignored in bulk or interrupt transactions.

**OTG A /  
Host**

**Note:** The value returned changes as the FIFO is unloaded and is only valid while the RXRDY bit in the **USBXCSRLn** register is set.

**OTG B /  
Device**

**USBXCOUNTn** is a 16-bit read-only register that holds the number of data bytes in the packet currently in line to be read from the receive FIFO. If the packet is transmitted as multiple bulk packets, the number given is for the combined packet.

Host**

**USBTXINTERVAL<sub>n</sub>** is an 8-bit register that, for interrupt and isochronous transfers, defines the polling interval for the currently selected transmit endpoint. For bulk endpoints, this register defines the number of frames after which the endpoint should time out on receiving a stream of NAK responses.

The **USBTXINTERVAL<sub>n</sub>** register value defines a number of frames, as follows:

| Transfer Type | Speed                   | Valid values (m) | Interpretation                                                                            |
|---------------|-------------------------|------------------|-------------------------------------------------------------------------------------------|
| Interrupt     | Low-Speed or Full-Speed | 0x01 – 0xFF      | The polling interval is $m$ frames.                                                       |
| Isochronous   | Full-Speed              | 0x01 – 0x10      | The polling interval is $2^{(m-1)}$ frames.                                               |
| Bulk          | Full-Speed              | 0x02 – 0x10      | The NAK Limit is $2^{(m-1)}$ frames. A value of 0 or 1 disables the NAK timeout function. |

#### USB Host Transmit Interval Endpoint 1 (USBTXINTERVAL1)

Base 0x4005.0000

Offset 0x11B

Type R/W, reset 0x00

| Bit/Field | Name            | Type | Reset | Description                                                                                                                                                                         |
|-----------|-----------------|------|-------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| 7:0       | TXPOLL / NAKLMT | R/W  | 0x00  | TX Polling / NAK Limit<br>The polling interval for interrupt/isochronous transfers; the NAK limit for bulk transfers. See table above for valid entries; other values are reserved. |

**OTG A /  
Host**

**USBRXINTERVAL<sub>n</sub>** is an 8-bit register that, for interrupt and isochronous transfers, defines the polling interval for the currently selected receive endpoint. For bulk endpoints, this register defines the number of frames after which the endpoint should time out on receiving a stream of NAK responses.

The **USBTXINTERVAL<sub>n</sub>** register value defines a number of frames, as follows:

| Transfer Type | Speed                   | Valid values (m) | Interpretation                              |
|---------------|-------------------------|------------------|---------------------------------------------|
| Interrupt     | Low-Speed or Full-Speed | 0x01 – 0xFF      | The polling interval is <i>m</i> frames.    |
| Isochronous   | Full-Speed              | 0x01 – 0x10      | The polling interval is $2^{(m-1)}$ frames. |

| Transfer Type | Speed      | Valid values (m) | Interpretation                                                                            |
|---------------|------------|------------------|-------------------------------------------------------------------------------------------|
| Bulk          | Full-Speed | 0x02 – 0x10      | The NAK Limit is $2^{(m-1)}$ frames. A value of 0 or 1 disables the NAK timeout function. |

**Register 314: USB Request Packet Count in Block Transfer Endpoint 15 (USBRQPKTCOUNT15), offset 0x33C**

**OTG A /  
Host**

This 16-bit read/write register is used in Host mode to specify the number of packets that are to be transferred in a block transfer of one or more bulk packets to receive endpoint n. The USB controller uses the value recorded in this register to determine the number of requests to issue where the AUTORQ bit in the **USBRXCSRHn** register has been set. See “IN Transactions as a Host” on page 907.

**Note:** Multiple packets combined into a single bulk packet within the FIFO count as one packet.

**Register 317: USB External Power Control (USBEPEN), offset 0x400****OTG A /  
Host**

This 32-bit register specifies the function of the two-pin external power interface (USB0EPEN and USB0PFLT). The assertion of the power fault input may generate an automatic action, as controlled by the hardware configuration registers. The automatic action is necessary because the fault condition may require a response faster than one provided by firmware.

## Register 318: USB External Power Control Raw Interrupt Status (USBEPICRIS), offset 0x404

OTG A /  
Host

This 32-bit register specifies the unmasked interrupt status of the two-pin external power interface.

USB External Power Control Raw Interrupt Status (USBEPICRIS)

Base 0x4005.0000

Offset 0x404

Type RO, reset 0x0000.0000

OTG B /  
Device

Value Description

1 A Power Fault status has been detected.

0 An interrupt has not occurred.

This bit is cleared by writing a 1 to the PF bit in the **USBEPICISC** register.

Register 319: USB External Power Control Interrupt Mask (USBEPICIM), offset 0x408

OTG A /  
Host

This 32-bit register specifies the interrupt mask of the two-pin external power interface.

USB External Power Control Interrupt Mask (USBEPICIM)

Base 0x4005.0000  
Offset 0x408  
Type R/W, reset 0x0000.0000

### Value Description

- |   |                                                                                                                                  |
|---|----------------------------------------------------------------------------------------------------------------------------------|
| 1 | The PF bits in the <b>USBEPICRIS</b> and <b>USBEPICIM</b> registers are set, providing an interrupt to the interrupt controller. |
| 0 | No interrupt has occurred or the interrupt is masked.                                                                            |

This bit is cleared by writing a 1. Clearing this bit also clears the PF bit in the **USBEPICRIS** register.

Register 321: USB Device RESUME Raw Interrupt Status (USBDRRIS), offset 0x410

OTG A /  
Host

The **USBDRRIS** 32-bit register is the raw interrupt status register. On a read, this register gives the current raw status value of the corresponding interrupt prior to masking. A write has no effect.

OTG B /  
Device

Value

Description

1

A RESUME status has been detected.

0

An interrupt has not occurred.

This bit is cleared by writing a 1 to the RESUME bit in the **USBDRISC** register.

**Register 322: USB Device RESUME Interrupt Mask (USBDRIM), offset 0x414****OTG A /  
Host**

The **USBDRIM** 32-bit register is the masked interrupt status register. On a read, this register gives the current masked status value of the corresponding interrupt. A write has no effect.

**OTG B /

### Value Description

- |   |                                                                                                                                   |
|---|-----------------------------------------------------------------------------------------------------------------------------------|
| 1 | The RESUME bits in the <b>USBDRRIS</b> and <b>USBDRCIM</b> registers are set, providing an interrupt to the interrupt controller. |
| 0 | No interrupt has occurred or the interrupt is masked.                                                                             |

This bit is cleared by writing a 1. Clearing this bit also clears the RESUME bit in the **USBDRCRIS** register.

## Register 324: USB General-Purpose Control and Status (USBGPCS), offset 0x41C

OTG A /  
Host

OTG B /  
Device

**USBGPCS** provides the state of the internal ID signal.

**Note:** When used in OTG mode, USB0VBUS and USB0ID do not require any configuration as they are dedicated pins for the USB controller and directly connect to the USB connector's VBUS and ID signals. If the USB controller is used as either a dedicated Host or Device, the DEVMOD0TG and DEVMOD bits in the **USB General-Purpose Control and Status (USBGPCS)** register can be used to connect the USB0VBUS and USB0ID inputs to fixed levels internally, freeing the PB0 and PB1 pins for GPIO use. For proper self-powered Device operation, the VBUS value must still be monitored to assure that if the Host removes VBUS, the self-powered Device disables the D+/D- pull-up resistors. This function can be accomplished by connecting a standard GPIO to VBUS.

**Register 325: USB VBUS Droop Control (USBVDC), offset 0x430**

**OTG A /  
Host**

This 32-bit register enables a controlled masking of VBUS to compensate for any in-rush current by a Device that is connected to the Host controller. The in-rush current can cause VBUS to droop, causing the USB controller's behavior to be unexpected. The USB Host controller allows VBUS to fall lower than the VBUS Valid level (4.75 V) but not below AValid (2.0 V) for 65 microseconds without signaling a VBUSERR interrupt in the controller. Without this, any glitch on VBUS would force the USB Host controller to remove power from VBUS and then re-enumerate the Device.

**USB VBUS Droop Control (USBVDC)**

### Value Description

- |   |                                                                                                                                |
|---|--------------------------------------------------------------------------------------------------------------------------------|
| 1 | The VD bits in the <b>USBVDCRIS</b> and <b>USBVDCIM</b> registers are set, providing an interrupt to the interrupt controller. |
| 0 | No interrupt has occurred or the interrupt is masked.                                                                          |

This bit is cleared by writing a 1. Clearing this bit also clears the VD bit in the **USBVDCRIS** register.

## Register 329: USB ID Valid Detect Raw Interrupt Status (USBIDVRIS), offset 0x444

**OTG**

This 32-bit register specifies whether the unmasked interrupt status of the ID value is valid.

| Value | Description                                                                                                                    |
|-------|--------------------------------------------------------------------------------------------------------------------------------|
| 1     | The ID bits in the <b>USBIDVRIS</b> and <b>USBIDVIM</b> registers are set, providing an interrupt to the interrupt controller. |
| 0     | No interrupt has occurred or the interrupt is masked.                                                                          |

This bit is cleared by writing a 1. Clearing this bit also clears the ID bit in the **USBIDVRIS** register.

**Register 332: USB DMA Select (USBDMASEL), offset 0x450****OTG A /  
Host**

This 32-bit register specifies which endpoints are mapped to the 6 allocated  $\mu$ DMA channels, see Table 7-1 on page 334 for more information on channel assignments.

**OTG B /  
Device****USB DMA Select (USBDMASEL)**

Base 0x4005.0000

Offset 0x450

Type R/W, reset 0x0033.2211

## 19 Analog Comparators

An analog comparator is a peripheral that compares two analog voltages and provides a logical output that signals the comparison result.

**Note:** Not all comparators have the option to drive an output pin. See “Signal Description” on page 1038 for more information.

The comparator can provide its output to a device pin, acting as a replacement for an analog comparator on the board. In addition, the comparator can signal the application via interrupts or trigger the start of a sample sequence in the ADC. The interrupt generation and ADC triggering logic is separate and independent. This flexibility means, for example, that an interrupt can be generated on a rising edge and the ADC triggered on a falling edge.

The Stellaris® LM3S5791 microcontroller provides three independent integrated analog comparators with the following functions:

- Compare external pin input to external pin input or to internal programmable voltage reference
- Compare a test voltage against any one of the following voltages:
  - An individual external reference voltage
  - A shared single external reference voltage
  - A shared internal reference voltage

## 19.1 Block Diagram

Figure 19-1. Analog Comparator Module Block Diagram

## 19.2 Signal Description

Table 19-1 on page 1038 and Table 19-2 on page 1039 list the external signals of the Analog Comparators and describe the function of each. The Analog Comparator output signals are alternate functions for some GPIO signals and default to be GPIO signals at reset. The column in the table below titled "Pin Mux/Pin Assignment" lists the possible GPIO pin placements for the Analog Comparator signals. The AFSEL bit in the **GPIO Alternate Function Select (GPIOAFSEL)** register (page 415) should be set to choose the Analog Comparator function. The number in parentheses is the encoding that must be programmed into the PMCN field in the **GPIO Port Control (GPIOCTL)** register (page 433) to assign the Analog Comparator signal to the specified GPIO port pin. The positive and negative input signals are configured by clearing the DEN bit in the **GPIO Digital Enable (GPIODEN)** register. For more information on configuring GPIOs, see "General-Purpose Input/Outputs (GPIOs)" on page 390.

a. The TTL designation indicates the pin has TTL-compatible voltage levels.

## 19.3 Functional Description

The comparator compares the VIN- and VIN+ inputs to produce an output, VOUT.

$$\begin{aligned} V_{IN-} < V_{IN+}, & V_{OUT} = 1 \\ V_{IN-} > V_{IN+}, & V_{OUT} = 0 \end{aligned}$$

As shown in Figure 19-2 on page 1040, the input source for  $V_{IN-}$  is an external input,  $Cn-$ . In addition to an external input,  $Cn+$ , input sources for  $V_{IN+}$  can be the  $C0+$  or an internal reference,  $V_{IREF}$ .

**Figure 19-2. Structure of Comparator Unit**

A comparator is configured through two status/control registers, **Analog Comparator Control (ACCTL)** and **Analog Comparator Status (ACSTAT)**. The internal reference is configured through one control register, **Analog Comparator Reference Voltage Control (ACREFCTL)**. Interrupt status and control are configured through three registers, **Analog Comparator Masked Interrupt Status (ACMIS)**, **Analog Comparator Raw Interrupt Status (ACRIS)**, and **Analog Comparator Interrupt Enable (ACINTEN)**.

Typically, the comparator output is used internally to generate an interrupt as controlled by the ISEN bit in the **ACCTL** register. The output may also be used to drive an external pin,  $C_o$  or generate an analog-to-digital converter (ADC) trigger.

**Important:** The ASRCP bits in the **ACCTL** register must be set before using the analog comparators.

### 19.3.1 Internal Reference Programming

The structure of the internal reference is shown in Figure 19-3 on page 1041. The internal reference is controlled by a single configuration register (**ACREFCTL**). Table 19-3 on page 1041 shows the programming options to develop specific internal reference values, to compare an external voltage against a particular voltage generated internally ( $V_{IREF}$ ).

**Figure 19-3. Comparator Internal Reference Structure****Table 19-3. Internal Reference Voltage and ACREFCTL Field Values**

| ACREFCTL Register |               | Output Reference Voltage Based on VREF Field Value                                                                                                                                                                                                       |
|-------------------|---------------|----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| EN Bit Value      | RNG Bit Value |                                                                                                                                                                                                                                                          |
| EN=0              | RNG=X         | 0 V (GND) for any value of VREF; however, it is recommended that RNG=1 and VREF=0 for the least noisy ground reference.                                                                                                                                  |
| EN=1              | RNG=0         | <p>Total resistance in ladder is 31 R.</p> $V_{IREF} = V_{DDA} \times \frac{R_{VREF}}{R_T}$ $V_{IREF} = V_{DDA} \times \frac{(VREF + 8)}{31}$ $V_{IREF} = 0.85 + 0.106 \times VREF$ <p>The range of internal reference in this mode is 0.85-2.448 V.</p> |
|                   | RNG=1         | <p>Total resistance in ladder is 23 R.</p> $V_{IREF} = V_{DDA} \times \frac{R_{VREF}}{R_T}$ $V_{IREF} = V_{DDA} \times \frac{VREF}{23}$ $V_{IREF} = 0.143 \times VREF$ <p>The range of internal reference for this mode is 0-2.152 V.</p>                |

## 19.4 Initialization and Configuration

The following example shows how to configure an analog comparator to read back its output value from an internal register.

1. Enable the analog comparator clock by writing a value of 0x0010.0000 to the **RCGC1** register in the System Control module (see page 274).
2. Enable the clock to the appropriate GPIO modules via the **RCGC2** register (see page 283). To find out which GPIO ports to enable, refer to Table 23-5 on page 1187.
3. In the GPIO module, enable the GPIO port/pin associated with the input signals as GPIO inputs. To determine which GPIO to configure, see Table 23-4 on page 1178.
4. Configure the PMCN fields in the **GPIOCTL** register to assign the analog comparator output signals to the appropriate pins (see page 433 and Table 23-5 on page 1187).
5. Configure the internal voltage reference to 1.65 V by writing the **ACREFCTL** register with the value 0x0000.030C.
6. Configure the comparator to use the internal voltage reference and to *not* invert the output by writing the **ACCTLn** register with the value of 0x0000.040C.
7. Delay for 10  $\mu$ s.
8. Read the comparator output value by reading the **ACSTATn** register's OVAL value.

Change the level of the comparator negative input signal C - to see the OVAL value change.

## 19.5 Register Map

Table 19-4 on page 1042 lists the comparator registers. The offset listed is a hexadecimal increment to the register's address, relative to the Analog Comparator base address of 0x4003.C000. Note that the analog comparator clock must be enabled before the registers can be programmed (see page 274). There must be a delay of 3 system clocks after the analog comparator module clock is enabled before any analog comparator module registers are accessed.

**Table 19-4. Analog Comparators Register Map**

| Offset | Name     | Type  | Reset       | Description                                 | See page |
|--------|----------|-------|-------------|---------------------------------------------|----------|
| 0x000  | ACMIS    | R/W1C | 0x0000.0000 | Analog Comparator Masked Interrupt Status   | 1044     |
| 0x004  | ACRIS    | RO    | 0x0000.0000 | Analog Comparator Raw Interrupt Status      | 1045     |
| 0x008  | ACINTEN  | R/W   | 0x0000.0000 | Analog Comparator Interrupt Enable          | 1046     |
| 0x010  | ACREFCTL | R/W   | 0x0000.0000 | Analog Comparator Reference Voltage Control | 1047     |
| 0x020  | ACSTAT0  | RO    | 0x0000.0000 | Analog Comparator Status 0                  | 1048     |
| 0x024  | ACCTL0   | R/W   | 0x0000.0000 | Analog Comparator Control 0                 | 1049     |
| 0x040  | ACSTAT1  | RO    | 0x0000.0000 | Analog Comparator Status 1                  | 1048     |
| 0x044  | ACCTL1   | R/W   | 0x0000.0000 | Analog Comparator Control 1                 | 1049     |
| 0x060  | ACSTAT2  | RO    | 0x0000.0000 | Analog Comparator Status 2                  | 1048     |

Table 19-4. Analog Comparators Register Map (*continued*)

| Offset | Name   | Type | Reset       | Description                 | See page |
|--------|--------|------|-------------|-----------------------------|----------|
| 0x064  | ACCTL2 | R/W  | 0x0000.0000 | Analog Comparator Control 2 | 1049     |

## 19.6 Register Descriptions

The remainder of this section lists and describes the Analog Comparator registers, in numerical order by address offset.

## Register 1: Analog Comparator Masked Interrupt Status (ACMIS), offset 0x000

This register provides a summary of the interrupt status (masked) of the comparators.

### Analog Comparator Masked Interrupt Status (ACMIS)

Base 0x4003.C000

Offset 0x000

Type R/W1C, reset 0x0000.0000

|       |          |    |    |    |    |    |    |    |    |    |    |    |    |       |       |       |

| 1         | The output of the comparator is inverted prior to being processed by hardware. |      |       |                                                                                                                                                                                                                                                                                                                                                                                                          |       |             |     |                                                            |     |                                                                                |     |             |     |             |
| 0         | reserved                                                                       | RO   | 0     | Software should not rely on the value of a reserved bit. To provide compatibility with future products, the value of a reserved bit should be preserved across a read-modify-write operation.                                                                                                                                                                                                            |       |             |     |                                                            |     |                                                                                |     |             |     |             |

## 20 Pulse Width Modulator (PWM)

Pulse width modulation (PWM) is a powerful technique for digitally encoding analog signal levels. High-resolution counters are used to generate a square wave, and the duty cycle of the square wave is modulated to encode an analog signal. Typical applications include switching power supplies and motor control.

The Stellaris® microcontroller contains one PWM module, with four PWM generator blocks and a control block, for a total of 8 PWM outputs. The control block determines the polarity of the PWM signals, and which signals are passed through to the pins.

Each PWM generator block produces two PWM signals that share the same timer and frequency and can either be programmed with independent actions or as a single pair of complementary signals with dead-band delays inserted. The output signals, `pwmA'` and `pwmB'`, of the PWM generation blocks are managed by the output control block before being passed to the device pins as `PWM0` and `PWM1` or `PWM2` and `PWM3`, and so on.

The Stellaris PWM module provides a great deal of flexibility and can generate simple PWM signals, such as those required by a simple charge pump as well as paired PWM signals with dead-band delays, such as those required by a half-H bridge driver. Three generator blocks can also generate the full six channels of gate controls required by a 3-phase inverter bridge.

Each PWM generator block has the following features:

- Four fault-condition handling inputs to quickly provide low-latency shutdown and prevent damage to the motor being controlled
- One 16-bit counter
  - Runs in Down or Up/Down mode
  - Output frequency controlled by a 16-bit load value
  - Load value updates can be synchronized
  - Produces output signals at zero and load value
- Two PWM comparators
  - Comparator value updates can be synchronized
  - Produces output signals on match
- PWM signal generator
  - Output PWM signal is constructed based on actions taken as a result of the counter and PWM comparator output signals
  - Produces two independent PWM signals
- Dead-band generator
  - Produces two PWM signals with programmable dead-band delays suitable for driving a half-H bridge
  - Can be bypassed, leaving input PWM signals unmodified

- Can initiate an ADC sample sequence

The control block determines the polarity of the PWM signals and which signals are passed through to the pins. The output of the PWM generation blocks are managed by the output control block before being passed to the device pins. The PWM control block has the following options:

- PWM output enable of each PWM signal
- Optional output inversion of each PWM signal (polarity control)
- Optional fault handling for each PWM signal
- Synchronization of timers in the PWM generator blocks
- Synchronization of timer/comparator updates across the PWM generator blocks
- Synchronization of PWM output enables across the PWM generator blocks
- Interrupt status summary of the PWM generator blocks
- Extended fault capabilities with multiple fault signals, programmable polarities, and filtering
- PWM generators can be operated independently or synchronized with other generators

## **20.1 Block Diagram**

Figure 20-1 on page 1053 provides the Stellaris PWM module diagram and Figure 20-2 on page 1053 provides a more detailed diagram of a Stellaris PWM generator. The LM3S5791 controller contains four generator blocks that generate eight independent PWM signals or four paired PWM signals with dead-band delays inserted.

## 20.2 Signal Description

Table 20-1 on page 1054 and Table 20-2 on page 1055 list the external signals of the PWM module and describe the function of each. The PWM controller signals are alternate functions for some GPIO

signals and default to be GPIO signals at reset. The column in the table below titled "Pin Mux/Pin Assignment" lists the possible GPIO pin placements for these PWM signals. The AFSEL bit in the **GPIO Alternate Function Select (GPIOAFSEL)** register (page 415) should be set to choose the PWM function. The number in parentheses is the encoding that must be programmed into the PMCN field in the **GPIO Port Control (GPIOCTL)** register (page 433) to assign the PWM signal to the specified GPIO port pin. For more information on configuring GPIOs, see "General-Purpose Input/Outputs (GPIOs)" on page 390.

Table 20-1. Signals for PWM (100LQFP)

| Pin Name | Pin Number | Pin Mux / Pin Assignment | Pin Type | Buffer Type <sup>a</sup> | Description                                          |
|----------|------------|--------------------------|----------|--------------------------|------------------------------------------------------|
| Fault0   | 6          | PE4 (4)                  | I        | TTL                      | PWM Fault 0.                                         |

a. The TTL designation indicates the pin has TTL-compatible voltage levels.

## 20.3 Functional Description

### 20.3.1 PWM Timer

The timer in each PWM generator runs in one of two modes: Count-Down mode or Count-Up/Down mode. In Count-Down mode, the timer counts from the load value to zero, goes back to the load value, and continues counting down. In Count-Up/Down mode, the timer counts from zero up to the load value, back down to zero, back up to the load value, and so on. Generally, Count-Down mode

is used for generating left- or right-aligned PWM signals, while the Count-Up/Down mode is used for generating center-aligned PWM signals.

The timers output three signals that are used in the PWM generation process: the direction signal (this is always Low in Count-Down mode, but alternates between Low and High in Count-Up/Down mode), a single-clock-cycle-width High pulse when the counter is zero, and a single-clock-cycle-width High pulse when the counter is equal to the load value. Note that in Count-Down mode, the zero pulse is immediately followed by the load pulse. In the figures in this chapter, these signals are labelled "dir," "zero," and "load."

### 20.3.2 PWM Comparators

Each PWM generator has two comparators that monitor the value of the counter; when either comparator matches the counter, they output a single-clock-cycle-width High pulse, labelled "cmpA" and "cmpB" in the figures in this chapter. When in Count-Up/Down mode, these comparators match both when counting up and when counting down, and thus are qualified by the counter direction signal. These qualified pulses are used in the PWM generation process. If either comparator match value is greater than the counter load value, then that comparator never outputs a High pulse.

Figure 20-3 on page 1058 shows the behavior of the counter and the relationship of these pulses when the counter is in Count-Down mode. Figure 20-4 on page 1058 shows the behavior of the counter and the relationship of these pulses when the counter is in Count-Up/Down mode. In these figures, the following definitions apply:

- LOAD is the value in the **PWMnLOAD** register
- COMPA is the value in the **PWMnCMPA** register
- COMPB is the value in the **PWMnCMPB** register
- 0 is the value zero
- load is the internal signal that has a single-clock-cycle-width High pulse when the counter is equal to the load value
- zero is the internal signal that has a single-clock-cycle-width High pulse when the counter is zero
- cmpA is the internal signal that has a single-clock-cycle-width High pulse when the counter is equal to COMPA
- cmpB is the internal signal that has a single-clock-cycle-width High pulse when the counter is equal to COMPB
- dir is the internal signal that indicates the count direction

**Figure 20-3. PWM Count-Down Mode****Figure 20-4. PWM Count-Up/Down Mode**

### 20.3.3 PWM Signal Generator

Each PWM generator takes the **load**, **zero**, **cmpA**, and **cmpB** pulses (qualified by the **dir** signal) and generates two internal PWM signals, **pwmA** and **pwmB**. In Count-Down mode, there are four events that can affect these signals: **zero**, **load**, **match A down**, and **match B down**. In Count-Up/Down mode, there are six events that can affect these signals: **zero**, **load**, **match A down**, **match A up**, **match B down**, and **match B up**. The **match A** or **match B** events are ignored when they coincide with the **zero** or **load** events. If the **match A** and **match B** events coincide, the first signal, **pwmA**, is generated based only on the **match A** event, and the second signal, **pwmB**, is generated based only on the **match B** event.

For each event, the effect on each output PWM signal is programmable: it can be left alone (ignoring the event), it can be toggled, it can be driven Low, or it can be driven High. These actions can be used to generate a pair of PWM signals of various positions and duty cycles, which do or do not overlap. Figure 20-5 on page 1059 shows the use of Count-Up/Down mode to generate a pair of

center-aligned, overlapped PWM signals that have different duty cycles. This figure shows the pwmA and pwmB signals before they have passed through the dead-band generator.

**Figure 20-5. PWM Generation Example In Count-Up/Down Mode**

In this example, the first generator is set to drive High on match A up, drive Low on match A down, and ignore the other four events. The second generator is set to drive High on match B up, drive Low on match B down, and ignore the other four events. Changing the value of comparator A changes the duty cycle of the pwmA signal, and changing the value of comparator B changes the duty cycle of the pwmB signal.

### 20.3.4 Dead-Band Generator

The pwmA and pwmB signals produced by each PWM generator are passed to the dead-band generator. If the dead-band generator is disabled, the PWM signals simply pass through to the pwmA' and pwmB' signals unmodified. If the dead-band generator is enabled, the pwmB signal is lost and two PWM signals are generated based on the pwmA signal. The first output PWM signal, pwmA' is the pwmA signal with the rising edge delayed by a programmable amount. The second output PWM signal, pwmB', is the inversion of the pwmA signal with a programmable delay added between the falling edge of the pwmA signal and the rising edge of the pwmB' signal.

The resulting signals are a pair of active High signals where one is always High, except for a programmable amount of time at transitions where both are Low. These signals are therefore suitable for driving a half-H bridge, with the dead-band delays preventing shoot-through current from damaging the power electronics. Figure 20-6 on page 1059 shows the effect of the dead-band generator on the pwmA signal and the resulting pwmA' and pwmB' signals that are transmitted to the output control block.

**Figure 20-6. PWM Dead-Band Generator**

### 20.3.5 Interrupt/ADC-Trigger Selector

Each PWM generator also takes the same four (or six) counter events and uses them to generate an interrupt or an ADC trigger. Any of these events or a set of these events can be selected as a source for an interrupt; when any of the selected events occur, an interrupt is generated. Additionally, the same event, a different event, the same set of events, or a different set of events can be selected as a source for an ADC trigger; when any of these selected events occur, an ADC trigger pulse is generated. The selection of events allows the interrupt or ADC trigger to occur at a specific position

within the pwmA or pwmB signal. Note that interrupts and ADC triggers are based on the raw events; delays in the PWM signal edges caused by the dead-band generator are not taken into account.

### 20.3.6 Synchronization Methods

The PWM module provides four PWM generators, each providing two PWM outputs that may be used in a wide variety of applications. Generally speaking, the PWM is used in one of two categories of operation:

- **Unsynchronized.** The PWM generator and its two output signals are used alone, independent of other PWM generators.
- **Synchronized.** The PWM generator and its two outputs signals are used in conjunction with other PWM generators using a common, unified time base. If multiple PWM generators are configured with the same counter load value, synchronization can be used to guarantee that they also have the same count value (the PWM generators must be configured before they are synchronized). With this feature, more than two PWMn signals can be produced with a known relationship between the edges of those signals because the counters always have the same values. Other states in the module provide mechanisms to maintain the common time base and mutual synchronization.

The counter in a PWM generator can be reset to zero by writing the **PWM Time Base Sync (PWMSYNC)** register and setting the SYNCn bit associated with the generator. Multiple PWM generators can be synchronized together by setting all necessary SYNCn bits in one access. For example, setting the SYNC0 and SYNC1 bits in the **PWMSYNC** register causes the counters in PWM generators 0 and 1 to reset together.

Additional synchronization can occur between multiple PWM generators by updating register contents in one of the following three ways:

- **Immediately.** The write value has immediate effect, and the hardware reacts immediately.
- **Locally Synchronized.** The write value does not affect the logic until the counter reaches the value zero at the end of the PWM cycle. In this case, the effect of the write is deferred, providing a guaranteed defined behavior and preventing overly short or overly long output PWM pulses.
- **Globally Synchronized.** The write value does not affect the logic until two sequential events have occurred: (1) the Update mode for the generator function is programmed for global synchronization in the **PWMnCTL** register, and (2) the counter reaches zero at the end of the PWM cycle. In this case, the effect of the write is deferred until the end of the PWM cycle following the end of all updates. This mode allows multiple items in multiple PWM generators to be updated simultaneously without odd effects during the update; everything runs from the old values until a point at which they all run from the new values. The Update mode of the load and comparator match values can be individually configured in each PWM generator block. It typically makes sense to use the synchronous update mechanism across PWM generator blocks when the timers in those blocks are synchronized, although this is not required in order for this mechanism to function properly.

The following registers provide either local or global synchronization based on the state of various Update mode bits and fields in the **PWMnCTL** register (LOADUPD; CMPAUPD; CMPBUPD):

- Generator Registers: **PWMnLOAD**, **PWMnCMPA**, and **PWMnCMPB**

The following registers default to immediate update, but are provided with the optional functionality of synchronously updating rather than having all updates take immediate effect:

- Module-Level Register: **PWMENABLE** (based on the state of the ENUPDn bits in the PWMENUPD register).
- Generator Register: **PWMnGENA**, **PWMnGENB**, **PWMnDBCTL**, **PWMnDBRISE**, and **PWMnDBFALL** (based on the state of various Update mode bits and fields in the **PWMnCTL** register (GENAUPD; GENBUPD; DBCTLUPD; DBRISEUPD; DBFALLUPD)).

All other registers are considered statically provisioned for the execution of an application or are used dynamically for purposes unrelated to maintaining synchronization and therefore do not need synchronous update functionality.

### 20.3.7 Fault Conditions

A fault condition is one in which the controller must be signaled to stop normal PWM function and then set the PWMn signals to a safe state. Two basic situations cause fault conditions:

- The microcontroller is stalled and cannot perform the necessary computation in the time required for motion control
- An external error or event is detected

The PWM generator can use the following inputs to generate a fault condition, including:

- FAULTn pin assertion
- A stall of the controller generated by the debugger
- The trigger of an ADC digital comparator

Fault conditions are calculated on a per-PWM generator basis. Each PWM generator configures the necessary conditions to indicate a fault condition exists. This method allows the development of applications with dependent and independent control.

Four fault input pins (FAULT0-FAULT3). These inputs may be used with circuits that generate an active High or active Low signal to indicate an error condition. A FAULTn pins may be individually programmed for the appropriate logic sense using the **PWMnFLTSEN** register.

The PWM generator's mode control, including fault condition handling, is provided in the **PWMnCTL** register. This register determines whether the input or a combination of FAULTn input signals and/or digital comparator triggers (as configured by the **PWMnFLTSRC0** and **PWMnFLTSRC1** registers) is used to generate a fault condition. The **PWMnCTL** register also selects whether the fault condition is maintained as long as the external condition lasts or if it is latched until the fault condition until cleared by software. Finally, this register also enables a counter that may be used to extend the period of a fault condition for external events to assure that the duration is a minimum length. The minimum fault period count is specified in the **PWMnMINFLTPER** register.

Status regarding the specific fault cause is provided in the **PWMnFLTSTAT0** and **PWMnFLTSTAT1** registers.

PWM generator fault conditions may be promoted to a controller interrupt using the **PWMINTEN** register.

### 20.3.8 Output Control Block

The output control block takes care of the final conditioning of the pwmA' and pwmB' signals before they go to the pins as the PWMn signals. Via a single register, the **PWM Output Enable** (**PWENABLE**) register, the set of PWM signals that are actually enabled to the pins can be modified.

This function can be used, for example, to perform commutation of a brushless DC motor with a single register write (and without modifying the individual PWM generators, which are modified by the feedback control loop). In addition, the updating of the bits in the **PWMENABLE** register can be configured to be immediate or locally or globally synchronized to the next synchronous update using the **PWM Enable Update (PWMENUPD)** register.

During fault conditions, the PWM output signals, PWMn, usually must be driven to safe values so that external equipment may be safely controlled. The **PWMFAULT** register specifies whether during a fault condition, the generated signal continues to be passed driven or to an encoding specified in the **PWMFAULTVAL** register.

A final inversion can be applied to any of the PWMn signals, making them active Low instead of the default active High using the **PWM Output Inversion (PWMINVERT)**. The inversion is applied even if a value has been enabled in the **PWMFAULT** register and specified in the **PWMFAULTVAL** register. In other words, if a bit is set in the **PWMFAULT**, **PWMFAULTVAL**, and **PWMINVERT** registers, the output on the PWMn signal is 0, not 1 as specified in the **PWMFAULTVAL** register.

## 20.4 Initialization and Configuration

The following example shows how to initialize PWM Generator 0 with a 25-kHz frequency, a 25% duty cycle on the PWM0 pin, and a 75% duty cycle on the PWM1 pin. This example assumes the system clock is 20 MHz.

1. Enable the PWM clock by writing a value of 0x0010.0000 to the **RCGC0** register in the System Control module (see page 266).
2. Enable the clock to the appropriate GPIO module via the **RCGC2** register in the System Control module (see page 283).
3. In the GPIO module, enable the appropriate pins for their alternate function using the **GPIOAFSEL** register. To determine which GPIOs to configure, see Table 23-4 on page 1178.
4. Configure the PMCN fields in the **GPIOPCTL** register to assign the PWM signals to the appropriate pins (see page 433 and Table 23-5 on page 1187).
5. Configure the **Run-Mode Clock Configuration (RCC)** register in the System Control module to use the PWM divide (USEPWMDIV) and set the divider (PWMDIV) to divide by 2 (000).
6. Configure the PWM generator for countdown mode with immediate updates to the parameters.
  - Write the **PWM0CTL** register with a value of 0x0000.0000.
  - Write the **PWM0GENA** register with a value of 0x0000.008C.
  - Write the **PWM0GENB** register with a value of 0x0000.080C.
7. Set the period. For a 25-KHz frequency, the period = 1/25,000, or 40 microseconds. The PWM clock source is 10 MHz; the system clock divided by 2. Thus there are 400 clock ticks per period. Use this value to set the **PWM0LOAD** register. In Count-Down mode, set the LOAD field in the **PWM0LOAD** register to the requested period minus one.
  - Write the **PWM0LOAD** register with a value of 0x0000.018F.
8. Set the pulse width of the PWM0 pin for a 25% duty cycle.
  - Write the **PWM0CMPA** register with a value of 0x0000.012B.

9. Set the pulse width of the PWM1 pin for a 75% duty cycle.
  - Write the **PWM0CMPB** register with a value of 0x0000.0063.
10. Start the timers in PWM generator 0.
  - Write the **PWM0CTL** register with a value of 0x0000.0001.
11. Enable PWM outputs.
  - Write the **PWMENABLE** register with a value of 0x0000.0003.

## 20.5 Register Map

Table 20-3 on page 1063 lists the PWM registers. The offset listed is a hexadecimal increment to the register's address, relative to the PWM module's base address:

- PWM0: 0x4002.8000

Note that the PWM module clock must be enabled before the registers can be programmed (see page 266). There must be a delay of 3 system clocks after the PWM module clock is enabled before any PWM module registers are accessed.

**Table 20-3. PWM Register Map**

| Offset | Name        | Type  | Reset       | Description                       | See page |
|--------|-------------|-------|-------------|-----------------------------------|----------|
| 0x000  | PWMCTL      | R/W   | 0x0000.0000 | PWM Master Control                | 1067     |

## 20.6 Register Descriptions

The remainder of this section lists and describes the PWM registers, in numerical order by address offset.

## Register 1: PWM Master Control (PWMCTL), offset 0x000

This register provides master control over the PWM generation blocks.

### PWM Master Control (PWMCTL)

PWM0 base: 0x4002.8000

Offset 0x000

Type R/W, reset 0x0000.0000

## Register 2: PWM Time Base Sync (PWMSYNC), offset 0x004

This register provides a method to perform synchronization of the counters in the PWM generation blocks. Setting a bit in this register causes the specified counter to reset back to 0; setting multiple bits resets multiple counters simultaneously. The bits auto-clear after the reset has occurred; reading them back as zero indicates that the synchronization has completed.

### PWM Time Base Sync (PWMSYNC)

PWM0 base: 0x4002.8000

Offset 0x004

**Register 3: PWM Output Enable (PWMENABLE), offset 0x008**

This register provides a master control of which generated pwmA' and pwmB' signals are output to the PWMn pins. By disabling a PWM output, the generation process can continue (for example, when the time bases are synchronized) without driving PWM signals to the pins. When bits in this register are set, the corresponding pwmA' or pwmB' signal is passed through to the output stage. When bits are clear, the pwmA' or pwmB' signal is replaced by a zero value which is also passed to the output stage. The **PWMINVERT** register controls the output stage, so if the corresponding bit is set in that register, the value seen on the PWMn signal is inverted from what is configured by the bits in this register. Updates to the bits in this register can be immediate or locally or globally synchronized to the next synchronous update as controlled by the ENUPDn fields in the **PWMENUPD** register.

**PWM Output Enable (PWMENABLE)**

**Register 4: PWM Output Inversion (PWMINVERT), offset 0x00C**

This register provides a master control of the polarity of the PWMn signals on the device pins. The pwmA' and pwmB' signals generated by the PWM generator are active High; but can be made active Low via this register. Disabled PWM channels are also passed through the output inverter (if so configured) so that inactive signals can be High. In addition, if the **PWMFAULT** register enables a specific value to be placed on the PWMn signals during a fault condition, that value is inverted if the corresponding bit in this register is set.

**PWM Output Inversion (PWMINVERT)**

**Register 5: PWM Output Fault (PWMFAULT), offset 0x010**

This register controls the behavior of the PWMn outputs in the presence of fault conditions. Both the fault inputs (FAULTn pins and digital comparator outputs) and debug events are considered fault conditions. On a fault condition, each pwmA' or pwmB' signal can be passed through unmodified or driven to the value specified by the corresponding bit in the **PWMFAULTVAL** register. For outputs that are configured for pass-through, the debug event handling on the corresponding PWM generator also determines if the pwmA' or pwmB' signal continues to be generated.

Fault condition control occurs before the output inverter, so PWM signals driven to a specified value on fault are inverted if the channel is configured for inversion (therefore, the pin is driven to the logical complement of the specified value on a fault condition).

**PWM Output Fault (PWMFAULT)**

**Register 7: PWM Raw Interrupt Status (PWMRIS), offset 0x018**

This register provides the current set of interrupt sources that are asserted, regardless of whether they are enabled to cause an interrupt to be asserted to the interrupt controller. The fault interrupt is asserted based on the fault condition source that is specified by the **PWMnCTL**, **PWMnFLTSRC0** and **PWMnFLTSRC1** registers. The fault interrupt is latched on detection and must be cleared through the **PWM Interrupt Status and Clear (PWMISC)** register. The actual value of the FAULTn signals can be observed using the **PWMSTATUS** register.

The PWM generator interrupts simply reflect the status of the PWM generators and are cleared via the interrupt status register in the PWM generator blocks. If a bit is set, the event is active; if a bit is clear the event is not active.

**PWM Raw Interrupt Status (PWMRIS)**

## Register 8: PWM Interrupt Status and Clear (PWMISC), offset 0x01C

This register provides a summary of the interrupt status of the individual PWM generator blocks. If a fault interrupt is set, the corresponding FAULTn input has caused an interrupt. For the fault interrupt, a write of 1 to that bit position clears the latched interrupt status. If an block interrupt bit is set, the corresponding generator block is asserting an interrupt. The individual interrupt status registers, **PWMnISC**, in each block must be consulted to determine the reason for the interrupt and used to clear the interrupt.

**Register 10: PWM Fault Condition Value (PWMFAULTVAL), offset 0x024**

This register specifies the output value driven on the PWMn signals during a fault condition if enabled by the corresponding bit in the **PWMFAULT** register. Note that if the corresponding bit in the **PWMINVERT** register is set, the output value is driven to the logical NOT of the bit value in this register.

**PWM Fault Condition Value (PWMFAULTVAL)**

PWM0 base: 0x4002.8000

Offset 0x024

Type R/W, reset 0x0000.0000

**Register 11: PWM Enable Update (PWMENUPD), offset 0x028**

This register specifies when updates to the PWMnEN bit in the **PWMENABLE** register are performed. The PWMnEN bit enables the pwmA' or pwmB' output to be passed to the microcontroller's pin. Updates can be immediate or locally or globally synchronized to the next synchronous update.

**PWM Enable Update (PWMENUPD)**

PWM0 base: 0x4002.8000

Offset 0x028

Type R/W, reset 0x0000.0000

**Register 12: PWM0 Control (PWM0CTL), offset 0x040****Register 13: PWM1 Control (PWM1CTL), offset 0x080****Register 14: PWM2 Control (PWM2CTL), offset 0x0C0****Register 15: PWM3 Control (PWM3CTL), offset 0x100**

These registers configure the PWM signal generation blocks (PWM0CTL controls the PWM generator 0 block, and so on). The Register Update mode, Debug mode, Counting mode, and Block Enable mode are all controlled via these registers. The blocks produce the PWM signals, which can be either two independent PWM signals (from the same counter), or a paired set of PWM signals with dead-band delays added.

The PWM0 block produces the PWM0 and PWM1 outputs, the PWM1 block produces the PWM2 and PWM3 outputs, the PWM2 block produces the PWM4 and PWM5 outputs, and the PWM3 block produces the PWM6 and PWM7 outputs.

**PWM0 Control (PWM0CTL)**

PWM0 base: 0x4002.8000

Offset 0x040

Type R/W, reset 0x0000.0000

| 17        | MINFLTPER | R/W  | 0     | <p>Minimum Fault Period</p> <p>This bit specifies that the PWM generator enables a one-shot counter to provide a minimum fault condition period.</p> <p>The timer begins counting on the rising edge of the fault condition to extend the condition for a minimum duration of the count value. The timer ignores the state of the fault condition while counting.</p> <p>The minimum fault delay is in effect only when the MINFLTPER bit is set. If a detected fault is in the process of being extended when the MINFLTPER bit is cleared, the fault condition extension is aborted.</p> <p>The delay time is specified by the <b>PWMnMINFLTPER</b> register MFP field value. The effect of this is to pulse stretch the fault condition input.</p> <p>The delay value is defined by the PWM clock period. Because the fault input is not synchronized to the PWM clock, the period of the time is <math>PWMClock * (MFP \text{ value} + 1)</math> or <math>PWMClock * (MFP \text{ value} + 2)</math>.</p> <p>The delay function makes sense only if the fault source is unlatched. A latched fault source makes the fault condition appear asserted until cleared by software and negates the utility of the extend feature. It applies to all fault condition sources as specified in the FLTSRC field.</p> <p>Value Description</p> <p>0 The FAULT input deassertion is unaffected.</p> <p>1 The <b>PWMnMINFLTPER</b> one-shot counter is active and extends the period of the fault condition to a minimum period.</p> |

**Register 16: PWM0 Interrupt and Trigger Enable (PWM0INTEN), offset 0x044**

**Register 17: PWM1 Interrupt and Trigger Enable (PWM1INTEN), offset 0x084**

**Register 18: PWM2 Interrupt and Trigger Enable (PWM2INTEN), offset 0x0C4**

**Register 19: PWM3 Interrupt and Trigger Enable (PWM3INTEN), offset 0x104**

These registers control the interrupt and ADC trigger generation capabilities of the PWM generators (**PWM0INTEN** controls the PWM generator 0 block, and so on). The events that can cause an interrupt or an ADC trigger are:

- The counter being equal to the load register
- The counter being equal to zero
- The counter being equal to the **PWMnCMPA** register while counting up
- The counter being equal to the **PWMnCMPA** register while counting down
- The counter being equal to the **PWMnCMB** register while counting up
- The counter being equal to the **PWMnCMB** register while counting down

Any combination of these events can generate either an interrupt or an ADC trigger, though no determination can be made as to the actual event that caused an ADC trigger if more than one is specified. The **PWMnRIS** register provides information about which events have caused raw interrupts.

**Register 20: PWM0 Raw Interrupt Status (PWM0RIS), offset 0x048****Register 21: PWM1 Raw Interrupt Status (PWM1RIS), offset 0x088****Register 22: PWM2 Raw Interrupt Status (PWM2RIS), offset 0x0C8****Register 23: PWM3 Raw Interrupt Status (PWM3RIS), offset 0x108**

These registers provide the current set of interrupt sources that are asserted, regardless of whether they cause an interrupt to be asserted to the controller (**PWM0RIS** controls the PWM generator 0 block, and so on). If a bit is set, the event has occurred; if a bit is clear, the event has not occurred. Bits in this register are cleared by writing a 1 to the corresponding bit in the **PWMnISC** register.

**Register 24: PWM0 Interrupt Status and Clear (PWM0ISC), offset 0x04C****Register 25: PWM1 Interrupt Status and Clear (PWM1ISC), offset 0x08C****Register 26: PWM2 Interrupt Status and Clear (PWM2ISC), offset 0x0CC****Register 27: PWM3 Interrupt Status and Clear (PWM3ISC), offset 0x10C**

These registers provide the current set of interrupt sources that are asserted to the interrupt controller (**PWM0ISC** controls the PWM generator 0 block, and so on). A bit is set if the event has occurred and is enabled in the **PWMnINTEN** register; if a bit is clear, the event has not occurred or is not enabled. These are R/W1C registers; writing a 1 to a bit position clears the corresponding interrupt reason.

**Register 28: PWM0 Load (PWM0LOAD), offset 0x050****Register 29: PWM1 Load (PWM1LOAD), offset 0x090****Register 30: PWM2 Load (PWM2LOAD), offset 0x0D0****Register 31: PWM3 Load (PWM3LOAD), offset 0x110**

These registers contain the load value for the PWM counter (**PWM0LOAD** controls the PWM generator 0 block, and so on). Based on the counter mode configured by the **MODE** bit in the **PWMnCTL** register, this value is either loaded into the counter after it reaches zero or is the limit of up-counting after which the counter decrements back to zero. When this value matches the counter, a pulse is output which can be configured to drive the generation of the pwmA and/or pwmB signal (via the **PWMnGENA/PWMnGENB** register) or drive an interruptor ADC trigger (via the **PWMnINTEN** register).

If the Load Value Update mode is locally synchronized (based on the **LOADUPD** field encoding in the **PWMnCTL** register), the 16-bit **LOAD** value is used the next time the counter reaches zero. If the update mode is globally synchronized, it is used the next time the counter reaches zero after a synchronous update has been requested through the **PWM Master Control (PWMCTL)** register (see page 1067). If this register is re-written before the actual update occurs, the previous value is never used and is lost.

| 15:0      | COMPB    | R/W  | 0x0000 | Comparator B Value<br>The value to be compared against the counter.                                                                                                                           |

**Register 44: PWM0 Generator A Control (PWM0GENA), offset 0x060****Register 45: PWM1 Generator A Control (PWM1GENA), offset 0x0A0****Register 46: PWM2 Generator A Control (PWM2GENA), offset 0x0E0****Register 47: PWM3 Generator A Control (PWM3GENA), offset 0x120**

These registers control the generation of the pwmA signal based on the load and zero output pulses from the counter, as well as the compare A and compare B pulses from the comparators (**PWM0GENA** controls the PWM generator 0 block, and so on). When the counter is running in Count-Down mode, only four of these events occur; when running in Count-Up/Down mode, all six occur. These events provide great flexibility in the positioning and duty cycle of the resulting PWM signal.

The **PWM0GENA** register controls generation of the pwm0A signal; **PWM1GENA**, the pwm1A signal; **PWM2GENA**, the pwm2A signal; and **PWM3GENA**, the pwm3A signal.

If a zero or load event coincides with a compare A or compare B event, the zero or load action is taken and the compare A or compare B action is ignored. If a compare A event coincides with a compare B event, the compare A action is taken and the compare B action is ignored.

If the Generator A update mode is immediate (based on the GENAUPD field encoding in the **PWMnCTL** register), the ACTCMPBD, ACTCMPBU, ACTCMPAD, ACTCMPAU, ACTLOAD, and ACTZERO values are used immediately. If the update mode is locally synchronized, these values are used the next time the counter reaches zero. If the update mode is globally synchronized, these values are used the next time the counter reaches zero after a synchronous update has been requested through the **PWM Master Control (PWMCTL)** register (see page 1067). If this register is rewritten before the actual update occurs, the previous value is never used and is lost.

**PWM0 Generator A Control (PWM0GENA)**

**Register 48: PWM0 Generator B Control (PWM0GENB), offset 0x064****Register 49: PWM1 Generator B Control (PWM1GENB), offset 0x0A4****Register 50: PWM2 Generator B Control (PWM2GENB), offset 0x0E4****Register 51: PWM3 Generator B Control (PWM3GENB), offset 0x124**

These registers control the generation of the pwmB signal based on the load and zero output pulses from the counter, as well as the compare A and compare B pulses from the comparators (**PWM0GENB** controls the PWM generator 0 block, and so on). When the counter is running in Count-Down mode, only four of these events occur; when running in Count-Up/Down mode, all six occur. These events provide great flexibility in the positioning and duty cycle of the resulting PWM signal.

The **PWM0GENB** register controls generation of the pwm0B signal; **PWM1GENB**, the pwm1B signal; **PWM2GENB**, the pwm2B signal; and **PWM3GENB**, the pwm3B signal.

If a zero or load event coincides with a compare A or compare B event, the zero or load action is taken and the compare A or compare B action is ignored. If a compare A event coincides with a compare B event, the compare B action is taken and the compare A action is ignored.

If the Generator B update mode is immediate (based on the GENBUPD field encoding in the **PWMnCTL** register), the ACTCMPBD, ACTCMPBU, ACTCMPAD, ACTCMPAU, ACTLOAD, and ACTZERO values are used immediately. If the update mode is locally synchronized, these values are used the next time the counter reaches zero. If the update mode is globally synchronized, these values are used the next time the counter reaches zero after a synchronous update has been requested through the **PWM Master Control (PWMCTL)** register (see page 1067). If this register is rewritten before the actual update occurs, the previous value is never used and is lost.

**Register 52: PWM0 Dead-Band Control (PWM0DBCTL), offset 0x068****Register 53: PWM1 Dead-Band Control (PWM1DBCTL), offset 0x0A8****Register 54: PWM2 Dead-Band Control (PWM2DBCTL), offset 0x0E8****Register 55: PWM3 Dead-Band Control (PWM3DBCTL), offset 0x128**

The **PWMnDBCTL** register controls the dead-band generator, which produces the PWMn signals based on the pwmA and pwmB signals. When disabled, the pwmA signal passes through to the pwmA' signal and the pwmB signal passes through to the pwmB' signal. When dead-band control is enabled, the pwmB signal is ignored, the pwmA' signal is generated by delaying the rising edge(s) of the pwmA signal by the value in the **PWMnDBRISE** register (see page 1115), and the pwmB' signal is generated by inverting the pwmA signal and delaying the falling edge(s) of the pwmA signal by the value in the **PWMnDBFALL** register (see page 1116). The Output Control block outputs the pwm0A' signal on the PWM0 signal and the pwm0B' signal on the PWM1 signal. In a similar manner, PWM2 and PWM3 are produced from the pwm1A' and pwm1B' signals, PWM4 and PWM5 are produced from the pwm2A' and pwm2B' signals, and PWM6 and PWM7 are produced from the pwm3A' and pwm3B' signals.

If the Dead-Band Control mode is immediate (based on the DBCTLUPD field encoding in the **PWMnCTL** register), the ENABLE bit value is used immediately. If the update mode is locally synchronized, this value is used the next time the counter reaches zero. If the update mode is globally synchronized, this value is used the next time the counter reaches zero after a synchronous update has been requested through the **PWM Master Control (PWMCTL)** register (see page 1067). If this register is rewritten before the actual update occurs, the previous value is never used and is lost.

| 0                 | The pwmA and pwmB signals pass through to the pwmA' and pwmB' signals unmodified.                          |      |            |                                                                                                                                                                                               |

**Register 56: PWM0 Dead-Band Rising-Edge Delay (PWM0DBRISE), offset 0x06C**

**Register 57: PWM1 Dead-Band Rising-Edge Delay (PWM1DBRISE), offset 0x0AC**

**Register 58: PWM2 Dead-Band Rising-Edge Delay (PWM2DBRISE), offset 0x0EC**

**Register 59: PWM3 Dead-Band Rising-Edge Delay (PWM3DBRISE), offset 0x12C**

The **PWMnDBRISE** register contains the number of clock cycles to delay the rising edge of the pwmA signal when generating the pwmA' signal. If the dead-band generator is disabled through the **PWMnDBCTL** register, this register is ignored. If the value of this register is larger than the width of a High pulse on the pwmA signal, the rising-edge delay consumes the entire High time of the signal, resulting in no High time on the output. Care must be taken to ensure that the pwmA High time always exceeds the rising-edge delay.

If the Dead-Band Rising-Edge Delay mode is immediate (based on the DBRISEUPD field encoding in the **PWMnCTL** register), the 12-bit RISEDELAY value is used immediately. If the update mode is locally synchronized, this value is used the next time the counter reaches zero. If the update mode is globally synchronized, this value is used the next time the counter reaches zero after a synchronous update has been requested through the **PWM Master Control (PWMCTL)** register (see page 1067). If this register is rewritten before the actual update occurs, the previous value is never used and is lost.

| 31:12     | reserved  | RO   | 0x0000.0 | Software should not rely on the value of a reserved bit. To provide compatibility with future products, the value of a reserved bit should be preserved across a read-modify-write operation. |
| 11:0      | RISEDELAY | R/W  | 0x000    | Dead-Band Rise Delay<br>The number of clock cycles to delay the rising edge of pwmA' after the rising edge of pwmA.                                                                           |

**Register 60: PWM0 Dead-Band Falling-Edge-Delay (PWM0DBFALL), offset 0x070**

**Register 61: PWM1 Dead-Band Falling-Edge-Delay (PWM1DBFALL), offset 0x0B0**

**Register 62: PWM2 Dead-Band Falling-Edge-Delay (PWM2DBFALL), offset 0x0F0**

**Register 63: PWM3 Dead-Band Falling-Edge-Delay (PWM3DBFALL), offset 0x130**

The **PWMnDBFALL** register contains the number of clock cycles to delay the rising edge of the pwmB' signal from the falling edge of the pwmA signal. If the dead-band generator is disabled through the **PWMnDBCTL** register, this register is ignored. If the value of this register is larger than the width of a Low pulse on the pwmA signal, the falling-edge delay consumes the entire Low time of the signal, resulting in no Low time on the output. Care must be taken to ensure that the pwmA Low time always exceeds the falling-edge delay.

If the Dead-Band Falling-Edge-Delay mode is immediate (based on the DBFALLUP field encoding in the **PWMnCTL** register), the 12-bit FALLDELAY value is used immediately. If the update mode is locally synchronized, this value is used the next time the counter reaches zero. If the update mode is globally synchronized, this value is used the next time the counter reaches zero after a synchronous update has been requested through the **PWM Master Control (PWMCTL)** register (see page 1067). If this register is rewritten before the actual update occurs, the previous value is never used and is lost.

**Register 64: PWM0 Fault Source 0 (PWM0FLTSRC0), offset 0x074****Register 65: PWM1 Fault Source 0 (PWM1FLTSRC0), offset 0x0B4****Register 66: PWM2 Fault Source 0 (PWM2FLTSRC0), offset 0x0F4****Register 67: PWM3 Fault Source 0 (PWM3FLTSRC0), offset 0x134**

This register specifies which fault pin inputs are used to generate a fault condition. Each bit in the following register indicates whether the corresponding fault pin is included in the fault condition. All enabled fault pins are ORed together to form the **PWMnFLTSRC0** portion of the fault condition. The **PWMnFLTSRC0** fault condition is then ORed with the **PWMnFLTSRC1** fault condition to generate the final fault condition for the PWM generator.

If the FLTSRC bit in the **PWMnCTL** register (see page 1092) is clear, only the **Fault0** signal affects the fault condition generated. Otherwise, sources defined in **PWMnFLTSRC0** and **PWMnFLTSRC1** affect the fault condition generated.

**PWM0 Fault Source 0 (PWM0FLTSRC0)**

**Register 68: PWM0 Fault Source 1 (PWM0FLTSRC1), offset 0x078****Register 69: PWM1 Fault Source 1 (PWM1FLTSRC1), offset 0x0B8****Register 70: PWM2 Fault Source 1 (PWM2FLTSRC1), offset 0x0F8****Register 71: PWM3 Fault Source 1 (PWM3FLTSRC1), offset 0x138**

This register specifies which digital comparator triggers from the ADC are used to generate a fault condition. Each bit in the following register indicates whether the corresponding digital comparator trigger is included in the fault condition. All enabled digital comparator triggers are ORed together to form the **PWMnFLTSRC1** portion of the fault condition. The **PWMnFLTSRC1** fault condition is then ORed with the **PWMnFLTSRC0** fault condition to generate the final fault condition for the PWM generator.

If the FLTSRC bit in the **PWMnCTL** register (see page 1092) is clear, only the PWM Fault pin affects the fault condition generated. Otherwise, sources defined in **PWMnFLTSRC0** and **PWMnFLTSRC1** affect the fault condition generated.

**PWM0 Fault Source 1 (PWM0FLTSRC1)**

**Register 72: PWM0 Minimum Fault Period (PWM0MINFLTPER), offset 0x07C**

**Register 73: PWM1 Minimum Fault Period (PWM1MINFLTPER), offset 0x0BC**

**Register 74: PWM2 Minimum Fault Period (PWM2MINFLTPER), offset 0x0FC**

**Register 75: PWM3 Minimum Fault Period (PWM3MINFLTPER), offset 0x13C**

If the MINFLTPER bit in the **PWMnCTL** register is set, this register specifies the 16-bit time-extension value to be used in extending the fault condition. The value is loaded into a 16-bit down counter, and the counter value is used to extend the fault condition. The fault condition is released in the clock immediately after the counter value reaches 0. The fault condition is asynchronous to the PWM clock; and the delay value is the product of the PWM clock period and the (MFP field value + 1) or (MFP field value + 2) depending on when the fault condition asserts with respect to the PWM clock. The counter decrements at the PWM clock rate, without pause or condition.

**Register 80: PWM0 Fault Status 0 (PWM0FLTSTAT0), offset 0x804****Register 81: PWM1 Fault Status 0 (PWM1FLTSTAT0), offset 0x884****Register 82: PWM2 Fault Status 0 (PWM2FLTSTAT0), offset 0x904****Register 83: PWM3 Fault Status 0 (PWM3FLTSTAT0), offset 0x984**

Along with the **PWMnFLTSTAT1** register, this register provides status regarding the fault condition inputs.

If the LATCH bit in the **PWMnCTL** register is clear, the contents of the **PWMnFLTSTAT0** register are read-only (RO) and provide the current state of the FAULTn inputs.

If the LATCH bit in the **PWMnCTL** register is set, the contents of the **PWMnFLTSTAT0** register are read / write 1 to clear (R/W1C) and provide a latched version of the FAULTn inputs. In this mode, the register bits are cleared by writing a 1 to a set bit. The FAULTn inputs are recorded after their sense is adjusted in the generator.

The contents of this register can only be written if the fault source extensions are enabled (the FLTSRC bit in the **PWMnCTL** register is set).

## 21 Quadrature Encoder Interface (QEI)

A quadrature encoder, also known as a 2-channel incremental encoder, converts linear displacement into a pulse signal. By monitoring both the number of pulses and the relative phase of the two signals, you can track the position, direction of rotation, and speed. In addition, a third channel, or index signal, can be used to reset the position counter.

The LM3S5791 microcontroller includes two quadrature encoder interface (QEI) modules. Each QEI module interprets the code produced by a quadrature encoder wheel to integrate position over time and determine direction of rotation. In addition, it can capture a running estimate of the velocity of the encoder wheel.

The Stellaris® LM3S5791 microcontroller includes two QEI modules providing control of two motors at the same time with the following features:

- Position integrator that tracks the encoder position
- Programmable noise filter on the inputs
- Velocity capture using built-in timer
- The input frequency of the QEI inputs may be as high as 1/4 of the processor frequency (for example, 12.5 MHz for a 50-MHz system)
- Interrupt generation on:
  - Index pulse
  - Velocity-timer expiration
  - Direction change
  - Quadrature error detection

### 21.1 Block Diagram

Figure 21-1 on page 1130 provides a block diagram of a Stellaris QEI module.

Figure 21-1. QEI Block Diagram

## 21.2 Signal Description

Table 21-1 on page 1130 and Table 21-2 on page 1131 list the external signals of the QEI module and describe the function of each. The QEI signals are alternate functions for some GPIO signals and default to be GPIO signals at reset. The column in the table below titled "Pin Mux/Pin Assignment" lists the possible GPIO pin placements for these QEI signals. The AFSEL bit in the **GPIO Alternate Function Select (GPIOAFSEL)** register (page 415) should be set to choose the QEI function. The number in parentheses is the encoding that must be programmed into the PMCN field in the **GPIO Port Control (GPIOPTCL)** register (page 433) to assign the QEI signal to the specified GPIO port pin. For more information on configuring GPIOs, see "General-Purpose Input/Outputs (GPIOs)" on page 390.

Table 21-1. Signals for QEI (100LQFP)

| Pin Name | Pin Number | Pin Mux / Pin Assignment | Pin Type | Buffer Type <sup>a</sup> | Description           |

a. The TTL designation indicates the pin has TTL-compatible voltage levels.

## 21.3 Functional Description

The QEI module interprets the two-bit gray code produced by a quadrature encoder wheel to integrate position over time and determine direction of rotation. In addition, it can capture a running estimate of the velocity of the encoder wheel.

The position integrator and velocity capture can be independently enabled, though the position integrator must be enabled before the velocity capture can be enabled. The two phase signals, PhA and PhB, can be swapped before being interpreted by the QEI module to change the meaning of

forward and backward and to correct for miswiring of the system. Alternatively, the phase signals can be interpreted as a clock and direction signal as output by some encoders.

The QEI module input signals have a digital noise filter on them that can be enabled to prevent spurious operation. The noise filter requires that the inputs be stable for a specified number of consecutive clock cycles before updating the edge detector. The filter is enabled by the **FILTEN** bit in the **QEI Control (QEICTL)** register. The frequency of the input update is programmable using the **FILTCNT** bit field in the **QEICTL** register.

The QEI module supports two modes of signal operation: quadrature phase mode and clock/direction mode. In quadrature phase mode, the encoder produces two clocks that are 90 degrees out of phase; the edge relationship is used to determine the direction of rotation. In clock/direction mode, the encoder produces a clock signal to indicate steps and a direction signal to indicate the direction of rotation. This mode is determined by the **SIGMODE** bit of the **QEICTL** register (see page 1136).

When the QEI module is set to use the quadrature phase mode (**SIGMODE** bit is clear), the capture mode for the position integrator can be set to update the position counter on every edge of the **PhA** signal or to update on every edge of both **PhA** and **PhB**. Updating the position counter on every **PhA** and **PhB** edge provides more positional resolution at the cost of less range in the positional counter.

When edges on **PhA** lead edges on **PhB**, the position counter is incremented. When edges on **PhB** lead edges on **PhA**, the position counter is decremented. When a rising and falling edge pair is seen on one of the phases without any edges on the other, the direction of rotation has changed.

The positional counter is automatically reset on one of two conditions: sensing the index pulse or reaching the maximum position value. The reset mode is determined by the **RESMODE** bit of the **QEICTL** register.

When **RESMODE** is set, the positional counter is reset when the index pulse is sensed. This mode limits the positional counter to the values  $[0:N-1]$ , where **N** is the number of phase edges in a full revolution of the encoder wheel. The **QEI Maximum Position (QEIMAXPOS)** register must be programmed with **N-1** so that the reverse direction from position 0 can move the position counter to **N-1**. In this mode, the position register contains the absolute position of the encoder relative to the index (or home) position once an index pulse has been seen.

When **RESMODE** is clear, the positional counter is constrained to the range  $[0:M]$ , where **M** is the programmable maximum value. The index pulse is ignored by the positional counter in this mode.

Velocity capture uses a configurable timer and a count register. The timer counts the number of phase edges (using the same configuration as for the position integrator) in a given time period. The edge count from the previous time period is available to the controller via the **QEI Velocity (QEISPEED)** register, while the edge count for the current time period is being accumulated in the **QEI Velocity Counter (QEICOUNT)** register. As soon as the current time period is complete, the total number of edges counted in that time period is made available in the **QEISPEED** register (overwriting the previous value), the **QEICOUNT** register is cleared, and counting commences on a new time period. The number of edges counted in a given time period is directly proportional to the velocity of the encoder.

Figure 21-2 on page 1133 shows how the Stellaris quadrature encoder converts the phase input signals into clock pulses, the direction signal, and how the velocity predivider operates (in Divide by 4 mode).

**Figure 21-2. Quadrature Encoder and Velocity Predivider Operation**

The period of the timer is configurable by specifying the load value for the timer in the **QEI Timer Load (QEILOAD)** register. When the timer reaches zero, an interrupt can be triggered, and the hardware reloads the timer with the **QEILOAD** value and continues to count down. At lower encoder speeds, a longer timer period is required to be able to capture enough edges to have a meaningful result. At higher encoder speeds, both a shorter timer period and/or the velocity predivider can be used.

The following equation converts the velocity counter value into an rpm value:

$$\text{rpm} = (\text{clock} * (2 \wedge \text{VELDIV}) * \text{SPEED} * 60) \div (\text{LOAD} * \text{ppr} * \text{edges})$$

where:

clock is the controller clock rate

ppr is the number of pulses per revolution of the physical encoder

edges is 2 or 4, based on the capture mode set in the **QEICTL** register (2 for CAPMODE clear and 4 for CAPMODE set)

For example, consider a motor running at 600 rpm. A 2048 pulse per revolution quadrature encoder is attached to the motor, producing 8192 phase edges per revolution. With a velocity predivider of ÷1 (VELDIV is clear) and clocking on both PhA and PhB edges, this results in 81,920 pulses per second (the motor turns 10 times per second). If the timer were clocked at 10,000 Hz, and the load value was 2,500 (¼ of a second), it would count 20,480 pulses per update. Using the above equation:

$$\text{rpm} = (10000 * 1 * 20480 * 60) \div (2500 * 2048 * 4) = 600 \text{ rpm}$$

Now, consider that the motor is sped up to 3000 rpm. This results in 409,600 pulses per second, or 102,400 every ¼ of a second. Again, the above equation gives:

$$\text{rpm} = (10000 * 1 * 102400 * 60) \div (2500 * 2048 * 4) = 3000 \text{ rpm}$$

Care must be taken when evaluating this equation because intermediate values may exceed the capacity of a 32-bit integer. In the above examples, the clock is 10,000 and the divisor is 2,500; both could be predivided by 100 (at compile time if they are constants) and therefore be 100 and 25. In fact, if they were compile-time constants, they could also be reduced to a simple multiply by 4, cancelled by the ÷4 for the edge-count factor.

**Important:** Reducing constant factors at compile time is the best way to control the intermediate values of this equation and reduce the processing requirement of computing this equation.

The division can be avoided by selecting a timer load value such that the divisor is a power of 2; a simple shift can therefore be done in place of the division. For encoders with a power of 2 pulses per revolution, the load value can be a power of 2. For other encoders, a load value must be selected such that the product is very close to a power of 2. For example, a 100 pulse-per-revolution encoder

could use a load value of 82, resulting in 32,800 as the divisor, which is 0.09% above  $2^{14}$ . In this case a shift by 15 would be an adequate approximation of the divide in most cases. If absolute accuracy were required, the microcontroller's divide instruction could be used.

The QEI module can produce a controller interrupt on several events: phase error, direction change, reception of the index pulse, and expiration of the velocity timer. Standard masking, raw interrupt status, interrupt status, and interrupt clear capabilities are provided.

## 21.4 Initialization and Configuration

The following example shows how to configure the Quadrature Encoder module to read back an absolute position:

1. Enable the QEI clock by writing a value of 0x0000.0100 to the **RCGC1** register in the System Control module (see page 274).
2. Enable the clock to the appropriate GPIO module via the **RCGC2** register in the System Control module (see page 283).
3. In the GPIO module, enable the appropriate pins for their alternate function using the **GPIOAFSEL** register. To determine which GPIOs to configure, see Table 23-4 on page 1178.
4. Configure the PMCN fields in the **GPIOPCTL** register to assign the QEI signals to the appropriate pins (see page 433 and Table 23-5 on page 1187).
5. Configure the quadrature encoder to capture edges on both signals and maintain an absolute position by resetting on index pulses. A 1000-line encoder with four edges per line, results in 4000 pulses per revolution; therefore, set the maximum position to 3999 (0xF9F) as the count is zero-based.
  - Write the **QEICTL** register with the value of 0x0000.0018.
  - Write the **QEIMAXPOS** register with the value of 0x0000.0F9F.
6. Enable the quadrature encoder by setting bit 0 of the **QEICTL** register.
7. Delay until the encoder position is required.
8. Read the encoder position by reading the **QEI Position (QEIPOS)** register value.

## 21.5 Register Map

Table 21-3 on page 1135 lists the QEI registers. The offset listed is a hexadecimal increment to the register's address, relative to the module's base address:

- QEIO: 0x4002.C000
- QEI1: 0x4002.D000

Note that the QEI module clock must be enabled before the registers can be programmed (see page 274). There must be a delay of 3 system clocks after the QEI module clock is enabled before any QEI module registers are accessed.

**Table 21-3. QEI Register Map**

| Offset | Name      | Type  | Reset       | Description                    | See page |
|--------|-----------|-------|-------------|--------------------------------|----------|
| 0x000  | QEICTL    | R/W   | 0x0000.0000 | QEI Control                    | 1136     |
| 0x004  | QEISTAT   | RO    | 0x0000.0000 | QEI Status                     | 1139     |

## 21.6 Register Descriptions

The remainder of this section lists and describes the QEI registers, in numerical order by address offset.

## Register 1: QEI Control (QEICTL), offset 0x000

This register contains the configuration of the QEI module. Separate enables are provided for the quadrature encoder and the velocity capture blocks; the quadrature encoder must be enabled in order to capture the velocity, but the velocity does not need to be captured in applications that do not need it. The phase signal interpretation, phase swap, Position Update mode, Position Reset mode, and velocity predivider are all set via this register.

### QEI Control (QEICTL)

QEI0 base: 0x4002.C000  
QEI1 base: 0x4002.D000  
Offset 0x000  
Type R/W, reset 0x0000.0000

Register 3: QEI Position (QEIPOS), offset 0x008

This register contains the current value of the position integrator. The value is updated by the status of the QEI phase inputs and can be set to a specific value by writing to it.

QEI Position (QEIPOS)

QEI0 base: 0x4002.C000

Register 5: QEI Timer Load (QEILOAD), offset 0x010

This register contains the load value for the velocity timer. Because this value is loaded into the timer on the clock cycle after the timer is zero, this value should be one less than the number of clocks in the desired period. So, for example, to have 2000 decimal clocks per timer period, this register should contain 1999 decimal.

QEI Timer Load (QEILOAD)

QEI0 base: 0x4002.C000  
QEI1 base: 0x4002.D000  
Offset 0x010  
Type R/W, reset 0x0000.0000

| Bit/Field | Name | Type | Reset       | Description                                                         |

Register 7: QEI Velocity Counter (QEICOUNT), offset 0x018

This register contains the running count of velocity pulses for the current time period. Because this count is a running total, the time period to which it applies cannot be known with precision (that is, a read of this register does not necessarily correspond to the time returned by the **QEITIME** register because there is a small window of time between the two reads, during which either value may have changed). The **QEISPEED** register should be used to determine the actual encoder velocity; this register is provided for information purposes only. This counter does not increment when the VELEN bit in the **QEICTL** register is clear.

QEI Velocity Counter (QEICOUNT)

QEI0 base: 0x4002.C000  
QEI1 base: 0x4002.D000  
Offset 0x018  
Type RO, reset 0x0000.0000

## Register 10: QEI Raw Interrupt Status (QEIRIS), offset 0x024

This register provides the current set of interrupt sources that are asserted, regardless of whether they cause an interrupt to be asserted to the controller (configured through the **QEINTEN** register). If a bit is set, the latched event has occurred; if a bit is clear, the event in question has not occurred.

### QEI Raw Interrupt Status (QEIRIS)

QEIO base: 0x4002.C000  
QEI1 base: 0x4002.D000  
Offset 0x024

## Register 11: QEI Interrupt Status and Clear (QEISC), offset 0x028

This register provides the current set of interrupt sources that are asserted to the controller. If a bit is set, the latched event has occurred and is enabled to generate an interrupt; if a bit is clear the event in question has not occurred or is not enabled to generate an interrupt. This register is R/W1C; writing a 1 to a bit position clears the bit and the corresponding interrupt reason.

### QEI Interrupt Status and Clear (QEISC)

## 22 Pin Diagram

The LM3S5791 microcontroller pin diagram is shown below.

Each GPIO signal is identified by its GPIO port unless it defaults to an alternate function on reset. In this case, the GPIO port name is followed by the default alternate function. To see a complete list of possible functions for each pin, see Table 23-5 on page 1187.

**Figure 22-1. 100-Pin LQFP Package Pin Diagram**

**Figure 22-2. 108-Ball BGA Package Pin Diagram (Top View)**

## 23 Signal Tables

The following tables list the signals available for each pin. Signals are configured as GPIOs on reset, except for those noted below. Use the **GPIOAMSEL** register (see page 431) to select analog mode. For a GPIO pin to be used for an alternate digital function, the corresponding bit in the **GPIOAFSEL** register (see page 415) must be set. Further pin muxing options are provided through the PMCx bit field in the **GPIOPCTL** register (see page 433), which selects one of several available peripheral functions for that GPIO.

**Important:** All GPIO pins are configured as GPIOs by default with the exception of the pins shown in the table below. A Power-On-Reset (POR) or asserting RST puts the pins back to their default state.

**Table 23-1. GPIO Pins With Default Alternate Functions**

| GPIO Pin | Default State     | GPIOAFSEL Bit | GPIOPCTL PMCx Bit Field |
|----------|-------------------|---------------|-------------------------|
| PA[1:0]  | UART0             | 0             | 0x1                     |
| PA[5:2]  | SSI0              | 0             | 0x1                     |
| PB[3:2]  | I <sup>2</sup> C0 | 0             | 0x1                     |
| PC[3:0]  | JTAG/SWD          | 1             | 0x3                     |

Table 23-2 on page 1155 shows the pin-to-signal-name mapping, including functional characteristics of the signals. Each possible alternate analog and digital function is listed for each pin.

Table 23-3 on page 1167 lists the signals in alphabetical order by signal name. If it is possible for a signal to be on multiple pins, each possible pin assignment is listed. The "Pin Mux" column indicates the GPIO and the encoding needed in the PMCx bit field in the **GPIOPCTL** register.

Table 23-4 on page 1178 groups the signals by functionality, except for GPIOs. If it is possible for a signal to be on multiple pins, each possible pin assignment is listed.

Table 23-5 on page 1187 lists the GPIO pins and their analog and digital alternate functions. The AINx and VREFA analog signals are not 5-V tolerant and go through an isolation circuit before reaching their circuitry. These signals are configured by clearing the corresponding DEN bit in the **GPIO Digital Enable (GPIODEN)** register and setting the corresponding AMSEL bit in the **GPIO Analog Mode Select (GPIOAMSEL)** register. Other analog signals are 5-V tolerant and are connected directly to their circuitry (C0-, C0+, C1-, C1+, C2-, C2+, USB0VBUS, USB0ID). These signals are configured by clearing the DEN bit in the **GPIO Digital Enable (GPIODEN)** register. The digital signals are enabled by setting the appropriate bit in the **GPIO Alternate Function Select (GPIOAFSEL)** and **GPIODEN** registers and configuring the PMCx bit field in the **GPIO Port Control (GPIOPCTL)** register to the numeric encoding shown in the table below. Table entries that are shaded gray are the default values for the corresponding GPIO pin.

Table 23-6 on page 1190 lists the signals based on number of possible pin assignments. This table can be used to plan how to configure the pins for a particular functionality. Application Note AN01274 Configuring Stellaris® Microcontrollers with Pin Multiplexing provides an overview of the pin muxing implementation, an explanation of how a system designer defines a pin configuration, and examples of the pin configuration process.

**Note:** All digital inputs are Schmitt triggered.

## 23.1 100-Pin LQFP Package Pin Tables

Table 23-2. Signals by Pin Number

| Pin Number | Pin Name | Pin Type | Buffer Type <sup>a</sup> | Description                                                                                                                                                                                                                                                                                                    |

|            | PWM4     | O        | TTL                      | PWM 4. This signal is controlled by PWM Generator 2.                                                                                                                                                                                                                                                           |
|            | U1CTS    | I        | TTL                      | UART module 1 Clear To Send modem status input signal.                                                                                                                                                                                                                                                         |
| 3          | VDDA     | -        | Power                    | The positive supply (3.3 V) for the analog circuits (ADC, Analog Comparators, etc.). These are separated from VDD to minimize the electrical noise contained on VDD from affecting the analog functions. VDDA pins must be connected to 3.3 V, regardless of system implementation.                            |
| 4          | GNDA     | -        | Power                    | The ground reference for the analog circuits (ADC, Analog Comparators, etc.). These are separated from GND to minimize the electrical noise contained on VDD from affecting the analog functions.                                                                                                              |
| 5          | PE5      | I/O      | TTL                      | GPIO port E bit 5.                                                                                                                                                                                                                                                                                             |
|            | AIN2     | I        | Analog                   | Analog-to-digital converter input 2.                                                                                                                                                                                                                                                                           |
|            | CCP5     | I/O      | TTL                      | Capture/Compare/PWM 5.                                                                                                                                                                                                                                                                                         |
|            | I2S0TXSD | I/O      | TTL                      | I <sup>2</sup> S module 0 transmit data.                                                                                                                                                                                                                                                                       |
| 6          | PE4      | I/O      | TTL                      | GPIO port E bit 4.                                                                                                                                                                                                                                                                                             |
|            | AIN3     | I        | Analog                   | Analog-to-digital converter input 3.                                                                                                                                                                                                                                                                           |
|            | CCP2     | I/O      | TTL                      | Capture/Compare/PWM 2.                                                                                                                                                                                                                                                                                         |
|            | CCP3     | I/O      | TTL                      | Capture/Compare/PWM 3.                                                                                                                                                                                                                                                                                         |
|            | Fault0   | I        | TTL                      | PWM Fault 0.                                                                                                                                                                                                                                                                                                   |
|            | I2S0TXWS | I/O      | TTL                      | I <sup>2</sup> S module 0 transmit word select.                                                                                                                                                                                                                                                                |
|            | U2Tx     | O        | TTL                      | UART module 2 transmit. When in IrDA mode, this signal has IrDA modulation.                                                                                                                                                                                                                                    |
| 7          | LDO      | -        | Power                    | Low drop-out regulator output voltage. This pin requires an external capacitor between the pin and GND of 1 $\mu$ F or greater. When the on-chip LDO is used to provide power to the logic, the LDO pin must also be connected to the VDDC pins at the board level in addition to the decoupling capacitor(s). |
| 8          | VDD      | -        | Power                    | Positive supply for I/O and some logic.                                                                                                                                                                                                                                                                        |
| 9          | GND      | -        | Power                    | Ground reference for logic and I/O pins.                                                                                                                                                                                                                                                                       |

Table 23-2. Signals by Pin Number (*continued*)

| Pin Number | Pin Name  | Pin Type | Buffer Type <sup>a</sup> | Description                                                                 |
|------------|-----------|----------|--------------------------|-----------------------------------------------------------------------------|
| 10         | PD0       | I/O      | TTL                      | GPIO port D bit 0.                                                          |
|            | AIN15     | I        | Analog                   | Analog-to-digital converter input 15.                                       |
|            | CAN0Rx    | I        | TTL                      | CAN module 0 receive.                                                       |
|            | CCP6      | I/O      | TTL                      | Capture/Compare/PWM 6.                                                      |
|            | I2S0RXSCK | I/O      | TTL                      | I <sup>2</sup> S module 0 receive clock.                                    |
|            | IDX0      | I        | TTL                      | QEI module 0 index.                                                         |
|            | PWM0      | O        | TTL                      | PWM 0. This signal is controlled by PWM Generator 0.                        |
|            | U1CTS     | I        | TTL                      | UART module 1 Clear To Send modem status input signal.                      |
|            | U1Rx      | I        | TTL                      | UART module 1 receive. When in IrDA mode, this signal has IrDA modulation.  |
|            | U2Rx      | I        | TTL                      | UART module 2 receive. When in IrDA mode, this signal has IrDA modulation.  |
| 11         | PD1       | I/O      | TTL                      | GPIO port D bit 1.                                                          |
|            | AIN14     | I        | Analog                   | Analog-to-digital converter input 14.                                       |
|            | CAN0Tx    | O        | TTL                      | CAN module 0 transmit.                                                      |
|            | CCP2      | I/O      | TTL                      | Capture/Compare/PWM 2.                                                      |
|            | CCP7      | I/O      | TTL                      | Capture/Compare/PWM 7.                                                      |
|            | I2S0RXWS  | I/O      | TTL                      | I <sup>2</sup> S module 0 receive word select.                              |
|            | PWM1      | O        | TTL                      | PWM 1. This signal is controlled by PWM Generator 0.                        |
|            | PhA0      | I        | TTL                      | QEI module 0 phase A.                                                       |
|            | PhB1      | I        | TTL                      | QEI module 1 phase B.                                                       |
|            | U1DCD     | I        | TTL                      | UART module 1 Data Carrier Detect modem status input signal.                |
|            | U1Tx      | O        | TTL                      | UART module 1 transmit. When in IrDA mode, this signal has IrDA modulation. |
|            | U2Tx      | O        | TTL                      | UART module 2 transmit. When in IrDA mode, this signal has IrDA modulation. |
| 12         | PD2       | I/O      | TTL                      | GPIO port D bit 2.                                                          |
|            | AIN13     | I        | Analog                   | Analog-to-digital converter input 13.                                       |
|            | CCP5      | I/O      | TTL                      | Capture/Compare/PWM 5.                                                      |
|            | CCP6      | I/O      | TTL                      | Capture/Compare/PWM 6.                                                      |
|            | EPI0S20   | I/O      | TTL                      | EPI module 0 signal 20.                                                     |
|            | PWM2      | O        | TTL                      | PWM 2. This signal is controlled by PWM Generator 1.                        |
|            | U1Rx      | I        | TTL                      | UART module 1 receive. When in IrDA mode, this signal has IrDA modulation.  |
| 13         | PD3       | I/O      | TTL                      | GPIO port D bit 3.                                                          |
|            | AIN12     | I        | Analog                   | Analog-to-digital converter input 12.                                       |
|            | CCP0      | I/O      | TTL                      | Capture/Compare/PWM 0.                                                      |
|            | CCP7      | I/O      | TTL                      | Capture/Compare/PWM 7.                                                      |
|            | EPI0S21   | I/O      | TTL                      | EPI module 0 signal 21.                                                     |
|            | PWM3      | O        | TTL                      | PWM 3. This signal is controlled by PWM Generator 1.                        |
|            | U1Tx      | O        | TTL                      | UART module 1 transmit. When in IrDA mode, this signal has IrDA modulation. |

Table 23-2. Signals by Pin Number (continued)

| Pin Number | Pin Name   | Pin Type | Buffer Type <sup>a</sup> | Description                                                                                      |
|------------|------------|----------|--------------------------|--------------------------------------------------------------------------------------------------|
| 14         | PJ0        | I/O      | TTL                      | GPIO port J bit 0.                                                                               |
|            | EPI0S16    | I/O      | TTL                      | EPI module 0 signal 16.                                                                          |
|            | I2C1SCL    | I/O      | OD                       | I <sup>2</sup> C module 1 clock.                                                                 |
|            | PWM0       | O        | TTL                      | PWM 0. This signal is controlled by PWM Generator 0.                                             |
| 15         | PH7        | I/O      | TTL                      | GPIO port H bit 7.                                                                               |
|            | EPI0S27    | I/O      | TTL                      | EPI module 0 signal 27.                                                                          |
|            | PWM5       | O        | TTL                      | PWM 5. This signal is controlled by PWM Generator 2.                                             |
|            | SSI1Tx     | O        | TTL                      | SSI module 1 transmit.                                                                           |
| 16         | PG3        | I/O      | TTL                      | GPIO port G bit 3.                                                                               |
|            | Fault0     | I        | TTL                      | PWM Fault 0.                                                                                     |
|            | Fault2     | I        | TTL                      | PWM Fault 2.                                                                                     |
|            | I2S0RXMCLK | I/O      | TTL                      | I <sup>2</sup> S module 0 receive master clock.                                                  |
|            | PWM1       | O        | TTL                      | PWM 1. This signal is controlled by PWM Generator 0.                                             |
| 17         | PG2        | I/O      | TTL                      | GPIO port G bit 2.                                                                               |
|            | Fault0     | I        | TTL                      | PWM Fault 0.                                                                                     |
|            | I2S0RXSD   | I/O      | TTL                      | I <sup>2</sup> S module 0 receive data.                                                          |
|            | IDX1       | I        | TTL                      | QEI module 1 index.                                                                              |
|            | PWM0       | O        | TTL                      | PWM 0. This signal is controlled by PWM Generator 0.                                             |
| 18         | PG1        | I/O      | TTL                      | GPIO port G bit 1.                                                                               |
|            | EPI0S14    | I/O      | TTL                      | EPI module 0 signal 14.                                                                          |
|            | I2C1SDA    | I/O      | OD                       | I <sup>2</sup> C module 1 data.                                                                  |
|            | PWM1       | O        | TTL                      | PWM 1. This signal is controlled by PWM Generator 0.                                             |
|            | PWM5       | O        | TTL                      | PWM 5. This signal is controlled by PWM Generator 2.                                             |
|            | U2Tx       | O        | TTL                      | UART module 2 transmit. When in IrDA mode, this signal has IrDA modulation.                      |
| 19         | PG0        | I/O      | TTL                      | GPIO port G bit 0.                                                                               |
|            | EPI0S13    | I/O      | TTL                      | EPI module 0 signal 13.                                                                          |
|            | I2C1SCL    | I/O      | OD                       | I <sup>2</sup> C module 1 clock.                                                                 |
|            | PWM0       | O        | TTL                      | PWM 0. This signal is controlled by PWM Generator 0.                                             |
|            | PWM4       | O        | TTL                      | PWM 4. This signal is controlled by PWM Generator 2.                                             |
|            | U2Rx       | I        | TTL                      | UART module 2 receive. When in IrDA mode, this signal has IrDA modulation.                       |
|            | USB0EPEN   | O        | TTL                      | Optionally used in Host mode to control an external power source to supply power to the USB bus. |
| 20         | VDD        | -        | Power                    | Positive supply for I/O and some logic.                                                          |
| 21         | GND        | -        | Power                    | Ground reference for logic and I/O pins.                                                         |

Table 23-2. Signals by Pin Number (*continued*)

| Pin Number | Pin Name | Pin Type | Buffer Type <sup>a</sup> | Description                                                                                               |
|------------|----------|----------|--------------------------|-----------------------------------------------------------------------------------------------------------|
| 22         | PC7      | I/O      | TTL                      | GPIO port C bit 7.                                                                                        |
|            | C10      | O        | TTL                      | Analog comparator 1 output.                                                                               |
|            | C2-      | I        | Analog                   | Analog comparator 2 negative input.                                                                       |
|            | CCP0     | I/O      | TTL                      | Capture/Compare/PWM 0.                                                                                    |
|            | CCP4     | I/O      | TTL                      | Capture/Compare/PWM 4.                                                                                    |
|            | EPI0S5   | I/O      | TTL                      | EPI module 0 signal 5.                                                                                    |
|            | PhB0     | I        | TTL                      | QEI module 0 phase B.                                                                                     |
|            | U1Tx     | O        | TTL                      | UART module 1 transmit. When in IrDA mode, this signal has IrDA modulation.                               |
|            | USB0PFLT | I        | TTL                      | Optionally used in Host mode by an external power source to indicate an error state by that power source. |
| 23         | PC6      | I/O      | TTL                      | GPIO port C bit 6.                                                                                        |
|            | C2+      | I        | Analog                   | Analog comparator 2 positive input.                                                                       |
|            | C20      | O        | TTL                      | Analog comparator 2 output.                                                                               |
|            | CCP0     | I/O      | TTL                      | Capture/Compare/PWM 0.                                                                                    |
|            | CCP3     | I/O      | TTL                      | Capture/Compare/PWM 3.                                                                                    |
|            | EPI0S4   | I/O      | TTL                      | EPI module 0 signal 4.                                                                                    |
|            | PWM7     | O        | TTL                      | PWM 7. This signal is controlled by PWM Generator 3.                                                      |
|            | PhB0     | I        | TTL                      | QEI module 0 phase B.                                                                                     |
|            | U1Rx     | I        | TTL                      | UART module 1 receive. When in IrDA mode, this signal has IrDA modulation.                                |
|            | USB0PFLT | I        | TTL                      | Optionally used in Host mode by an external power source to indicate an error state by that power source. |
| 24         | PC5      | I/O      | TTL                      | GPIO port C bit 5.                                                                                        |
|            | C00      | O        | TTL                      | Analog comparator 0 output.                                                                               |
|            | C1+      | I        | Analog                   | Analog comparator 1 positive input.                                                                       |
|            | C10      | O        | TTL                      | Analog comparator 1 output.                                                                               |
|            | CCP1     | I/O      | TTL                      | Capture/Compare/PWM 1.                                                                                    |
|            | CCP3     | I/O      | TTL                      | Capture/Compare/PWM 3.                                                                                    |
|            | EPI0S3   | I/O      | TTL                      | EPI module 0 signal 3.                                                                                    |
|            | Fault2   | I        | TTL                      | PWM Fault 2.                                                                                              |
|            | USB0EPEN | O        | TTL                      | Optionally used in Host mode to control an external power source to supply power to the USB bus.          |
| 25         | PC4      | I/O      | TTL                      | GPIO port C bit 4.                                                                                        |
|            | CCP1     | I/O      | TTL                      | Capture/Compare/PWM 1.                                                                                    |
|            | CCP2     | I/O      | TTL                      | Capture/Compare/PWM 2.                                                                                    |
|            | CCP4     | I/O      | TTL                      | Capture/Compare/PWM 4.                                                                                    |
|            | CCP5     | I/O      | TTL                      | Capture/Compare/PWM 5.                                                                                    |
|            | EPI0S2   | I/O      | TTL                      | EPI module 0 signal 2.                                                                                    |
|            | PWM6     | O        | TTL                      | PWM 6. This signal is controlled by PWM Generator 3.                                                      |
|            | PhA0     | I        | TTL                      | QEI module 0 phase A.                                                                                     |

Table 23-2. Signals by Pin Number (continued)

| Pin Number | Pin Name  | Pin Type | Buffer Type <sup>a</sup> | Description                                                                                      |
|------------|-----------|----------|--------------------------|--------------------------------------------------------------------------------------------------|
| 26         | PA0       | I/O      | TTL                      | GPIO port A bit 0.                                                                               |
|            | I2C1SCL   | I/O      | OD                       | I <sup>2</sup> C module 1 clock.                                                                 |
|            | U0Rx      | I        | TTL                      | UART module 0 receive. When in IrDA mode, this signal has IrDA modulation.                       |
|            | U1Rx      | I        | TTL                      | UART module 1 receive. When in IrDA mode, this signal has IrDA modulation.                       |
| 27         | PA1       | I/O      | TTL                      | GPIO port A bit 1.                                                                               |
|            | I2C1SDA   | I/O      | OD                       | I <sup>2</sup> C module 1 data.                                                                  |
|            | U0Tx      | O        | TTL                      | UART module 0 transmit. When in IrDA mode, this signal has IrDA modulation.                      |
|            | U1Tx      | O        | TTL                      | UART module 1 transmit. When in IrDA mode, this signal has IrDA modulation.                      |
| 28         | PA2       | I/O      | TTL                      | GPIO port A bit 2.                                                                               |
|            | I2S0RXSD  | I/O      | TTL                      | I <sup>2</sup> S module 0 receive data.                                                          |
|            | PWM4      | O        | TTL                      | PWM 4. This signal is controlled by PWM Generator 2.                                             |
|            | SSI0Ck    | I/O      | TTL                      | SSI module 0 clock.                                                                              |
| 29         | PA3       | I/O      | TTL                      | GPIO port A bit 3.                                                                               |
|            | I2S0RXCLK | I/O      | TTL                      | I <sup>2</sup> S module 0 receive master clock.                                                  |
|            | PWM5      | O        | TTL                      | PWM 5. This signal is controlled by PWM Generator 2.                                             |
|            | SSI0Fss   | I/O      | TTL                      | SSI module 0 frame.                                                                              |
| 30         | PA4       | I/O      | TTL                      | GPIO port A bit 4.                                                                               |
|            | CAN0Rx    | I        | TTL                      | CAN module 0 receive.                                                                            |
|            | I2S0TXSCK | I/O      | TTL                      | I <sup>2</sup> S module 0 transmit clock.                                                        |
|            | PWM6      | O        | TTL                      | PWM 6. This signal is controlled by PWM Generator 3.                                             |
|            | SSI0Rx    | I        | TTL                      | SSI module 0 receive.                                                                            |
| 31         | PA5       | I/O      | TTL                      | GPIO port A bit 5.                                                                               |
|            | CAN0Tx    | O        | TTL                      | CAN module 0 transmit.                                                                           |
|            | I2S0TXWS  | I/O      | TTL                      | I <sup>2</sup> S module 0 transmit word select.                                                  |
|            | PWM7      | O        | TTL                      | PWM 7. This signal is controlled by PWM Generator 3.                                             |
|            | SSI0Tx    | O        | TTL                      | SSI module 0 transmit.                                                                           |
| 32         | VDD       | -        | Power                    | Positive supply for I/O and some logic.                                                          |
| 33         | GND       | -        | Power                    | Ground reference for logic and I/O pins.                                                         |
| 34         | PA6       | I/O      | TTL                      | GPIO port A bit 6.                                                                               |
|            | CAN0Rx    | I        | TTL                      | CAN module 0 receive.                                                                            |
|            | CCP1      | I/O      | TTL                      | Capture/Compare/PWM 1.                                                                           |
|            | I2C1SCL   | I/O      | OD                       | I <sup>2</sup> C module 1 clock.                                                                 |
|            | PWM0      | O        | TTL                      | PWM 0. This signal is controlled by PWM Generator 0.                                             |
|            | PWM4      | O        | TTL                      | PWM 4. This signal is controlled by PWM Generator 2.                                             |
|            | U1CTS     | I        | TTL                      | UART module 1 Clear To Send modem status input signal.                                           |
|            | USB0EPEN  | O        | TTL                      | Optionally used in Host mode to control an external power source to supply power to the USB bus. |

Table 23-2. Signals by Pin Number (*continued*)

| Pin Number | Pin Name  | Pin Type | Buffer Type <sup>a</sup> | Description                                                                                               |
|------------|-----------|----------|--------------------------|-----------------------------------------------------------------------------------------------------------|
| 35         | PA7       | I/O      | TTL                      | GPIO port A bit 7.                                                                                        |
|            | CAN0Tx    | O        | TTL                      | CAN module 0 transmit.                                                                                    |
|            | CCP3      | I/O      | TTL                      | Capture/Compare/PWM 3.                                                                                    |
|            | CCP4      | I/O      | TTL                      | Capture/Compare/PWM 4.                                                                                    |
|            | I2C1SDA   | I/O      | OD                       | I <sup>2</sup> C module 1 data.                                                                           |
|            | PWM1      | O        | TTL                      | PWM 1. This signal is controlled by PWM Generator 0.                                                      |
|            | PWM5      | O        | TTL                      | PWM 5. This signal is controlled by PWM Generator 2.                                                      |
|            | U1DCD     | I        | TTL                      | UART module 1 Data Carrier Detect modem status input signal.                                              |
|            | USB0PFLT  | I        | TTL                      | Optionally used in Host mode by an external power source to indicate an error state by that power source. |
| 36         | PG7       | I/O      | TTL                      | GPIO port G bit 7.                                                                                        |
|            | CCP5      | I/O      | TTL                      | Capture/Compare/PWM 5.                                                                                    |
|            | EPI0S31   | I/O      | TTL                      | EPI module 0 signal 31.                                                                                   |
|            | PWM7      | O        | TTL                      | PWM 7. This signal is controlled by PWM Generator 3.                                                      |
|            | PhB1      | I        | TTL                      | QEI module 1 phase B.                                                                                     |
| 37         | PG6       | I/O      | TTL                      | GPIO port G bit 6.                                                                                        |
|            | Fault1    | I        | TTL                      | PWM Fault 1.                                                                                              |
|            | I2S0RXWS  | I/O      | TTL                      | I <sup>2</sup> S module 0 receive word select.                                                            |
|            | PWM6      | O        | TTL                      | PWM 6. This signal is controlled by PWM Generator 3.                                                      |
|            | PhA1      | I        | TTL                      | QEI module 1 phase A.                                                                                     |
|            | U1RI      | I        | TTL                      | UART module 1 Ring Indicator modem status input signal.                                                   |
| 38         | VDDC      | -        | Power                    | Positive supply for most of the logic function, including the processor core and most peripherals.        |
| 39         | PJ2       | I/O      | TTL                      | GPIO port J bit 2.                                                                                        |
|            | CCP0      | I/O      | TTL                      | Capture/Compare/PWM 0.                                                                                    |
|            | EPI0S18   | I/O      | TTL                      | EPI module 0 signal 18.                                                                                   |
|            | Fault0    | I        | TTL                      | PWM Fault 0.                                                                                              |
| 40         | PG5       | I/O      | TTL                      | GPIO port G bit 5.                                                                                        |
|            | CCP5      | I/O      | TTL                      | Capture/Compare/PWM 5.                                                                                    |
|            | Fault1    | I        | TTL                      | PWM Fault 1.                                                                                              |
|            | I2S0RXSCK | I/O      | TTL                      | I <sup>2</sup> S module 0 receive clock.                                                                  |
|            | IDX0      | I        | TTL                      | QEI module 0 index.                                                                                       |
|            | PWM7      | O        | TTL                      | PWM 7. This signal is controlled by PWM Generator 3.                                                      |
|            | U1DTR     | O        | TTL                      | UART module 1 Data Terminal Ready modem status input signal.                                              |
| 41         | PG4       | I/O      | TTL                      | GPIO port G bit 4.                                                                                        |
|            | CCP3      | I/O      | TTL                      | Capture/Compare/PWM 3.                                                                                    |
|            | EPI0S15   | I/O      | TTL                      | EPI module 0 signal 15.                                                                                   |
|            | Fault1    | I        | TTL                      | PWM Fault 1.                                                                                              |
|            | PWM6      | O        | TTL                      | PWM 6. This signal is controlled by PWM Generator 3.                                                      |
|            | U1RI      | I        | TTL                      | UART module 1 Ring Indicator modem status input signal.                                                   |

Table 23-2. Signals by Pin Number (continued)

| Pin Number | Pin Name   | Pin Type | Buffer Type <sup>a</sup> | Description                                                                               |
|------------|------------|----------|--------------------------|-------------------------------------------------------------------------------------------|
| 42         | PF7        | I/O      | TTL                      | GPIO port F bit 7.                                                                        |
|            | CCP4       | I/O      | TTL                      | Capture/Compare/PWM 4.                                                                    |
|            | EPI0S12    | I/O      | TTL                      | EPI module 0 signal 12.                                                                   |
|            | Fault1     | I        | TTL                      | PWM Fault 1.                                                                              |
|            | PhB0       | I        | TTL                      | QEI module 0 phase B.                                                                     |
| 43         | PF6        | I/O      | TTL                      | GPIO port F bit 6.                                                                        |
|            | C20        | O        | TTL                      | Analog comparator 2 output.                                                               |
|            | CCP1       | I/O      | TTL                      | Capture/Compare/PWM 1.                                                                    |
|            | I2S0TXMCLK | I/O      | TTL                      | I <sup>2</sup> S module 0 transmit master clock.                                          |
|            | PhA0       | I        | TTL                      | QEI module 0 phase A.                                                                     |
|            | U1RTS      | O        | TTL                      | UART module 1 Request to Send modem output control line.                                  |
| 44         | VDD        | -        | Power                    | Positive supply for I/O and some logic.                                                   |
| 45         | GND        | -        | Power                    | Ground reference for logic and I/O pins.                                                  |
| 46         | PF5        | I/O      | TTL                      | GPIO port F bit 5.                                                                        |
|            | C10        | O        | TTL                      | Analog comparator 1 output.                                                               |
|            | CCP2       | I/O      | TTL                      | Capture/Compare/PWM 2.                                                                    |
|            | EPI0S15    | I/O      | TTL                      | EPI module 0 signal 15.                                                                   |
|            | SSI1TX     | O        | TTL                      | SSI module 1 transmit.                                                                    |
| 47         | PF0        | I/O      | TTL                      | GPIO port F bit 0.                                                                        |
|            | CAN1Rx     | I        | TTL                      | CAN module 1 receive.                                                                     |
|            | I2S0TXSD   | I/O      | TTL                      | I <sup>2</sup> S module 0 transmit data.                                                  |
|            | PWM0       | O        | TTL                      | PWM 0. This signal is controlled by PWM Generator 0.                                      |
|            | PhB0       | I        | TTL                      | QEI module 0 phase B.                                                                     |
|            | U1DSR      | I        | TTL                      | UART module 1 Data Set Ready modem output control line.                                   |
| 48         | OSC0       | I        | Analog                   | Main oscillator crystal input or an external clock reference input.                       |
| 49         | OSC1       | O        | Analog                   | Main oscillator crystal output. Leave unconnected when using a single-ended clock source. |
| 50         | PJ3        | I/O      | TTL                      | GPIO port J bit 3.                                                                        |
|            | CCP6       | I/O      | TTL                      | Capture/Compare/PWM 6.                                                                    |
|            | EPI0S19    | I/O      | TTL                      | EPI module 0 signal 19.                                                                   |
|            | U1CTS      | I        | TTL                      | UART module 1 Clear To Send modem status input signal.                                    |
| 51         | NC         | -        | -                        | No connect. Leave the pin electrically unconnected/isolated.                              |
| 52         | PJ4        | I/O      | TTL                      | GPIO port J bit 4.                                                                        |
|            | CCP4       | I/O      | TTL                      | Capture/Compare/PWM 4.                                                                    |
|            | EPI0S28    | I/O      | TTL                      | EPI module 0 signal 28.                                                                   |
|            | U1DCD      | I        | TTL                      | UART module 1 Data Carrier Detect modem status input signal.                              |
| 53         | PJ5        | I/O      | TTL                      | GPIO port J bit 5.                                                                        |
|            | CCP2       | I/O      | TTL                      | Capture/Compare/PWM 2.                                                                    |
|            | EPI0S29    | I/O      | TTL                      | EPI module 0 signal 29.                                                                   |
|            | U1DSR      | I        | TTL                      | UART module 1 Data Set Ready modem output control line.                                   |

Table 23-2. Signals by Pin Number (continued)

| Pin Number | Pin Name   | Pin Type | Buffer Type <sup>a</sup> | Description                                                  |
|------------|------------|----------|--------------------------|--------------------------------------------------------------|
| 54         | PJ6        | I/O      | TTL                      | GPIO port J bit 6.                                           |
|            | CCP1       | I/O      | TTL                      | Capture/Compare/PWM 1.                                       |
|            | EPI0S30    | I/O      | TTL                      | EPI module 0 signal 30.                                      |
|            | U1RTS      | O        | TTL                      | UART module 1 Request to Send modem output control line.     |
| 55         | PJ7        | I/O      | TTL                      | GPIO port J bit 7.                                           |
|            | CCP0       | I/O      | TTL                      | Capture/Compare/PWM 0.                                       |
|            | U1DTR      | O        | TTL                      | UART module 1 Data Terminal Ready modem status input signal. |
| 56         | VDD        | -        | Power                    | Positive supply for I/O and some logic.                      |
| 57         | GND        | -        | Power                    | Ground reference for logic and I/O pins.                     |
| 58         | PF4        | I/O      | TTL                      | GPIO port F bit 4.                                           |
|            | C0o        | O        | TTL                      | Analog comparator 0 output.                                  |
|            | CCP0       | I/O      | TTL                      | Capture/Compare/PWM 0.                                       |
|            | EPI0S12    | I/O      | TTL                      | EPI module 0 signal 12.                                      |
|            | Fault0     | I        | TTL                      | PWM Fault 0.                                                 |
|            | SSI1Rx     | I        | TTL                      | SSI module 1 receive.                                        |
| 59         | PF3        | I/O      | TTL                      | GPIO port F bit 3.                                           |
|            | PWM3       | O        | TTL                      | PWM 3. This signal is controlled by PWM Generator 1.         |
|            | PWM5       | O        | TTL                      | PWM 5. This signal is controlled by PWM Generator 2.         |
|            | SSI1Fss    | I/O      | TTL                      | SSI module 1 frame.                                          |
| 60         | PF2        | I/O      | TTL                      | GPIO port F bit 2.                                           |
|            | PWM2       | O        | TTL                      | PWM 2. This signal is controlled by PWM Generator 1.         |
|            | PWM4       | O        | TTL                      | PWM 4. This signal is controlled by PWM Generator 2.         |
|            | SSI1Clk    | I/O      | TTL                      | SSI module 1 clock.                                          |
| 61         | PF1        | I/O      | TTL                      | GPIO port F bit 1.                                           |
|            | CAN1Tx     | O        | TTL                      | CAN module 1 transmit.                                       |
|            | CCP3       | I/O      | TTL                      | Capture/Compare/PWM 3.                                       |
|            | I2S0TXMCLK | I/O      | TTL                      | I <sup>2</sup> S module 0 transmit master clock.             |
|            | IDX1       | I        | TTL                      | QEI module 1 index.                                          |
|            | PWM1       | O        | TTL                      | PWM 1. This signal is controlled by PWM Generator 0.         |
|            | U1RTS      | O        | TTL                      | UART module 1 Request to Send modem output control line.     |
| 62         | PH6        | I/O      | TTL                      | GPIO port H bit 6.                                           |
|            | EPI0S26    | I/O      | TTL                      | EPI module 0 signal 26.                                      |
|            | PWM4       | O        | TTL                      | PWM 4. This signal is controlled by PWM Generator 2.         |
|            | SSI1Rx     | I        | TTL                      | SSI module 1 receive.                                        |
| 63         | PH5        | I/O      | TTL                      | GPIO port H bit 5.                                           |
|            | EPI0S11    | I/O      | TTL                      | EPI module 0 signal 11.                                      |
|            | Fault2     | I        | TTL                      | PWM Fault 2.                                                 |
|            | SSI1Fss    | I/O      | TTL                      | SSI module 1 frame.                                          |
| 64         | RST        | I        | TTL                      | System reset input.                                          |

Table 23-2. Signals by Pin Number (*continued*)

| Pin Number | Pin Name | Pin Type | Buffer Type <sup>a</sup> | Description                                                                                                                                                                                                                                                   |
|------------|----------|----------|--------------------------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| 65         | PB3      | I/O      | TTL                      | GPIO port B bit 3.                                                                                                                                                                                                                                            |
|            | Fault0   | I        | TTL                      | PWM Fault 0.                                                                                                                                                                                                                                                  |
|            | Fault3   | I        | TTL                      | PWM Fault 3.                                                                                                                                                                                                                                                  |
|            | I2C0SDA  | I/O      | OD                       | I <sup>2</sup> C module 0 data.                                                                                                                                                                                                                               |
|            | USB0PFLT | I        | TTL                      | Optionally used in Host mode by an external power source to indicate an error state by that power source.                                                                                                                                                     |
| 66         | PB0      | I/O      | TTL                      | GPIO port B bit 0.                                                                                                                                                                                                                                            |
|            | CCP0     | I/O      | TTL                      | Capture/Compare/PWM 0.                                                                                                                                                                                                                                        |
|            | PWM2     | O        | TTL                      | PWM 2. This signal is controlled by PWM Generator 1.                                                                                                                                                                                                          |
|            | U1Rx     | I        | TTL                      | UART module 1 receive. When in IrDA mode, this signal has IrDA modulation.                                                                                                                                                                                    |
|            | USB0ID   | I        | Analog                   | This signal senses the state of the USB ID signal. The USB PHY enables an integrated pull-up, and an external element (USB connector) indicates the initial state of the USB controller (pulled down is the A side of the cable and pulled up is the B side). |
| 67         | PB1      | I/O      | TTL                      | GPIO port B bit 1.                                                                                                                                                                                                                                            |
|            | CCP1     | I/O      | TTL                      | Capture/Compare/PWM 1.                                                                                                                                                                                                                                        |
|            | CCP2     | I/O      | TTL                      | Capture/Compare/PWM 2.                                                                                                                                                                                                                                        |
|            | PWM3     | O        | TTL                      | PWM 3. This signal is controlled by PWM Generator 1.                                                                                                                                                                                                          |
|            | U1Tx     | O        | TTL                      | UART module 1 transmit. When in IrDA mode, this signal has IrDA modulation.                                                                                                                                                                                   |
|            | USB0VBUS | I/O      | Analog                   | This signal is used during the session request protocol. This signal allows the USB PHY to both sense the voltage level of VBUS, and pull up VBUS momentarily during VBUS pulsing.                                                                            |
| 68         | VDD      | -        | Power                    | Positive supply for I/O and some logic.                                                                                                                                                                                                                       |
| 69         | GND      | -        | Power                    | Ground reference for logic and I/O pins.                                                                                                                                                                                                                      |
| 70         | USB0DM   | I/O      | Analog                   | Bidirectional differential data pin (D- per USB specification) for USB0.                                                                                                                                                                                      |
| 71         | USB0DP   | I/O      | Analog                   | Bidirectional differential data pin (D+ per USB specification) for USB0.                                                                                                                                                                                      |
| 72         | PB2      | I/O      | TTL                      | GPIO port B bit 2.                                                                                                                                                                                                                                            |
|            | CCP0     | I/O      | TTL                      | Capture/Compare/PWM 0.                                                                                                                                                                                                                                        |
|            | CCP3     | I/O      | TTL                      | Capture/Compare/PWM 3.                                                                                                                                                                                                                                        |
|            | I2C0SCL  | I/O      | OD                       | I <sup>2</sup> C module 0 clock.                                                                                                                                                                                                                              |
|            | IDX0     | I        | TTL                      | QEI module 0 index.                                                                                                                                                                                                                                           |
|            | USB0EPEN | O        | TTL                      | Optionally used in Host mode to control an external power source to supply power to the USB bus.                                                                                                                                                              |
| 73         | USB0BIAS | O        | Analog                   | 9.1-kΩ resistor (1% precision) used internally for USB analog circuitry.                                                                                                                                                                                      |

Table 23-2. Signals by Pin Number (continued)

| Pin Number | Pin Name | Pin Type | Buffer Type <sup>a</sup> | Description                                                                                               |
|------------|----------|----------|--------------------------|-----------------------------------------------------------------------------------------------------------|
| 74         | PE0      | I/O      | TTL                      | GPIO port E bit 0.                                                                                        |
|            | CCP3     | I/O      | TTL                      | Capture/Compare/PWM 3.                                                                                    |
|            | EPI0S8   | I/O      | TTL                      | EPI module 0 signal 8.                                                                                    |
|            | PWM4     | O        | TTL                      | PWM 4. This signal is controlled by PWM Generator 2.                                                      |
|            | SSI1Clk  | I/O      | TTL                      | SSI module 1 clock.                                                                                       |
|            | USB0PFLT | I        | TTL                      | Optionally used in Host mode by an external power source to indicate an error state by that power source. |
| 75         | PE1      | I/O      | TTL                      | GPIO port E bit 1.                                                                                        |
|            | CCP2     | I/O      | TTL                      | Capture/Compare/PWM 2.                                                                                    |
|            | CCP6     | I/O      | TTL                      | Capture/Compare/PWM 6.                                                                                    |
|            | EPI0S9   | I/O      | TTL                      | EPI module 0 signal 9.                                                                                    |
|            | Fault0   | I        | TTL                      | PWM Fault 0.                                                                                              |
|            | PWM5     | O        | TTL                      | PWM 5. This signal is controlled by PWM Generator 2.                                                      |
|            | SSI1Fss  | I/O      | TTL                      | SSI module 1 frame.                                                                                       |
| 76         | PH4      | I/O      | TTL                      | GPIO port H bit 4.                                                                                        |
|            | EPI0S10  | I/O      | TTL                      | EPI module 0 signal 10.                                                                                   |
|            | SSI1Clk  | I/O      | TTL                      | SSI module 1 clock.                                                                                       |
|            | USB0PFLT | I        | TTL                      | Optionally used in Host mode by an external power source to indicate an error state by that power source. |
| 77         | PC3      | I/O      | TTL                      | GPIO port C bit 3.                                                                                        |
|            | SW0      | O        | TTL                      | JTAG TDO and SWO.                                                                                         |
|            | TD0      | O        | TTL                      | JTAG TDO and SWO.                                                                                         |
| 78         | PC2      | I/O      | TTL                      | GPIO port C bit 2.                                                                                        |
|            | TDI      | I        | TTL                      | JTAG TDI.                                                                                                 |
| 79         | PC1      | I/O      | TTL                      | GPIO port C bit 1.                                                                                        |

|            | IDX0      | I        | TTL                      | QEI module 0 index.                                                                                                                                                                                                                                                                                                        |
|            | VREFA     | I        | Analog                   | This input provides a reference voltage used to specify the input voltage at which the ADC converts to a maximum value. In other words, the voltage that is applied to VREFA is the voltage with which an AINn signal is converted to 1023. The VREFA input is limited to the range specified in Table 25-29 on page 1253. |

Table 23-2. Signals by Pin Number (*continued*)

| Pin Number | Pin Name | Pin Type | Buffer Type <sup>a</sup> | Description                                                                 |
|------------|----------|----------|--------------------------|-----------------------------------------------------------------------------|
| 91         | PB5      | I/O      | TTL                      | GPIO port B bit 5.                                                          |
|            | AIN11    | I        | Analog                   | Analog-to-digital converter input 11.                                       |
|            | C0o      | O        | TTL                      | Analog comparator 0 output.                                                 |
|            | C1-      | I        | Analog                   | Analog comparator 1 negative input.                                         |
|            | CAN0Tx   | O        | TTL                      | CAN module 0 transmit.                                                      |
|            | CCP0     | I/O      | TTL                      | Capture/Compare/PWM 0.                                                      |
|            | CCP2     | I/O      | TTL                      | Capture/Compare/PWM 2.                                                      |
|            | CCP5     | I/O      | TTL                      | Capture/Compare/PWM 5.                                                      |
|            | CCP6     | I/O      | TTL                      | Capture/Compare/PWM 6.                                                      |
|            | EPI0S22  | I/O      | TTL                      | EPI module 0 signal 22.                                                     |
|            | U1Tx     | O        | TTL                      | UART module 1 transmit. When in IrDA mode, this signal has IrDA modulation. |
| 92         | PB4      | I/O      | TTL                      | GPIO port B bit 4.                                                          |
|            | AIN10    | I        | Analog                   | Analog-to-digital converter input 10.                                       |
|            | C0-      | I        | Analog                   | Analog comparator 0 negative input.                                         |
|            | CAN0Rx   | I        | TTL                      | CAN module 0 receive.                                                       |
|            | EPI0S23  | I/O      | TTL                      | EPI module 0 signal 23.                                                     |
|            | IDX0     | I        | TTL                      | QEI module 0 index.                                                         |
|            | U1Rx     | I        | TTL                      | UART module 1 receive. When in IrDA mode, this signal has IrDA modulation.  |
|            | U2Rx     | I        | TTL                      | UART module 2 receive. When in IrDA mode, this signal has IrDA modulation.  |
| 93         | VDD      | -        | Power                    | Positive supply for I/O and some logic.                                     |
| 94         | GND      | -        | Power                    | Ground reference for logic and I/O pins.                                    |
| 95         | PE2      | I/O      | TTL                      | GPIO port E bit 2.                                                          |

|            | PhA1     | I        | TTL                      | QEI module 1 phase A.                                                       |
|            | PhB0     | I        | TTL                      | QEI module 0 phase B.                                                       |
|            | SSI1Tx   | O        | TTL                      | SSI module 1 transmit.                                                      |

Table 23-2. Signals by Pin Number (continued)

| Pin Number | Pin Name   | Pin Type | Buffer Type <sup>a</sup> | Description                                                                 |
|------------|------------|----------|--------------------------|-----------------------------------------------------------------------------|
| 97         | PD4        | I/O      | TTL                      | GPIO port D bit 4.                                                          |
|            | AIN7       | I        | Analog                   | Analog-to-digital converter input 7.                                        |
|            | CCP0       | I/O      | TTL                      | Capture/Compare/PWM 0.                                                      |
|            | CCP3       | I/O      | TTL                      | Capture/Compare/PWM 3.                                                      |
|            | EPI0S19    | I/O      | TTL                      | EPI module 0 signal 19.                                                     |
|            | I2S0RXSD   | I/O      | TTL                      | I <sup>2</sup> S module 0 receive data.                                     |
|            | U1RI       | I        | TTL                      | UART module 1 Ring Indicator modem status input signal.                     |
| 98         | PD5        | I/O      | TTL                      | GPIO port D bit 5.                                                          |
|            | AIN6       | I        | Analog                   | Analog-to-digital converter input 6.                                        |
|            | CCP2       | I/O      | TTL                      | Capture/Compare/PWM 2.                                                      |
|            | CCP4       | I/O      | TTL                      | Capture/Compare/PWM 4.                                                      |
|            | EPI0S28    | I/O      | TTL                      | EPI module 0 signal 28.                                                     |
|            | I2S0RXMCLK | I/O      | TTL                      | I <sup>2</sup> S module 0 receive master clock.                             |
|            | U2Rx       | I        | TTL                      | UART module 2 receive. When in IrDA mode, this signal has IrDA modulation.  |
| 99         | PD6        | I/O      | TTL                      | GPIO port D bit 6.                                                          |
|            | AIN5       | I        | Analog                   | Analog-to-digital converter input 5.                                        |
|            | EPI0S29    | I/O      | TTL                      | EPI module 0 signal 29.                                                     |
|            | Fault0     | I        | TTL                      | PWM Fault 0.                                                                |
|            | I2S0TXSCK  | I/O      | TTL                      | I <sup>2</sup> S module 0 transmit clock.                                   |
|            | U2Tx       | O        | TTL                      | UART module 2 transmit. When in IrDA mode, this signal has IrDA modulation. |
| 100        | PD7        | I/O      | TTL                      | GPIO port D bit 7.                                                          |
|            | AIN4       | I        | Analog                   | Analog-to-digital converter input 4.                                        |
|            | C0o        | O        | TTL                      | Analog comparator 0 output.                                                 |
|            | CCP1       | I/O      | TTL                      | Capture/Compare/PWM 1.                                                      |
|            | EPI0S30    | I/O      | TTL                      | EPI module 0 signal 30.                                                     |
|            | I2S0TXWS   | I/O      | TTL                      | I <sup>2</sup> S module 0 transmit word select.                             |
|            | IDX0       | I        | TTL                      | QEI module 0 index.                                                         |
|            | U1DTR      | O        | TTL                      | UART module 1 Data Terminal Ready modem status input signal.                |

a. The TTL designation indicates the pin has TTL-compatible voltage levels.

Table 23-3. Signals by Signal Name

| Pin Name | Pin Number | Pin Mux / Pin Assignment | Pin Type | Buffer Type <sup>a</sup> | Description                          |
|----------|------------|--------------------------|----------|--------------------------|--------------------------------------|
| AIN0     | 1          | PE7                      | I        | Analog                   | Analog-to-digital converter input 0. |
| AIN1     | 2          | PE6                      | I        | Analog                   | Analog-to-digital converter input 1. |
| AIN2     | 5          | PE5                      | I        | Analog                   | Analog-to-digital converter input 2. |
| AIN3     | 6          | PE4                      | I        | Analog                   | Analog-to-digital converter input 3. |
| AIN4     | 100        | PD7                      | I        | Analog                   | Analog-to-digital converter input 4. |
| AIN5     | 99         | PD6                      | I        | Analog                   | Analog-to-digital converter input 5. |
| AIN6     | 98         | PD5                      | I        | Analog                   | Analog-to-digital converter input 6. |

Table 23-3. Signals by Signal Name (continued)

| Pin Name | Pin Number                                               | Pin Mux / Pin Assignment                                                                                    | Pin Type | Buffer Type <sup>a</sup> | Description                           |
|----------|----------------------------------------------------------|-------------------------------------------------------------------------------------------------------------|----------|--------------------------|---------------------------------------|

Table 23-3. Signals by Signal Name (continued)

| Pin Name | Pin Number | Pin Mux / Pin Assignment | Pin Type | Buffer Type <sup>a</sup> | Description        |
|----------|------------|--------------------------|----------|--------------------------|--------------------|
| PC5      | 24         | -                        | I/O      | TTL                      | GPIO port C bit 5. |
| PC6      | 23         | -                        | I/O      | TTL                      | GPIO port C bit 6. |
| PC7      | 22         | -                        | I/O      | TTL                      | GPIO port C bit 7. |
| PD0      | 10         | -                        | I/O      | TTL                      | GPIO port D bit 0. |
| PD1      | 11         | -                        | I/O      | TTL                      | GPIO port D bit 1. |
| PD2      | 12         | -                        | I/O      | TTL                      | GPIO port D bit 2. |
| PD3      | 13         | -                        | I/O      | TTL                      | GPIO port D bit 3. |
| PD4      | 97         | -                        | I/O      | TTL                      | GPIO port D bit 4. |
| PD5      | 98         | -                        | I/O      | TTL                      | GPIO port D bit 5. |
| PD6      | 99         | -                        | I/O      | TTL                      | GPIO port D bit 6. |
| PD7      | 100        | -                        | I/O      | TTL                      | GPIO port D bit 7. |
| PE0      | 74         | -                        | I/O      | TTL                      | GPIO port E bit 0. |
| PE1      | 75         | -                        | I/O      | TTL                      | GPIO port E bit 1. |
| PE2      | 95         | -                        | I/O      | TTL                      | GPIO port E bit 2. |
| PE3      | 96         | -                        | I/O      | TTL                      | GPIO port E bit 3. |
| PE4      | 6          | -                        | I/O      | TTL                      | GPIO port E bit 4. |
| PE5      | 5          | -                        | I/O      | TTL                      | GPIO port E bit 5. |
| PE6      | 2          | -                        | I/O      | TTL                      | GPIO port E bit 6. |
| PE7      | 1          | -                        | I/O      | TTL                      | GPIO port E bit 7. |
| PF0      | 47         | -                        | I/O      | TTL                      | GPIO port F bit 0. |
| PF1      | 61         | -                        | I/O      | TTL                      | GPIO port F bit 1. |
| PF2      | 60         | -                        | I/O      | TTL                      | GPIO port F bit 2. |
| PF3      | 59         | -                        | I/O      | TTL                      | GPIO port F bit 3. |
| PF4      | 58         | -                        | I/O      | TTL                      | GPIO port F bit 4. |
| PF5      | 46         | -                        | I/O      | TTL                      | GPIO port F bit 5. |
| PF6      | 43         | -                        | I/O      | TTL                      | GPIO port F bit 6. |
| PF7      | 42         | -                        | I/O      | TTL                      | GPIO port F bit 7. |
| PG0      | 19         | -                        | I/O      | TTL                      | GPIO port G bit 0. |
| PG1      | 18         | -                        | I/O      | TTL                      | GPIO port G bit 1. |
| PG2      | 17         | -                        | I/O      | TTL                      | GPIO port G bit 2. |
| PG3      | 16         | -                        | I/O      | TTL                      | GPIO port G bit 3. |
| PG4      | 41         | -                        | I/O      | TTL                      | GPIO port G bit 4. |
| PG5      | 40         | -                        | I/O      | TTL                      | GPIO port G bit 5. |
| PG6      | 37         | -                        | I/O      | TTL                      | GPIO port G bit 6. |
| PG7      | 36         | -                        | I/O      | TTL                      | GPIO port G bit 7. |
| PH0      | 86         | -                        | I/O      | TTL                      | GPIO port H bit 0. |
| PH1      | 85         | -                        | I/O      | TTL                      | GPIO port H bit 1. |
| PH2      | 84         | -                        | I/O      | TTL                      | GPIO port H bit 2. |
| PH3      | 83         | -                        | I/O      | TTL                      | GPIO port H bit 3. |
| PH4      | 76         | -                        | I/O      | TTL                      | GPIO port H bit 4. |
| PH5      | 63         | -                        | I/O      | TTL                      | GPIO port H bit 5. |

Table 23-3. Signals by Signal Name (continued)

| Pin Name  | Pin Number                                  | Pin Mux / Pin Assignment                                                  | Pin Type | Buffer Type <sup>a</sup> | Description                                                                                                                                                                                                                                                                                                                |
|-----------|---------------------------------------------|---------------------------------------------------------------------------|----------|--------------------------|----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| USB0ID    | 66                                          | PB0                                                                       | I        | Analog                   | This signal senses the state of the USB ID signal. The USB PHY enables an integrated pull-up, and an external element (USB connector) indicates the initial state of the USB controller (pulled down is the A side of the cable and pulled up is the B side).                                                              |
| USB0PFLT  | 22<br>23<br>35<br>65<br>74<br>76<br>87      | PC7 (6)<br>PC6 (7)<br>PA7 (8)<br>PB3 (8)<br>PE0 (9)<br>PH4 (4)<br>PJ1 (9) | I        | TTL                      | Optionally used in Host mode by an external power source to indicate an error state by that power source.                                                                                                                                                                                                                  |
| USB0RBIAS | 73                                          | fixed                                                                     | O        | Analog                   | 9.1-kΩ resistor (1% precision) used internally for USB analog circuitry.                                                                                                                                                                                                                                                   |
| USB0VBUS  | 67                                          | PB1                                                                       | I/O      | Analog                   | This signal is used during the session request protocol. This signal allows the USB PHY to both sense the voltage level of VBUS, and pull up VBUS momentarily during VBUS pulsing.                                                                                                                                         |
| VDD       | 8<br>20<br>32<br>44<br>56<br>68<br>81<br>93 | fixed                                                                     | -        | Power                    | Positive supply for I/O and some logic.                                                                                                                                                                                                                                                                                    |
| VDDA      | 3                                           | fixed                                                                     | -        | Power                    | The positive supply (3.3 V) for the analog circuits (ADC, Analog Comparators, etc.). These are separated from VDD to minimize the electrical noise contained on VDD from affecting the analog functions. VDDA pins must be connected to 3.3 V, regardless of system implementation.                                        |
| VDDC      | 38<br>88                                    | fixed                                                                     | -        | Power                    | Positive supply for most of the logic function, including the processor core and most peripherals.                                                                                                                                                                                                                         |
| VREFA     | 90                                          | PB6                                                                       | I        | Analog                   | This input provides a reference voltage used to specify the input voltage at which the ADC converts to a maximum value. In other words, the voltage that is applied to VREFA is the voltage with which an AINn signal is converted to 1023. The VREFA input is limited to the range specified in Table 25-29 on page 1253. |

a. The TTL designation indicates the pin has TTL-compatible voltage levels.

Table 23-4. Signals by Function, Except for GPIO

| Function           | Pin Name | Pin Number                  | Pin Type | Buffer Type <sup>a</sup> | Description                                                                                                                                                                                                                                                                                                                |
|--------------------|----------|-----------------------------|----------|--------------------------|----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|

|                    | VREFA    | 90                          | I        | Analog                   | This input provides a reference voltage used to specify the input voltage at which the ADC converts to a maximum value. In other words, the voltage that is applied to VREFA is the voltage with which an AINn signal is converted to 1023. The VREFA input is limited to the range specified in Table 25-29 on page 1253. |

This signal is controlled by PWM Generator 3.                                                                                                                                                                                                                                                           |
| Power    | GND      | 9<br>21<br>33<br>45<br>57<br>69<br>82<br>94 | -        | Power                    | Ground reference for logic and I/O pins.                                                                                                                                                                                                                                                                       |
|          | GNDA     | 4                                           | -        | Power                    | The ground reference for the analog circuits (ADC, Analog Comparators, etc.). These are separated from GND to minimize the electrical noise contained on VDD from affecting the analog functions.                                                                                                              |
|          | LDO      | 7                                           | -        | Power                    | Low drop-out regulator output voltage. This pin requires an external capacitor between the pin and GND of 1 $\mu$ F or greater. When the on-chip LDO is used to provide power to the logic, the LDO pin must also be connected to the VDDC pins at the board level in addition to the decoupling capacitor(s). |
|          | VDD      | 8<br>20<br>32<br>44<br>56<br>68<br>81<br>93 | -        | Power                    | Positive supply for I/O and some logic.                                                                                                                                                                                                                                                                        |
|          | VDDA     | 3                                           | -        | Power                    | The positive supply (3.3 V) for the analog circuits (ADC, Analog Comparators, etc.). These are separated from VDD to minimize the electrical noise contained on VDD from affecting the analog functions. VDDA pins must be connected to 3.3 V, regardless of system implementation.                            |
|          | VDDC     | 38<br>88                                    | -        | Power                    | Positive supply for most of the logic function, including the processor core and most peripherals.                                                                                                                                                                                                             |

|          | U2Tx     | 6<br>11<br>18<br>99              | O        | TTL                      | UART module 2 transmit. When in IrDA mode, this signal has IrDA modulation. |

Table 23-4. Signals by Function, Except for GPIO (*continued*)

| Function | Pin Name  | Pin Number                             | Pin Type | Buffer Type <sup>a</sup> | Description                                                                                                                                                                                                                                                   |
|----------|-----------|----------------------------------------|----------|--------------------------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| USB      | USB0DM    | 70                                     | I/O      | Analog                   | Bidirectional differential data pin (D- per USB specification) for USB0.                                                                                                                                                                                      |
|          | USB0DP    | 71                                     | I/O      | Analog                   | Bidirectional differential data pin (D+ per USB specification) for USB0.                                                                                                                                                                                      |
|          | USB0EPEN  | 19<br>24<br>34<br>72<br>83             | O        | TTL                      | Optionally used in Host mode to control an external power source to supply power to the USB bus.                                                                                                                                                              |
|          | USB0ID    | 66                                     | I        | Analog                   | This signal senses the state of the USB ID signal. The USB PHY enables an integrated pull-up, and an external element (USB connector) indicates the initial state of the USB controller (pulled down is the A side of the cable and pulled up is the B side). |
|          | USB0PFLT  | 22<br>23<br>35<br>65<br>74<br>76<br>87 | I        | TTL                      | Optionally used in Host mode by an external power source to indicate an error state by that power source.                                                                                                                                                     |
|          | USB0RBIAS | 73                                     | O        | Analog                   | 9.1-kΩ resistor (1% precision) used internally for USB analog circuitry.                                                                                                                                                                                      |
|          | USB0VBUS  | 67                                     | I/O      | Analog                   | This signal is used during the session request protocol. This signal allows the USB PHY to both sense the voltage level of VBUS, and pull up VBUS momentarily during VBUS pulsing.                                                                            |

a. The TTL designation indicates the pin has TTL-compatible voltage levels.

Table 23-5. GPIO Pins and Alternate Functions

## 23.2 108-Pin BGA Package Pin Tables

Table 23-7. Signals by Pin Number

| Pin Number | Pin Name  | Pin Type | Buffer Type <sup>a</sup> | Description                                                                 |
|------------|-----------|----------|--------------------------|-----------------------------------------------------------------------------|
| A1         | PE6       | I/O      | TTL                      | GPIO port E bit 6.                                                          |
|            | AIN1      | I        | Analog                   | Analog-to-digital converter input 1.                                        |
|            | C10       | O        | TTL                      | Analog comparator 1 output.                                                 |
|            | PWM4      | O        | TTL                      | PWM 4. This signal is controlled by PWM Generator 2.                        |
|            | U1CTS     | I        | TTL                      | UART module 1 Clear To Send modem status input signal.                      |
| A2         | PD7       | I/O      | TTL                      | GPIO port D bit 7.                                                          |
|            | AIN4      | I        | Analog                   | Analog-to-digital converter input 4.                                        |
|            | C00       | O        | TTL                      | Analog comparator 0 output.                                                 |
|            | CCP1      | I/O      | TTL                      | Capture/Compare/PWM 1.                                                      |
|            | EPI0S30   | I/O      | TTL                      | EPI module 0 signal 30.                                                     |
|            | I2S0TXWS  | I/O      | TTL                      | I <sup>2</sup> S module 0 transmit word select.                             |
|            | IDX0      | I        | TTL                      | QEI module 0 index.                                                         |
|            | U1DTR     | O        | TTL                      | UART module 1 Data Terminal Ready modem status input signal.                |
| A3         | PD6       | I/O      | TTL                      | GPIO port D bit 6.                                                          |
|            | AIN5      | I        | Analog                   | Analog-to-digital converter input 5.                                        |
|            | EPI0S29   | I/O      | TTL                      | EPI module 0 signal 29.                                                     |
|            | Fault0    | I        | TTL                      | PWM Fault 0.                                                                |
|            | I2S0TXSCK | I/O      | TTL                      | I <sup>2</sup> S module 0 transmit clock.                                   |
|            | U2Tx      | O        | TTL                      | UART module 2 transmit. When in IrDA mode, this signal has IrDA modulation. |

Table 23-7. Signals by Pin Number (continued)

| Pin Number | Pin Name  | Pin Type | Buffer Type <sup>a</sup> | Description                                                                                                                                                                                                                                                                                                                |
|------------|-----------|----------|--------------------------|----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| A4         | PE2       | I/O      | TTL                      | GPIO port E bit 2.                                                                                                                                                                                                                                                                                                         |
|            | AIN9      | I        | Analog                   | Analog-to-digital converter input 9.                                                                                                                                                                                                                                                                                       |
|            | CCP2      | I/O      | TTL                      | Capture/Compare/PWM 2.                                                                                                                                                                                                                                                                                                     |
|            | CCP4      | I/O      | TTL                      | Capture/Compare/PWM 4.                                                                                                                                                                                                                                                                                                     |
|            | EPI0S24   | I/O      | TTL                      | EPI module 0 signal 24.                                                                                                                                                                                                                                                                                                    |
|            | PhA0      | I        | TTL                      | QEI module 0 phase A.                                                                                                                                                                                                                                                                                                      |
|            | PhB1      | I        | TTL                      | QEI module 1 phase B.                                                                                                                                                                                                                                                                                                      |
|            | SSI1Rx    | I        | TTL                      | SSI module 1 receive.                                                                                                                                                                                                                                                                                                      |
| A5         | GNDA      | -        | Power                    | The ground reference for the analog circuits (ADC, Analog Comparators, etc.). These are separated from GND to minimize the electrical noise contained on VDD from affecting the analog functions.                                                                                                                          |
| A6         | PB4       | I/O      | TTL                      | GPIO port B bit 4.                                                                                                                                                                                                                                                                                                         |
|            | AIN10     | I        | Analog                   | Analog-to-digital converter input 10.                                                                                                                                                                                                                                                                                      |
|            | C0-       | I        | Analog                   | Analog comparator 0 negative input.                                                                                                                                                                                                                                                                                        |
|            | CAN0Rx    | I        | TTL                      | CAN module 0 receive.                                                                                                                                                                                                                                                                                                      |
|            | EPI0S23   | I/O      | TTL                      | EPI module 0 signal 23.                                                                                                                                                                                                                                                                                                    |
|            | IDX0      | I        | TTL                      | QEI module 0 index.                                                                                                                                                                                                                                                                                                        |
|            | U1Rx      | I        | TTL                      | UART module 1 receive. When in IrDA mode, this signal has IrDA modulation.                                                                                                                                                                                                                                                 |
|            | U2Rx      | I        | TTL                      | UART module 2 receive. When in IrDA mode, this signal has IrDA modulation.                                                                                                                                                                                                                                                 |
| A7         | PB6       | I/O      | TTL                      | GPIO port B bit 6.                                                                                                                                                                                                                                                                                                         |

|            | VREFA     | I        | Analog                   | This input provides a reference voltage used to specify the input voltage at which the ADC converts to a maximum value. In other words, the voltage that is applied to VREFA is the voltage with which an AINn signal is converted to 1023. The VREFA input is limited to the range specified in Table 25-29 on page 1253. |

|            | CCP3     | I/O      | TTL                      | Capture/Compare/PWM 3.                                                                           |
|            | I2C0SCL  | I/O      | OD                       | I <sup>2</sup> C module 0 clock.                                                                 |
|            | IDX0     | I        | TTL                      | QEI module 0 index.                                                                              |
|            | USB0EPEN | O        | TTL                      | Optionally used in Host mode to control an external power source to supply power to the USB bus. |
| A12        | PE1      | I/O      | TTL                      | GPIO port E bit 1.                                                                               |
|            | CCP2     | I/O      | TTL                      | Capture/Compare/PWM 2.                                                                           |
|            | CCP6     | I/O      | TTL                      | Capture/Compare/PWM 6.                                                                           |
|            | EPI0S9   | I/O      | TTL                      | EPI module 0 signal 9.                                                                           |
|            | Fault0   | I        | TTL                      | PWM Fault 0.                                                                                     |
|            | PWM5     | O        | TTL                      | PWM 5. This signal is controlled by PWM Generator 2.                                             |
|            | SSI1Fss  | I/O      | TTL                      | SSI module 1 frame.                                                                              |
| B1         | PE7      | I/O      | TTL                      | GPIO port E bit 7.                                                                               |
|            | AIN0     | I        | Analog                   | Analog-to-digital converter input 0.                                                             |
|            | C2o      | O        | TTL                      | Analog comparator 2 output.                                                                      |
|            | PWM5     | O        | TTL                      | PWM 5. This signal is controlled by PWM Generator 2.                                             |
|            | U1DCD    | I        | TTL                      | UART module 1 Data Carrier Detect modem status input signal.                                     |
| B2         | PE4      | I/O      | TTL                      | GPIO port E bit 4.                                                                               |
|            | AIN3     | I        | Analog                   | Analog-to-digital converter input 3.                                                             |
|            | CCP2     | I/O      | TTL                      | Capture/Compare/PWM 2.                                                                           |
|            | CCP3     | I/O      | TTL                      | Capture/Compare/PWM 3.                                                                           |
|            | Fault0   | I        | TTL                      | PWM Fault 0.                                                                                     |
|            | I2S0TXWS | I/O      | TTL                      | I <sup>2</sup> S module 0 transmit word select.                                                  |
|            | U2Tx     | O        | TTL                      | UART module 2 transmit. When in IrDA mode, this signal has IrDA modulation.                      |
| B3         | PE5      | I/O      | TTL                      | GPIO port E bit 5.                                                                               |
|            | AIN2     | I        | Analog                   | Analog-to-digital converter input 2.                                                             |
|            | CCP5     | I/O      | TTL                      | Capture/Compare/PWM 5.                                                                           |
|            | I2S0TXSD | I/O      | TTL                      | I <sup>2</sup> S module 0 transmit data.                                                         |
| B4         | PE3      | I/O      | TTL                      | GPIO port E bit 3.                                                                               |
|            | AIN8     | I        | Analog                   | Analog-to-digital converter input 8.                                                             |
|            | CCP1     | I/O      | TTL                      | Capture/Compare/PWM 1.                                                                           |
|            | CCP7     | I/O      | TTL                      | Capture/Compare/PWM 7.                                                                           |
|            | EPI0S25  | I/O      | TTL                      | EPI module 0 signal 25.                                                                          |
|            | PhA1     | I        | TTL                      | QEI module 1 phase A.                                                                            |
|            | PhB0     | I        | TTL                      | QEI module 0 phase B.                                                                            |
|            | SSI1Tx   | O        | TTL                      | SSI module 1 transmit.                                                                           |

Table 23-7. Signals by Pin Number (continued)

| Pin Number | Pin Name | Pin Type | Buffer Type <sup>a</sup> | Description                                                                                               |
|------------|----------|----------|--------------------------|-----------------------------------------------------------------------------------------------------------|
| B5         | PD4      | I/O      | TTL                      | GPIO port D bit 4.                                                                                        |
|            | AIN7     | I        | Analog                   | Analog-to-digital converter input 7.                                                                      |
|            | CCP0     | I/O      | TTL                      | Capture/Compare/PWM 0.                                                                                    |
|            | CCP3     | I/O      | TTL                      | Capture/Compare/PWM 3.                                                                                    |
|            | EPI0S19  | I/O      | TTL                      | EPI module 0 signal 19.                                                                                   |
|            | I2S0RXSD | I/O      | TTL                      | I <sup>2</sup> S module 0 receive data.                                                                   |
|            | U1RI     | I        | TTL                      | UART module 1 Ring Indicator modem status input signal.                                                   |
| B6         | PJ1      | I/O      | TTL                      | GPIO port J bit 1.                                                                                        |
|            | EPI0S17  | I/O      | TTL                      | EPI module 0 signal 17.                                                                                   |
|            | I2C1SDA  | I/O      | OD                       | I <sup>2</sup> C module 1 data.                                                                           |
|            | PWM1     | O        | TTL                      | PWM 1. This signal is controlled by PWM Generator 0.                                                      |
|            | USB0PFLT | I        | TTL                      | Optionally used in Host mode by an external power source to indicate an error state by that power source. |
| B7         | PB5      | I/O      | TTL                      | GPIO port B bit 5.                                                                                        |
|            | AIN11    | I        | Analog                   | Analog-to-digital converter input 11.                                                                     |
|            | C0o      | O        | TTL                      | Analog comparator 0 output.                                                                               |
|            | C1-      | I        | Analog                   | Analog comparator 1 negative input.                                                                       |
|            | CAN0Tx   | O        | TTL                      | CAN module 0 transmit.                                                                                    |
|            | CCP0     | I/O      | TTL                      | Capture/Compare/PWM 0.                                                                                    |
|            | CCP2     | I/O      | TTL                      | Capture/Compare/PWM 2.                                                                                    |
|            | CCP5     | I/O      | TTL                      | Capture/Compare/PWM 5.                                                                                    |
|            | CCP6     | I/O      | TTL                      | Capture/Compare/PWM 6.                                                                                    |
|            | EPI0S22  | I/O      | TTL                      | EPI module 0 signal 22.                                                                                   |
|            | U1Tx     | O        | TTL                      | UART module 1 transmit. When in IrDA mode, this signal has IrDA modulation.                               |
| B8         | PC2      | I/O      | TTL                      | GPIO port C bit 2.                                                                                        |
|            | TDI      | I        | TTL                      | JTAG TDI.                                                                                                 |
| B9         | PC1      | I/O      | TTL                      | GPIO port C bit 1.                                                                                        |
|            | SWDIO    | I/O      | TTL                      | JTAG TMS and SWDIO.                                                                                       |
|            | TMS      | I        | TTL                      | JTAG TMS and SWDIO.                                                                                       |
| B10        | PH4      | I/O      | TTL                      | GPIO port H bit 4.                                                                                        |
|            | EPI0S10  | I/O      | TTL                      | EPI module 0 signal 10.                                                                                   |
|            | SSI1Clk  | I/O      | TTL                      | SSI module 1 clock.                                                                                       |
|            | USB0PFLT | I        | TTL                      | Optionally used in Host mode by an external power source to indicate an error state by that power source. |
| B11        | PE0      | I/O      | TTL                      | GPIO port E bit 0.                                                                                        |
|            | CCP3     | I/O      | TTL                      | Capture/Compare/PWM 3.                                                                                    |
|            | EPI0S8   | I/O      | TTL                      | EPI module 0 signal 8.                                                                                    |
|            | PWM4     | O        | TTL                      | PWM 4. This signal is controlled by PWM Generator 2.                                                      |
|            | SSI1Clk  | I/O      | TTL                      | SSI module 1 clock.                                                                                       |
|            | USB0PFLT | I        | TTL                      | Optionally used in Host mode by an external power source to indicate an error state by that power source. |

Table 23-7. Signals by Pin Number (continued)

| Pin Number | Pin Name   | Pin Type | Buffer Type <sup>a</sup> | Description                                                                                                                                                                                                                                                                         |
|------------|------------|----------|--------------------------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| B12        | USB0RBIAS  | O        | Analog                   | 9.1-kΩ resistor (1% precision) used internally for USB analog circuitry.                                                                                                                                                                                                            |
| C1         | NC         | -        | -                        | No connect. Leave the pin electrically unconnected/isolated.                                                                                                                                                                                                                        |
| C2         | NC         | -        | -                        | No connect. Leave the pin electrically unconnected/isolated.                                                                                                                                                                                                                        |
| C3         | VDDC       | -        | Power                    | Positive supply for most of the logic function, including the processor core and most peripherals.                                                                                                                                                                                  |
| C4         | GND        | -        | Power                    | Ground reference for logic and I/O pins.                                                                                                                                                                                                                                            |
| C5         | GND        | -        | Power                    | Ground reference for logic and I/O pins.                                                                                                                                                                                                                                            |
| C6         | PD5        | I/O      | TTL                      | GPIO port D bit 5.                                                                                                                                                                                                                                                                  |
|            | AIN6       | I        | Analog                   | Analog-to-digital converter input 6.                                                                                                                                                                                                                                                |
|            | CCP2       | I/O      | TTL                      | Capture/Compare/PWM 2.                                                                                                                                                                                                                                                              |
|            | CCP4       | I/O      | TTL                      | Capture/Compare/PWM 4.                                                                                                                                                                                                                                                              |
|            | EPI0S28    | I/O      | TTL                      | EPI module 0 signal 28.                                                                                                                                                                                                                                                             |
|            | I2S0RXMCLK | I/O      | TTL                      | I <sup>2</sup> S module 0 receive master clock.                                                                                                                                                                                                                                     |
|            | U2Rx       | I        | TTL                      | UART module 2 receive. When in IrDA mode, this signal has IrDA modulation.                                                                                                                                                                                                          |
| C7         | VDDA       | -        | Power                    | The positive supply (3.3 V) for the analog circuits (ADC, Analog Comparators, etc.). These are separated from VDD to minimize the electrical noise contained on VDD from affecting the analog functions. VDDA pins must be connected to 3.3 V, regardless of system implementation. |
| C8         | PH1        | I/O      | TTL                      | GPIO port H bit 1.                                                                                                                                                                                                                                                                  |
|            | CCP7       | I/O      | TTL                      | Capture/Compare/PWM 7.                                                                                                                                                                                                                                                              |
|            | EPI0S7     | I/O      | TTL                      | EPI module 0 signal 7.                                                                                                                                                                                                                                                              |
|            | PWM3       | O        | TTL                      | PWM 3. This signal is controlled by PWM Generator 1.                                                                                                                                                                                                                                |
|            | PWM5       | O        | TTL                      | PWM 5. This signal is controlled by PWM Generator 2.                                                                                                                                                                                                                                |
| C9         | PH0        | I/O      | TTL                      | GPIO port H bit 0.                                                                                                                                                                                                                                                                  |
|            | CCP6       | I/O      | TTL                      | Capture/Compare/PWM 6.                                                                                                                                                                                                                                                              |
|            | EPI0S6     | I/O      | TTL                      | EPI module 0 signal 6.                                                                                                                                                                                                                                                              |
|            | PWM2       | O        | TTL                      | PWM 2. This signal is controlled by PWM Generator 1.                                                                                                                                                                                                                                |
|            | PWM4       | O        | TTL                      | PWM 4. This signal is controlled by PWM Generator 2.                                                                                                                                                                                                                                |

|            | CCP2     | I/O      | TTL                      | Capture/Compare/PWM 2.                                                                                                                                                                                                                                                                                         |
|            | PWM3     | O        | TTL                      | PWM 3. This signal is controlled by PWM Generator 1.                                                                                                                                                                                                                                                           |
|            | U1Tx     | O        | TTL                      | UART module 1 transmit. When in IrDA mode, this signal has IrDA modulation.                                                                                                                                                                                                                                    |
|            | USB0VBUS | I/O      | Analog                   | This signal is used during the session request protocol. This signal allows the USB PHY to both sense the voltage level of VBUS, and pull up VBUS momentarily during VBUS pulsing.                                                                                                                             |
| E1         | NC       | -        | -                        | No connect. Leave the pin electrically unconnected/isolated.                                                                                                                                                                                                                                                   |
| E2         | NC       | -        | -                        | No connect. Leave the pin electrically unconnected/isolated.                                                                                                                                                                                                                                                   |
| E3         | LDO      | -        | Power                    | Low drop-out regulator output voltage. This pin requires an external capacitor between the pin and GND of 1 $\mu$ F or greater. When the on-chip LDO is used to provide power to the logic, the LDO pin must also be connected to the VDDC pins at the board level in addition to the decoupling capacitor(s). |
| E10        | VDD      | -        | Power                    | Positive supply for I/O and some logic.                                                                                                                                                                                                                                                                        |
| E11        | PB3      | I/O      | TTL                      | GPIO port B bit 3.                                                                                                                                                                                                                                                                                             |
|            | Fault0   | I        | TTL                      | PWM Fault 0.                                                                                                                                                                                                                                                                                                   |
|            | Fault3   | I        | TTL                      | PWM Fault 3.                                                                                                                                                                                                                                                                                                   |
|            | I2C0SDA  | I/O      | OD                       | I <sup>2</sup> C module 0 data.                                                                                                                                                                                                                                                                                |
|            | USB0PFLT | I        | TTL                      | Optionally used in Host mode by an external power source to indicate an error state by that power source.                                                                                                                                                                                                      |
| E12        | PB0      | I/O      | TTL                      | GPIO port B bit 0.                                                                                                                                                                                                                                                                                             |
|            | CCP0     | I/O      | TTL                      | Capture/Compare/PWM 0.                                                                                                                                                                                                                                                                                         |
|            | PWM2     | O        | TTL                      | PWM 2. This signal is controlled by PWM Generator 1.                                                                                                                                                                                                                                                           |
|            | U1Rx     | I        | TTL                      | UART module 1 receive. When in IrDA mode, this signal has IrDA modulation.                                                                                                                                                                                                                                     |
|            | USB0ID   | I        | Analog                   | This signal senses the state of the USB ID signal. The USB PHY enables an integrated pull-up, and an external element (USB connector) indicates the initial state of the USB controller (pulled down is the A side of the cable and pulled up is the B side).                                                  |
| F1         | NC       | -        | -                        | No connect. Leave the pin electrically unconnected/isolated.                                                                                                                                                                                                                                                   |
| F2         | NC       | -        | -                        | No connect. Leave the pin electrically unconnected/isolated.                                                                                                                                                                                                                                                   |

Table 23-7. Signals by Pin Number (continued)

| Pin Number | Pin Name  | Pin Type | Buffer Type <sup>a</sup> | Description                                                                 |
|------------|-----------|----------|--------------------------|-----------------------------------------------------------------------------|
| F3         | PJ0       | I/O      | TTL                      | GPIO port J bit 0.                                                          |
|            | EPI0S16   | I/O      | TTL                      | EPI module 0 signal 16.                                                     |
|            | I2C1SCL   | I/O      | OD                       | I <sup>2</sup> C module 1 clock.                                            |
|            | PWM0      | O        | TTL                      | PWM 0. This signal is controlled by PWM Generator 0.                        |
| F10        | PH5       | I/O      | TTL                      | GPIO port H bit 5.                                                          |
|            | EPI0S11   | I/O      | TTL                      | EPI module 0 signal 11.                                                     |
|            | Fault2    | I        | TTL                      | PWM Fault 2.                                                                |
|            | SSI1Fss   | I/O      | TTL                      | SSI module 1 frame.                                                         |
| F11        | GND       | -        | Power                    | Ground reference for logic and I/O pins.                                    |
| F12        | GND       | -        | Power                    | Ground reference for logic and I/O pins.                                    |
| G1         | PD0       | I/O      | TTL                      | GPIO port D bit 0.                                                          |
|            | AIN15     | I        | Analog                   | Analog-to-digital converter input 15.                                       |
|            | CAN0Rx    | I        | TTL                      | CAN module 0 receive.                                                       |
|            | CCP6      | I/O      | TTL                      | Capture/Compare/PWM 6.                                                      |
|            | I2S0RXSCK | I/O      | TTL                      | I <sup>2</sup> S module 0 receive clock.                                    |
|            | IDX0      | I        | TTL                      | QEI module 0 index.                                                         |
|            | PWM0      | O        | TTL                      | PWM 0. This signal is controlled by PWM Generator 0.                        |
|            | U1CTS     | I        | TTL                      | UART module 1 Clear To Send modem status input signal.                      |
|            | U1Rx      | I        | TTL                      | UART module 1 receive. When in IrDA mode, this signal has IrDA modulation.  |
|            | U2Rx      | I        | TTL                      | UART module 2 receive. When in IrDA mode, this signal has IrDA modulation.  |
| G2         | PD1       | I/O      | TTL                      | GPIO port D bit 1.                                                          |
|            | AIN14     | I        | Analog                   | Analog-to-digital converter input 14.                                       |
|            | CAN0Tx    | O        | TTL                      | CAN module 0 transmit.                                                      |
|            | CCP2      | I/O      | TTL                      | Capture/Compare/PWM 2.                                                      |
|            | CCP7      | I/O      | TTL                      | Capture/Compare/PWM 7.                                                      |
|            | I2S0RXWS  | I/O      | TTL                      | I <sup>2</sup> S module 0 receive word select.                              |
|            | PWM1      | O        | TTL                      | PWM 1. This signal is controlled by PWM Generator 0.                        |
|            | PhA0      | I        | TTL                      | QEI module 0 phase A.                                                       |
|            | PhB1      | I        | TTL                      | QEI module 1 phase B.                                                       |
|            | U1DCD     | I        | TTL                      | UART module 1 Data Carrier Detect modem status input signal.                |
|            | U1Tx      | O        | TTL                      | UART module 1 transmit. When in IrDA mode, this signal has IrDA modulation. |
|            | U2Tx      | O        | TTL                      | UART module 2 transmit. When in IrDA mode, this signal has IrDA modulation. |
| G3         | PH6       | I/O      | TTL                      | GPIO port H bit 6.                                                          |
|            | EPI0S26   | I/O      | TTL                      | EPI module 0 signal 26.                                                     |
|            | PWM4      | O        | TTL                      | PWM 4. This signal is controlled by PWM Generator 2.                        |
|            | SSI1Rx    | I        | TTL                      | SSI module 1 receive.                                                       |
| G10        | VDD       | -        | Power                    | Positive supply for I/O and some logic.                                     |
| G11        | VDD       | -        | Power                    | Positive supply for I/O and some logic.                                     |

Table 23-7. Signals by Pin Number (continued)

| Pin Number | Pin Name   | Pin Type | Buffer Type <sup>a</sup> | Description                                                                 |
|------------|------------|----------|--------------------------|-----------------------------------------------------------------------------|
| G12        | VDD        | -        | Power                    | Positive supply for I/O and some logic.                                     |
| H1         | PD3        | I/O      | TTL                      | GPIO port D bit 3.                                                          |
|            | AIN12      | I        | Analog                   | Analog-to-digital converter input 12.                                       |
|            | CCP0       | I/O      | TTL                      | Capture/Compare/PWM 0.                                                      |
|            | CCP7       | I/O      | TTL                      | Capture/Compare/PWM 7.                                                      |
|            | EPI0S21    | I/O      | TTL                      | EPI module 0 signal 21.                                                     |
|            | PWM3       | O        | TTL                      | PWM 3. This signal is controlled by PWM Generator 1.                        |
|            | U1Tx       | O        | TTL                      | UART module 1 transmit. When in IrDA mode, this signal has IrDA modulation. |
| H2         | PD2        | I/O      | TTL                      | GPIO port D bit 2.                                                          |
|            | AIN13      | I        | Analog                   | Analog-to-digital converter input 13.                                       |
|            | CCP5       | I/O      | TTL                      | Capture/Compare/PWM 5.                                                      |
|            | CCP6       | I/O      | TTL                      | Capture/Compare/PWM 6.                                                      |
|            | EPI0S20    | I/O      | TTL                      | EPI module 0 signal 20.                                                     |
|            | PWM2       | O        | TTL                      | PWM 2. This signal is controlled by PWM Generator 1.                        |
|            | U1Rx       | I        | TTL                      | UART module 1 receive. When in IrDA mode, this signal has IrDA modulation.  |
| H3         | PH7        | I/O      | TTL                      | GPIO port H bit 7.                                                          |
|            | EPI0S27    | I/O      | TTL                      | EPI module 0 signal 27.                                                     |
|            | PWM5       | O        | TTL                      | PWM 5. This signal is controlled by PWM Generator 2.                        |
|            | SSI1Tx     | O        | TTL                      | SSI module 1 transmit.                                                      |
| H10        | VDD        | -        | Power                    | Positive supply for I/O and some logic.                                     |
| H11        | RST        | I        | TTL                      | System reset input.                                                         |
| H12        | PF1        | I/O      | TTL                      | GPIO port F bit 1.                                                          |
|            | CAN1Tx     | O        | TTL                      | CAN module 1 transmit.                                                      |
|            | CCP3       | I/O      | TTL                      | Capture/Compare/PWM 3.                                                      |
|            | I2S0TXMCLK | I/O      | TTL                      | I <sup>2</sup> S module 0 transmit master clock.                            |
|            | IDX1       | I        | TTL                      | QEI module 1 index.                                                         |
|            | PWM1       | O        | TTL                      | PWM 1. This signal is controlled by PWM Generator 0.                        |
|            | U1RTS      | O        | TTL                      | UART module 1 Request to Send modem output control line.                    |
| J1         | PG2        | I/O      | TTL                      | GPIO port G bit 2.                                                          |
|            | Fault0     | I        | TTL                      | PWM Fault 0.                                                                |
|            | I2S0RXSD   | I/O      | TTL                      | I <sup>2</sup> S module 0 receive data.                                     |
|            | IDX1       | I        | TTL                      | QEI module 1 index.                                                         |
|            | PWM0       | O        | TTL                      | PWM 0. This signal is controlled by PWM Generator 0.                        |
| J2         | PG3        | I/O      | TTL                      | GPIO port G bit 3.                                                          |
|            | Fault0     | I        | TTL                      | PWM Fault 0.                                                                |
|            | Fault2     | I        | TTL                      | PWM Fault 2.                                                                |
|            | I2S0RXMCLK | I/O      | TTL                      | I <sup>2</sup> S module 0 receive master clock.                             |
|            | PWM1       | O        | TTL                      | PWM 1. This signal is controlled by PWM Generator 0.                        |
| J3         | GND        | -        | Power                    | Ground reference for logic and I/O pins.                                    |
| J10        | GND        | -        | Power                    | Ground reference for logic and I/O pins.                                    |

Table 23-7. Signals by Pin Number (continued)

| Pin Number | Pin Name | Pin Type | Buffer Type <sup>a</sup> | Description                                                                                      |
|------------|----------|----------|--------------------------|--------------------------------------------------------------------------------------------------|
| J11        | PF2      | I/O      | TTL                      | GPIO port F bit 2.                                                                               |
|            | PWM2     | O        | TTL                      | PWM 2. This signal is controlled by PWM Generator 1.                                             |
|            | PWM4     | O        | TTL                      | PWM 4. This signal is controlled by PWM Generator 2.                                             |
|            | SSI1Clk  | I/O      | TTL                      | SSI module 1 clock.                                                                              |
| J12        | PF3      | I/O      | TTL                      | GPIO port F bit 3.                                                                               |
|            | PWM3     | O        | TTL                      | PWM 3. This signal is controlled by PWM Generator 1.                                             |
|            | PWM5     | O        | TTL                      | PWM 5. This signal is controlled by PWM Generator 2.                                             |
|            | SSI1Fss  | I/O      | TTL                      | SSI module 1 frame.                                                                              |
| K1         | PG0      | I/O      | TTL                      | GPIO port G bit 0.                                                                               |
|            | EPI0S13  | I/O      | TTL                      | EPI module 0 signal 13.                                                                          |
|            | I2C1SCL  | I/O      | OD                       | I <sup>2</sup> C module 1 clock.                                                                 |
|            | PWM0     | O        | TTL                      | PWM 0. This signal is controlled by PWM Generator 0.                                             |
|            | PWM4     | O        | TTL                      | PWM 4. This signal is controlled by PWM Generator 2.                                             |
|            | U2Rx     | I        | TTL                      | UART module 2 receive. When in IrDA mode, this signal has IrDA modulation.                       |
|            | USB0EPEN | O        | TTL                      | Optionally used in Host mode to control an external power source to supply power to the USB bus. |
| K2         | PG1      | I/O      | TTL                      | GPIO port G bit 1.                                                                               |
|            | EPI0S14  | I/O      | TTL                      | EPI module 0 signal 14.                                                                          |
|            | I2C1SDA  | I/O      | OD                       | I <sup>2</sup> C module 1 data.                                                                  |
|            | PWM1     | O        | TTL                      | PWM 1. This signal is controlled by PWM Generator 0.                                             |
|            | PWM5     | O        | TTL                      | PWM 5. This signal is controlled by PWM Generator 2.                                             |
|            | U2Tx     | O        | TTL                      | UART module 2 transmit. When in IrDA mode, this signal has IrDA modulation.                      |
| K3         | PG4      | I/O      | TTL                      | GPIO port G bit 4.                                                                               |
|            | CCP3     | I/O      | TTL                      | Capture/Compare/PWM 3.                                                                           |
|            | EPI0S15  | I/O      | TTL                      | EPI module 0 signal 15.                                                                          |
|            | Fault1   | I        | TTL                      | PWM Fault 1.                                                                                     |
|            | PWM6     | O        | TTL                      | PWM 6. This signal is controlled by PWM Generator 3.                                             |
|            | U1RI     | I        | TTL                      | UART module 1 Ring Indicator modem status input signal.                                          |
| K4         | PF7      | I/O      | TTL                      | GPIO port F bit 7.                                                                               |
|            | CCP4     | I/O      | TTL                      | Capture/Compare/PWM 4.                                                                           |
|            | EPI0S12  | I/O      | TTL                      | EPI module 0 signal 12.                                                                          |
|            | Fault1   | I        | TTL                      | PWM Fault 1.                                                                                     |
|            | PhB0     | I        | TTL                      | QEI module 0 phase B.                                                                            |
| K5         | GND      | -        | Power                    | Ground reference for logic and I/O pins.                                                         |
| K6         | PJ2      | I/O      | TTL                      | GPIO port J bit 2.                                                                               |
|            | CCP0     | I/O      | TTL                      | Capture/Compare/PWM 0.                                                                           |
|            | EPI0S18  | I/O      | TTL                      | EPI module 0 signal 18.                                                                          |
|            | Fault0   | I        | TTL                      | PWM Fault 0.                                                                                     |
| K7         | VDD      | -        | Power                    | Positive supply for I/O and some logic.                                                          |
| K8         | VDD      | -        | Power                    | Positive supply for I/O and some logic.                                                          |

Table 23-7. Signals by Pin Number (continued)

| Pin Number | Pin Name   | Pin Type | Buffer Type <sup>a</sup> | Description                                                                                               |
|------------|------------|----------|--------------------------|-----------------------------------------------------------------------------------------------------------|
| K9         | VDD        | -        | Power                    | Positive supply for I/O and some logic.                                                                   |
| K10        | GND        | -        | Power                    | Ground reference for logic and I/O pins.                                                                  |
| K11        | PJ4        | I/O      | TTL                      | GPIO port J bit 4.                                                                                        |
|            | CCP4       | I/O      | TTL                      | Capture/Compare/PWM 4.                                                                                    |
|            | EPI0S28    | I/O      | TTL                      | EPI module 0 signal 28.                                                                                   |
|            | U1DCD      | I        | TTL                      | UART module 1 Data Carrier Detect modem status input signal.                                              |
| K12        | PJ5        | I/O      | TTL                      | GPIO port J bit 5.                                                                                        |
|            | CCP2       | I/O      | TTL                      | Capture/Compare/PWM 2.                                                                                    |
|            | EPI0S29    | I/O      | TTL                      | EPI module 0 signal 29.                                                                                   |
|            | U1DSR      | I        | TTL                      | UART module 1 Data Set Ready modem output control line.                                                   |
| L1         | PC4        | I/O      | TTL                      | GPIO port C bit 4.                                                                                        |
|            | CCP1       | I/O      | TTL                      | Capture/Compare/PWM 1.                                                                                    |
|            | CCP2       | I/O      | TTL                      | Capture/Compare/PWM 2.                                                                                    |
|            | CCP4       | I/O      | TTL                      | Capture/Compare/PWM 4.                                                                                    |
|            | CCP5       | I/O      | TTL                      | Capture/Compare/PWM 5.                                                                                    |
|            | EPI0S2     | I/O      | TTL                      | EPI module 0 signal 2.                                                                                    |
|            | PWM6       | O        | TTL                      | PWM 6. This signal is controlled by PWM Generator 3.                                                      |
|            | PhA0       | I        | TTL                      | QEI module 0 phase A.                                                                                     |
| L2         | PC7        | I/O      | TTL                      | GPIO port C bit 7.                                                                                        |
|            | C10        | O        | TTL                      | Analog comparator 1 output.                                                                               |
|            | C2-        | I        | Analog                   | Analog comparator 2 negative input.                                                                       |
|            | CCP0       | I/O      | TTL                      | Capture/Compare/PWM 0.                                                                                    |
|            | CCP4       | I/O      | TTL                      | Capture/Compare/PWM 4.                                                                                    |
|            | EPI0S5     | I/O      | TTL                      | EPI module 0 signal 5.                                                                                    |
|            | PhB0       | I        | TTL                      | QEI module 0 phase B.                                                                                     |
|            | U1Tx       | O        | TTL                      | UART module 1 transmit. When in IrDA mode, this signal has IrDA modulation.                               |
|            | USB0PFLT   | I        | TTL                      | Optionally used in Host mode by an external power source to indicate an error state by that power source. |
| L3         | PA0        | I/O      | TTL                      | GPIO port A bit 0.                                                                                        |
|            | I2C1SCL    | I/O      | OD                       | I <sup>2</sup> C module 1 clock.                                                                          |
|            | U0Rx       | I        | TTL                      | UART module 0 receive. When in IrDA mode, this signal has IrDA modulation.                                |
|            | U1Rx       | I        | TTL                      | UART module 1 receive. When in IrDA mode, this signal has IrDA modulation.                                |
| L4         | PA3        | I/O      | TTL                      | GPIO port A bit 3.                                                                                        |
|            | I2S0RXMCLK | I/O      | TTL                      | I <sup>2</sup> S module 0 receive master clock.                                                           |
|            | PWM5       | O        | TTL                      | PWM 5. This signal is controlled by PWM Generator 2.                                                      |
|            | SSI0Fss    | I/O      | TTL                      | SSI module 0 frame.                                                                                       |

Table 23-7. Signals by Pin Number (continued)

| Pin Number | Pin Name  | Pin Type | Buffer Type <sup>a</sup> | Description                                                                                      |
|------------|-----------|----------|--------------------------|--------------------------------------------------------------------------------------------------|
| L5         | PA4       | I/O      | TTL                      | GPIO port A bit 4.                                                                               |
|            | CAN0Rx    | I        | TTL                      | CAN module 0 receive.                                                                            |
|            | I2S0TXSCK | I/O      | TTL                      | I <sup>2</sup> S module 0 transmit clock.                                                        |
|            | PWM6      | O        | TTL                      | PWM 6. This signal is controlled by PWM Generator 3.                                             |
|            | SSI0Rx    | I        | TTL                      | SSI module 0 receive.                                                                            |
| L6         | PA6       | I/O      | TTL                      | GPIO port A bit 6.                                                                               |
|            | CAN0Rx    | I        | TTL                      | CAN module 0 receive.                                                                            |
|            | CCP1      | I/O      | TTL                      | Capture/Compare/PWM 1.                                                                           |
|            | I2C1SCL   | I/O      | OD                       | I <sup>2</sup> C module 1 clock.                                                                 |
|            | PWM0      | O        | TTL                      | PWM 0. This signal is controlled by PWM Generator 0.                                             |
|            | PWM4      | O        | TTL                      | PWM 4. This signal is controlled by PWM Generator 2.                                             |
|            | U1CTS     | I        | TTL                      | UART module 1 Clear To Send modem status input signal.                                           |
|            | USB0EPEN  | O        | TTL                      | Optionally used in Host mode to control an external power source to supply power to the USB bus. |
| L7         | PG6       | I/O      | TTL                      | GPIO port G bit 6.                                                                               |
|            | Fault1    | I        | TTL                      | PWM Fault 1.                                                                                     |
|            | I2S0RXWS  | I/O      | TTL                      | I <sup>2</sup> S module 0 receive word select.                                                   |
|            | PWM6      | O        | TTL                      | PWM 6. This signal is controlled by PWM Generator 3.                                             |
|            | PhA1      | I        | TTL                      | QEI module 1 phase A.                                                                            |
|            | U1RI      | I        | TTL                      | UART module 1 Ring Indicator modem status input signal.                                          |
| L8         | PF5       | I/O      | TTL                      | GPIO port F bit 5.                                                                               |
|            | C10       | O        | TTL                      | Analog comparator 1 output.                                                                      |
|            | CCP2      | I/O      | TTL                      | Capture/Compare/PWM 2.                                                                           |
|            | EPI0S15   | I/O      | TTL                      | EPI module 0 signal 15.                                                                          |
|            | SSI1Tx    | O        | TTL                      | SSI module 1 transmit.                                                                           |
| L9         | PF4       | I/O      | TTL                      | GPIO port F bit 4.                                                                               |
|            | C00       | O        | TTL                      | Analog comparator 0 output.                                                                      |
|            | CCP0      | I/O      | TTL                      | Capture/Compare/PWM 0.                                                                           |
|            | EPI0S12   | I/O      | TTL                      | EPI module 0 signal 12.                                                                          |
|            | Fault0    | I        | TTL                      | PWM Fault 0.                                                                                     |
|            | SSI1Rx    | I        | TTL                      | SSI module 1 receive.                                                                            |
| L10        | PJ6       | I/O      | TTL                      | GPIO port J bit 6.                                                                               |
|            | CCP1      | I/O      | TTL                      | Capture/Compare/PWM 1.                                                                           |
|            | EPI0S30   | I/O      | TTL                      | EPI module 0 signal 30.                                                                          |
|            | U1RTS     | O        | TTL                      | UART module 1 Request to Send modem output control line.                                         |
| L11        | OSC0      | I        | Analog                   | Main oscillator crystal input or an external clock reference input.                              |
| L12        | PJ7       | I/O      | TTL                      | GPIO port J bit 7.                                                                               |
|            | CCP0      | I/O      | TTL                      | Capture/Compare/PWM 0.                                                                           |
|            | U1DTR     | O        | TTL                      | UART module 1 Data Terminal Ready modem status input signal.                                     |

Table 23-7. Signals by Pin Number (*continued*)

| Pin Number | Pin Name | Pin Type | Buffer Type <sup>a</sup> | Description                                                                                               |
|------------|----------|----------|--------------------------|-----------------------------------------------------------------------------------------------------------|
| M1         | PC5      | I/O      | TTL                      | GPIO port C bit 5.                                                                                        |
|            | C0o      | O        | TTL                      | Analog comparator 0 output.                                                                               |
|            | C1+      | I        | Analog                   | Analog comparator 1 positive input.                                                                       |
|            | C1o      | O        | TTL                      | Analog comparator 1 output.                                                                               |
|            | CCP1     | I/O      | TTL                      | Capture/Compare/PWM 1.                                                                                    |
|            | CCP3     | I/O      | TTL                      | Capture/Compare/PWM 3.                                                                                    |
|            | EPI0S3   | I/O      | TTL                      | EPI module 0 signal 3.                                                                                    |
|            | Fault2   | I        | TTL                      | PWM Fault 2.                                                                                              |
|            | USB0EPEN | O        | TTL                      | Optionally used in Host mode to control an external power source to supply power to the USB bus.          |
| M2         | PC6      | I/O      | TTL                      | GPIO port C bit 6.                                                                                        |
|            | C2+      | I        | Analog                   | Analog comparator 2 positive input.                                                                       |
|            | C2o      | O        | TTL                      | Analog comparator 2 output.                                                                               |
|            | CCP0     | I/O      | TTL                      | Capture/Compare/PWM 0.                                                                                    |
|            | CCP3     | I/O      | TTL                      | Capture/Compare/PWM 3.                                                                                    |
|            | EPI0S4   | I/O      | TTL                      | EPI module 0 signal 4.                                                                                    |
|            | PWM7     | O        | TTL                      | PWM 7. This signal is controlled by PWM Generator 3.                                                      |
|            | PhB0     | I        | TTL                      | QEI module 0 phase B.                                                                                     |
|            | U1Rx     | I        | TTL                      | UART module 1 receive. When in IrDA mode, this signal has IrDA modulation.                                |
|            | USB0PFLT | I        | TTL                      | Optionally used in Host mode by an external power source to indicate an error state by that power source. |
| M3         | PA1      | I/O      | TTL                      | GPIO port A bit 1.                                                                                        |
|            | I2C1SDA  | I/O      | OD                       | I <sup>2</sup> C module 1 data.                                                                           |
|            | U0Tx     | O        | TTL                      | UART module 0 transmit. When in IrDA mode, this signal has IrDA modulation.                               |
|            | U1Tx     | O        | TTL                      | UART module 1 transmit. When in IrDA mode, this signal has IrDA modulation.                               |
| M4         | PA2      | I/O      | TTL                      | GPIO port A bit 2.                                                                                        |
|            | I2S0RXSD | I/O      | TTL                      | I <sup>2</sup> S module 0 receive data.                                                                   |
|            | PWM4     | O        | TTL                      | PWM 4. This signal is controlled by PWM Generator 2.                                                      |
|            | SSI0C1k  | I/O      | TTL                      | SSI module 0 clock.                                                                                       |
| M5         | PA5      | I/O      | TTL                      | GPIO port A bit 5.                                                                                        |
|            | CAN0Tx   | O        | TTL                      | CAN module 0 transmit.                                                                                    |
|            | I2S0TXWS | I/O      | TTL                      | I <sup>2</sup> S module 0 transmit word select.                                                           |
|            | PWM7     | O        | TTL                      | PWM 7. This signal is controlled by PWM Generator 3.                                                      |
|            | SSI0Tx   | O        | TTL                      | SSI module 0 transmit.                                                                                    |

Table 23-7. Signals by Pin Number (continued)

| Pin Number | Pin Name   | Pin Type | Buffer Type <sup>a</sup> | Description                                                                                               |
|------------|------------|----------|--------------------------|-----------------------------------------------------------------------------------------------------------|
| M6         | PA7        | I/O      | TTL                      | GPIO port A bit 7.                                                                                        |
|            | CAN0Tx     | O        | TTL                      | CAN module 0 transmit.                                                                                    |
|            | CCP3       | I/O      | TTL                      | Capture/Compare/PWM 3.                                                                                    |
|            | CCP4       | I/O      | TTL                      | Capture/Compare/PWM 4.                                                                                    |
|            | I2C1SDA    | I/O      | OD                       | I <sup>2</sup> C module 1 data.                                                                           |
|            | PWM1       | O        | TTL                      | PWM 1. This signal is controlled by PWM Generator 0.                                                      |
|            | PWM5       | O        | TTL                      | PWM 5. This signal is controlled by PWM Generator 2.                                                      |
|            | U1DCD      | I        | TTL                      | UART module 1 Data Carrier Detect modem status input signal.                                              |
|            | USB0PFLT   | I        | TTL                      | Optionally used in Host mode by an external power source to indicate an error state by that power source. |
| M7         | PG5        | I/O      | TTL                      | GPIO port G bit 5.                                                                                        |
|            | CCP5       | I/O      | TTL                      | Capture/Compare/PWM 5.                                                                                    |
|            | Fault1     | I        | TTL                      | PWM Fault 1.                                                                                              |
|            | I2S0RXSCK  | I/O      | TTL                      | I <sup>2</sup> S module 0 receive clock.                                                                  |
|            | IDX0       | I        | TTL                      | QEI module 0 index.                                                                                       |
|            | PWM7       | O        | TTL                      | PWM 7. This signal is controlled by PWM Generator 3.                                                      |
|            | U1DTR      | O        | TTL                      | UART module 1 Data Terminal Ready modem status input signal.                                              |
| M8         | PF6        | I/O      | TTL                      | GPIO port F bit 6.                                                                                        |
|            | C2o        | O        | TTL                      | Analog comparator 2 output.                                                                               |
|            | CCP1       | I/O      | TTL                      | Capture/Compare/PWM 1.                                                                                    |
|            | I2S0TXMCLK | I/O      | TTL                      | I <sup>2</sup> S module 0 transmit master clock.                                                          |
|            | PhA0       | I        | TTL                      | QEI module 0 phase A.                                                                                     |
|            | U1RTS      | O        | TTL                      | UART module 1 Request to Send modem output control line.                                                  |
| M9         | PF0        | I/O      | TTL                      | GPIO port F bit 0.                                                                                        |
|            | CAN1Rx     | I        | TTL                      | CAN module 1 receive.                                                                                     |
|            | I2S0TXSD   | I/O      | TTL                      | I <sup>2</sup> S module 0 transmit data.                                                                  |
|            | PWM0       | O        | TTL                      | PWM 0. This signal is controlled by PWM Generator 0.                                                      |
|            | PhB0       | I        | TTL                      | QEI module 0 phase B.                                                                                     |
|            | U1DSR      | I        | TTL                      | UART module 1 Data Set Ready modem output control line.                                                   |
| M10        | PJ3        | I/O      | TTL                      | GPIO port J bit 3.                                                                                        |
|            | CCP6       | I/O      | TTL                      | Capture/Compare/PWM 6.                                                                                    |
|            | EPI0S19    | I/O      | TTL                      | EPI module 0 signal 19.                                                                                   |
|            | U1CTS      | I        | TTL                      | UART module 1 Clear To Send modem status input signal.                                                    |
| M11        | OSC1       | O        | Analog                   | Main oscillator crystal output. Leave unconnected when using a single-ended clock source.                 |
| M12        | NC         | -        | -                        | No connect. Leave the pin electrically unconnected/isolated.                                              |

a. The TTL designation indicates the pin has TTL-compatible voltage levels.

Table 23-8. Signals by Signal Name

| Pin Name | Pin Number | Pin Mux / Pin Assignment | Pin Type | Buffer Type <sup>a</sup> | Description                          |
|----------|------------|--------------------------|----------|--------------------------|--------------------------------------|
| AIN0     | B1         | PE7                      | I        | Analog                   | Analog-to-digital converter input 0. |

Table 23-8. Signals by Signal Name (continued)

| Pin Name | Pin Number                  | Pin Mux / Pin Assignment                            | Pin Type | Buffer Type <sup>a</sup> | Description                           |
|----------|-----------------------------|-----------------------------------------------------|----------|--------------------------|---------------------------------------|
| AIN1     | A1                          | PE6                                                 | I        | Analog                   | Analog-to-digital converter input 1.  |
| AIN2     | B3                          | PE5                                                 | I        | Analog                   | Analog-to-digital converter input 2.  |

This pin requires an external capacitor between the pin and GND of 1 $\mu$ F or greater. When the on-chip LDO is used to provide power to the logic, the LD0 pin must also be connected to the VDDC pins at the board level in addition to the decoupling capacitor(s). |

When in IrDA mode, this signal has IrDA modulation.                                                                                                                                                                                   |
| USB0DM    | C11                                               | fixed                                                                     | I/O      | Analog                   | Bidirectional differential data pin (D- per USB specification) for USB0.                                                                                                                                                                                      |
| USB0DP    | C12                                               | fixed                                                                     | I/O      | Analog                   | Bidirectional differential data pin (D+ per USB specification) for USB0.                                                                                                                                                                                      |
| USB0EPEN  | K1<br>M1<br>L6<br>A11<br>D10                      | PG0 (7)<br>PC5 (6)<br>PA6 (8)<br>PB2 (8)<br>PH3 (4)                       | O        | TTL                      | Optionally used in Host mode to control an external power source to supply power to the USB bus.                                                                                                                                                              |
| USB0ID    | E12                                               | PB0                                                                       | I        | Analog                   | This signal senses the state of the USB ID signal. The USB PHY enables an integrated pull-up, and an external element (USB connector) indicates the initial state of the USB controller (pulled down is the A side of the cable and pulled up is the B side). |
| USB0PFLT  | L2<br>M2<br>M6<br>E11<br>B11<br>B10<br>B6         | PC7 (6)<br>PC6 (7)<br>PA7 (8)<br>PB3 (8)<br>PE0 (9)<br>PH4 (4)<br>PJ1 (9) | I        | TTL                      | Optionally used in Host mode by an external power source to indicate an error state by that power source.                                                                                                                                                     |
| USB0RBIAS | B12                                               | fixed                                                                     | O        | Analog                   | 9.1-kΩ resistor (1% precision) used internally for USB analog circuitry.                                                                                                                                                                                      |
| USB0VBUS  | D12                                               | PB1                                                                       | I/O      | Analog                   | This signal is used during the session request protocol. This signal allows the USB PHY to both sense the voltage level of VBUS, and pull up VBUS momentarily during VBUS pulsing.                                                                            |
| VDD       | K7<br>G12<br>K8<br>K9<br>H10<br>G10<br>E10<br>G11 | fixed                                                                     | -        | Power                    | Positive supply for I/O and some logic.                                                                                                                                                                                                                       |

Table 23-8. Signals by Signal Name (*continued*)

| Pin Name | Pin Number | Pin Mux / Pin Assignment | Pin Type | Buffer Type <sup>a</sup> | Description                                                                                                                                                                                                                                                                                                                |
|----------|------------|--------------------------|----------|--------------------------|----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| VDDA     | C7         | fixed                    | -        | Power                    | The positive supply (3.3 V) for the analog circuits (ADC, Analog Comparators, etc.). These are separated from VDD to minimize the electrical noise contained on VDD from affecting the analog functions. VDDA pins must be connected to 3.3 V, regardless of system implementation.                                        |
| VDDC     | D3<br>C3   | fixed                    | -        | Power                    | Positive supply for most of the logic function, including the processor core and most peripherals.                                                                                                                                                                                                                         |
| VREFA    | A7         | PB6                      | I        | Analog                   | This input provides a reference voltage used to specify the input voltage at which the ADC converts to a maximum value. In other words, the voltage that is applied to VREFA is the voltage with which an AINn signal is converted to 1023. The VREFA input is limited to the range specified in Table 25-29 on page 1253. |

a. The TTL designation indicates the pin has TTL-compatible voltage levels.

Table 23-9. Signals by Function, Except for GPIO

| Function | Pin Name | Pin Number | Pin Type | Buffer Type <sup>a</sup> | Description                                                                                                                                                                                                                                                                                                                |
|----------|----------|------------|----------|--------------------------|----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| ADC      | AIN0     | B1         | I        | Analog                   | Analog-to-digital converter input 0.                                                                                                                                                                                                                                                                                       |

|          | VREFA    | A7         | I        | Analog                   | This input provides a reference voltage used to specify the input voltage at which the ADC converts to a maximum value. In other words, the voltage that is applied to VREFA is the voltage with which an AINn signal is converted to 1023. The VREFA input is limited to the range specified in Table 25-29 on page 1253. |

Table 23-9. Signals by Function, Except for GPIO (*continued*)

| Function                | Pin Name | Pin Number                  | Pin Type | Buffer Type <sup>a</sup> | Description                         |
|-------------------------|----------|-----------------------------|----------|--------------------------|-------------------------------------|

This signal is controlled by PWM Generator 3.                                                                                                                                                                                                                                                           |
| Power    | GND      | C4<br>C5<br>J3<br>K5<br>K10<br>J10<br>F11<br>F12  | -        | Power                    | Ground reference for logic and I/O pins.                                                                                                                                                                                                                                                                       |
|          | GNDA     | A5                                                | -        | Power                    | The ground reference for the analog circuits (ADC, Analog Comparators, etc.). These are separated from GND to minimize the electrical noise contained on VDD from affecting the analog functions.                                                                                                              |
|          | LD0      | E3                                                | -        | Power                    | Low drop-out regulator output voltage. This pin requires an external capacitor between the pin and GND of 1 $\mu$ F or greater. When the on-chip LDO is used to provide power to the logic, the LD0 pin must also be connected to the VDDC pins at the board level in addition to the decoupling capacitor(s). |
|          | VDD      | K7<br>G12<br>K8<br>K9<br>H10<br>G10<br>E10<br>G11 | -        | Power                    | Positive supply for I/O and some logic.                                                                                                                                                                                                                                                                        |
|          | VDDA     | C7                                                | -        | Power                    | The positive supply (3.3 V) for the analog circuits (ADC, Analog Comparators, etc.). These are separated from VDD to minimize the electrical noise contained on VDD from affecting the analog functions. VDDA pins must be connected to 3.3 V, regardless of system implementation.                            |
|          | VDDC     | D3<br>C3                                          | -        | Power                    | Positive supply for most of the logic function, including the processor core and most peripherals.                                                                                                                                                                                                             |

Table 23-9. Signals by Function, Except for GPIO (*continued*)

| Function                | Pin Name | Pin Number                        | Pin Type | Buffer Type <sup>a</sup> | Description                                                                               |
|-------------------------|----------|-----------------------------------|----------|--------------------------|-------------------------------------------------------------------------------------------|

| USB      | USB0DM    | C11                                       | I/O      | Analog                   | Bidirectional differential data pin (D- per USB specification) for USB0.                                                                                                                                                                                      |
|          | USB0DP    | C12                                       | I/O      | Analog                   | Bidirectional differential data pin (D+ per USB specification) for USB0.                                                                                                                                                                                      |
|          | USB0EPEN  | K1<br>M1<br>L6<br>A11<br>D10              | O        | TTL                      | Optionally used in Host mode to control an external power source to supply power to the USB bus.                                                                                                                                                              |
|          | USB0ID    | E12                                       | I        | Analog                   | This signal senses the state of the USB ID signal. The USB PHY enables an integrated pull-up, and an external element (USB connector) indicates the initial state of the USB controller (pulled down is the A side of the cable and pulled up is the B side). |
|          | USB0PFLT  | L2<br>M2<br>M6<br>E11<br>B11<br>B10<br>B6 | I        | TTL                      | Optionally used in Host mode by an external power source to indicate an error state by that power source.                                                                                                                                                     |
|          | USB0RBIAS | B12                                       | O        | Analog                   | 9.1-kΩ resistor (1% precision) used internally for USB analog circuitry.                                                                                                                                                                                      |
|          | USB0VBUS  | D12                                       | I/O      | Analog                   | This signal is used during the session request protocol. This signal allows the USB PHY to both sense the voltage level of VBUS, and pull up VBUS momentarily during VBUS pulsing.                                                                            |

a. The TTL designation indicates the pin has TTL-compatible voltage levels.

## 23.3 Connections for Unused Signals

Table 23-12 on page 1231 show how to handle signals for functions that are not used in a particular system implementation for devices that are in a 100-pin LQFP package. Two options are shown in the table: an acceptable practice and a preferred practice for reduced power consumption and improved EMC characteristics. If a module is not used in a system, and its inputs are grounded, it is important that the clock to the module is never enabled by setting the corresponding bit in the **RCGCx** register.

**Table 23-12. Connections for Unused Signals (100-pin LQFP)**

| Function       | Signal Name      | Pin Number | Acceptable Practice                        | Preferred Practice                                             |
|----------------|------------------|------------|--------------------------------------------|----------------------------------------------------------------|
| GPIO           | All unused GPIOs | -          | NC                                         | GND                                                            |
| No Connects    | NC               | -          | NC                                         | NC                                                             |
| System Control | OSC0             | 48         | NC                                         | GND                                                            |
|                | OSC1             | 49         | NC                                         | NC                                                             |
|                | RST              | 48         | Pull up as shown in Figure 5-1 on page 199 | Connect through a capacitor to GND as close to pin as possible |
| USB            | USB0RBIAS        | 73         | Connect to GND through 10-kΩ resistor.     | Connect to GND through 10-kΩ resistor.                         |
|                | USB0DM           | 70         | NC                                         | GND                                                            |
|                | USB0DP           | 71         | NC                                         | GND                                                            |

Table 23-13 on page 1231 show how to handle signals for functions that are not used in a particular system implementation for devices that are in a 108-pin BGA package. Two options are shown in the table: an acceptable practice and a preferred practice for reduced power consumption and improved EMC characteristics. If a module is not used in a system, and its inputs are grounded, it is important that the clock to the module is never enabled by setting the corresponding bit in the **RCGCx** register.

**Table 23-13. Connections for Unused Signals, 108-pin BGA**

| Function    | Signal Name      | Pin Number | Acceptable Practice | Preferred Practice |
|-------------|------------------|------------|---------------------|--------------------|
| GPIO        | All unused GPIOs | -          | NC                  | GND                |
| No Connects | NC               | -          | NC                  | NC                 |

**Table 23-13. Connections for Unused Signals, 108-pin BGA (continued)**

| Function       | Signal Name | Pin Number | Acceptable Practice                            | Preferred Practice                                             |
|----------------|-------------|------------|------------------------------------------------|----------------------------------------------------------------|
| System Control | OSC0        | L11        | NC                                             | GND                                                            |
|                | OSC1        | M11        | NC                                             | NC                                                             |
|                | RST         | H11        | Pull up as shown in Figure 5-1 on page 199     | Connect through a capacitor to GND as close to pin as possible |
| USB            | USB0RBIAS   | B12        | Connect to GND through 10-k $\Omega$ resistor. | Connect to GND through 10-k $\Omega$ resistor.                 |
|                | USB0DM      | C11        | NC                                             | GND                                                            |
|                | USB0DP      | C12        | NC                                             | GND                                                            |

## 24 Operating Characteristics

**Table 24-1. Temperature Characteristics**

| Characteristic                         | Symbol | Value       | Unit |
|----------------------------------------|--------|-------------|------|
| Industrial operating temperature range | $T_A$  | -40 to +85  | °C   |
| Unpowered storage temperature range    | $T_S$  | -65 to +150 | °C   |

**Table 24-2. Thermal Characteristics**

| Characteristic                                        | Symbol        | Value                         | Unit |
|-------------------------------------------------------|---------------|-------------------------------|------|
| Thermal resistance (junction to ambient) <sup>a</sup> | $\Theta_{JA}$ | 32                            | °C/W |
| Junction temperature <sup>b</sup>                     | $T_J$         | $T_A + (P \cdot \Theta_{JA})$ | °C   |

a. Junction to ambient thermal resistance  $\Theta_{JA}$  numbers are determined by a package simulator.

b. Power dissipation is a function of temperature.

**Table 24-3. ESD Absolute Maximum Ratings<sup>a</sup>**

| Parameter Name | Min | Nom | Max | Unit |
|----------------|-----|-----|-----|------|
| $V_{ESDHBM}$   | -   | -   | 2.0 | kV   |
| $V_{ESDCDM}$   | -   | -   | 1.0 | kV   |
| $V_{ESDMM}$    | -   | -   | 100 | V    |

a. All Stellaris parts are ESD tested following the JEDEC standard.

## 25 Electrical Characteristics

### 25.1 DC Characteristics

#### 25.1.1 Maximum Ratings

The maximum ratings are the limits to which the device can be subjected without permanently damaging the device.

**Note:** The device is not guaranteed to operate properly at the maximum ratings.

**Table 25-1. Maximum Ratings**

| Parameter | Parameter Name <sup>a</sup>                                                    | Value |                | Unit |
|-----------|--------------------------------------------------------------------------------|-------|----------------|------|
|           |                                                                                | Min   | Max            |      |
| $V_{DD}$  | I/O supply voltage ( $V_{DD}$ )                                                | 0     | 4              | V    |
| $V_{DDA}$ | Analog supply voltage ( $V_{DDA}$ )                                            | 0     | 4              | V    |
| $V_{IN}$  | Input voltage                                                                  | -0.3  | 5.5            | V    |
|           | Input voltage for a GPIO configured as an analog input                         | -0.3  | $V_{DD} + 0.3$ | V    |
|           | Input voltage for PB0 and PB1 when configured as GPIO                          | -0.3  | $V_{DD} + 0.3$ | V    |
| $I$       | Maximum current per output pins                                                | -     | 25             | mA   |
| $V_{NON}$ | Maximum input voltage on a non-power pin when the microcontroller is unpowered | -     | 300            | mV   |

a. Voltages are measured with respect to GND.

**Important:** This device contains circuitry to protect the inputs against damage due to high-static voltages or electric fields; however, it is advised that normal precautions be taken to avoid application of any voltage higher than maximum-rated voltages to this high-impedance circuit. Reliability of operation is enhanced if unused inputs are connected to an appropriate logic voltage level (for example, either GND or  $V_{DD}$ ).

#### 25.1.2 Recommended DC Operating Conditions

For special high-current applications, the GPIO output buffers may be used with the following restrictions. With the GPIO pins configured as 8-mA output drivers, a total of four GPIO outputs may be used to sink current loads up to 18 mA each. At 18-mA sink current loading, the  $V_{OL}$  value is specified as 1.2 V. The high-current GPIO package pins must be selected such that there are only a maximum of two per side of the physical package or BGA pin group with the total number of high-current GPIO outputs not exceeding four for the entire package.

**Table 25-2. Recommended DC Operating Conditions**

| Parameter   | Parameter Name                                            | Min            | Nom | Max  | Unit |
|-------------|-----------------------------------------------------------|----------------|-----|------|------|
| $V_{DD}$    | I/O supply voltage                                        | 3.0            | 3.3 | 3.6  | V    |
| $V_{DDA}$   | Analog supply voltage                                     | 3.0            | 3.3 | 3.6  | V    |
| $V_{DDC}^a$ | Core supply voltage                                       | 1.08           | 1.2 | 1.32 | V    |
| $V_{IH}$    | High-level input voltage                                  | 2.0            | -   | 5.0  | V    |
|             | High-level input voltage - OSC0 single-ended clock source | $V_{DD} - 0.5$ | -   | 3.6  | V    |

**Table 25-2. Recommended DC Operating Conditions (continued)**

| Parameter  | Parameter Name                                           | Min  | Nom | Max | Unit |
|------------|----------------------------------------------------------|------|-----|-----|------|
| $V_{IL}$   | Low-level input voltage                                  | -0.3 | -   | 1.3 | V    |
|            | Low-level input voltage - OSC0 single-ended clock source | -0.3 | -   | 0.5 | V    |
| $V_{OH}^b$ | High-level output voltage                                | 2.4  | -   | -   | V    |
| $V_{OL}^a$ | Low-level output voltage                                 | -    | -   | 0.4 | V    |
| $I_{OH}$   | High-level source current, $V_{OH}=2.4$ V                |      |     |     |      |
|            | 2-mA Drive                                               | 2.0  | -   | -   | mA   |
|            | 4-mA Drive                                               | 4.0  | -   | -   | mA   |
|            | 8-mA Drive                                               | 8.0  | -   | -   | mA   |
| $I_{OL}$   | Low-level sink current, $V_{OL}=0.4$ V                   |      |     |     |      |
|            | 2-mA Drive                                               | 2.0  | -   | -   | mA   |
|            | 4-mA Drive                                               | 4.0  | -   | -   | mA   |
|            | 8-mA Drive                                               | 8.0  | -   | -   | mA   |

a.  $V_{DDC}$  is supplied from the output of the LDO.

b.  $V_{OL}$  and  $V_{OH}$  shift to 1.2 V when using high-current GPIOs.

### 25.1.3 On-Chip Low Drop-Out (LDO) Regulator Characteristics

**Table 25-3. LDO Regulator Characteristics**

| Parameter | Parameter Name                                           | Min  | Nom | Max  | Unit    |
|-----------|----------------------------------------------------------|------|-----|------|---------|
| $C_{LDO}$ | External filter capacitor size for internal power supply | 1.0  | -   | 3.0  | $\mu$ F |
| $V_{LDO}$ | LDO output voltage                                       | 1.08 | 1.2 | 1.32 | V       |

### 25.1.4 Flash Memory Characteristics

**Table 25-4. Flash Memory Characteristics**

| Parameter   | Parameter Name                                                             | Min    | Nom | Max | Unit   |
|-------------|----------------------------------------------------------------------------|--------|-----|-----|--------|
| $PE_{CYC}$  | Number of guaranteed mass program/erase cycles before failure <sup>a</sup> | 15,000 | -   | -   | cycles |
| $T_{RET}$   | Data retention at average operating temperature of 125°C                   | 10     | -   | -   | years  |
| $T_{PROG}$  | Word program time                                                          | -      | -   | 1   | ms     |
| $T_{BPROG}$ | Buffer program time                                                        | -      | -   | 1   | ms     |
| $T_{ERASE}$ | Page erase time                                                            | -      | -   | 12  | ms     |
| $T_{ME}$    | Mass erase time                                                            | -      | -   | 16  | ms     |

a. A program/erase cycle is defined as switching the bits from 1-> 0 -> 1. Caution should be used when performing block erases, as repeated block erases can shorten the number of guaranteed erase cycles, see "Flash Memory Programming" on page 301.

## 25.1.5 GPIO Module Characteristics

**Table 25-5. GPIO Module DC Characteristics**

| Parameter           | Parameter Name                          | Min | Nom | Max | Unit |
|---------------------|-----------------------------------------|-----|-----|-----|------|
| R <sub>GPIOPU</sub> | GPIO internal pull-up resistor          | 50  | -   | 110 | kΩ   |
| R <sub>GPIOPD</sub> | GPIO internal pull-down resistor        | 55  | -   | 180 | kΩ   |
| I <sub>LKG</sub>    | GPIO input leakage current <sup>a</sup> | -   | -   | 2   | μA   |

a. The leakage current is measured with GND or V<sub>DD</sub> applied to the corresponding pin(s). The leakage of digital port pins is measured individually. The port pin is configured as an input and the pullup/pulldown resistor is disabled.

## 25.1.6 USB Module Characteristics

The Stellaris<sup>®</sup> USB controller DC electrical specifications are compliant with the *Universal Serial Bus Specification Rev. 2.0* (full-speed and low-speed support) and the *On-The-Go Supplement to the USB 2.0 Specification Rev. 1.0*. Some components of the USB system are integrated within the LM3S5791 microcontroller and specific to the Stellaris microcontroller design. An external component resistor is needed as specified in Table 25-6.

**Table 25-6. USB Controller DC Characteristics**

| Parameter          | Parameter Name                                       | Value      | Unit |
|--------------------|------------------------------------------------------|------------|------|
| R <sub>UBIAS</sub> | Value of the pull-down resistor on the USB0RBIAS pin | 9.1K ± 1 % | Ω    |

## 25.1.7 Current Specifications

This section provides information on typical and maximum power consumption under various conditions. Unless otherwise indicated, current consumption numbers include use of the on-chip LDO regulator and therefore include I<sub>DDC</sub>.

### 25.1.7.1 Nominal Power Consumption

The following table provides nominal figures for current consumption.

**Table 25-7. Nominal Power Consumption**

| Parameter                 | Parameter Name          | Conditions                                                                                                                                   | Nom | Unit |
|---------------------------|-------------------------|----------------------------------------------------------------------------------------------------------------------------------------------|-----|------|
| I <sub>DD_RUN</sub>       | Run mode 1 (Flash loop) | V <sub>DD</sub> = 3.3 V<br>Code= while(1){} executed out of Flash<br>Peripherals = All ON<br>System Clock = 50 MHz (with PLL)<br>Temp = 25°C | 56  | mA   |
| I <sub>DD_SLEEP</sub>     | Sleep mode              | V <sub>DD</sub> = 3.3 V<br>Peripherals = All clock gated<br>System Clock = 50 MHz (with PLL)<br>Temp = 25°C                                  | 8   | mA   |
| I <sub>DD_DEEPSLEEP</sub> | Deep-sleep mode         | Peripherals = All OFF<br>System Clock = IOS30KHZ/64<br>Temp = 25°C                                                                           | 550 | μA   |

### 25.1.7.2 Maximum Current Specifications

The current measurements specified in the table that follows are maximum values under the following conditions:

- $V_{DD} = 3.6\text{ V}$
- $V_{DDC} = 1.2\text{ V}$
- $V_{DDA} = 3.6\text{ V}$
- Temperature =  $25^{\circ}\text{C}$
- Clock source (MOSC) = 3.579545-MHz crystal oscillator

**Table 25-8. Detailed Current Specifications**

| Parameter           | Parameter Name           | Conditions                                                                                                                                                          | Max     | Unit |
|---------------------|--------------------------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------|---------|------|
| $I_{DD\_RUN}$       | Run mode 1 (Flash loop)  | $V_{DD} = 3.6\text{ V}$<br>Code= while(1){} executed out of Flash<br>Peripherals = All ON<br>System Clock = 80 MHz (with PLL)<br>Temperature = $25^{\circ}\text{C}$ | 97      | mA   |
| $I_{DD\_SLEEP}$     | Sleep mode               | $V_{DD} = 3.6\text{ V}$<br>Peripherals = All Clock Gated<br>System Clock = 80 MHz (with PLL)<br>Temperature = $25^{\circ}\text{C}$                                  | 19      | mA   |
| $I_{DD\_DEEPSLEEP}$ | Deep-Sleep mode          | $V_{DD} = 3.6\text{ V}$<br>Peripherals = All Clock Gated<br>System Clock = 80 MHz<br>Temperature = $25^{\circ}\text{C}$                                             | 1.4     | mA   |
| $I_{DD\_PROGRAM}$   | Programming Flash memory | $V_{DD} = 3.6\text{ V}$<br>Peripherals = All OFF<br>System Clock = 80 MHz<br>Temperature = $25^{\circ}\text{C}$                                                     | pending | mA   |
| $I_{DD\_ERASE}$     | Erasing Flash memory     | $V_{DD} = 3.6\text{ V}$<br>Peripherals = All OFF<br>System Clock = 80 MHz<br>Temperature = $25^{\circ}\text{C}$                                                     | pending | mA   |

**Table 25-9. External  $V_{DDC}$  Source Current Specifications**

| Parameter      | Parameter Name                             | Conditions                                                                                                                                                                                      | Max | Unit |
|----------------|--------------------------------------------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|-----|------|
| $I_{DDC\_RUN}$ | Run mode 1 (Flash loop), $V_{DDC}$ current | $V_{DD} = 3.6\text{ V}$<br>$V_{DDC} = 1.2\text{ V}$<br>Code= while(1){} executed out of Flash<br>Peripherals = All ON<br>System Clock = 80 MHz (with PLL)<br>Temperature = $25^{\circ}\text{C}$ | 94  | mA   |

### 25.1.7.3 Typical Current Consumption vs. Frequency

Figure 25-1 on page 1238 shows how typical current varies with frequency when bypassing the PLL. Conditions are as follows:

- Executing while (1) out of Flash memory
- All peripherals on
- $V_{DD} = 3.3\text{ V}$

- $V_{DDC} = 1.2\text{ V}$
- $V_{DDA} = 3.3\text{ V}$
- Temperature =  $25^{\circ}\text{C}$

**Table 25-10. Current Consumption vs. Frequency, PLL Bypassed**

| Frequency (MHz) | $I_{DD\_RUN}$ (mA) |
|-----------------|--------------------|
| 1               | 21                 |
| 8               | 21                 |
| 16              | 28                 |

**Figure 25-1. Typical Current Across Frequency, PLL Bypassed**

Figure 25-2 on page 1239 shows how typical current varies with frequency when using the PLL. Conditions are as follows:

- Executing while (1) out of Flash memory
- All peripherals on
- $V_{DD} = 3.3\text{ V}$
- $V_{DDC} = 1.2\text{ V}$
- $V_{DDA} = 3.3\text{ V}$
- Temperature =  $25^{\circ}\text{C}$
- Clock source (MOSC) = 16-MHz crystal oscillator

Table 25-11. Current Consumption vs. Frequency, Using PLL

| Frequency (MHz) | I <sub>DD_RUN</sub> (mA) |
|-----------------|--------------------------|
| 6.25            | 23                       |
| 12.5            | 28                       |
| 25              | 38                       |
| 50              | 57                       |
| 80              | 81                       |

Figure 25-2. Typical Current Across Frequency, Using PLL

## 25.2 AC Characteristics

### 25.2.1 Load Conditions

Unless otherwise specified, the following conditions are true for all timing measurements.

Figure 25-3. Load Conditions

### 25.2.2 Clocks

The following sections provide specifications on the various clock sources and mode.

### 25.2.2.1 PLL Specifications

The following tables provide specifications for using the PLL.

**Table 25-12. Phase Locked Loop (PLL) Characteristics**

| Parameter             | Parameter Name                        | Min                | Nom | Max               | Unit |
|-----------------------|---------------------------------------|--------------------|-----|-------------------|------|
| f <sub>REF_XTAL</sub> | Crystal reference <sup>a</sup>        | 3.579545           | -   | 16.384            | MHz  |
| f <sub>REF_EXT</sub>  | External clock reference <sup>a</sup> | 3.579545           | -   | 16.384            | MHz  |
| f <sub>PLL</sub>      | PLL frequency <sup>b</sup>            | -                  | 400 | -                 | MHz  |
| T <sub>READY</sub>    | PLL lock time                         | 0.562 <sup>c</sup> | -   | 1.38 <sup>d</sup> | ms   |

a. The exact value is determined by the crystal value programmed into the XTAL field of the **Run-Mode Clock Configuration (RCC)** register.

b. PLL frequency is automatically calculated by the hardware based on the XTAL field of the **RCC** register.

c. Using a 16.384-MHz crystal

d. Using 3.5795-MHz crystal

Table 25-13 on page 1240 shows the actual frequency of the PLL based on the crystal frequency used (defined by the XTAL field in the **RCC** register).

**Table 25-13. Actual PLL Frequency**

| XTAL | Crystal Frequency (MHz) | PLL Frequency (MHz) | Error   |
|------|-------------------------|---------------------|---------|
| 0x04 | 3.5795                  | 400.904             | 0.0023% |
| 0x05 | 3.6864                  | 398.1312            | 0.0047% |
| 0x06 | 4.0                     | 400                 | -       |
| 0x07 | 4.096                   | 401.408             | 0.0035% |
| 0x08 | 4.9152                  | 398.1312            | 0.0047% |
| 0x09 | 5.0                     | 400                 | -       |
| 0x0A | 5.12                    | 399.36              | 0.0016% |
| 0x0B | 6.0                     | 400                 | -       |
| 0x0C | 6.144                   | 399.36              | 0.0016% |
| 0x0D | 7.3728                  | 398.1312            | 0.0047% |
| 0x0E | 8.0                     | 400                 | 0.0047% |
| 0x0F | 8.192                   | 398.6773333         | 0.0033% |
| 0x10 | 10.0                    | 400                 | -       |
| 0x11 | 12.0                    | 400                 | -       |
| 0x12 | 12.288                  | 401.408             | 0.0035% |
| 0x13 | 13.56                   | 397.76              | 0.0056% |
| 0x14 | 14.318                  | 400.90904           | 0.0023% |
| 0x15 | 16.0                    | 400                 | -       |

### 25.2.2.2 PIOSC Specifications

**Table 25-14. PIOSC Clock Characteristics**

| Parameter            | Parameter Name                                                                       | Min | Nom    | Max | Unit |
|----------------------|--------------------------------------------------------------------------------------|-----|--------|-----|------|
| f <sub>PIOSC25</sub> | Internal 16-MHz precision oscillator frequency variance, factory calibrated at 25 °C | -   | ±0.25% | ±1% | -    |

Table 25-14. PIOSC Clock Characteristics (continued)

| Parameter   | Parameter Name                                                                                                           | Min | Nom | Max | Unit |
|-------------|--------------------------------------------------------------------------------------------------------------------------|-----|-----|-----|------|
| $f_{PIOSC}$ | Internal 16-MHz precision oscillator frequency variance, factory calibrated at 25 °C, across specified temperature range | -   | -   | ±3% | -    |

### 25.2.2.3 Internal 30-kHz Oscillator Specifications

Table 25-15. 30-kHz Clock Characteristics

| Parameter       | Parameter Name                       | Min | Nom | Max | Unit |
|-----------------|--------------------------------------|-----|-----|-----|------|
| $f_{IOSC30KHZ}$ | Internal 30-KHz oscillator frequency | 15  | 30  | 45  | KHz  |

### 25.2.2.4 Main Oscillator Specifications

Table 25-16. Main Oscillator Clock Characteristics

| Parameter               | Parameter Name                                                                | Min  | Nom | Max    | Unit |
|-------------------------|-------------------------------------------------------------------------------|------|-----|--------|------|
| $f_{MOSC}$              | Main oscillator frequency                                                     | 1    | -   | 16.384 | MHz  |
| $t_{MOSC\_PER}$         | Main oscillator period                                                        | 61   | -   | 1000   | ns   |
| $t_{MOSC\_SETTLE}$      | Main oscillator settling time                                                 | 17.5 | -   | 20     | ms   |
| $f_{REF\_XTAL\_BYPASS}$ | Crystal reference using the main oscillator (PLL in BYPASS mode) <sup>a</sup> | 1    | -   | 16.384 | MHz  |
| $f_{REF\_EXT\_BYPASS}$  | External clock reference (PLL in BYPASS mode) <sup>a</sup>                    | 0    | -   | 80     | MHz  |

a. The ADC must be clocked from the PLL or directly from a 16-MHz clock source to operate properly.

Table 25-17. MOSC Oscillator Input Characteristics

| Name                               | Value |      |      |      |      |      | Condition |
|------------------------------------|-------|------|------|------|------|------|-----------|
| Frequency                          | 16    | 12   | 8    | 6    | 4    | 3.5  | MHz       |
| Frequency tolerance                | ±100  | ±100 | ±100 | ±100 | ±100 | ±100 | PPM       |
| Equivalent series resistance (max) | 70    | 90   | 120  | 160  | 200  | 220  | Ω         |
| Load capacitance                   | 16    | 16   | 16   | 16   | 16   | 16   | pF        |
| Drive level (typ)                  | 100   | 100  | 100  | 100  | 100  | 100  | μw        |

### 25.2.2.5 System Clock Specifications with ADC Operation

Table 25-18. System Clock Characteristics with ADC Operation

| Parameter    | Parameter Name                                                                 | Min | Nom | Max | Unit |
|--------------|--------------------------------------------------------------------------------|-----|-----|-----|------|
| $f_{sysadc}$ | System clock frequency when the ADC module is operating (when PLL is bypassed) | 16  | -   | -   | MHz  |

## 25.2.3 Power and Brown-out Characteristics

Table 25-19. Power Characteristics

| Parameter No. | Parameter | Parameter Name            | Min  | Nom | Max  | Unit |
|---------------|-----------|---------------------------|------|-----|------|------|
| P1            | $V_{TH}$  | Power-On Reset threshold  | -    | 2   | -    | V    |
| P2            | $V_{BTH}$ | Brown-Out Reset threshold | 2.85 | 2.9 | 2.95 | V    |

Table 25-19. Power Characteristics (*continued*)

| Parameter No.    | Parameter       | Parameter Name                                        | Min | Nom | Max | Unit    |
|------------------|-----------------|-------------------------------------------------------|-----|-----|-----|---------|
| P3               | $T_{POR}$       | Power-On Reset timeout                                | 6   | -   | 18  | ms      |
| P4               | $T_{BOR}$       | Brown-Out timeout                                     | -   | 500 | -   | $\mu$ s |
| P5               | $T_{IRPOR}$     | Internal reset timeout after POR                      | -   | -   | 2   | ms      |
| P6               | $T_{IRBOR}$     | Internal reset timeout after BOR                      | -   | -   | 2   | ms      |
| P7               | $T_{VDDRISE}$   | Supply voltage ( $V_{DD}$ ) rise time (0V-3.0V)       | -   | -   | 10  | ms      |
| P8               | $T_{VDD2\_3}$   | Supply voltage ( $V_{DD}$ ) rise time (2.0V-3.0V)     | -   | -   | 6   | ms      |
| P10 <sup>a</sup> | $V_{START}$     | $V_{DD}$ and $V_{DDC}$ voltage ramp start             | -   | -   | 0.2 | V       |
| P11 <sup>a</sup> | $V_{VDDC\_REQ}$ | $V_{DDC}$ voltage minimum when $V_{DD}$ reaches 1.5 V | 1.0 | -   | -   | V       |

a. This specification only applies when supplying  $V_{DDC}$  using an external regulator.

## 25.2.4 JTAG and Boundary Scan

Table 25-20. JTAG Characteristics

| Parameter No. | Parameter | Parameter Name                               | Min | Nom | Max | Unit |
|---------------|-----------|----------------------------------------------|-----|-----|-----|------|
| J1            | $f_{TCK}$ | TCK operational clock frequency <sup>a</sup> | 0   | -   | 10  | MHz  |
| J2            | $t_{TCK}$ | TCK operational clock period                 | 100 | -   | -   | ns   |

Table 25-20. JTAG Characteristics (continued)

| Parameter No.         | Parameter                              | Parameter Name                    | Min | Nom       | Max | Unit |
|-----------------------|----------------------------------------|-----------------------------------|-----|-----------|-----|------|
| J3                    | $t_{TCK\_LOW}$                         | TCK clock Low time                | -   | $t_{TCK}$ | -   | ns   |
| J4                    | $t_{TCK\_HIGH}$                        | TCK clock High time               | -   | $t_{TCK}$ | -   | ns   |
| J5                    | $t_{TCK\_R}$                           | TCK rise time                     | 0   | -         | 10  | ns   |
| J6                    | $t_{TCK\_F}$                           | TCK fall time                     | 0   | -         | 10  | ns   |
| J7                    | $t_{TMS\_SU}$                          | TMS setup time to TCK rise        | 20  | -         | -   | ns   |
| J8                    | $t_{TMS\_HLD}$                         | TMS hold time from TCK rise       | 20  | -         | -   | ns   |
| J9                    | $t_{TDI\_SU}$                          | TDI setup time to TCK rise        | 25  | -         | -   | ns   |
| J10                   | $t_{TDI\_HLD}$                         | TDI hold time from TCK rise       | 25  | -         | -   | ns   |
| J11<br>$t_{TDO\_ZDV}$ | TCK fall to Data Valid from High-Z     | 2-mA drive                        | -   | 23        | 35  | ns   |
|                       |                                        | 4-mA drive                        |     | 15        | 26  | ns   |
|                       |                                        | 8-mA drive                        |     | 14        | 25  | ns   |
|                       |                                        | 8-mA drive with slew rate control |     | 18        | 29  | ns   |
| J12<br>$t_{TDO\_DV}$  | TCK fall to Data Valid from Data Valid | 2-mA drive                        | -   | 21        | 35  | ns   |
|                       |                                        | 4-mA drive                        |     | 14        | 25  | ns   |
|                       |                                        | 8-mA drive                        |     | 13        | 24  | ns   |
|                       |                                        | 8-mA drive with slew rate control |     | 18        | 28  | ns   |
| J13<br>$t_{TDO\_DVZ}$ | TCK fall to High-Z from Data Valid     | 2-mA drive                        | -   | 9         | 11  | ns   |
|                       |                                        | 4-mA drive                        |     | 7         | 9   | ns   |
|                       |                                        | 8-mA drive                        |     | 6         | 8   | ns   |
|                       |                                        | 8-mA drive with slew rate control |     | 7         | 9   | ns   |

a. A ratio of at least 8:1 must be kept between the system clock and TCK.

Figure 25-9. JTAG Test Access Port (TAP) Timing

## 25.2.5 Reset

Table 25-21. Reset Characteristics

| Parameter No. | Parameter   | Parameter Name                                               | Min | Nom | Max | Unit    |
|---------------|-------------|--------------------------------------------------------------|-----|-----|-----|---------|
| R1            | $T_{IRHWR}$ | Internal reset timeout after hardware reset (RST pin)        | -   | -   | 2   | ms      |
| R2            | $T_{IRSWR}$ | Internal reset timeout after software-initiated system reset | -   | -   | 2   | ms      |
| R3            | $T_{IRWDR}$ | Internal reset timeout after watchdog reset                  | -   | -   | 2   | ms      |
| R4            | $T_{IRMFR}$ | Internal reset timeout after MOSC failure reset              | -   | -   | 2   | ms      |
| R5            | $T_{MIN}$   | Minimum RST pulse width                                      | 2   | -   | -   | $\mu$ s |

Figure 25-10. External Reset Timing ( $\overline{\text{RST}}$ )

Figure 25-11. Software Reset Timing

Figure 25-12. Watchdog Reset Timing

Figure 25-13. MOSC Failure Reset Timing

## 25.2.6 Sleep Modes

Table 25-22. Sleep Modes AC Characteristics<sup>a</sup>

| Parameter No | Parameter          | Parameter Name                                                             | Min | Nom | Max         | Unit          |
|--------------|--------------------|----------------------------------------------------------------------------|-----|-----|-------------|---------------|
| D1           | $t_{WAKE\_S}$      | Time to wake from interrupt in sleep or deep-sleep mode, not using the PLL | -   | -   | 7           | system clocks |
| D2           | $t_{WAKE\_PLL\_S}$ | Time to wake from interrupt in sleep or deep-sleep mode when using the PLL | -   | -   | $T_{READY}$ | ms            |
| D3           | $t_{ENTER\_DS}$    | Time to enter deep-sleep mode from sleep request                           | -   | 0   | $16^b$      | ms            |

a. Values in this table assume the IOSC is the clock source during sleep or deep-sleep mode.

b. Nominal specification occurs 99.9995% of the time.

## 25.2.7 General-Purpose I/O (GPIO)

**Note:** All GPIOs are 5-V tolerant.

Table 25-23. GPIO Characteristics

| Parameter   | Parameter Name                                | Condition                         | Min | Nom | Max | Unit |
|-------------|-----------------------------------------------|-----------------------------------|-----|-----|-----|------|
| $t_{GPIOR}$ | GPIO Rise Time (from 20% to 80% of $V_{DD}$ ) | 2-mA drive                        | -   | 14  | 20  | ns   |
|             |                                               | 4-mA drive                        |     | 7   | 10  | ns   |
|             |                                               | 8-mA drive                        |     | 4   | 5   | ns   |
|             |                                               | 8-mA drive with slew rate control |     | 6   | 8   | ns   |
| $t_{GPIOF}$ | GPIO Fall Time (from 80% to 20% of $V_{DD}$ ) | 2-mA drive                        | -   | 14  | 21  | ns   |
|             |                                               | 4-mA drive                        |     | 7   | 11  | ns   |
|             |                                               | 8-mA drive                        |     | 4   | 6   | ns   |
|             |                                               | 8-mA drive with slew rate control |     | 6   | 8   | ns   |

## 25.2.8 External Peripheral Interface (EPI)

When the EPI module is in SDRAM mode, the drive strength must be configured to 8 mA. Table 25-24 on page 1247 shows the rise and fall times in SDRAM mode with 16 pF load conditions. When the EPI module is in Host-Bus or General-Purpose mode, the values in Table 25-23 on page 1246 should be used.

**Table 25-24. EPI SDRAM Characteristics**

| Parameter           | Parameter Name                                      | Condition                 | Min | Nom | Max | Unit |
|---------------------|-----------------------------------------------------|---------------------------|-----|-----|-----|------|
| $t_{\text{SDRAMR}}$ | EPI Rise Time (from 20% to 80% of $V_{\text{DD}}$ ) | 8-mA drive, $C_L = 16$ pF | -   | 2   | 3   | ns   |
| $t_{\text{SDRAMF}}$ | EPI Fall Time (from 80% to 20% of $V_{\text{DD}}$ ) | 8-mA drive, $C_L = 16$ pF | -   | 2   | 3   | ns   |

**Table 25-25. EPI SDRAM Interface Characteristics<sup>a</sup>**

| Parameter No | Parameter        | Parameter Name         | Min | Nom | Max | Unit          |
|--------------|------------------|------------------------|-----|-----|-----|---------------|
| E1           | $t_{\text{CK}}$  | SDRAM Clock period     | 20  | -   | -   | ns            |
| E2           | $t_{\text{CH}}$  | SDRAM Clock high time  | 10  | -   | -   | ns            |
| E3           | $t_{\text{CL}}$  | SDRAM Clock low time   | 10  | -   | -   | ns            |
| E4           | $t_{\text{COV}}$ | CLK to output valid    | -5  | -   | 5   | ns            |
| E5           | $t_{\text{COI}}$ | CLK to output invalid  | -5  | -   | 5   | ns            |
| E6           | $t_{\text{COT}}$ | CLK to output tristate | -5  | -   | 5   | ns            |
| E7           | $t_{\text{S}}$   | Input set up to CLK    | 10  | -   | -   | ns            |
| E8           | $t_{\text{H}}$   | CLK to input hold      | 0   | -   | -   | ns            |
| E9           | $t_{\text{PU}}$  | Power-up time          | 100 | -   | -   | $\mu\text{s}$ |
| E10          | $t_{\text{RP}}$  | Precharge all banks    | 20  | -   | -   | ns            |
| E11          | $t_{\text{RFC}}$ | Auto refresh           | 66  | -   | -   | ns            |
| E12          | $t_{\text{MRD}}$ | Program mode register  | 40  | 40  | 40  | ns            |

a. The EPI SDRAM interface must use 8-mA drive.

**Figure 25-14. SDRAM Initialization and Load Mode Register Timing**

**Notes:**

1. If CS is high at clock high time, all applied commands are NOP.
2. The Mode register may be loaded prior to the auto refresh cycles if desired.
3. JEDEC and PC100 specify three clocks.
4. Outputs are guaranteed High-Z after command is issued.

## 25.2.9 Analog-to-Digital Converter (ADC)

**Table 25-28. ADC Characteristics<sup>a</sup>**

| Parameter            | Parameter Name                                                                  | Min   | Nom | Max                 | Unit               |
|----------------------|---------------------------------------------------------------------------------|-------|-----|---------------------|--------------------|
| $V_{\text{ADCIIN}}$  | Maximum single-ended, full-scale analog input voltage, using internal reference | -     | -   | 3.0                 | V                  |
|                      | Maximum single-ended, full-scale analog input voltage, using external reference | -     | -   | $V_{\text{REFA}}$   | V                  |
|                      | Minimum single-ended, full-scale analog input voltage                           | 0.0   | -   | -                   | V                  |
|                      | Maximum differential, full-scale analog input voltage, using internal reference | -     | -   | 1.5                 | V                  |
|                      | Maximum differential, full-scale analog input voltage, using external reference | -     | -   | $V_{\text{REFA}}/2$ | V                  |
|                      | Minimum differential, full-scale analog input voltage                           | 0.0   | -   | -                   | V                  |
| N                    | Resolution                                                                      | 10    |     |                     | bits               |
| $f_{\text{ADC}}$     | ADC internal clock frequency <sup>b</sup>                                       | 14    | 16  | 18                  | MHz                |
| $t_{\text{ADCCONV}}$ | Conversion time <sup>c</sup>                                                    | 1     |     |                     | $\mu\text{s}$      |
| $f_{\text{ADCCONV}}$ | Conversion rate <sup>c</sup>                                                    | 1000  |     |                     | k samples/s        |
| $t_{\text{ADCSAMP}}$ | Sample time                                                                     | 187.5 | -   | -                   | ns                 |
| $t_{\text{LT}}$      | Latency from trigger to start of conversion                                     | -     | 2   | -                   | system clocks      |
| $I_{\text{L}}$       | ADC input leakage                                                               | -     | -   | $\pm 1.0$           | $\mu\text{A}$      |
| $R_{\text{ADC}}$     | ADC equivalent resistance                                                       | -     | -   | 10                  | $\text{k}\Omega$   |
| $C_{\text{ADC}}$     | ADC equivalent capacitance                                                      | 0.9   | 1.0 | 1.1                 | pF                 |
| $E_{\text{L}}$       | Integral nonlinearity error                                                     | -     | -   | $\pm 1$             | LSB                |
| $E_{\text{D}}$       | Differential nonlinearity error                                                 | -     | -   | $\pm 1$             | LSB                |
| $E_{\text{O}}$       | Offset error                                                                    | -     | -   | $\pm 1$             | LSB                |
| $E_{\text{G}}$       | Full-scale gain error                                                           | -     | -   | $\pm 3$             | LSB                |
| $E_{\text{TS}}$      | Temperature sensor accuracy                                                     | -     | -   | $\pm 5$             | $^{\circ}\text{C}$ |

a. The ADC reference voltage is 3.0 V. This reference voltage is internally generated from the 3.3 VDDA supply by a band gap circuit.

b. The ADC must be clocked from the PLL or directly from an external clock source to operate properly.

c. The conversion time and rate scale from the specified number if the ADC internal clock frequency is any value other than 16 MHz.

Figure 25-23. ADC Input Equivalency Diagram

Table 25-29. ADC Module External Reference Characteristics<sup>a</sup>

| Parameter  | Parameter Name                                  | Min | Nom       | Max  | Unit    |
|------------|-------------------------------------------------|-----|-----------|------|---------|
| $V_{REFA}$ | External voltage reference for ADC <sup>b</sup> | 2.4 | -         | 3.06 | V       |
| $I_L$      | External voltage reference leakage current      | -   | $\pm 1.0$ | -    | $\mu A$ |

a. Care must be taken to supply a reference voltage of acceptable quality.

b. Ground is always used as the reference level for the minimum conversion value.

Table 25-30. ADC Module Internal Reference Characteristics

| Parameter  | Parameter Name                                  | Min | Nom | Max       | Unit |
|------------|-------------------------------------------------|-----|-----|-----------|------|
| $V_{REFI}$ | Internal voltage reference for ADC              | -   | 3.0 | -         | V    |
| $E_{IR}$   | Variation across temperature for a given device | -   | -   | $\pm 2.5$ | %    |

## 25.2.10 Synchronous Serial Interface (SSI)

Table 25-31. SSI Characteristics

| Parameter No. | Parameter       | Parameter Name                     | Min | Nom | Max   | Unit          |
|---------------|-----------------|------------------------------------|-----|-----|-------|---------------|
| S1            | $t_{CLK\_PER}$  | SSIClk cycle time                  | 2   | -   | 65024 | system clocks |
| S2            | $t_{CLK\_HIGH}$ | SSIClk high time                   | -   | 0.5 | -     | t clk_per     |
| S3            | $t_{CLK\_LOW}$  | SSIClk low time                    | -   | 0.5 | -     | t clk_per     |
| S4            | $t_{CLKRF}$     | SSIClk rise/fall time <sup>a</sup> | -   | 4   | 6     | ns            |
| S5            | $t_{DMD}$       | Data from master valid delay time  | 0   | -   | 1     | system clocks |
| S6            | $t_{DMS}$       | Data from master setup time        | 1   | -   | -     | system clocks |
| S7            | $t_{DMH}$       | Data from master hold time         | 2   | -   | -     | system clocks |
| S8            | $t_{DSS}$       | Data from slave setup time         | 1   | -   | -     | system clocks |
| S9            | $t_{DSH}$       | Data from slave hold time          | 2   | -   | -     | system clocks |

a. Note that the delays shown are using 8-mA drive strength.

**Figure 25-26. SSI Timing for SPI Frame Format (FRF=00), with SPH=1**

## 25.2.11 Inter-Integrated Circuit (I<sup>2</sup>C) Interface

**Table 25-32. I<sup>2</sup>C Characteristics**

| Parameter No.   | Parameter  | Parameter Name                                                             | Min | Nom | Max          | Unit          |
|-----------------|------------|----------------------------------------------------------------------------|-----|-----|--------------|---------------|
| 11 <sup>a</sup> | $t_{SCH}$  | Start condition hold time                                                  | 36  | -   | -            | system clocks |
| 12 <sup>a</sup> | $t_{LP}$   | Clock Low period                                                           | 36  | -   | -            | system clocks |
| 13 <sup>b</sup> | $t_{SRT}$  | I2CSCL/I2CSDA rise time ( $V_{IL}=0.5\text{ V}$ to $V_{IH}=2.4\text{ V}$ ) | -   | -   | (see note b) | ns            |
| 14 <sup>a</sup> | $t_{DH}$   | Data hold time                                                             | 2   | -   | -            | system clocks |
| 15 <sup>c</sup> | $t_{SFT}$  | I2CSCL/I2CSDA fall time ( $V_{IH}=2.4\text{ V}$ to $V_{IL}=0.5\text{ V}$ ) | -   | 9   | 10           | ns            |
| 16 <sup>a</sup> | $t_{HT}$   | Clock High time                                                            | 24  | -   | -            | system clocks |
| 17 <sup>a</sup> | $t_{DS}$   | Data setup time                                                            | 18  | -   | -            | system clocks |
| 18 <sup>a</sup> | $t_{SCSR}$ | Start condition setup time (for repeated start condition only)             | 36  | -   | -            | system clocks |
| 19 <sup>a</sup> | $t_{SCS}$  | Stop condition setup time                                                  | 24  | -   | -            | system clocks |

a. Values depend on the value programmed into the TPR bit in the **I<sup>2</sup>C Master Timer Period (I2CMTPR)** register; a TPR programmed for the maximum I2CSCL frequency (TPR=0x2) results in a minimum output timing as shown in the table above. The I<sup>2</sup>C interface is designed to scale the actual data transition time to move it to the middle of the I2CSCL Low period. The actual position is affected by the value programmed into the TPR; however, the numbers given in the above values are minimum values.

b. Because I2CSCL and I2CSDA are open-drain-type outputs, which the controller can only actively drive Low, the time I2CSCL or I2CSDA takes to reach a high level depends on external signal capacitance and pull-up resistor values.

c. Specified at a nominal 50 pF load.

Figure 25-27. I<sup>2</sup>C Timing

## 25.2.12 Inter-Integrated Circuit Sound (I<sup>2</sup>S) Interface

Table 25-33. I<sup>2</sup>S Master Clock (Receive and Transmit)

| Parameter No. | Parameter        | Parameter Name | Min                           | Nom | Max | Unit |
|---------------|------------------|----------------|-------------------------------|-----|-----|------|
| M1            | $t_{MCLK\_PER}$  | Cycle time     | 20.3                          | -   | -   | ns   |
| M2            | $t_{MCLKRF}$     | Rise/fall time | See Table 25-23 on page 1246. |     |     | ns   |
| M3            | $t_{MCLK\_HIGH}$ | High time      | 10                            | -   | -   | ns   |
| M4            | $t_{MCLK\_LOW}$  | Low time       | 10                            | -   | -   | ns   |
| M5            | $t_{MDC}$        | Duty cycle     | 48                            | -   | 52  | %    |
| M6            | $t_{MJITTER}$    | Jitter         | -                             | -   | 2.5 | ns   |

Table 25-34. I<sup>2</sup>S Slave Clock (Receive and Transmit)

| Parameter No. | Parameter        | Parameter Name | Min | Nom | Max | Unit |
|---------------|------------------|----------------|-----|-----|-----|------|
| M7            | $t_{SCLK\_PER}$  | Cycle time     | 80  | -   | -   | ns   |
| M8            | $t_{SCLK\_HIGH}$ | High time      | 40  | -   | -   | ns   |
| M9            | $t_{SCLK\_LOW}$  | Low time       | 40  | -   | -   | ns   |
| M10           | $t_{SDC}$        | Duty cycle     | -   | 50  | -   | %    |

### 25.2.13 Universal Serial Bus (USB) Controller

The Stellaris USB controller AC electrical specifications are compliant with the *Universal Serial Bus Specification Rev. 2.0* (full-speed and low-speed support) and the *On-The-Go Supplement to the USB 2.0 Specification Rev. 1.0*.

## 25.2.14 Analog Comparator

**Table 25-37. Analog Comparator Characteristics**

| Parameter | Parameter Name                         | Min | Nom      | Max          | Unit    |
|-----------|----------------------------------------|-----|----------|--------------|---------|
| $V_{OS}$  | Input offset voltage                   | -   | $\pm 10$ | $\pm 25$     | mV      |
| $V_{CM}$  | Input common mode voltage range        | 0   | -        | $V_{DD}-1.5$ | V       |
| $C_{MRR}$ | Common mode rejection ratio            | 50  | -        | -            | dB      |
| $T_{RT}$  | Response time                          | -   | -        | 1            | $\mu s$ |
| $T_{MC}$  | Comparator mode change to Output Valid | -   | -        | 10           | $\mu s$ |

**Table 25-38. Analog Comparator Voltage Reference Characteristics**

| Parameter | Parameter Name               | Min | Nom         | Max       | Unit |
|-----------|------------------------------|-----|-------------|-----------|------|
| $R_{HR}$  | Resolution high range        | -   | $V_{DD}/31$ | -         | LSB  |
| $R_{LR}$  | Resolution low range         | -   | $V_{DD}/23$ | -         | LSB  |
| $A_{HR}$  | Absolute accuracy high range | -   | -           | $\pm 1/2$ | LSB  |
| $A_{LR}$  | Absolute accuracy low range  | -   | -           | $\pm 1/4$ | LSB  |

# A Register Quick Reference

## B Ordering and Contact Information

### B.1 Ordering Information

**Table B-1. Part Ordering Information**

| Orderable Part Number | Description                                                                          |
|-----------------------|--------------------------------------------------------------------------------------|
| LM3S5791-IQC80-C5     | Stellaris® LM3S5791 Microcontroller Industrial Temperature 100-pin LQFP              |
| LM3S5791-IBZ80-C5     | Stellaris LM3S5791 Microcontroller Industrial Temperature 108-ball BGA               |
| LM3S5791-IQC80-C5T    | Stellaris LM3S5791 Microcontroller Industrial Temperature 100-pin LQFP Tape-and-reel |
| LM3S5791-IBZ80-C5T    | Stellaris LM3S5791 Microcontroller Industrial Temperature 108-ball BGA Tape-and-reel |

### B.2 Part Markings

The Stellaris microcontrollers are marked with an identifying number. This code contains the following information:

- The first line indicates the part number. In the example figure below, this is the LM3S9B90.
- In the second line, the first seven characters indicate the temperature, package, speed, and revision. In the example below, this is an Industrial temperature (I), 100-pin LQFP package (QC), 80-MHz (80), revision C0 (C0) device.
- The remaining characters contain internal tracking numbers.

## **B.3 Kits**

The Stellaris Family provides the hardware and software tools that engineers need to begin development quickly.

- Reference Design Kits accelerate product development by providing ready-to-run hardware and comprehensive documentation including hardware design files
- Evaluation Kits provide a low-cost and effective means of evaluating Stellaris microcontrollers before purchase
- Development Kits provide you with all the tools you need to develop and prototype embedded applications right out of the box

See the website at [www.ti.com/stellaris](http://www.ti.com/stellaris) for the latest tools available, or ask your distributor.

## **B.4 Support Information**

For support on Stellaris products, contact the TI Worldwide Product Information Center nearest you: <http://www-k.ext.ti.com/sc/technical-support/product-information-centers.htm>.

## C Package Information

### C.1 100-Pin LQFP Package

#### C.1.1 Package Dimensions

Figure C-1. 100-Pin LQFP Package Dimensions

**Note:** The following notes apply to the package drawing.

1. All dimensions shown in mm.
2. Dimensions shown are nominal with tolerances indicated.
3. Foot length 'L' is measured at gage plane 0.25 mm above seating plane.

| Body +2.00 mm Footprint, 1.4 mm package thickness |             |                     |
|---------------------------------------------------|-------------|---------------------|
| Symbols                                           | Leads       | 100L                |
| A                                                 | Max.        | 1.60                |
| A <sub>1</sub>                                    | -           | 0.05 Min./0.15 Max. |
| A <sub>2</sub>                                    | ±0.05       | 1.40                |
| D                                                 | ±0.20       | 16.00               |
| D <sub>1</sub>                                    | ±0.05       | 14.00               |
| E                                                 | ±0.20       | 16.00               |
| E <sub>1</sub>                                    | ±0.05       | 14.00               |
| L                                                 | +0.15/-0.10 | 0.60                |
| e                                                 | Basic       | 0.50                |
| b                                                 | +0.05       | 0.22                |
| θ                                                 | -           | 0°-7°               |
| ddd                                               | Max.        | 0.08                |
| ccc                                               | Max.        | 0.08                |
| JEDEC Reference Drawing                           |             | MS-026              |
| Variation Designator                              |             | BED                 |

C.1.2 Tray Dimensions

Figure C-2. 100-Pin LQFP Tray Dimensions

C.1.3 Tape and Reel Dimensions

Note: In the figure that follows, pin 1 is located in the top right corner of the device.

Figure C-3. 100-Pin LQFP Tape and Reel Dimensions

## C.2 108-Ball BGA Package

### C.2.1 Package Dimensions

Figure C-4. 108-Ball BGA Package Dimensions

**Note:** The following notes apply to the package drawing.

1. ALL DIMENSIONS ARE IN MILLIMETERS.
2. 'e' REPRESENTS THE BASIC SOLDER BALL GRID PITCH.
3. 'M' REPRESENTS THE BASIC SOLDER BALL MATRIX SIZE.  
AND SYMBOL 'N' IS THE NUMBER OF BALLS AFTER DEPOPULATING.
4. 'b' IS MEASURABLE AT THE MAXIMUM SOLDER BALL DIAMETER AFTER REFLOW  
PARALLEL TO PRIMARY DATUM [C].
5. DIMENSION 'ccc' IS MEASURED PARALLEL TO PRIMARY DATUM [C].
6. PRIMARY DATUM [C] AND SEATING PLANE ARE DEFINED BY THE SPHERICAL  
CROWNS OF THE SOLDER BALLS.
7. PACKAGE SURFACE SHALL BE MATTE FINISH CHARMILLES 24 TO 27.
8. SUBSTRATE MATERIAL BASE IS BT RESIN.
9. THE OVERALL PACKAGE THICKNESS "A" ALREADY CONSIDERS COLLAPSE BALLS
10. DIMENSIONING AND TOLERANCING PER ASME Y14.5M 1994.
11. EXCEPT DIMENSION b.

| Symbols            | MIN      | NOM   | MAX   |

Figure C-5. 108-Ball BGA Tray Dimensions

## C.2.3 Tape and Reel Dimensions

Figure C-6. 108-Ball BGA Tape and Reel Dimensions

THIS DRAWING CONTAINS INFORMATION THAT IS PROPRIETARY TO C-PAK PTE.LTD.

## IMPORTANT NOTICE

Texas Instruments Incorporated and its subsidiaries (TI) reserve the right to make corrections, modifications, enhancements, improvements, and other changes to its products and services at any time and to discontinue any product or service without notice. Customers should obtain the latest relevant information before placing orders and should verify that such information is current and complete. All products are sold subject to TI's terms and conditions of sale supplied at the time of order acknowledgment.

TI warrants performance of its hardware products to the specifications applicable at the time of sale in accordance with TI's standard warranty. Testing and other quality control techniques are used to the extent TI deems necessary to support this warranty. Except where mandated by government requirements, testing of all parameters of each product is not necessarily performed.

TI assumes no liability for applications assistance or customer product design. Customers are responsible for their products and applications using TI components. To minimize the risks associated with customer products and applications, customers should provide adequate design and operating safeguards.

TI does not warrant or represent that any license, either express or implied, is granted under any TI patent right, copyright, mask work right, or other TI intellectual property right relating to any combination, machine, or process in which TI products or services are used. Information published by TI regarding third-party products or services does not constitute a license from TI to use such products or services or a warranty or endorsement thereof. Use of such information may require a license from a third party under the patents or other intellectual property of the third party, or a license from TI under the patents or other intellectual property of TI.

Reproduction of TI information in TI data books or data sheets is permissible only if reproduction is without alteration and is accompanied by all associated warranties, conditions, limitations, and notices. Reproduction of this information with alteration is an unfair and deceptive business practice. TI is not responsible or liable for such altered documentation. Information of third parties may be subject to additional restrictions.

Resale of TI products or services with statements different from or beyond the parameters stated by TI for that product or service voids all express and any implied warranties for the associated TI product or service and is an unfair and deceptive business practice. TI is not responsible or liable for any such statements.

TI products are not authorized for use in safety-critical applications (such as life support) where a failure of the TI product would reasonably be expected to cause severe personal injury or death, unless officers of the parties have executed an agreement specifically governing such use. Buyers represent that they have all necessary expertise in the safety and regulatory ramifications of their applications, and acknowledge and agree that they are solely responsible for all legal, regulatory and safety-related requirements concerning their products and any use of TI products in such safety-critical applications, notwithstanding any applications-related information or support that may be provided by TI. Further, Buyers must fully indemnify TI and its representatives against any damages arising out of the use of TI products in such safety-critical applications.

TI products are neither designed nor intended for use in military/aerospace applications or environments unless the TI products are specifically designated by TI as military-grade or "enhanced plastic." Only products designated by TI as military-grade meet military specifications. Buyers acknowledge and agree that any such use of TI products which TI has not designated as military-grade is solely at the Buyer's risk, and that they are solely responsible for compliance with all legal and regulatory requirements in connection with such use.

TI products are neither designed nor intended for use in automotive applications or environments unless the specific TI products are designated by TI as compliant with ISO/TS 16949 requirements. Buyers acknowledge and agree that, if they use any non-designated products in automotive applications, TI will not be responsible for any failure to meet such requirements.
