**Register 114: USB Receive Hub Address Endpoint 15 (USBRXHUBADDR15), offset 0x0FE**

**OTG A /  
Host**

**USBRXHUBADDR<sub>n</sub>** is an 8-bit read/write register that, like **USBRXHUBPORT<sub>n</sub>**, only must be written when a full- or low-speed Device is connected to receive endpoint EP<sub>n</sub> via a USB 2.0 hub. This register records the address of the USB 2.0 hub through which the target associated with the endpoint is accessed.

**Note:** **USBTXHUBADDR0** is used for both receive and transmit for endpoint 0.

**Register 144: USB Maximum Transmit Data Endpoint 15 (USBTXMAXP15), offset 0x1F0**

**OTG A /  
Host**

The **USBTXMAXPn** 16-bit register defines the maximum amount of data that can be transferred through the transmit endpoint in a single operation.

**OTG B /  
Device**

Bits [10:0] define (in bytes) the maximum payload transmitted in a single transaction. The value set can be up to 1024 bytes but is subject to the constraints placed by the *USB Specification* on packet sizes for bulk, interrupt and isochronous transfers in full-speed operation.

The total amount of data represented by the value written to this register must not exceed the FIFO size for the transmit endpoint, and must not exceed half the FIFO size if double-buffering is required.

If this register is changed after packets have been sent from the endpoint, the transmit endpoint FIFO must be completely flushed (using the FLUSH bit in **USBTXCSSL1n**) after writing the new value to this register.

**Note:** **USBTXMAXPn** must be set to an even number of bytes for proper interrupt generation in  $\mu$ DMA Basic Mode.

## Register 146: USB Control and Status Endpoint 0 High (USBCSRH0), offset 0x103

OTG A /  
Host

USBSR0H is an 8-bit register that provides control and status bits for endpoint 0.

OTG B /  
Device

### OTG A / Host Mode

**Register 147: USB Receive Byte Count Endpoint 0 (USBCOUNT0), offset 0x108****OTG A /  
Host**

**USBCOUNT0** is an 8-bit read-only register that indicates the number of received data bytes in the endpoint 0 FIFO. The value returned changes as the contents of the FIFO change and is only valid while the RXRDY bit is set.

**OTG B /  
Device**

**Register 149: USB NAK Limit (USBNAKLMT), offset 0x10B**

**OTG A /  
Host**

**USBNAKLMT** is an 8-bit register that sets the number of frames after which endpoint 0 should time out on receiving a stream of NAK responses. (Equivalent settings for other endpoints can be made through their **USBTXINTERVALn** and **USBRXINTERVALn** registers.)

The number of frames selected is  $2^{(m-1)}$  (where  $m$  is the value set in the register, with valid values of 2–16). If the Host receives NAK responses from the target for more frames than the number represented by the limit set in this register, the endpoint is halted.

**Note:** A value of 0 or 1 disables the NAK timeout function.

**Register 194: USB Maximum Receive Data Endpoint 15 (USBRXMAXP15), offset 0x1F4**

**OTG A /  
Host**

The **USBRXMAXPn** is a 16-bit register which defines the maximum amount of data that can be transferred through the selected receive endpoint in a single operation.

**OTG B /  
Device**

Bits 10:0 define (in bytes) the maximum payload transmitted in a single transaction. The value set can be up to 1024 bytes but is subject to the constraints placed by the *USB Specification* on packet sizes for bulk, interrupt and isochronous transfers in full-speed operations.

The total amount of data represented by the value written to this register must not exceed the FIFO size for the receive endpoint, and must not exceed half the FIFO size if double-buffering is required.

**Note:** **USBRXMAXPn** must be set to an even number of bytes for proper interrupt generation in  $\mu$ DMA Basic mode.

**OTG A /  
Host**

**Note:** The value returned changes as the FIFO is unloaded and is only valid while the RXRDY bit in the **USBXCSRLn** register is set.

**USBXCOUNTn** is a 16-bit read-only register that holds the number of data bytes in the packet currently in line to be read from the receive FIFO. If the packet is transmitted as multiple bulk packets, the number given is for the combined packet.

Host**

**USBTXINTERVAL<sub>n</sub>** is an 8-bit register that, for interrupt and isochronous transfers, defines the polling interval for the currently selected transmit endpoint. For bulk endpoints, this register defines the number of frames after which the endpoint should time out on receiving a stream of NAK responses.

The **USBTXINTERVAL<sub>n</sub>** register value defines a number of frames, as follows:

| Transfer Type | Speed                   | Valid values (m) | Interpretation                                                                            |
|---------------|-------------------------|------------------|-------------------------------------------------------------------------------------------|
| Interrupt     | Low-Speed or Full-Speed | 0x01 – 0xFF      | The polling interval is $m$ frames.                                                       |
| Isochronous   | Full-Speed              | 0x01 – 0x10      | The polling interval is $2^{(m-1)}$ frames.                                               |
| Bulk          | Full-Speed              | 0x02 – 0x10      | The NAK Limit is $2^{(m-1)}$ frames. A value of 0 or 1 disables the NAK timeout function. |

**OTG A /  
Host**

**USBRXINTERVAL<sub>n</sub>** is an 8-bit register that, for interrupt and isochronous transfers, defines the polling interval for the currently selected receive endpoint. For bulk endpoints, this register defines the number of frames after which the endpoint should time out on receiving a stream of NAK responses.

The **USBTXINTERVAL<sub>n</sub>** register value defines a number of frames, as follows:

| Transfer Type | Speed                   | Valid values (m) | Interpretation                                            |
|---------------|-------------------------|------------------|-----------------------------------------------------------|
| Interrupt     | Low-Speed or Full-Speed | 0x01 – 0xFF      | The polling interval is <i>m</i> frames.                  |
| Isochronous   | Full-Speed              | 0x01 – 0x10      | The polling interval is 2 <sup>(<i>m</i>-1)</sup> frames. |

| Transfer Type | Speed      | Valid values (m) | Interpretation                                                                                   |
|---------------|------------|------------------|--------------------------------------------------------------------------------------------------|
| Bulk          | Full-Speed | 0x02 – 0x10      | The NAK Limit is 2 <sup>(m-1)</sup> frames. A value of 0 or 1 disables the NAK timeout function. |

USB Host Receive Polling Interval Endpoint 1 (USBRXINTERVAL1)

Base 0x4005.0000  
Offset 0x11D  
Type R/W, reset 0x00

| Bit/Field | Name            | Type | Reset | Description            |
|-----------|-----------------|------|-------|------------------------|
| 7:0       | TXPOLL / NAKLMT | R/W  | 0x00  | RX Polling / NAK Limit |

The polling interval for interrupt/isochronous transfers; the NAK limit for bulk transfers. See table above for valid entries; other values are reserved.

**OTG A /  
Host**

This 16-bit read/write register is used in Host mode to specify the number of packets that are to be transferred in a block transfer of one or more bulk packets to receive endpoint n. The USB controller uses the value recorded in this register to determine the number of requests to issue where the AUTORQ bit in the **USBRXC\_SRHn** register has been set. See “IN Transactions as a Host” on page 902.

**Note:** Multiple packets combined into a single bulk packet within the FIFO count as one packet.

**Register 317: USB External Power Control (USBEPD), offset 0x400****OTG A /  
Host**

This 32-bit register specifies the function of the two-pin external power interface (USB0EPEN and USB0PFLT). The assertion of the power fault input may generate an automatic action, as controlled by the hardware configuration registers. The automatic action is necessary because the fault condition may require a response faster than one provided by firmware.

**OTG B /  
Device**

USB External Power Control (USBEPD)

Base 0x4005.0000

Offset 0x400

Type R/W, reset 0x0000.0000

| 2         | EPENDE | R/W  | 0     | <p>EPEN Drive Enable</p> <p>This bit specifies whether the USB0EPEN signal is driven or undriven (tristate). When driven, the signal value is specified by the EPEN field. When not driven, the EPEN field is ignored and the USB0EPEN signal is placed in a high-impedance state.</p> <p>Value Description</p> <p>0 Not Driven</p> <p>The USB0EPEN signal is high impedance.</p> <p>1 Driven</p> <p>The USB0EPEN signal is driven to the logical value specified by the value of the EPEN field.</p> <p>The USB0EPEN signal is undriven at reset because the sense of the external power supply enable is unknown. By adding the high-impedance state, system designers may bias the power supply enable to the disabled state using a large resistor (100 kΩ) and later configure and drive the output signal to enable the power supply.</p> |
| 1:0       | EPEN   | R/W  | 0x0   | <p>External Power Supply Enable Configuration</p> <p>This bit field specifies and controls the logical value driven on the USB0EPEN signal.</p> <p>Value Description</p> <p>0x0 Power Enable Active Low</p> <p>The USB0EPEN signal is driven Low if the EPENDE bit is set.</p> <p>0x1 Power Enable Active High</p> <p>The USB0EPEN signal is driven High if the EPENDE bit is set.</p> <p>0x2 Power Enable High if VBUS Low</p> <p>The USB0EPEN signal is driven High when the A device is not recognized.</p> <p>0x3 Power Enable High if VBUS High</p> <p>The USB0EPEN signal is driven High when the A device is recognized.</p>                                                                                                                                                                                                             |

Register 318: USB External Power Control Raw Interrupt Status (USBEPCRIS), offset 0x404

OTG A /  
Host

This 32-bit register specifies the unmasked interrupt status of the two-pin external power interface.

USB External Power Control Raw Interrupt Status (USBEPCRIS)

Base 0x4005.0000

Offset 0x404

Type RO, reset 0x0000.0000

OTG B /  
Device

|-------|----------------------------------------------------------------------------------------------------------------------------------|
| 1     | The PF bits in the <b>USBEPICRIS</b> and <b>USBEPICIM</b> registers are set, providing an interrupt to the interrupt controller. |
| 0     | No interrupt has occurred or the interrupt is masked.                                                                            |

This bit is cleared by writing a 1. Clearing this bit also clears the PF bit in the **USBEPICRIS** register.

## Register 321: USB Device RESUME Raw Interrupt Status (USBDRRIS), offset 0x410

OTG A /  
Host

The **USBDRRIS** 32-bit register is the raw interrupt status register. On a read, this register gives the current raw status value of the corresponding interrupt prior to masking. A write has no effect.

OTG B /  
Device

| Value | Description                                                                                                                                                                                              |
|-------|----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| 1     | The raw interrupt signal from a detected RESUME is sent to the interrupt controller. This bit should only be set when a SUSPEND has been detected (the SUSPEND bit in the <b>USBIS</b> register is set). |
| 0     | A detected RESUME does not affect the interrupt status.                                                                                                                                                  |

## Register 323: USB Device RESUME Interrupt Status and Clear (USBDRISC), offset 0x418

OTG A /  
Host

The **USBDRISC** 32-bit register is the interrupt clear register. On a write of 1, the corresponding interrupt is cleared. A write of 0 has no effect.

OTG B /  
Device

USB Device RESUME Interrupt Status and Clear (USBDRISC)

Base 0x4005.0000

Offset 0x418

Type W1C, reset 0x0000.0000

### Value Description

- 1 The RESUME bits in the **USBDRRIS** and **USBDRCIM** registers are set, providing an interrupt to the interrupt controller.
- 0 No interrupt has occurred or the interrupt is masked.

This bit is cleared by writing a 1. Clearing this bit also clears the RESUME bit in the **USBDRCRIS** register.

**Register 324: USB General-Purpose Control and Status (USBGPCS), offset 0x41C**

OTG A /  
Host

OTG B /  
Device

**USBGPCS** provides the state of the internal ID signal.

**Note:** When used in OTG mode, USB0VBUS and USB0ID do not require any configuration as they are dedicated pins for the USB controller and directly connect to the USB connector's VBUS and ID signals. If the USB controller is used as either a dedicated Host or Device, the DEVMOD0TG and DEVMOD bits in the **USB General-Purpose Control and Status (USBGPCS)** register can be used to connect the USB0VBUS and USB0ID inputs to fixed levels internally, freeing the PB0 and PB1 pins for GPIO use. For proper self-powered Device operation, the VBUS value must still be monitored to assure that if the Host removes VBUS, the self-powered Device disables the D+/D- pull-up resistors. This function can be accomplished by connecting a standard GPIO to VBUS.

**Register 325: USB VBUS Droop Control (USBVDC), offset 0x430**

**OTG A /  
Host**

This 32-bit register enables a controlled masking of VBUS to compensate for any in-rush current by a Device that is connected to the Host controller. The in-rush current can cause VBUS to droop, causing the USB controller's behavior to be unexpected. The USB Host controller allows VBUS to fall lower than the VBUS Valid level (4.5 V) but not below AValid (2.0 V) for 65 microseconds without signaling a VBUSERR interrupt in the controller. Without this, any glitch on VBUS would force the USB Host controller to remove power from VBUS and then re-enumerate the Device.

| 0         | VD       | R/W1C | 0          | VBUS Droop Interrupt Status and Clear                                                                                                                                                         |

| Value | Description                                                                                                                    |
|-------|--------------------------------------------------------------------------------------------------------------------------------|
| 1     | The VD bits in the <b>USBVDCRIS</b> and <b>USBVDCIM</b> registers are set, providing an interrupt to the interrupt controller. |
| 0     | No interrupt has occurred or the interrupt is masked.                                                                          |

This bit is cleared by writing a 1. Clearing this bit also clears the VD bit in the **USBVDCRIS** register.

## Register 329: USB ID Valid Detect Raw Interrupt Status (USBIDVRIS), offset 0x444

**OTG**

This 32-bit register specifies whether the unmasked interrupt status of the ID value is valid.

### USB ID Valid Detect Raw Interrupt Status (USBIDVRIS)

#### Value Description

|   |                                |
|---|--------------------------------|
| 1 | A valid ID has been detected.  |
| 0 | An interrupt has not occurred. |

This bit is cleared by writing a 1 to the ID bit in the **USBIDVISC** register.

Register 330: USB ID Valid Detect Interrupt Mask (USBIDVIM), offset 0x448

OTG

This 32-bit register specifies the interrupt mask of the ID valid detection.

USB ID Valid Detect Interrupt Mask (USBIDVIM)

## 22 Analog Comparators

An analog comparator is a peripheral that compares two analog voltages and provides a logical output that signals the comparison result.

**Note:** Not all comparators have the option to drive an output pin.

The comparator can provide its output to a device pin, acting as a replacement for an analog comparator on the board. In addition, the comparator can signal the application via interrupts or trigger the start of a sample sequence in the ADC. The interrupt generation and ADC triggering logic is separate and independent. This flexibility means, for example, that an interrupt can be generated on a rising edge and the ADC triggered on a falling edge.

The Stellaris<sup>®</sup> LM3S9B90 microcontroller provides three independent integrated analog comparators with the following functions:

- Compare external pin input to external pin input or to internal programmable voltage reference
- Compare a test voltage against any one of the following voltages:
  - An individual external reference voltage
  - A shared single external reference voltage
  - A shared internal reference voltage

## 22.1 Block Diagram

Figure 22-1. Analog Comparator Module Block Diagram

## 22.2 Signal Description

Table 22-1 on page 1033 and Table 22-2 on page 1034 list the external signals of the Analog Comparators and describe the function of each. The Analog Comparator output signals are alternate functions for some GPIO signals and default to be GPIO signals at reset. The column in the table below titled "Pin Mux/Pin Assignment" lists the possible GPIO pin placements for the Analog Comparator signals. The AFSEL bit in the **GPIO Alternate Function Select (GPIOAFSEL)** register (page 349) should be set to choose the Analog Comparator function. The number in parentheses is the encoding that must be programmed into the PMCN field in the **GPIO Port Control (GPIOCTL)** register (page 367) to assign the Analog Comparator signal to the specified GPIO port pin. The positive and negative input signals are configured by clearing the DEN bit in the **GPIO Digital Enable (GPIODEN)** register. For more information on configuring GPIOs, see "General-Purpose Input/Outputs (GPIOs)" on page 325.

Table 22-1. Signals for Analog Comparators (100LQFP)

| Pin Name | Pin Number | Pin Mux / Pin Assignment | Pin Type | Buffer Type <sup>a</sup> | Description                         |

a. The TTL designation indicates the pin has TTL-compatible voltage levels.

## 22.3 Functional Description

The comparator compares the VIN- and VIN+ inputs to produce an output, VOUT.

$V_{IN-} < V_{IN+}$ ,  $V_{OUT} = 1$

$V_{IN-} > V_{IN+}$ ,  $V_{OUT} = 0$

As shown in Figure 22-2 on page 1035, the input source for VIN- is an external input, Cn-. In addition to an external input, Cn+, input sources for VIN+ can be the C0+ or an internal reference,  $V_{\text{IREF}}$ .

**Figure 22-2. Structure of Comparator Unit**

A comparator is configured through two status/control registers, **Analog Comparator Control (ACCTL)** and **Analog Comparator Status (ACSTAT)**. The internal reference is configured through one control register, **Analog Comparator Reference Voltage Control (ACREFCTL)**. Interrupt status and control are configured through three registers, **Analog Comparator Masked Interrupt Status (ACMIS)**, **Analog Comparator Raw Interrupt Status (ACRIS)**, and **Analog Comparator Interrupt Enable (ACINTEN)**.

Typically, the comparator output is used internally to generate an interrupt as controlled by the ISEN bit in the **ACCTL** register. The output may also be used to drive an external pin, Co or generate an analog-to-digital converter (ADC) trigger.

**Important:** The ASRCP bits in the **ACCTL** register must be set before using the analog comparators.

### 22.3.1 Internal Reference Programming

The structure of the internal reference is shown in Figure 22-3 on page 1035. The internal reference is controlled by a single configuration register (**ACREFCTL**). Table 22-3 on page 1036 shows the programming options to develop specific internal reference values, to compare an external voltage against a particular voltage generated internally ( $V_{\text{IREF}}$ ).

**Figure 22-3. Comparator Internal Reference Structure**

**Table 22-3. Internal Reference Voltage and ACREFCTL Field Values**

| ACREFCTL Register |               | Output Reference Voltage Based on VREF Field Value                                                                                                                                                                                                       |
|-------------------|---------------|----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| EN Bit Value      | RNG Bit Value |                                                                                                                                                                                                                                                          |
| EN=0              | RNG=X         | 0 V (GND) for any value of VREF; however, it is recommended that RNG=1 and VREF=0 for the least noisy ground reference.                                                                                                                                  |
| EN=1              | RNG=0         | <p>Total resistance in ladder is 31 R.</p> $V_{IREF} = V_{DDA} \times \frac{R_{VREF}}{R_T}$ $V_{IREF} = V_{DDA} \times \frac{(VREF + 8)}{31}$ $V_{IREF} = 0.85 + 0.106 \times VREF$ <p>The range of internal reference in this mode is 0.85-2.448 V.</p> |
|                   | RNG=1         | <p>Total resistance in ladder is 23 R.</p> $V_{IREF} = V_{DDA} \times \frac{R_{VREF}}{R_T}$ $V_{IREF} = V_{DDA} \times \frac{VREF}{23}$ $V_{IREF} = 0.143 \times VREF$ <p>The range of internal reference for this mode is 0-2.152 V.</p>                |

## 22.4 Initialization and Configuration

The following example shows how to configure an analog comparator to read back its output value from an internal register.

1. Enable the analog comparator 0 clock by writing a value of 0x0010.0000 to the **RCGC1** register in the System Control module (see page 178).
2. In the GPIO module, enable the GPIO port/pin associated with the input signals as GPIO inputs. To determine which GPIO to configure, see Table 24-4 on page 1066.
3. Configure the PMCN fields in the **GPIOPCTL** register to assign the analog comparator output signals to the appropriate pins (see page 367 and Table 24-5 on page 1073).

4. Configure the internal voltage reference to 1.65 V by writing the **ACREFCTL** register with the value 0x0000.030C.
5. Configure the comparator to use the internal voltage reference and to *not* invert the output by writing the **ACCTLn** register with the value of 0x0000.040C.
6. Delay for 10  $\mu$ s.
7. Read the comparator output value by reading the **ACSTATn** register's OVAL value.

Change the level of the comparator negative input signal C- to see the OVAL value change.

## 22.5 Register Map

Table 22-4 on page 1037 lists the comparator registers. The offset listed is a hexadecimal increment to the register's address, relative to the Analog Comparator base address of 0x4003.C000. Note that the analog comparator clock must be enabled before the registers can be programmed (see page 178).

**Table 22-4. Analog Comparators Register Map**

| Offset | Name     | Type  | Reset       | Description                                 | See page |

## 22.6 Register Descriptions

The remainder of this section lists and describes the Analog Comparator registers, in numerical order by address offset.

## Register 1: Analog Comparator Masked Interrupt Status (ACMIS), offset 0x000

This register provides a summary of the interrupt status (masked) of the comparators.

### Analog Comparator Masked Interrupt Status (ACMIS)

Base 0x4003.C000

Offset 0x000

Type R/W1C, reset 0x0000.0000

## Register 4: Analog Comparator Reference Voltage Control (ACREFCTL), offset 0x010

This register specifies whether the resistor ladder is powered on as well as the range and tap.

### Analog Comparator Reference Voltage Control (ACREFCTL)

Base 0x4003.C000

Offset 0x010

Type R/W, reset 0x0000.0000

| 0         | reserved                                                                       | RO   | 0     | Software should not rely on the value of a reserved bit. To provide compatibility with future products, the value of a reserved bit should be preserved across a read-modify-write operation.                                                                                                                                                                                                            |       |             |     |                                                            |     |                                                                                |     |             |     |             |

## 23 Pin Diagram

The LM3S9B90 microcontroller pin diagrams are shown below.

Each GPIO signal is identified by its GPIO port unless it defaults to an alternate function on reset. In this case, the GPIO port name is followed by the default alternate function. To see a complete list of possible functions for each pin, see Table 24-5 on page 1073.

**Figure 23-1. 100-Pin LQFP Package Pin Diagram**

Figure 23-2. 108-Ball BGA Package Pin Diagram (Top View)

## 24 Signal Tables

The following tables list the signals available for each pin. Signals are configured as GPIOs on reset, except for those noted below. Use the **GPIOAMSEL** register (see page 365) to select analog mode. For a GPIO pin to be used for an alternate digital function, the corresponding bit in the **GPIOAFSEL** register (see page 349) must be set. Further pin muxing options are provided through the PMCx bit field in the **GPIOPCTL** register (see page 367), which selects one of several available peripheral functions for that GPIO.

**Important:** All GPIO pins are configured as GPIOs by default with the exception of the pins shown in the table below. A Power-On-Reset (POR) or asserting RST puts the pins back to their default state.

**Table 24-1. GPIO Pins With Default Alternate Functions**

| GPIO Pin | Default State     | GPIOAFSEL Bit | GPIOPCTL PMCx Bit Field |
|----------|-------------------|---------------|-------------------------|
| PA[1:0]  | UART0             | 1             | 0x1                     |
| PA[5:2]  | SSI0              | 1             | 0x1                     |
| PB[3:2]  | I <sup>2</sup> C0 | 1             | 0x1                     |
| PC[3:0]  | JTAG/SWD          | 1             | 0x3                     |

Table 24-2 on page 1048 shows the pin-to-signal-name mapping, including functional characteristics of the signals. Each possible alternate analog and digital function is listed for each pin.

Table 24-3 on page 1057 lists the signals in alphabetical order by signal name. If it is possible for a signal to be on multiple pins, each possible pin assignment is listed. The "Pin Mux" column indicates the GPIO and the encoding needed in the PMCx bit field in the **GPIOPCTL** register.

Table 24-4 on page 1066 groups the signals by functionality, except for GPIOs. If it is possible for a signal to be on multiple pins, each possible pin assignment is listed.

Table 24-5 on page 1073 lists the GPIO pins and their analog and digital alternate functions. The AINx and VREFA analog signals are not 5-V tolerant and go through an isolation circuit before reaching their circuitry. These signals are configured by clearing the corresponding DEN bit in the **GPIO Digital Enable (GPIODEN)** register and setting the corresponding AMSEL bit in the **GPIO Analog Mode Select (GPIOAMSEL)** register. Other analog signals are 5-V tolerant and are connected directly to their circuitry (C0-, C0+, C1-, C1+, C2-, C2+, USB0VBUS, USB0ID). These signals are configured by clearing the DEN bit in the **GPIO Digital Enable (GPIODEN)** register. The digital signals are enabled by setting the appropriate bit in the **GPIO Alternate Function Select (GPIOAFSEL)** and **GPIODEN** registers and configuring the PMCx bit field in the **GPIO Port Control (GPIOPCTL)** register to the numeric encoding shown in the table below. Table entries that are shaded gray are the default values for the corresponding GPIO pin.

Table 24-6 on page 1076 lists the signals based on number of possible pin assignments. This table can be used to plan how to configure the pins for a particular functionality. Application Note AN01274 Configuring Stellaris® Microcontrollers with Pin Multiplexing provides an overview of the pin muxing implementation, an explanation of how a system designer defines a pin configuration, and examples of the pin configuration process.

## 24.1 100-Pin LQFP Package Pin Tables

Table 24-2. Signals by Pin Number

| Pin Number | Pin Name | Pin Type | Buffer Type <sup>a</sup> | Description                                                                                                                                                                                                                                                                                                    |

| 2          | PE6      | I/O      | TTL                      | GPIO port E bit 6.                                                                                                                                                                                                                                                                                             |
|            | AIN1     | I        | Analog                   | Analog-to-digital converter input 1.                                                                                                                                                                                                                                                                           |
|            | C1o      | O        | TTL                      | Analog comparator 1 output.                                                                                                                                                                                                                                                                                    |
|            | U1CTS    | I        | TTL                      | UART module 1 Clear To Send modem status input signal.                                                                                                                                                                                                                                                         |
| 3          | VDDA     | -        | Power                    | The positive supply (3.3 V) for the analog circuits (ADC, Analog Comparators, etc.). These are separated from VDD to minimize the electrical noise contained on VDD from affecting the analog functions. VDDA pins must be connected to 3.3 V, regardless of system implementation.                            |
| 4          | GNDA     | -        | Power                    | The ground reference for the analog circuits (ADC, Analog Comparators, etc.). These are separated from GND to minimize the electrical noise contained on VDD from affecting the analog functions.                                                                                                              |
| 5          | PE5      | I/O      | TTL                      | GPIO port E bit 5.                                                                                                                                                                                                                                                                                             |
|            | AIN2     | I        | Analog                   | Analog-to-digital converter input 2.                                                                                                                                                                                                                                                                           |
|            | CCP5     | I/O      | TTL                      | Capture/Compare/PWM 5.                                                                                                                                                                                                                                                                                         |
|            | I2S0TXSD | I/O      | TTL                      | I <sup>2</sup> S module 0 transmit data.                                                                                                                                                                                                                                                                       |
| 6          | PE4      | I/O      | TTL                      | GPIO port E bit 4.                                                                                                                                                                                                                                                                                             |
|            | AIN3     | I        | Analog                   | Analog-to-digital converter input 3.                                                                                                                                                                                                                                                                           |
|            | CCP2     | I/O      | TTL                      | Capture/Compare/PWM 2.                                                                                                                                                                                                                                                                                         |
|            | CCP3     | I/O      | TTL                      | Capture/Compare/PWM 3.                                                                                                                                                                                                                                                                                         |
|            | I2S0TXWS | I/O      | TTL                      | I <sup>2</sup> S module 0 transmit word select.                                                                                                                                                                                                                                                                |
|            | U2Tx     | O        | TTL                      | UART module 2 transmit. When in IrDA mode, this signal has IrDA modulation.                                                                                                                                                                                                                                    |
| 7          | LDO      | -        | Power                    | Low drop-out regulator output voltage. This pin requires an external capacitor between the pin and GND of 1 $\mu$ F or greater. When the on-chip LDO is used to provide power to the logic, the LDO pin must also be connected to the VDDC pins at the board level in addition to the decoupling capacitor(s). |
| 8          | VDD      | -        | Power                    | Positive supply for I/O and some logic.                                                                                                                                                                                                                                                                        |
| 9          | GND      | -        | Power                    | Ground reference for logic and I/O pins.                                                                                                                                                                                                                                                                       |

Table 24-2. Signals by Pin Number (*continued*)

| Pin Number | Pin Name  | Pin Type | Buffer Type <sup>a</sup> | Description                                                                 |
|------------|-----------|----------|--------------------------|-----------------------------------------------------------------------------|
| 10         | PD0       | I/O      | TTL                      | GPIO port D bit 0.                                                          |
|            | AIN15     | I        | Analog                   | Analog-to-digital converter input 15.                                       |
|            | CAN0Rx    | I        | TTL                      | CAN module 0 receive.                                                       |
|            | CCP6      | I/O      | TTL                      | Capture/Compare/PWM 6.                                                      |
|            | I2S0RXSCK | I/O      | TTL                      | I <sup>2</sup> S module 0 receive clock.                                    |
|            | U1CTS     | I        | TTL                      | UART module 1 Clear To Send modem status input signal.                      |
|            | U1Rx      | I        | TTL                      | UART module 1 receive. When in IrDA mode, this signal has IrDA modulation.  |
|            | U2Rx      | I        | TTL                      | UART module 2 receive. When in IrDA mode, this signal has IrDA modulation.  |
| 11         | PD1       | I/O      | TTL                      | GPIO port D bit 1.                                                          |
|            | AIN14     | I        | Analog                   | Analog-to-digital converter input 14.                                       |
|            | CAN0Tx    | O        | TTL                      | CAN module 0 transmit.                                                      |
|            | CCP2      | I/O      | TTL                      | Capture/Compare/PWM 2.                                                      |
|            | CCP7      | I/O      | TTL                      | Capture/Compare/PWM 7.                                                      |
|            | I2S0RXWS  | I/O      | TTL                      | I <sup>2</sup> S module 0 receive word select.                              |
|            | U1DCD     | I        | TTL                      | UART module 1 Data Carrier Detect modem status input signal.                |
|            | U1Tx      | O        | TTL                      | UART module 1 transmit. When in IrDA mode, this signal has IrDA modulation. |
|            | U2Tx      | O        | TTL                      | UART module 2 transmit. When in IrDA mode, this signal has IrDA modulation. |
| 12         | PD2       | I/O      | TTL                      | GPIO port D bit 2.                                                          |
|            | AIN13     | I        | Analog                   | Analog-to-digital converter input 13.                                       |
|            | CCP5      | I/O      | TTL                      | Capture/Compare/PWM 5.                                                      |
|            | CCP6      | I/O      | TTL                      | Capture/Compare/PWM 6.                                                      |
|            | EPI0S20   | I/O      | TTL                      | EPI module 0 signal 20.                                                     |
|            | U1Rx      | I        | TTL                      | UART module 1 receive. When in IrDA mode, this signal has IrDA modulation.  |
| 13         | PD3       | I/O      | TTL                      | GPIO port D bit 3.                                                          |
|            | AIN12     | I        | Analog                   | Analog-to-digital converter input 12.                                       |
|            | CCP0      | I/O      | TTL                      | Capture/Compare/PWM 0.                                                      |
|            | CCP7      | I/O      | TTL                      | Capture/Compare/PWM 7.                                                      |
|            | EPI0S21   | I/O      | TTL                      | EPI module 0 signal 21.                                                     |
|            | U1Tx      | O        | TTL                      | UART module 1 transmit. When in IrDA mode, this signal has IrDA modulation. |
| 14         | EPI0S16   | I/O      | TTL                      | EPI module 0 signal 16.                                                     |
|            | I2C1SCL   | I/O      | OD                       | I <sup>2</sup> C module 1 clock.                                            |
|            | PJ0       | I/O      | TTL                      | GPIO port J bit 0.                                                          |
| 15         | PH7       | I/O      | TTL                      | GPIO port H bit 7.                                                          |
|            | EPI0S27   | I/O      | TTL                      | EPI module 0 signal 27.                                                     |
|            | SSI1Tx    | O        | TTL                      | SSI module 1 transmit.                                                      |
| 16         | XTALPPHY  | I        | Analog                   | Ethernet PHY XTALP 25-MHz oscillator crystal input.                         |
| 17         | XTALNPHY  | O        | Analog                   | Ethernet PHY XTALN 25-MHz oscillator crystal output.                        |

Table 24-2. Signals by Pin Number (*continued*)

| Pin Number | Pin Name | Pin Type | Buffer Type <sup>a</sup> | Description                                                                                               |
|------------|----------|----------|--------------------------|-----------------------------------------------------------------------------------------------------------|
| 18         | PG1      | I/O      | TTL                      | GPIO port G bit 1.                                                                                        |
|            | EPI0S14  | I/O      | TTL                      | EPI module 0 signal 14.                                                                                   |
|            | I2C1SDA  | I/O      | OD                       | I <sup>2</sup> C module 1 data.                                                                           |
|            | U2Tx     | O        | TTL                      | UART module 2 transmit. When in IrDA mode, this signal has IrDA modulation.                               |
| 19         | PG0      | I/O      | TTL                      | GPIO port G bit 0.                                                                                        |
|            | EPI0S13  | I/O      | TTL                      | EPI module 0 signal 13.                                                                                   |
|            | I2C1SCL  | I/O      | OD                       | I <sup>2</sup> C module 1 clock.                                                                          |
|            | U2Rx     | I        | TTL                      | UART module 2 receive. When in IrDA mode, this signal has IrDA modulation.                                |
|            | USB0EPEN | O        | TTL                      | Optionally used in Host mode to control an external power source to supply power to the USB bus.          |
| 20         | VDD      | -        | Power                    | Positive supply for I/O and some logic.                                                                   |
| 21         | GND      | -        | Power                    | Ground reference for logic and I/O pins.                                                                  |
| 22         | PC7      | I/O      | TTL                      | GPIO port C bit 7.                                                                                        |
|            | C1o      | O        | TTL                      | Analog comparator 1 output.                                                                               |
|            | C2-      | I        | Analog                   | Analog comparator 2 negative input.                                                                       |
|            | CCP0     | I/O      | TTL                      | Capture/Compare/PWM 0.                                                                                    |
|            | CCP4     | I/O      | TTL                      | Capture/Compare/PWM 4.                                                                                    |
|            | EPI0S5   | I/O      | TTL                      | EPI module 0 signal 5.                                                                                    |
|            | U1Tx     | O        | TTL                      | UART module 1 transmit. When in IrDA mode, this signal has IrDA modulation.                               |
|            | USB0PFLT | I        | TTL                      | Optionally used in Host mode by an external power source to indicate an error state by that power source. |
| 23         | PC6      | I/O      | TTL                      | GPIO port C bit 6.                                                                                        |
|            | C2+      | I        | Analog                   | Analog comparator 2 positive input.                                                                       |
|            | C2o      | O        | TTL                      | Analog comparator 2 output.                                                                               |
|            | CCP0     | I/O      | TTL                      | Capture/Compare/PWM 0.                                                                                    |
|            | CCP3     | I/O      | TTL                      | Capture/Compare/PWM 3.                                                                                    |
|            | EPI0S4   | I/O      | TTL                      | EPI module 0 signal 4.                                                                                    |
|            | U1Rx     | I        | TTL                      | UART module 1 receive. When in IrDA mode, this signal has IrDA modulation.                                |
|            | USB0PFLT | I        | TTL                      | Optionally used in Host mode by an external power source to indicate an error state by that power source. |
| 24         | PC5      | I/O      | TTL                      | GPIO port C bit 5.                                                                                        |
|            | C0o      | O        | TTL                      | Analog comparator 0 output.                                                                               |
|            | C1+      | I        | Analog                   | Analog comparator 1 positive input.                                                                       |
|            | C1o      | O        | TTL                      | Analog comparator 1 output.                                                                               |
|            | CCP1     | I/O      | TTL                      | Capture/Compare/PWM 1.                                                                                    |
|            | CCP3     | I/O      | TTL                      | Capture/Compare/PWM 3.                                                                                    |
|            | EPI0S3   | I/O      | TTL                      | EPI module 0 signal 3.                                                                                    |
|            | USB0EPEN | O        | TTL                      | Optionally used in Host mode to control an external power source to supply power to the USB bus.          |

Table 24-2. Signals by Pin Number (continued)

| Pin Number | Pin Name   | Pin Type | Buffer Type <sup>a</sup> | Description                                                                                      |
|------------|------------|----------|--------------------------|--------------------------------------------------------------------------------------------------|
| 25         | PC4        | I/O      | TTL                      | GPIO port C bit 4.                                                                               |
|            | CCP1       | I/O      | TTL                      | Capture/Compare/PWM 1.                                                                           |
|            | CCP2       | I/O      | TTL                      | Capture/Compare/PWM 2.                                                                           |
|            | CCP4       | I/O      | TTL                      | Capture/Compare/PWM 4.                                                                           |
|            | CCP5       | I/O      | TTL                      | Capture/Compare/PWM 5.                                                                           |
|            | EPI0S2     | I/O      | TTL                      | EPI module 0 signal 2.                                                                           |
| 26         | PA0        | I/O      | TTL                      | GPIO port A bit 0.                                                                               |
|            | I2C1SCL    | I/O      | OD                       | I <sup>2</sup> C module 1 clock.                                                                 |
|            | U0Rx       | I        | TTL                      | UART module 0 receive. When in IrDA mode, this signal has IrDA modulation.                       |
|            | U1Rx       | I        | TTL                      | UART module 1 receive. When in IrDA mode, this signal has IrDA modulation.                       |
| 27         | PA1        | I/O      | TTL                      | GPIO port A bit 1.                                                                               |
|            | I2C1SDA    | I/O      | OD                       | I <sup>2</sup> C module 1 data.                                                                  |
|            | U0Tx       | O        | TTL                      | UART module 0 transmit. When in IrDA mode, this signal has IrDA modulation.                      |
|            | U1Tx       | O        | TTL                      | UART module 1 transmit. When in IrDA mode, this signal has IrDA modulation.                      |
| 28         | PA2        | I/O      | TTL                      | GPIO port A bit 2.                                                                               |
|            | I2S0RXSD   | I/O      | TTL                      | I <sup>2</sup> S module 0 receive data.                                                          |
|            | SSI0Clk    | I/O      | TTL                      | SSI module 0 clock.                                                                              |
| 29         | PA3        | I/O      | TTL                      | GPIO port A bit 3.                                                                               |
|            | I2S0RXMCLK | I/O      | TTL                      | I <sup>2</sup> S module 0 receive master clock.                                                  |
|            | SSI0Fss    | I/O      | TTL                      | SSI module 0 frame.                                                                              |
| 30         | PA4        | I/O      | TTL                      | GPIO port A bit 4.                                                                               |
|            | CAN0Rx     | I        | TTL                      | CAN module 0 receive.                                                                            |
|            | I2S0TXSCK  | I/O      | TTL                      | I <sup>2</sup> S module 0 transmit clock.                                                        |
|            | SSI0Rx     | I        | TTL                      | SSI module 0 receive.                                                                            |
| 31         | PA5        | I/O      | TTL                      | GPIO port A bit 5.                                                                               |
|            | CAN0Tx     | O        | TTL                      | CAN module 0 transmit.                                                                           |
|            | I2S0TXWS   | I/O      | TTL                      | I <sup>2</sup> S module 0 transmit word select.                                                  |
|            | SSI0Tx     | O        | TTL                      | SSI module 0 transmit.                                                                           |
| 32         | VDD        | -        | Power                    | Positive supply for I/O and some logic.                                                          |
| 33         | ERBIAS     | O        | Analog                   | 12.4-kΩ resistor (1% precision) used internally for Ethernet PHY.                                |
| 34         | PA6        | I/O      | TTL                      | GPIO port A bit 6.                                                                               |
|            | CAN0Rx     | I        | TTL                      | CAN module 0 receive.                                                                            |
|            | CCP1       | I/O      | TTL                      | Capture/Compare/PWM 1.                                                                           |
|            | I2C1SCL    | I/O      | OD                       | I <sup>2</sup> C module 1 clock.                                                                 |
|            | U1CTS      | I        | TTL                      | UART module 1 Clear To Send modem status input signal.                                           |
|            | USB0EPEN   | O        | TTL                      | Optionally used in Host mode to control an external power source to supply power to the USB bus. |

Table 24-2. Signals by Pin Number (continued)

| Pin Number | Pin Name | Pin Type | Buffer Type <sup>a</sup> | Description                                                                                               |
|------------|----------|----------|--------------------------|-----------------------------------------------------------------------------------------------------------|
| 35         | PA7      | I/O      | TTL                      | GPIO port A bit 7.                                                                                        |
|            | CAN0Tx   | O        | TTL                      | CAN module 0 transmit.                                                                                    |
|            | CCP3     | I/O      | TTL                      | Capture/Compare/PWM 3.                                                                                    |
|            | CCP4     | I/O      | TTL                      | Capture/Compare/PWM 4.                                                                                    |
|            | I2C1SDA  | I/O      | OD                       | I <sup>2</sup> C module 1 data.                                                                           |
|            | U1DCD    | I        | TTL                      | UART module 1 Data Carrier Detect modem status input signal.                                              |
|            | USB0PFLT | I        | TTL                      | Optionally used in Host mode by an external power source to indicate an error state by that power source. |
| 36         | PG7      | I/O      | TTL                      | GPIO port G bit 7.                                                                                        |
|            | CCP5     | I/O      | TTL                      | Capture/Compare/PWM 5.                                                                                    |
|            | EPI0S31  | I/O      | TTL                      | EPI module 0 signal 31.                                                                                   |
| 37         | RXIN     | I        | Analog                   | RXIN of the Ethernet PHY.                                                                                 |
| 38         | VDDC     | -        | Power                    | Positive supply for most of the logic function, including the processor core and most peripherals.        |
| 39         | CCP0     | I/O      | TTL                      | Capture/Compare/PWM 0.                                                                                    |
|            | EPI0S18  | I/O      | TTL                      | EPI module 0 signal 18.                                                                                   |
|            | PJ2      | I/O      | TTL                      | GPIO port J bit 2.                                                                                        |
| 40         | RXIP     | I        | Analog                   | RXIP of the Ethernet PHY.                                                                                 |
| 41         | PF5      | I/O      | TTL                      | GPIO port F bit 5.                                                                                        |
|            | C10      | O        | TTL                      | Analog comparator 1 output.                                                                               |
|            | CCP2     | I/O      | TTL                      | Capture/Compare/PWM 2.                                                                                    |
|            | EPI0S15  | I/O      | TTL                      | EPI module 0 signal 15.                                                                                   |
|            | SSI1Tx   | O        | TTL                      | SSI module 1 transmit.                                                                                    |
| 42         | PF4      | I/O      | TTL                      | GPIO port F bit 4.                                                                                        |
|            | C00      | O        | TTL                      | Analog comparator 0 output.                                                                               |
|            | CCP0     | I/O      | TTL                      | Capture/Compare/PWM 0.                                                                                    |
|            | EPI0S12  | I/O      | TTL                      | EPI module 0 signal 12.                                                                                   |
|            | SSI1Rx   | I        | TTL                      | SSI module 1 receive.                                                                                     |
| 43         | TX0P     | O        | TTL                      | TX0P of the Ethernet PHY.                                                                                 |
| 44         | VDD      | -        | Power                    | Positive supply for I/O and some logic.                                                                   |
| 45         | GND      | -        | Power                    | Ground reference for logic and I/O pins.                                                                  |
| 46         | TX0N     | O        | TTL                      | TX0N of the Ethernet PHY.                                                                                 |
| 47         | PF0      | I/O      | TTL                      | GPIO port F bit 0.                                                                                        |
|            | CAN1Rx   | I        | TTL                      | CAN module 1 receive.                                                                                     |
|            | I2S0TXSD | I/O      | TTL                      | I <sup>2</sup> S module 0 transmit data.                                                                  |
|            | U1DSR    | I        | TTL                      | UART module 1 Data Set Ready modem output control line.                                                   |
| 48         | OSC0     | I        | Analog                   | Main oscillator crystal input or an external clock reference input.                                       |
| 49         | OSC1     | O        | Analog                   | Main oscillator crystal output. Leave unconnected when using a single-ended clock source.                 |
| 50         | WAKE     | I        | TTL                      | An external input that brings the processor out of Hibernate mode when asserted.                          |
| 51         | HIB      | O        | OD                       | An open-drain output that indicates the processor is in Hibernate mode.                                   |

Table 24-2. Signals by Pin Number (continued)

| Pin Number | Pin Name   | Pin Type | Buffer Type <sup>a</sup> | Description                                                                                                                                                                                                                                                   |
|------------|------------|----------|--------------------------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| 52         | XOSC0      | I        | Analog                   | Hibernation module oscillator crystal input or an external clock reference input. Note that this is either a 4.194304-MHz crystal or a 32.768-kHz oscillator for the Hibernation module RTC. See the CLKSEL bit in the <b>HIBCTL</b> register.                |
| 53         | XOSC1      | O        | Analog                   | Hibernation module oscillator crystal output. Leave unconnected when using a single-ended clock source.                                                                                                                                                       |
| 54         | GND        | -        | Power                    | Ground reference for logic and I/O pins.                                                                                                                                                                                                                      |
| 55         | VBAT       | -        | Power                    | Power source for the Hibernation module. It is normally connected to the positive terminal of a battery and serves as the battery backup/Hibernation module power-source supply.                                                                              |
| 56         | VDD        | -        | Power                    | Positive supply for I/O and some logic.                                                                                                                                                                                                                       |
| 57         | GND        | -        | Power                    | Ground reference for logic and I/O pins.                                                                                                                                                                                                                      |
| 58         | MDIO       | I/O      | OD                       | MDIO of the Ethernet PHY.                                                                                                                                                                                                                                     |
| 59         | PF3        | I/O      | TTL                      | GPIO port F bit 3.                                                                                                                                                                                                                                            |
|            | LED0       | O        | TTL                      | Ethernet LED 0.                                                                                                                                                                                                                                               |
|            | SSI1Fss    | I/O      | TTL                      | SSI module 1 frame.                                                                                                                                                                                                                                           |
| 60         | PF2        | I/O      | TTL                      | GPIO port F bit 2.                                                                                                                                                                                                                                            |
|            | LED1       | O        | TTL                      | Ethernet LED 1.                                                                                                                                                                                                                                               |
|            | SSI1Clk    | I/O      | TTL                      | SSI module 1 clock.                                                                                                                                                                                                                                           |
| 61         | PF1        | I/O      | TTL                      | GPIO port F bit 1.                                                                                                                                                                                                                                            |
|            | CAN1Tx     | O        | TTL                      | CAN module 1 transmit.                                                                                                                                                                                                                                        |
|            | CCP3       | I/O      | TTL                      | Capture/Compare/PWM 3.                                                                                                                                                                                                                                        |
|            | I2S0TXMCLK | I/O      | TTL                      | I <sup>2</sup> S module 0 transmit master clock.                                                                                                                                                                                                              |
|            | U1RTS      | O        | TTL                      | UART module 1 Request to Send modem output control line.                                                                                                                                                                                                      |
| 62         | PH6        | I/O      | TTL                      | GPIO port H bit 6.                                                                                                                                                                                                                                            |
|            | EPI0S26    | I/O      | TTL                      | EPI module 0 signal 26.                                                                                                                                                                                                                                       |
|            | SSI1Rx     | I        | TTL                      | SSI module 1 receive.                                                                                                                                                                                                                                         |
| 63         | PH5        | I/O      | TTL                      | GPIO port H bit 5.                                                                                                                                                                                                                                            |

|            | I2C0SDA    | I/O      | OD                       | I <sup>2</sup> C module 0 data.                                                                                                                                                                                                                               |
|            | USB0PFLT   | I        | TTL                      | Optionally used in Host mode by an external power source to indicate an error state by that power source.                                                                                                                                                     |
| 66         | PB0        | I/O      | TTL                      | GPIO port B bit 0.                                                                                                                                                                                                                                            |
|            | CCP0       | I/O      | TTL                      | Capture/Compare/PWM 0.                                                                                                                                                                                                                                        |
|            | U1Rx       | I        | TTL                      | UART module 1 receive. When in IrDA mode, this signal has IrDA modulation.                                                                                                                                                                                    |
|            | USB0ID     | I        | Analog                   | This signal senses the state of the USB ID signal. The USB PHY enables an integrated pull-up, and an external element (USB connector) indicates the initial state of the USB controller (pulled down is the A side of the cable and pulled up is the B side). |

Table 24-2. Signals by Pin Number (*continued*)

| Pin Number | Pin Name | Pin Type | Buffer Type <sup>a</sup> | Description                                                                                                                                                                        |
|------------|----------|----------|--------------------------|------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| 67         | PB1      | I/O      | TTL                      | GPIO port B bit 1.                                                                                                                                                                 |
|            | CCP1     | I/O      | TTL                      | Capture/Compare/PWM 1.                                                                                                                                                             |
|            | CCP2     | I/O      | TTL                      | Capture/Compare/PWM 2.                                                                                                                                                             |
|            | U1Tx     | O        | TTL                      | UART module 1 transmit. When in IrDA mode, this signal has IrDA modulation.                                                                                                        |
|            | USB0VBUS | I/O      | Analog                   | This signal is used during the session request protocol. This signal allows the USB PHY to both sense the voltage level of VBUS, and pull up VBUS momentarily during VBUS pulsing. |
| 68         | VDD      | -        | Power                    | Positive supply for I/O and some logic.                                                                                                                                            |
| 69         | GND      | -        | Power                    | Ground reference for logic and I/O pins.                                                                                                                                           |
| 70         | USB0DM   | I/O      | Analog                   | Bidirectional differential data pin (D- per USB specification).                                                                                                                    |
| 71         | USB0DP   | I/O      | Analog                   | Bidirectional differential data pin (D+ per USB specification).                                                                                                                    |
| 72         | PB2      | I/O      | TTL                      | GPIO port B bit 2.                                                                                                                                                                 |
|            | CCP0     | I/O      | TTL                      | Capture/Compare/PWM 0.                                                                                                                                                             |
|            | CCP3     | I/O      | TTL                      | Capture/Compare/PWM 3.                                                                                                                                                             |
|            | I2C0SCL  | I/O      | OD                       | I <sup>2</sup> C module 0 clock.                                                                                                                                                   |
|            | USB0EPEN | O        | TTL                      | Optionally used in Host mode to control an external power source to supply power to the USB bus.                                                                                   |
| 73         | USB0BIAS | O        | Analog                   | 9.1-kΩ resistor (1% precision) used internally for USB analog circuitry.                                                                                                           |
| 74         | PE0      | I/O      | TTL                      | GPIO port E bit 0.                                                                                                                                                                 |
|            | CCP3     | I/O      | TTL                      | Capture/Compare/PWM 3.                                                                                                                                                             |
|            | EPI0S8   | I/O      | TTL                      | EPI module 0 signal 8.                                                                                                                                                             |
|            | SSI1C1k  | I/O      | TTL                      | SSI module 1 clock.                                                                                                                                                                |
|            | USB0PFLT | I        | TTL                      | Optionally used in Host mode by an external power source to indicate an error state by that power source.                                                                          |
| 75         | PE1      | I/O      | TTL                      | GPIO port E bit 1.                                                                                                                                                                 |
|            | CCP2     | I/O      | TTL                      | Capture/Compare/PWM 2.                                                                                                                                                             |
|            | CCP6     | I/O      | TTL                      | Capture/Compare/PWM 6.                                                                                                                                                             |
|            | EPI0S9   | I/O      | TTL                      | EPI module 0 signal 9.                                                                                                                                                             |

|            | VREFA     | I        | Analog                   | This input provides a reference voltage used to specify the input voltage at which the ADC converts to a maximum value. In other words, the voltage that is applied to VREFA is the voltage with which an AINn signal is converted to 1023. The VREFA input is limited to the range specified in Table 26-2 on page 1111. |

Table 24-2. Signals by Pin Number (continued)

| Pin Number | Pin Name | Pin Type | Buffer Type <sup>a</sup> | Description                                                                 |
|------------|----------|----------|--------------------------|-----------------------------------------------------------------------------|
| 91         | PB5      | I/O      | TTL                      | GPIO port B bit 5.                                                          |
|            | AIN11    | I        | Analog                   | Analog-to-digital converter input 11.                                       |

|            | EPI0S19  | I/O      | TTL                      | EPI module 0 signal 19.                                                     |
|            | I2S0RXSD | I/O      | TTL                      | I <sup>2</sup> S module 0 receive data.                                     |
|            | U1RI     | I        | TTL                      | UART module 1 Ring Indicator modem status input signal.                     |

Table 24-2. Signals by Pin Number (*continued*)

| Pin Number | Pin Name  | Pin Type | Buffer Type <sup>a</sup> | Description                                                                 |
|------------|-----------|----------|--------------------------|-----------------------------------------------------------------------------|
| 98         | PD5       | I/O      | TTL                      | GPIO port D bit 5.                                                          |
|            | AIN6      | I        | Analog                   | Analog-to-digital converter input 6.                                        |
|            | CCP2      | I/O      | TTL                      | Capture/Compare/PWM 2.                                                      |
|            | CCP4      | I/O      | TTL                      | Capture/Compare/PWM 4.                                                      |
|            | EPI0S28   | I/O      | TTL                      | EPI module 0 signal 28.                                                     |
|            | I2S0RXCLK | I/O      | TTL                      | I <sup>2</sup> S module 0 receive master clock.                             |
|            | U2Rx      | I        | TTL                      | UART module 2 receive. When in IrDA mode, this signal has IrDA modulation.  |
| 99         | PD6       | I/O      | TTL                      | GPIO port D bit 6.                                                          |
|            | AIN5      | I        | Analog                   | Analog-to-digital converter input 5.                                        |
|            | EPI0S29   | I/O      | TTL                      | EPI module 0 signal 29.                                                     |
|            | I2S0TXSCK | I/O      | TTL                      | I <sup>2</sup> S module 0 transmit clock.                                   |
|            | U2Tx      | O        | TTL                      | UART module 2 transmit. When in IrDA mode, this signal has IrDA modulation. |
| 100        | PD7       | I/O      | TTL                      | GPIO port D bit 7.                                                          |
|            | AIN4      | I        | Analog                   | Analog-to-digital converter input 4.                                        |
|            | C0o       | O        | TTL                      | Analog comparator 0 output.                                                 |
|            | CCP1      | I/O      | TTL                      | Capture/Compare/PWM 1.                                                      |
|            | EPI0S30   | I/O      | TTL                      | EPI module 0 signal 30.                                                     |
|            | I2S0TXWS  | I/O      | TTL                      | I <sup>2</sup> S module 0 transmit word select.                             |
|            | U1DTR     | O        | TTL                      | UART module 1 Data Terminal Ready modem status input signal.                |

a. The TTL designation indicates the pin has TTL-compatible voltage levels.

Table 24-3. Signals by Signal Name

| Pin Name | Pin Number | Pin Mux / Pin Assignment | Pin Type | Buffer Type <sup>a</sup> | Description                           |
|----------|------------|--------------------------|----------|--------------------------|---------------------------------------|
| AIN0     | 1          | PE7                      | I        | Analog                   | Analog-to-digital converter input 0.  |
| AIN1     | 2          | PE6                      | I        | Analog                   | Analog-to-digital converter input 1.  |
| AIN2     | 5          | PE5                      | I        | Analog                   | Analog-to-digital converter input 2.  |
| AIN3     | 6          | PE4                      | I        | Analog                   | Analog-to-digital converter input 3.  |
| AIN4     | 100        | PD7                      | I        | Analog                   | Analog-to-digital converter input 4.  |
| AIN5     | 99         | PD6                      | I        | Analog                   | Analog-to-digital converter input 5.  |
| AIN6     | 98         | PD5                      | I        | Analog                   | Analog-to-digital converter input 6.  |
| AIN7     | 97         | PD4                      | I        | Analog                   | Analog-to-digital converter input 7.  |
| AIN8     | 96         | PE3                      | I        | Analog                   | Analog-to-digital converter input 8.  |
| AIN9     | 95         | PE2                      | I        | Analog                   | Analog-to-digital converter input 9.  |
| AIN10    | 92         | PB4                      | I        | Analog                   | Analog-to-digital converter input 10. |
| AIN11    | 91         | PB5                      | I        | Analog                   | Analog-to-digital converter input 11. |
| AIN12    | 13         | PD3                      | I        | Analog                   | Analog-to-digital converter input 12. |
| AIN13    | 12         | PD2                      | I        | Analog                   | Analog-to-digital converter input 13. |
| AIN14    | 11         | PD1                      | I        | Analog                   | Analog-to-digital converter input 14. |
| AIN15    | 10         | PD0                      | I        | Analog                   | Analog-to-digital converter input 15. |

| LDO        | 7              | fixed                         | -        | Power                    | Low drop-out regulator output voltage. This pin requires an external capacitor between the pin and GND of 1 $\mu$ F or greater. When the on-chip LDO is used to provide power to the logic, the LDO pin must also be connected to the VDDC pins at the board level in addition to the decoupling capacitor(s). |

| USB0ID    | 66                                     | PB0                                                                       | I        | Analog                   | This signal senses the state of the USB ID signal. The USB PHY enables an integrated pull-up, and an external element (USB connector) indicates the initial state of the USB controller (pulled down is the A side of the cable and pulled up is the B side). |
| USB0PFLT  | 22<br>23<br>35<br>65<br>74<br>76<br>87 | PC7 (6)<br>PC6 (7)<br>PA7 (8)<br>PB3 (8)<br>PE0 (9)<br>PH4 (4)<br>PJ1 (9) | I        | TTL                      | Optionally used in Host mode by an external power source to indicate an error state by that power source.                                                                                                                                                     |
| USB0RBIAS | 73                                     | fixed                                                                     | O        | Analog                   | 9.1-kΩ resistor (1% precision) used internally for USB analog circuitry.                                                                                                                                                                                      |
| USB0VBUS  | 67                                     | PB1                                                                       | I/O      | Analog                   | This signal is used during the session request protocol. This signal allows the USB PHY to both sense the voltage level of VBUS, and pull up VBUS momentarily during VBUS pulsing.                                                                            |

Table 24-3. Signals by Signal Name (continued)

| Pin Name | Pin Number                                  | Pin Mux / Pin Assignment | Pin Type | Buffer Type <sup>a</sup> | Description                                                                                                                                                                                                                                                                                                               |
|----------|---------------------------------------------|--------------------------|----------|--------------------------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| VBAT     | 55                                          | fixed                    | -        | Power                    | Power source for the Hibernation module. It is normally connected to the positive terminal of a battery and serves as the battery backup/Hibernation module power-source supply.                                                                                                                                          |
| VDD      | 8<br>20<br>32<br>44<br>56<br>68<br>81<br>93 | fixed                    | -        | Power                    | Positive supply for I/O and some logic.                                                                                                                                                                                                                                                                                   |
| VDDA     | 3                                           | fixed                    | -        | Power                    | The positive supply (3.3 V) for the analog circuits (ADC, Analog Comparators, etc.). These are separated from VDD to minimize the electrical noise contained on VDD from affecting the analog functions. VDDA pins must be connected to 3.3 V, regardless of system implementation.                                       |
| VDDC     | 38<br>88                                    | fixed                    | -        | Power                    | Positive supply for most of the logic function, including the processor core and most peripherals.                                                                                                                                                                                                                        |
| VREFA    | 90                                          | PB6                      | I        | Analog                   | This input provides a reference voltage used to specify the input voltage at which the ADC converts to a maximum value. In other words, the voltage that is applied to VREFA is the voltage with which an AINn signal is converted to 1023. The VREFA input is limited to the range specified in Table 26-2 on page 1111. |
| WAKE     | 50                                          | fixed                    | I        | TTL                      | An external input that brings the processor out of Hibernate mode when asserted.                                                                                                                                                                                                                                          |
| XOSC0    | 52                                          | fixed                    | I        | Analog                   | Hibernation module oscillator crystal input or an external clock reference input. Note that this is either a 4.194304-MHz crystal or a 32.768-kHz oscillator for the Hibernation module RTC. See the CLKSEL bit in the <b>HIBCTL</b> register.                                                                            |
| XOSC1    | 53                                          | fixed                    | O        | Analog                   | Hibernation module oscillator crystal output. Leave unconnected when using a single-ended clock source.                                                                                                                                                                                                                   |
| XTALNPHY | 17                                          | fixed                    | O        | Analog                   | Ethernet PHY XTALN 25-MHz oscillator crystal output.                                                                                                                                                                                                                                                                      |
| XTALPPHY | 16                                          | fixed                    | I        | Analog                   | Ethernet PHY XTALP 25-MHz oscillator crystal input.                                                                                                                                                                                                                                                                       |

a. The TTL designation indicates the pin has TTL-compatible voltage levels.

Table 24-4. Signals by Function, Except for GPIO

| Function           | Pin Name | Pin Number                  | Pin Type | Buffer Type <sup>a</sup> | Description                                                                                                                                                                                                                                                                                                               |
|--------------------|----------|-----------------------------|----------|--------------------------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| ADC                | AIN0     | 1                           | I        | Analog                   | Analog-to-digital converter input 0.                                                                                                                                                                                                                                                                                      |
|                    | AIN1     | 2                           | I        | Analog                   | Analog-to-digital converter input 1.                                                                                                                                                                                                                                                                                      |
|                    | AIN2     | 5                           | I        | Analog                   | Analog-to-digital converter input 2.                                                                                                                                                                                                                                                                                      |
|                    | AIN3     | 6                           | I        | Analog                   | Analog-to-digital converter input 3.                                                                                                                                                                                                                                                                                      |
|                    | AIN4     | 100                         | I        | Analog                   | Analog-to-digital converter input 4.                                                                                                                                                                                                                                                                                      |
|                    | AIN5     | 99                          | I        | Analog                   | Analog-to-digital converter input 5.                                                                                                                                                                                                                                                                                      |

|                    | VREFA    | 90                          | I        | Analog                   | This input provides a reference voltage used to specify the input voltage at which the ADC converts to a maximum value. In other words, the voltage that is applied to VREFA is the voltage with which an AINn signal is converted to 1023. The VREFA input is limited to the range specified in Table 26-2 on page 1111. |

Table 24-4. Signals by Function, Except for GPIO (*continued*)

| Function     | Pin Name  | Pin Number           | Pin Type | Buffer Type <sup>a</sup> | Description                                                                                                                                                                                                                             |
|--------------|-----------|----------------------|----------|--------------------------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Hibernate    | HIB       | 51                   | O        | OD                       | An open-drain output that indicates the processor is in Hibernate mode.                                                                                                                                                                 |
|              | VBAT      | 55                   | -        | Power                    | Power source for the Hibernation module. It is normally connected to the positive terminal of a battery and serves as the battery backup/Hibernation module power-source supply.                                                        |
|              | WAKE      | 50                   | I        | TTL                      | An external input that brings the processor out of Hibernate mode when asserted.                                                                                                                                                        |
|              | XOSC0     | 52                   | I        | Analog                   | Hibernation module oscillator crystal input or an external clock reference input. Note that this is either a 4.194304-MHz crystal or a 32.768-kHz oscillator for the Hibernation module RTC. See the CLKSEL bit in the HIBCTL register. |
|              | XOSC1     | 53                   | O        | Analog                   | Hibernation module oscillator crystal output. Leave unconnected when using a single-ended clock source.                                                                                                                                 |
| I2C          | I2C0SCL   | 72                   | I/O      | OD                       | I <sup>2</sup> C module 0 clock.                                                                                                                                                                                                        |
|              | I2C0SDA   | 65                   | I/O      | OD                       | I <sup>2</sup> C module 0 data.                                                                                                                                                                                                         |

Table 24-4. Signals by Function, Except for GPIO (*continued*)

| Function | Pin Name | Pin Number                                  | Pin Type | Buffer Type <sup>a</sup> | Description                                                                                                                                                                                                                                                                                                    |
|----------|----------|---------------------------------------------|----------|--------------------------|----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Power    | GND      | 9<br>21<br>45<br>54<br>57<br>69<br>82<br>94 | -        | Power                    | Ground reference for logic and I/O pins.                                                                                                                                                                                                                                                                       |
|          | GNDA     | 4                                           | -        | Power                    | The ground reference for the analog circuits (ADC, Analog Comparators, etc.). These are separated from GND to minimize the electrical noise contained on VDD from affecting the analog functions.                                                                                                              |
|          | LDO      | 7                                           | -        | Power                    | Low drop-out regulator output voltage. This pin requires an external capacitor between the pin and GND of 1 $\mu$ F or greater. When the on-chip LDO is used to provide power to the logic, the LDO pin must also be connected to the VDDC pins at the board level in addition to the decoupling capacitor(s). |
|          | VDD      | 8<br>20<br>32<br>44<br>56<br>68<br>81<br>93 | -        | Power                    | Positive supply for I/O and some logic.                                                                                                                                                                                                                                                                        |
|          | VDDA     | 3                                           | -        | Power                    | The positive supply (3.3 V) for the analog circuits (ADC, Analog Comparators, etc.). These are separated from VDD to minimize the electrical noise contained on VDD from affecting the analog functions. VDDA pins must be connected to 3.3 V, regardless of system implementation.                            |
|          | VDDC     | 38<br>88                                    | -        | Power                    | Positive supply for most of the logic function, including the processor core and most peripherals.                                                                                                                                                                                                             |
| SSI      | SSI0Clk  | 28                                          | I/O      | TTL                      | SSI module 0 clock.                                                                                                                                                                                                                                                                                            |
|          | SSI0Fss  | 29                                          | I/O      | TTL                      | SSI module 0 frame.                                                                                                                                                                                                                                                                                            |
|          | SSI0Rx   | 30                                          | I        | TTL                      | SSI module 0 receive.                                                                                                                                                                                                                                                                                          |

Table 24-4. Signals by Function, Except for GPIO (*continued*)

| Function | Pin Name  | Pin Number                             | Pin Type | Buffer Type <sup>a</sup> | Description                                                                                                                                                                                                                                                   |
|----------|-----------|----------------------------------------|----------|--------------------------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| USB      | USB0DM    | 70                                     | I/O      | Analog                   | Bidirectional differential data pin (D- per USB specification).                                                                                                                                                                                               |
|          | USB0DP    | 71                                     | I/O      | Analog                   | Bidirectional differential data pin (D+ per USB specification).                                                                                                                                                                                               |
|          | USB0EPEN  | 19<br>24<br>34<br>72<br>83             | O        | TTL                      | Optionally used in Host mode to control an external power source to supply power to the USB bus.                                                                                                                                                              |
|          | USB0ID    | 66                                     | I        | Analog                   | This signal senses the state of the USB ID signal. The USB PHY enables an integrated pull-up, and an external element (USB connector) indicates the initial state of the USB controller (pulled down is the A side of the cable and pulled up is the B side). |
|          | USB0PFLT  | 22<br>23<br>35<br>65<br>74<br>76<br>87 | I        | TTL                      | Optionally used in Host mode by an external power source to indicate an error state by that power source.                                                                                                                                                     |
|          | USB0RBIAS | 73                                     | O        | Analog                   | 9.1-kΩ resistor (1% precision) used internally for USB analog circuitry.                                                                                                                                                                                      |
|          | USB0VBUS  | 67                                     | I/O      | Analog                   | This signal is used during the session request protocol. This signal allows the USB PHY to both sense the voltage level of VBUS, and pull up VBUS momentarily during VBUS pulsing.                                                                            |
|          |           |                                        |          |                          |                                                                                                                                                                                                                                                               |

a. The TTL designation indicates the pin has TTL-compatible voltage levels.

Table 24-5. GPIO Pins and Alternate Functions

Table 24-7. Signals by Pin Number (continued)

| Pin Number | Pin Name | Pin Type | Buffer Type <sup>a</sup> | Description                                                                                                                                                                                                                                                                                                    |
|------------|----------|----------|--------------------------|----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| D2         | NC       | -        | -                        | No connect. Leave the pin electrically unconnected/isolated.                                                                                                                                                                                                                                                   |
| D3         | VDDC     | -        | Power                    | Positive supply for most of the logic function, including the processor core and most peripherals.                                                                                                                                                                                                             |
| D10        | PH3      | I/O      | TTL                      | GPIO port H bit 3.                                                                                                                                                                                                                                                                                             |
|            | EPI0S0   | I/O      | TTL                      | EPI module 0 signal 0.                                                                                                                                                                                                                                                                                         |
|            | USB0EPEN | O        | TTL                      | Optionally used in Host mode to control an external power source to supply power to the USB bus.                                                                                                                                                                                                               |
| D11        | PH2      | I/O      | TTL                      | GPIO port H bit 2.                                                                                                                                                                                                                                                                                             |
|            | C10      | O        | TTL                      | Analog comparator 1 output.                                                                                                                                                                                                                                                                                    |
|            | EPI0S1   | I/O      | TTL                      | EPI module 0 signal 1.                                                                                                                                                                                                                                                                                         |
| D12        | PB1      | I/O      | TTL                      | GPIO port B bit 1.                                                                                                                                                                                                                                                                                             |
|            | CCP1     | I/O      | TTL                      | Capture/Compare/PWM 1.                                                                                                                                                                                                                                                                                         |
|            | CCP2     | I/O      | TTL                      | Capture/Compare/PWM 2.                                                                                                                                                                                                                                                                                         |
|            | U1Tx     | O        | TTL                      | UART module 1 transmit. When in IrDA mode, this signal has IrDA modulation.                                                                                                                                                                                                                                    |
|            | USB0VBUS | I/O      | Analog                   | This signal is used during the session request protocol. This signal allows the USB PHY to both sense the voltage level of VBUS, and pull up VBUS momentarily during VBUS pulsing.                                                                                                                             |
| E1         | NC       | -        | -                        | No connect. Leave the pin electrically unconnected/isolated.                                                                                                                                                                                                                                                   |
| E2         | NC       | -        | -                        | No connect. Leave the pin electrically unconnected/isolated.                                                                                                                                                                                                                                                   |
| E3         | LDO      | -        | Power                    | Low drop-out regulator output voltage. This pin requires an external capacitor between the pin and GND of 1 $\mu$ F or greater. When the on-chip LDO is used to provide power to the logic, the LDO pin must also be connected to the VDDC pins at the board level in addition to the decoupling capacitor(s). |
| E10        | VDD      | -        | Power                    | Positive supply for I/O and some logic.                                                                                                                                                                                                                                                                        |
| E11        | PB3      | I/O      | TTL                      | GPIO port B bit 3.                                                                                                                                                                                                                                                                                             |
|            | I2C0SDA  | I/O      | OD                       | I <sup>2</sup> C module 0 data.                                                                                                                                                                                                                                                                                |
|            | USB0PFLT | I        | TTL                      | Optionally used in Host mode by an external power source to indicate an error state by that power source.                                                                                                                                                                                                      |
| E12        | PB0      | I/O      | TTL                      | GPIO port B bit 0.                                                                                                                                                                                                                                                                                             |
|            | CCP0     | I/O      | TTL                      | Capture/Compare/PWM 0.                                                                                                                                                                                                                                                                                         |
|            | U1Rx     | I        | TTL                      | UART module 1 receive. When in IrDA mode, this signal has IrDA modulation.                                                                                                                                                                                                                                     |
|            | USB0ID   | I        | Analog                   | This signal senses the state of the USB ID signal. The USB PHY enables an integrated pull-up, and an external element (USB connector) indicates the initial state of the USB controller (pulled down is the A side of the cable and pulled up is the B side).                                                  |
| F1         | NC       | -        | -                        | No connect. Leave the pin electrically unconnected/isolated.                                                                                                                                                                                                                                                   |
| F2         | NC       | -        | -                        | No connect. Leave the pin electrically unconnected/isolated.                                                                                                                                                                                                                                                   |
| F3         | EPI0S16  | I/O      | TTL                      | EPI module 0 signal 16.                                                                                                                                                                                                                                                                                        |
|            | I2C1SCL  | I/O      | OD                       | I <sup>2</sup> C module 1 clock.                                                                                                                                                                                                                                                                               |
|            | PJ0      | I/O      | TTL                      | GPIO port J bit 0.                                                                                                                                                                                                                                                                                             |
| F10        | PH5      | I/O      | TTL                      | GPIO port H bit 5.                                                                                                                                                                                                                                                                                             |
|            | EPI0S11  | I/O      | TTL                      | EPI module 0 signal 11.                                                                                                                                                                                                                                                                                        |
|            | SSI1Fss  | I/O      | TTL                      | SSI module 1 frame.                                                                                                                                                                                                                                                                                            |

Table 24-7. Signals by Pin Number (continued)

| Pin Number | Pin Name  | Pin Type | Buffer Type <sup>a</sup> | Description                                                                 |
|------------|-----------|----------|--------------------------|-----------------------------------------------------------------------------|
| F11        | GND       | -        | Power                    | Ground reference for logic and I/O pins.                                    |
| F12        | GND       | -        | Power                    | Ground reference for logic and I/O pins.                                    |
| G1         | PD0       | I/O      | TTL                      | GPIO port D bit 0.                                                          |
|            | AIN15     | I        | Analog                   | Analog-to-digital converter input 15.                                       |
|            | CAN0Rx    | I        | TTL                      | CAN module 0 receive.                                                       |
|            | CCP6      | I/O      | TTL                      | Capture/Compare/PWM 6.                                                      |
|            | I2S0RXSCK | I/O      | TTL                      | I <sup>2</sup> S module 0 receive clock.                                    |
|            | U1CTS     | I        | TTL                      | UART module 1 Clear To Send modem status input signal.                      |
|            | U1Rx      | I        | TTL                      | UART module 1 receive. When in IrDA mode, this signal has IrDA modulation.  |
|            | U2Rx      | I        | TTL                      | UART module 2 receive. When in IrDA mode, this signal has IrDA modulation.  |
| G2         | PD1       | I/O      | TTL                      | GPIO port D bit 1.                                                          |
|            | AIN14     | I        | Analog                   | Analog-to-digital converter input 14.                                       |
|            | CAN0Tx    | O        | TTL                      | CAN module 0 transmit.                                                      |
|            | CCP2      | I/O      | TTL                      | Capture/Compare/PWM 2.                                                      |
|            | CCP7      | I/O      | TTL                      | Capture/Compare/PWM 7.                                                      |
|            | I2S0RXWS  | I/O      | TTL                      | I <sup>2</sup> S module 0 receive word select.                              |
|            | U1DCD     | I        | TTL                      | UART module 1 Data Carrier Detect modem status input signal.                |
|            | U1Tx      | O        | TTL                      | UART module 1 transmit. When in IrDA mode, this signal has IrDA modulation. |
|            | U2Tx      | O        | TTL                      | UART module 2 transmit. When in IrDA mode, this signal has IrDA modulation. |
| G3         | PH6       | I/O      | TTL                      | GPIO port H bit 6.                                                          |
|            | EPI0S26   | I/O      | TTL                      | EPI module 0 signal 26.                                                     |
|            | SSI1Rx    | I        | TTL                      | SSI module 1 receive.                                                       |
| G10        | VDD       | -        | Power                    | Positive supply for I/O and some logic.                                     |
| G11        | VDD       | -        | Power                    | Positive supply for I/O and some logic.                                     |
| G12        | VDD       | -        | Power                    | Positive supply for I/O and some logic.                                     |
| H1         | PD3       | I/O      | TTL                      | GPIO port D bit 3.                                                          |
|            | AIN12     | I        | Analog                   | Analog-to-digital converter input 12.                                       |
|            | CCP0      | I/O      | TTL                      | Capture/Compare/PWM 0.                                                      |
|            | CCP7      | I/O      | TTL                      | Capture/Compare/PWM 7.                                                      |
|            | EPI0S21   | I/O      | TTL                      | EPI module 0 signal 21.                                                     |
|            | U1Tx      | O        | TTL                      | UART module 1 transmit. When in IrDA mode, this signal has IrDA modulation. |
| H2         | PD2       | I/O      | TTL                      | GPIO port D bit 2.                                                          |
|            | AIN13     | I        | Analog                   | Analog-to-digital converter input 13.                                       |
|            | CCP5      | I/O      | TTL                      | Capture/Compare/PWM 5.                                                      |
|            | CCP6      | I/O      | TTL                      | Capture/Compare/PWM 6.                                                      |
|            | EPI0S20   | I/O      | TTL                      | EPI module 0 signal 20.                                                     |
|            | U1Rx      | I        | TTL                      | UART module 1 receive. When in IrDA mode, this signal has IrDA modulation.  |

Table 24-7. Signals by Pin Number (continued)

| Pin Number | Pin Name   | Pin Type | Buffer Type <sup>a</sup> | Description                                                                                      |
|------------|------------|----------|--------------------------|--------------------------------------------------------------------------------------------------|
| H3         | PH7        | I/O      | TTL                      | GPIO port H bit 7.                                                                               |
|            | EPI0S27    | I/O      | TTL                      | EPI module 0 signal 27.                                                                          |
|            | SSI1Tx     | O        | TTL                      | SSI module 1 transmit.                                                                           |
| H10        | VDD        | -        | Power                    | Positive supply for I/O and some logic.                                                          |
| H11        | RST        | I        | TTL                      | System reset input.                                                                              |
| H12        | PF1        | I/O      | TTL                      | GPIO port F bit 1.                                                                               |
|            | CAN1Tx     | O        | TTL                      | CAN module 1 transmit.                                                                           |
|            | CCP3       | I/O      | TTL                      | Capture/Compare/PWM 3.                                                                           |
|            | I2S0TXMCLK | I/O      | TTL                      | I <sup>2</sup> S module 0 transmit master clock.                                                 |
|            | U1RTS      | O        | TTL                      | UART module 1 Request to Send modem output control line.                                         |
| J1         | XTALNPHY   | O        | Analog                   | Ethernet PHY XTALN 25-MHz oscillator crystal output.                                             |
| J2         | XTALPPHY   | I        | Analog                   | Ethernet PHY XTALP 25-MHz oscillator crystal input.                                              |
| J3         | ERBIAS     | O        | Analog                   | 12.4-kΩ resistor (1% precision) used internally for Ethernet PHY.                                |
| J10        | GND        | -        | Power                    | Ground reference for logic and I/O pins.                                                         |
| J11        | PF2        | I/O      | TTL                      | GPIO port F bit 2.                                                                               |
|            | LED1       | O        | TTL                      | Ethernet LED 1.                                                                                  |
|            | SSI1Clk    | I/O      | TTL                      | SSI module 1 clock.                                                                              |
| J12        | PF3        | I/O      | TTL                      | GPIO port F bit 3.                                                                               |
|            | LED0       | O        | TTL                      | Ethernet LED 0.                                                                                  |
|            | SSI1Fss    | I/O      | TTL                      | SSI module 1 frame.                                                                              |
| K1         | PG0        | I/O      | TTL                      | GPIO port G bit 0.                                                                               |
|            | EPI0S13    | I/O      | TTL                      | EPI module 0 signal 13.                                                                          |
|            | I2C1SCL    | I/O      | OD                       | I <sup>2</sup> C module 1 clock.                                                                 |
|            | U2Rx       | I        | TTL                      | UART module 2 receive. When in IrDA mode, this signal has IrDA modulation.                       |
|            | USB0EPEN   | O        | TTL                      | Optionally used in Host mode to control an external power source to supply power to the USB bus. |
| K2         | PG1        | I/O      | TTL                      | GPIO port G bit 1.                                                                               |
|            | EPI0S14    | I/O      | TTL                      | EPI module 0 signal 14.                                                                          |
|            | I2C1SDA    | I/O      | OD                       | I <sup>2</sup> C module 1 data.                                                                  |
|            | U2Tx       | O        | TTL                      | UART module 2 transmit. When in IrDA mode, this signal has IrDA modulation.                      |
| K3         | PF5        | I/O      | TTL                      | GPIO port F bit 5.                                                                               |
|            | C10        | O        | TTL                      | Analog comparator 1 output.                                                                      |
|            | CCP2       | I/O      | TTL                      | Capture/Compare/PWM 2.                                                                           |
|            | EPI0S15    | I/O      | TTL                      | EPI module 0 signal 15.                                                                          |
|            | SSI1Tx     | O        | TTL                      | SSI module 1 transmit.                                                                           |
| K4         | PF4        | I/O      | TTL                      | GPIO port F bit 4.                                                                               |
|            | C00        | O        | TTL                      | Analog comparator 0 output.                                                                      |
|            | CCP0       | I/O      | TTL                      | Capture/Compare/PWM 0.                                                                           |
|            | EPI0S12    | I/O      | TTL                      | EPI module 0 signal 12.                                                                          |

Table 24-7. Signals by Pin Number (*continued*)

| Pin Number | Pin Name | Pin Type | Buffer Type <sup>a</sup> | Description                                                                                                                                                                      |
|------------|----------|----------|--------------------------|----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| L6         | PA6      | I/O      | TTL                      | GPIO port A bit 6.                                                                                                                                                               |
|            | CAN0Rx   | I        | TTL                      | CAN module 0 receive.                                                                                                                                                            |
|            | CCP1     | I/O      | TTL                      | Capture/Compare/PWM 1.                                                                                                                                                           |
|            | I2C1SCL  | I/O      | OD                       | I <sup>2</sup> C module 1 clock.                                                                                                                                                 |
|            | U1CTS    | I        | TTL                      | UART module 1 Clear To Send modem status input signal.                                                                                                                           |
|            | USB0EPEN | O        | TTL                      | Optionally used in Host mode to control an external power source to supply power to the USB bus.                                                                                 |
| L7         | RXIN     | I        | Analog                   | RXIN of the Ethernet PHY.                                                                                                                                                        |
| L8         | TXON     | O        | TTL                      | TXON of the Ethernet PHY.                                                                                                                                                        |
| L9         | MDIO     | I/O      | OD                       | MDIO of the Ethernet PHY.                                                                                                                                                        |
| L10        | GND      | -        | Power                    | Ground reference for logic and I/O pins.                                                                                                                                         |
| L11        | OSC0     | I        | Analog                   | Main oscillator crystal input or an external clock reference input.                                                                                                              |
| L12        | VBAT     | -        | Power                    | Power source for the Hibernation module. It is normally connected to the positive terminal of a battery and serves as the battery backup/Hibernation module power-source supply. |
| M1         | PC5      | I/O      | TTL                      | GPIO port C bit 5.                                                                                                                                                               |
|            | C0o      | O        | TTL                      | Analog comparator 0 output.                                                                                                                                                      |
|            | C1+      | I        | Analog                   | Analog comparator 1 positive input.                                                                                                                                              |
|            | C1o      | O        | TTL                      | Analog comparator 1 output.                                                                                                                                                      |
|            | CCP1     | I/O      | TTL                      | Capture/Compare/PWM 1.                                                                                                                                                           |
|            | CCP3     | I/O      | TTL                      | Capture/Compare/PWM 3.                                                                                                                                                           |
|            | EPI0S3   | I/O      | TTL                      | EPI module 0 signal 3.                                                                                                                                                           |
|            | USB0EPEN | O        | TTL                      | Optionally used in Host mode to control an external power source to supply power to the USB bus.                                                                                 |
| M2         | PC6      | I/O      | TTL                      | GPIO port C bit 6.                                                                                                                                                               |
|            | C2+      | I        | Analog                   | Analog comparator 2 positive input.                                                                                                                                              |
|            | C2o      | O        | TTL                      | Analog comparator 2 output.                                                                                                                                                      |
|            | CCP0     | I/O      | TTL                      | Capture/Compare/PWM 0.                                                                                                                                                           |
|            | CCP3     | I/O      | TTL                      | Capture/Compare/PWM 3.                                                                                                                                                           |
|            | EPI0S4   | I/O      | TTL                      | EPI module 0 signal 4.                                                                                                                                                           |
|            | U1Rx     | I        | TTL                      | UART module 1 receive. When in IrDA mode, this signal has IrDA modulation.                                                                                                       |
|            | USB0PFLT | I        | TTL                      | Optionally used in Host mode by an external power source to indicate an error state by that power source.                                                                        |
| M3         | PA1      | I/O      | TTL                      | GPIO port A bit 1.                                                                                                                                                               |
|            | I2C1SDA  | I/O      | OD                       | I <sup>2</sup> C module 1 data.                                                                                                                                                  |

**Table 24-7. Signals by Pin Number (continued)**

| Pin Number | Pin Name | Pin Type | Buffer Type <sup>a</sup> | Description                                                                                               |
|------------|----------|----------|--------------------------|-----------------------------------------------------------------------------------------------------------|
| M5         | PA5      | I/O      | TTL                      | GPIO port A bit 5.                                                                                        |
|            | CAN0Tx   | O        | TTL                      | CAN module 0 transmit.                                                                                    |
|            | I2S0TXWS | I/O      | TTL                      | I <sup>2</sup> S module 0 transmit word select.                                                           |
|            | SSI0Tx   | O        | TTL                      | SSI module 0 transmit.                                                                                    |
| M6         | PA7      | I/O      | TTL                      | GPIO port A bit 7.                                                                                        |
|            | CAN0Tx   | O        | TTL                      | CAN module 0 transmit.                                                                                    |
|            | CCP3     | I/O      | TTL                      | Capture/Compare/PWM 3.                                                                                    |
|            | CCP4     | I/O      | TTL                      | Capture/Compare/PWM 4.                                                                                    |
|            | I2C1SDA  | I/O      | OD                       | I <sup>2</sup> C module 1 data.                                                                           |
|            | U1DCD    | I        | TTL                      | UART module 1 Data Carrier Detect modem status input signal.                                              |
|            | USB0PFLT | I        | TTL                      | Optionally used in Host mode by an external power source to indicate an error state by that power source. |
| M7         | RXIP     | I        | Analog                   | RXIP of the Ethernet PHY.                                                                                 |
| M8         | TXOP     | O        | TTL                      | TXOP of the Ethernet PHY.                                                                                 |
| M9         | PF0      | I/O      | TTL                      | GPIO port F bit 0.                                                                                        |
|            | CAN1Rx   | I        | TTL                      | CAN module 1 receive.                                                                                     |
|            | I2S0TXSD | I/O      | TTL                      | I <sup>2</sup> S module 0 transmit data.                                                                  |
|            | U1DSR    | I        | TTL                      | UART module 1 Data Set Ready modem output control line.                                                   |
| M10        | WAKE     | I        | TTL                      | An external input that brings the processor out of Hibernate mode when asserted.                          |
| M11        | OSC1     | O        | Analog                   | Main oscillator crystal output. Leave unconnected when using a single-ended clock source.                 |
| M12        | HIB      | O        | OD                       | An open-drain output that indicates the processor is in Hibernate mode.                                   |

a. The TTL designation indicates the pin has TTL-compatible voltage levels.

**Table 24-8. Signals by Signal Name**

| Pin Name | Pin Number | Pin Mux / Pin Assignment | Pin Type | Buffer Type <sup>a</sup> | Description                           |
|----------|------------|--------------------------|----------|--------------------------|---------------------------------------|
| AIN0     | B1         | PE7                      | I        | Analog                   | Analog-to-digital converter input 0.  |
| AIN1     | A1         | PE6                      | I        | Analog                   | Analog-to-digital converter input 1.  |
| AIN2     | B3         | PE5                      | I        | Analog                   | Analog-to-digital converter input 2.  |
| AIN3     | B2         | PE4                      | I        | Analog                   | Analog-to-digital converter input 3.  |
| AIN4     | A2         | PD7                      | I        | Analog                   | Analog-to-digital converter input 4.  |
| AIN5     | A3         | PD6                      | I        | Analog                   | Analog-to-digital converter input 5.  |
| AIN6     | C6         | PD5                      | I        | Analog                   | Analog-to-digital converter input 6.  |
| AIN7     | B5         | PD4                      | I        | Analog                   | Analog-to-digital converter input 7.  |
| AIN8     | B4         | PE3                      | I        | Analog                   | Analog-to-digital converter input 8.  |
| AIN9     | A4         | PE2                      | I        | Analog                   | Analog-to-digital converter input 9.  |
| AIN10    | A6         | PB4                      | I        | Analog                   | Analog-to-digital converter input 10. |
| AIN11    | B7         | PB5                      | I        | Analog                   | Analog-to-digital converter input 11. |
| AIN12    | H1         | PD3                      | I        | Analog                   | Analog-to-digital converter input 12. |
| AIN13    | H2         | PD2                      | I        | Analog                   | Analog-to-digital converter input 13. |

Table 24-8. Signals by Signal Name (continued)

| Pin Name | Pin Number                                           | Pin Mux / Pin Assignment                                                                        | Pin Type | Buffer Type <sup>a</sup> | Description                           |

| USB0ID   | E12                                       | PB0                                                                       | I        | Analog                   | This signal senses the state of the USB ID signal. The USB PHY enables an integrated pull-up, and an external element (USB connector) indicates the initial state of the USB controller (pulled down is the A side of the cable and pulled up is the B side). |
| USB0PFLT | L2<br>M2<br>M6<br>E11<br>B11<br>B10<br>B6 | PC7 (6)<br>PC6 (7)<br>PA7 (8)<br>PB3 (8)<br>PE0 (9)<br>PH4 (4)<br>PJ1 (9) | I        | TTL                      | Optionally used in Host mode by an external power source to indicate an error state by that power source.                                                                                                                                                     |

Table 24-8. Signals by Signal Name (*continued*)

| Pin Name  | Pin Number                                        | Pin Mux / Pin Assignment | Pin Type | Buffer Type <sup>a</sup> | Description                                                                                                                                                                                                                                                                                                               |
|-----------|---------------------------------------------------|--------------------------|----------|--------------------------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| USB0RBIAS | B12                                               | fixed                    | O        | Analog                   | 9.1-kΩ resistor (1% precision) used internally for USB analog circuitry.                                                                                                                                                                                                                                                  |
| USB0VBUS  | D12                                               | PB1                      | I/O      | Analog                   | This signal is used during the session request protocol. This signal allows the USB PHY to both sense the voltage level of VBUS, and pull up VBUS momentarily during VBUS pulsing.                                                                                                                                        |
| VBAT      | L12                                               | fixed                    | -        | Power                    | Power source for the Hibernation module. It is normally connected to the positive terminal of a battery and serves as the battery backup/Hibernation module power-source supply.                                                                                                                                          |
| VDD       | K7<br>G12<br>K8<br>K9<br>H10<br>G10<br>E10<br>G11 | fixed                    | -        | Power                    | Positive supply for I/O and some logic.                                                                                                                                                                                                                                                                                   |
| VDDA      | C7                                                | fixed                    | -        | Power                    | The positive supply (3.3 V) for the analog circuits (ADC, Analog Comparators, etc.). These are separated from VDD to minimize the electrical noise contained on VDD from affecting the analog functions. VDDA pins must be connected to 3.3 V, regardless of system implementation.                                       |
| VDDC      | D3<br>C3                                          | fixed                    | -        | Power                    | Positive supply for most of the logic function, including the processor core and most peripherals.                                                                                                                                                                                                                        |
| VREFA     | A7                                                | PB6                      | I        | Analog                   | This input provides a reference voltage used to specify the input voltage at which the ADC converts to a maximum value. In other words, the voltage that is applied to VREFA is the voltage with which an AINn signal is converted to 1023. The VREFA input is limited to the range specified in Table 26-2 on page 1111. |
| WAKE      | M10                                               | fixed                    | I        | TTL                      | An external input that brings the processor out of Hibernation mode when asserted.                                                                                                                                                                                                                                        |
| XOSC0     | K11                                               | fixed                    | I        | Analog                   | Hibernation module oscillator crystal input or an external clock reference input. Note that this is either a 4.194304-MHz crystal or a 32.768-kHz oscillator for the Hibernation module RTC. See the CLKSEL bit in the <b>HIBCTL</b> register.                                                                            |
| XOSC1     | K12                                               | fixed                    | O        | Analog                   | Hibernation module oscillator crystal output. Leave unconnected when using a single-ended clock source.                                                                                                                                                                                                                   |
| XTALNPHY  | J1                                                | fixed                    | O        | Analog                   | Ethernet PHY XTALN 25-MHz oscillator crystal output.                                                                                                                                                                                                                                                                      |
| XTALPPHY  | J2                                                | fixed                    | I        | Analog                   | Ethernet PHY XTALP 25-MHz oscillator crystal input.                                                                                                                                                                                                                                                                       |

a. The TTL designation indicates the pin has TTL-compatible voltage levels.

Table 24-9. Signals by Function, Except for GPIO

| Function           | Pin Name | Pin Number                  | Pin Type | Buffer Type <sup>a</sup> | Description                                                                                                                                                                                                                                                                                                               |
|--------------------|----------|-----------------------------|----------|--------------------------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| ADC                | AIN0     | B1                          | I        | Analog                   | Analog-to-digital converter input 0.                                                                                                                                                                                                                                                                                      |
|                    | AIN1     | A1                          | I        | Analog                   | Analog-to-digital converter input 1.                                                                                                                                                                                                                                                                                      |
|                    | AIN2     | B3                          | I        | Analog                   | Analog-to-digital converter input 2.                                                                                                                                                                                                                                                                                      |
|                    | AIN3     | B2                          | I        | Analog                   | Analog-to-digital converter input 3.                                                                                                                                                                                                                                                                                      |
|                    | AIN4     | A2                          | I        | Analog                   | Analog-to-digital converter input 4.                                                                                                                                                                                                                                                                                      |
|                    | AIN5     | A3                          | I        | Analog                   | Analog-to-digital converter input 5.                                                                                                                                                                                                                                                                                      |

|                    | VREFA    | A7                          | I        | Analog                   | This input provides a reference voltage used to specify the input voltage at which the ADC converts to a maximum value. In other words, the voltage that is applied to VREFA is the voltage with which an AINn signal is converted to 1023. The VREFA input is limited to the range specified in Table 26-2 on page 1111. |

Table 24-9. Signals by Function, Except for GPIO (*continued*)

| Function | Pin Name | Pin Number                                        | Pin Type | Buffer Type <sup>a</sup> | Description                                                                                                                                                                                                                                                                                                    |
|----------|----------|---------------------------------------------------|----------|--------------------------|----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Power    | GND      | C4<br>C5<br>K5<br>L10<br>K10<br>J10<br>F11<br>F12 | -        | Power                    | Ground reference for logic and I/O pins.                                                                                                                                                                                                                                                                       |
|          | GNDA     | A5                                                | -        | Power                    | The ground reference for the analog circuits (ADC, Analog Comparators, etc.). These are separated from GND to minimize the electrical noise contained on VDD from affecting the analog functions.                                                                                                              |
|          | LDO      | E3                                                | -        | Power                    | Low drop-out regulator output voltage. This pin requires an external capacitor between the pin and GND of 1 $\mu$ F or greater. When the on-chip LDO is used to provide power to the logic, the LDO pin must also be connected to the VDDC pins at the board level in addition to the decoupling capacitor(s). |
|          | VDD      | K7<br>G12<br>K8<br>K9<br>H10<br>G10<br>E10<br>G11 | -        | Power                    | Positive supply for I/O and some logic.                                                                                                                                                                                                                                                                        |
|          | VDDA     | C7                                                | -        | Power                    | The positive supply (3.3 V) for the analog circuits (ADC, Analog Comparators, etc.). These are separated from VDD to minimize the electrical noise contained on VDD from affecting the analog functions. VDDA pins must be connected to 3.3 V, regardless of system implementation.                            |
|          | VDDC     | D3<br>C3                                          | -        | Power                    | Positive supply for most of the logic function, including the processor core and most peripherals.                                                                                                                                                                                                             |
| SSI      | SSI0Clk  | M4                                                | I/O      | TTL                      | SSI module 0 clock.                                                                                                                                                                                                                                                                                            |

|          | USB0DP    | C12                                       | I/O      | Analog                   | Bidirectional differential data pin (D+ per USB specification).                                                                                                                                                                                               |
|          | USB0EPEN  | K1<br>M1<br>L6<br>A11<br>D10              | O        | TTL                      | Optionally used in Host mode to control an external power source to supply power to the USB bus.                                                                                                                                                              |
|          | USB0ID    | E12                                       | I        | Analog                   | This signal senses the state of the USB ID signal. The USB PHY enables an integrated pull-up, and an external element (USB connector) indicates the initial state of the USB controller (pulled down is the A side of the cable and pulled up is the B side). |
|          | USB0PFLT  | L2<br>M2<br>M6<br>E11<br>B11<br>B10<br>B6 | I        | TTL                      | Optionally used in Host mode by an external power source to indicate an error state by that power source.                                                                                                                                                     |
|          | USB0RBIAS | B12                                       | O        | Analog                   | 9.1-kΩ resistor (1% precision) used internally for USB analog circuitry.                                                                                                                                                                                      |
|          | USB0VBUS  | D12                                       | I/O      | Analog                   | This signal is used during the session request protocol. This signal allows the USB PHY to both sense the voltage level of VBUS, and pull up VBUS momentarily during VBUS pulsing.                                                                            |

a. The TTL designation indicates the pin has TTL-compatible voltage levels.

## 24.3 Connections for Unused Signals

Table 24-12 on page 1108 show how to handle signals for functions that are not used in a particular system implementation for devices that are in a 100-pin LQFP package. Two options are shown in the table: an acceptable practice and a preferred practice for reduced power consumption and improved EMC characteristics. If a module is not used in a system, and its inputs are grounded, it is important that the clock to the module is never enabled by setting the corresponding bit in the **RCGCx** register.

Table 24-12. Connections for Unused Signals (100-pin LQFP)

| Function       | Signal Name      | Pin Number | Acceptable Practice                        | Preferred Practice                                             |
|----------------|------------------|------------|--------------------------------------------|----------------------------------------------------------------|
| Ethernet       | ERBIAS           | 33         | Connect to GND through 12.4-kΩ resistor.   | Connect to GND through 12.4-kΩ resistor.                       |
|                | MDIO             | 58         | NC                                         | NC                                                             |
|                | RXIN             | 37         | NC                                         | GND                                                            |
|                | RXIP             | 40         | NC                                         | GND                                                            |
|                | TXON             | 46         | NC                                         | GND                                                            |
|                | TXOP             | 43         | NC                                         | GND                                                            |
|                | XTALNPHY         | 17         | NC                                         | NC                                                             |
|                | XTALPPHY         | 16         | NC                                         | GND                                                            |
| GPIO           | All unused GPIOs | -          | NC                                         | GND                                                            |
| Hibernate      | HIB              | 51         | NC                                         | NC                                                             |
|                | VBAT             | 55         | NC                                         | GND                                                            |
|                | WAKE             | 50         | NC                                         | GND                                                            |
|                | X0SC0            | 52         | NC                                         | GND                                                            |
|                | X0SC1            | 53         | NC                                         | NC                                                             |
| No Connects    | NC               | -          | NC                                         | NC                                                             |
| System Control | OSC0             | 48         | NC                                         | GND                                                            |
|                | OSC1             | 49         | NC                                         | NC                                                             |
|                | RST              | 48         | Pull up as shown in Figure 6-1 on page 101 | Connect through a capacitor to GND as close to pin as possible |
| USB            | USB0RBIAS        | 73         | Connect to GND through 10-kΩ resistor.     | Connect to GND through 10-kΩ resistor.                         |
|                | USB0DM           | 70         | NC                                         | GND                                                            |
|                | USB0DP           | 71         | NC                                         | GND                                                            |

Table 24-13 on page 1109 show how to handle signals for functions that are not used in a particular system implementation for devices that are in a 108-pin BGA package. Two options are shown in the table: an acceptable practice and a preferred practice for reduced power consumption and improved EMC characteristics. If a module is not used in a system, and its inputs are grounded, it is important that the clock to the module is never enabled by setting the corresponding bit in the **RCGCx** register.

**Table 24-13. Connections for Unused Signals, 108-pin BGA**

| Function       | Signal Name      | Pin Number | Acceptable Practice                        | Preferred Practice                                             |
|----------------|------------------|------------|--------------------------------------------|----------------------------------------------------------------|
| Ethernet       | ERBIAS           | J3         | Connect to GND through 12.4-kΩ resistor.   | Connect to GND through 12.4-kΩ resistor.                       |
|                | MDIO             | L9         | NC                                         | NC                                                             |
|                | RXIN             | L7         | NC                                         | GND                                                            |
|                | RXIP             | M7         | NC                                         | GND                                                            |
|                | TX0N             | L8         | NC                                         | GND                                                            |
|                | TX0P             | M8         | NC                                         | GND                                                            |

|                | XOSC1            | K12        | NC                                         | NC                                                             |
| No Connects    | NC               | -          | NC                                         | NC                                                             |
| System Control | OSC0             | L11        | NC                                         | GND                                                            |
|                | OSC1             | M11        | NC                                         | NC                                                             |
|                | RST              | H11        | Pull up as shown in Figure 6-1 on page 101 | Connect through a capacitor to GND as close to pin as possible |
| USB            | USB0RBIAS        | B12        | Connect to GND through 10-kΩ resistor.     | Connect to GND through 10-kΩ resistor.                         |
|                | USB0DM           | C11        | NC                                         | GND                                                            |
|                | USB0DP           | C12        | NC                                         | GND                                                            |

## 25 Operating Characteristics

**Table 25-1. Temperature Characteristics**

| Characteristic                         | Symbol | Value       | Unit |
|----------------------------------------|--------|-------------|------|
| Industrial operating temperature range | $T_A$  | -40 to +85  | °C   |
| Unpowered storage temperature range    | $T_S$  | -65 to +150 | °C   |

**Table 25-2. Thermal Characteristics**

| Characteristic                                        | Symbol        | Value                               | Unit |
|-------------------------------------------------------|---------------|-------------------------------------|------|
| Thermal resistance (junction to ambient) <sup>a</sup> | $\Theta_{JA}$ | 34                                  | °C/W |
| Average junction temperature <sup>b</sup>             | $T_J$         | $T_A + (P_{AVG} \cdot \Theta_{JA})$ | °C   |

a. Junction to ambient thermal resistance  $\Theta_{JA}$  numbers are determined by a package simulator.

b. Power dissipation is a function of temperature.

**Table 25-3. ESD Absolute Maximum Ratings<sup>a</sup>**

| Parameter Name | Min | Nom | Max | Unit |
|----------------|-----|-----|-----|------|
| $V_{ESDHBM}$   | -   | -   | 2.0 | kV   |
| $V_{ESDCDM}$   | -   | -   | 1.0 | kV   |
| $V_{ESDMM}$    | -   | -   | 100 | V    |

a. All Stellaris parts are ESD tested following the JEDEC standard.

## 26 Electrical Characteristics

### 26.1 DC Characteristics

#### 26.1.1 Maximum Ratings

The maximum ratings are the limits to which the device can be subjected without permanently damaging the device.

**Note:** The device is not guaranteed to operate properly at the maximum ratings.

**Table 26-1. Maximum Ratings**

| Parameter        | Parameter Name <sup>a</sup>                | Value |     | Unit |
|------------------|--------------------------------------------|-------|-----|------|
|                  |                                            | Min   | Max |      |
| V <sub>DD</sub>  | I/O supply voltage (V <sub>DD</sub> )      | 0     | 4   | V    |
| V <sub>DDA</sub> | Analog supply voltage (V <sub>DDA</sub> )  | 0     | 4   | V    |
| V <sub>BAT</sub> | Battery supply voltage (V <sub>BAT</sub> ) | 0     | 4   | V    |
| V <sub>IN</sub>  | Input voltage                              | -0.3  | 5.5 | V    |
| I                | Maximum current per output pins            | -     | 25  | mA   |

a. Voltages are measured with respect to GND.

**Important:** This device contains circuitry to protect the inputs against damage due to high-static voltages or electric fields; however, it is advised that normal precautions be taken to avoid application of any voltage higher than maximum-rated voltages to this high-impedance circuit. Reliability of operation is enhanced if unused inputs are connected to an appropriate logic voltage level (for example, either GND or V<sub>DD</sub>).

#### 26.1.2 Recommended DC Operating Conditions

For special high-current applications, the GPIO output buffers may be used with the following restrictions. With the GPIO pins configured as 8-mA output drivers, a total of four GPIO outputs may be used to sink current loads up to 18 mA each. At 18-mA sink current loading, the V<sub>OL</sub> value is specified as 1.2 V. The high-current GPIO package pins must be selected such that there are only a maximum of two per side of the physical package or BGA pin group with the total number of high-current GPIO outputs not exceeding four for the entire package.

**Table 26-2. Recommended DC Operating Conditions**

| Parameter                     | Parameter Name            | Min  | Nom | Max  | Unit |
|-------------------------------|---------------------------|------|-----|------|------|
| V <sub>DD</sub>               | I/O supply voltage        | 3.0  | 3.3 | 3.6  | V    |
| V <sub>DDA</sub>              | Analog supply voltage     | 3.0  | 3.3 | 3.6  | V    |
| V <sub>DDC</sub> <sup>a</sup> | Core supply voltage       | 1.08 | 1.2 | 1.32 | V    |
| V <sub>IH</sub>               | High-level input voltage  | 2.0  | -   | 5.0  | V    |
| V <sub>IL</sub>               | Low-level input voltage   | -0.3 | -   | 1.3  | V    |
| V <sub>OH</sub> <sup>b</sup>  | High-level output voltage | 2.4  | -   | -    | V    |
| V <sub>OL</sub> <sup>a</sup>  | Low-level output voltage  | -    | -   | 0.4  | V    |

Table 26-2. Recommended DC Operating Conditions (*continued*)

| Parameter | Parameter Name                            | Min | Nom | Max | Unit |
|-----------|-------------------------------------------|-----|-----|-----|------|
| $I_{OH}$  | High-level source current, $V_{OH}=2.4$ V |     |     |     |      |
|           | 2-mA Drive                                | 2.0 | -   | -   | mA   |
|           | 4-mA Drive                                | 4.0 | -   | -   | mA   |
|           | 8-mA Drive                                | 8.0 | -   | -   | mA   |
| $I_{OL}$  | Low-level sink current, $V_{OL}=0.4$ V    |     |     |     |      |
|           | 2-mA Drive                                | 2.0 | -   | -   | mA   |
|           | 4-mA Drive                                | 4.0 | -   | -   | mA   |
|           | 8-mA Drive                                | 8.0 | -   | -   | mA   |

a.  $V_{DDC}$  is supplied from the output of the LDO.

b.  $V_{OL}$  and  $V_{OH}$  shift to 1.2 V when using high-current GPIOs.

### 26.1.3 On-Chip Low Drop-Out (LDO) Regulator Characteristics

Table 26-3. LDO Regulator Characteristics

| Parameter | Parameter Name                                           | Min  | Nom | Max  | Unit    |
|-----------|----------------------------------------------------------|------|-----|------|---------|
| $C_{LDO}$ | External filter capacitor size for internal power supply | 1.0  | -   | 3.0  | $\mu$ F |
| $V_{LDO}$ | LDO output voltage                                       | 1.08 | 1.2 | 1.32 | V       |

### 26.1.4 Hibernation Module Characteristics

Table 26-4. Hibernation Module DC Characteristics

| Parameter    | Parameter Name             | Min | Nominal | Max | Unit |
|--------------|----------------------------|-----|---------|-----|------|
| $V_{BAT}$    | Battery supply voltage     | 2.4 | 3.0     | 3.6 | V    |
| $V_{LOWBAT}$ | Low battery detect voltage | -   | 2.35    | -   | V    |

### 26.1.5 Flash Memory Characteristics

Table 26-5. Flash Memory Characteristics

| Parameter   | Parameter Name                                                             | Min    | Nom | Max | Unit   |
|-------------|----------------------------------------------------------------------------|--------|-----|-----|--------|
| $PE_{CYC}$  | Number of guaranteed mass program/erase cycles before failure <sup>a</sup> | 15,000 | -   | -   | cycles |
| $T_{RET}$   | Data retention at average operating temperature of 125°C                   | 10     | -   | -   | years  |
| $T_{PROG}$  | Word program time                                                          | -      | -   | 1   | ms     |
| $T_{BPROG}$ | Buffer program time                                                        | -      | -   | 1   | ms     |
| $T_{ERASE}$ | Page erase time                                                            | -      | -   | 12  | ms     |
| $T_{ME}$    | Mass erase time                                                            | -      | -   | 16  | ms     |

a. A program/erase cycle is defined as switching the bits from 1-> 0 -> 1. Caution should be used when performing block erases, as repeated block erases can shorten the number of guaranteed erase cycles, see "Flash Memory Programming" on page 234.

## 26.1.6 GPIO Module Characteristics

**Table 26-6. GPIO Module DC Characteristics**

| Parameter           | Parameter Name                   | Min | Nom | Max | Unit |
|---------------------|----------------------------------|-----|-----|-----|------|
| R <sub>GPIOPU</sub> | GPIO internal pull-up resistor   | 50  | -   | 110 | kΩ   |
| R <sub>GPIOPD</sub> | GPIO internal pull-down resistor | 55  | -   | 180 | kΩ   |

## 26.1.7 USB Module Characteristics

The Stellaris® USB controller DC electrical specifications are compliant with the *Universal Serial Bus Specification Rev. 2.0* (full-speed and low-speed support) and the *On-The-Go Supplement to the USB 2.0 Specification Rev. 1.0*. Some components of the USB system are integrated within the LM3S9B90 microcontroller and specific to the Stellaris® microcontroller design. An external component resistor is needed as specified in Table 26-7.

**Table 26-7. USB Controller DC Characteristics**

| Parameter          | Parameter Name                                       | Value      | Unit |
|--------------------|------------------------------------------------------|------------|------|
| R <sub>UBIAS</sub> | Value of the pull-down resistor on the USB0RBIAS pin | 9.1K ± 1 % | Ω    |

## 26.1.8 Ethernet Controller Characteristics

**Table 26-8. Ethernet Controller DC Characteristics**

| Parameter          | Parameter Name                                    | Value       | Unit |
|--------------------|---------------------------------------------------|-------------|------|
| R <sub>EBIAS</sub> | Value of the pull-down resistor on the ERBIAS pin | 12.4K ± 1 % | Ω    |

## 26.1.9 Current Specifications

This section provides information on typical and maximum power consumption under various conditions.

### 26.1.9.1 Preliminary Current Consumption Specifications

The following table provides preliminary figures for current consumption while ongoing characterization is completed.

**Table 26-9. Preliminary Current Consumption**

| Parameter             | Parameter Name          | Conditions                                                                                                                               | Nom | Max | Unit |
|-----------------------|-------------------------|------------------------------------------------------------------------------------------------------------------------------------------|-----|-----|------|
| I <sub>DD_RUN</sub>   | Run mode 1 (Flash loop) | V <sub>DD</sub> = 3.3 V<br>Code= while(1){} executed in Flash<br>Peripherals = All ON<br>System Clock = 50 MHz (with PLL)<br>Temp = 25°C | 80  | -   | mA   |
| I <sub>DD_SLEEP</sub> | Sleep mode              | V <sub>DD</sub> = 3.3 V<br>Peripherals = All clock gated<br>System Clock = 50 MHz (with PLL)<br>Temp = 25°C                              | 8   | -   | mA   |

**Table 26-9. Preliminary Current Consumption (continued)**

| Parameter           | Parameter Name                                                              | Conditions                                                                                                                                              | Nom                  | Max | Unit |
|---------------------|-----------------------------------------------------------------------------|---------------------------------------------------------------------------------------------------------------------------------------------------------|----------------------|-----|------|
| $I_{DD\_DEEPSLEEP}$ | Deep-sleep mode                                                             | Peripherals = All OFF<br>System Clock = IOS30KHZ/64<br>Temp = 25°C                                                                                      | 550                  | -   | μA   |
| $I_{HIB\_NORTC}$    | Hibernate mode (external wake, RTC disabled, I/O not powered <sup>a</sup> ) | $V_{BAT} = 3.0\text{ V}$<br>$V_{DD} = 0\text{ V}$<br>$V_{DDA} = 0\text{ V}$<br>Peripherals = All OFF<br>System Clock = OFF<br>Hibernate Module = 0 kHz  | 8                    | -   | μA   |
| $I_{HIB\_RTC}$      | Hibernate mode (RTC enabled, I/O not powered <sup>a</sup> )                 | $V_{BAT} = 3.0\text{ V}$<br>$V_{DD} = 0\text{ V}$<br>$V_{DDA} = 0\text{ V}$<br>Peripherals = All OFF<br>System Clock = OFF<br>Hibernate Module = 32 kHz | 18                   | -   | μA   |
| $I_{HIB\_VDD3ON}$   | Hibernate mode (RTC enabled, I/O powered <sup>b</sup> )                     | $V_{BAT} = 3.0\text{ V}$<br>$V_{DD} = 0\text{ V}$<br>$V_{DDA} = 0\text{ V}$<br>Peripherals = All OFF<br>System Clock = OFF<br>Hibernate Module = 32 kHz | pending <sup>c</sup> | -   | μA   |

a. The VDD3ON mode must be disabled for the I/O ring to be unpowered.

b. The VDD3ON mode must be enabled for the I/O ring to be powered.

c. Pending product characterization.

## 26.2 AC Characteristics

### 26.2.1 Load Conditions

Unless otherwise specified, the following conditions are true for all timing measurements.

**Figure 26-1. Load Conditions**

### 26.2.2 Clocks

The following sections provide specifications on the various clock sources and mode.

### 26.2.2.1 PLL Specifications

The following tables provide specifications for using the PLL.

**Table 26-10. Phase Locked Loop (PLL) Characteristics**

| Parameter       | Parameter Name                        | Min                | Nom | Max               | Unit |
|-----------------|---------------------------------------|--------------------|-----|-------------------|------|
| $f_{REF\_XTAL}$ | Crystal reference <sup>a</sup>        | 3.579545           | -   | 16.384            | MHz  |
| $f_{REF\_EXT}$  | External clock reference <sup>a</sup> | 3.579545           | -   | 16.384            | MHz  |
| $f_{PLL}$       | PLL frequency <sup>b</sup>            | -                  | 400 | -                 | MHz  |
| $T_{READY}$     | PLL lock time                         | 0.562 <sup>c</sup> | -   | 1.38 <sup>d</sup> | ms   |

a. The exact value is determined by the crystal value programmed into the XTAL field of the **Run-Mode Clock Configuration (RCC)** register.

b. PLL frequency is automatically calculated by the hardware based on the XTAL field of the **RCC** register.

c. Using a 16.384-MHz crystal

d. Using 3.5795-MHz crystal

Table 26-11 on page 1115 shows the actual frequency of the PLL based on the crystal frequency used (defined by the XTAL field in the **RCC** register).

**Table 26-11. Actual PLL Frequency**

| XTAL | Crystal Frequency (MHz) | PLL Frequency (MHz) | Error   |
|------|-------------------------|---------------------|---------|
| 0x04 | 3.5795                  | 400.904             | 0.0023% |
| 0x05 | 3.6864                  | 398.1312            | 0.0047% |
| 0x06 | 4.0                     | 400                 | -       |
| 0x07 | 4.096                   | 401.408             | 0.0035% |
| 0x08 | 4.9152                  | 398.1312            | 0.0047% |
| 0x09 | 5.0                     | 400                 | -       |
| 0x0A | 5.12                    | 399.36              | 0.0016% |
| 0x0B | 6.0                     | 400                 | -       |
| 0x0C | 6.144                   | 399.36              | 0.0016% |
| 0x0D | 7.3728                  | 398.1312            | 0.0047% |
| 0x0E | 8.0                     | 400                 | 0.0047% |
| 0x0F | 8.192                   | 398.6773333         | 0.0033% |
| 0x10 | 10.0                    | 400                 | -       |
| 0x11 | 12.0                    | 400                 | -       |
| 0x12 | 12.288                  | 401.408             | 0.0035% |
| 0x13 | 13.56                   | 397.76              | 0.0056% |
| 0x14 | 14.318                  | 400.90904           | 0.0023% |
| 0x15 | 16.0                    | 400                 | -       |
| 0x16 | 16.384                  | 404.1386667         | 0.010%  |

### 26.2.2.2 PIOSC Specifications

**Table 26-12. PIOSC Clock Characteristics**

| Parameter     | Parameter Name                                                                       | Min | Nom    | Max | Unit |
|---------------|--------------------------------------------------------------------------------------|-----|--------|-----|------|
| $f_{PIOSC25}$ | Internal 16-MHz precision oscillator frequency variance, factory calibrated at 25 °C | -   | ±0.25% | ±1% | -    |

Table 26-12. PIOSC Clock Characteristics (*continued*)

| Parameter       | Parameter Name                                                                                                           | Min | Nom    | Max | Unit |
|-----------------|--------------------------------------------------------------------------------------------------------------------------|-----|--------|-----|------|
| $f_{PIOSCT}$    | Internal 16-MHz precision oscillator frequency variance, factory calibrated at 25 °C, across specified temperature range | -   | -      | ±3% | -    |
| $f_{PIOSCUCAL}$ | Internal 16-MHz precision oscillator frequency variance, user calibrated at a chosen temperature                         | -   | ±0.25% | ±1% | -    |

### 26.2.2.3 Internal 30-kHz Oscillator Specifications

Table 26-13. 30-kHz Clock Characteristics

| Parameter       | Parameter Name                       | Min | Nom | Max | Unit |
|-----------------|--------------------------------------|-----|-----|-----|------|
| $f_{IOSC30KHZ}$ | Internal 30-KHz oscillator frequency | 15  | 30  | 45  | KHz  |

### 26.2.2.4 Hibernation Clock Source Specifications

Table 26-14. Hibernation Clock Characteristics

| Parameter            | Parameter Name                                    | Min | Nom      | Max | Unit |
|----------------------|---------------------------------------------------|-----|----------|-----|------|
| $f_{HIBOSC}$         | Hibernation module oscillator frequency           | -   | 4.194304 | -   | MHz  |
| $f_{HIBOSC\_XTAL}$   | Crystal reference for hibernation oscillator      | -   | 4.194304 | -   | MHz  |
| $f_{HIBOSC\_EXT}$    | External clock reference for hibernation module   | -   | 32.768   | -   | KHz  |
| $t_{HIBOSC\_SETTLE}$ | Hibernation oscillator settling time <sup>a</sup> | -   | -        | 10  | ms   |

a. This parameter is highly sensitive to PCB layout and trace lengths, which may make this parameter time longer. Care must be taken in PCB design to minimize trace lengths and RLC (resistance, inductance, capacitance).

Table 26-15. HIB Oscillator Input Characteristics

| Name                               | Value    | Condition |
|------------------------------------|----------|-----------|
| Frequency                          | 4.194304 | MHz       |
| Frequency tolerance                | ±100     | PPM       |
| Oscillation mode                   | parallel | -         |
| Equivalent series resistance (max) | 200      | Ω         |
| Load capacitance                   | 16       | pF        |
| Drive level (typ)                  | 100      | μw        |

### 26.2.2.5 Main Oscillator Specifications

Table 26-16. Main Oscillator Clock Characteristics

| Parameter               | Parameter Name                                                                | Min  | Nom | Max    | Unit |
|-------------------------|-------------------------------------------------------------------------------|------|-----|--------|------|
| $f_{MOSC}$              | Main oscillator frequency                                                     | 1    | -   | 16.384 | MHz  |
| $t_{MOSC\_PER}$         | Main oscillator period                                                        | 61   | -   | 1000   | ns   |
| $t_{MOSC\_SETTLE}$      | Main oscillator settling time                                                 | 17.5 | -   | 20     | ms   |
| $f_{REF\_XTAL\_BYPASS}$ | Crystal reference using the main oscillator (PLL in BYPASS mode) <sup>a</sup> | 1    | -   | 16.384 | MHz  |
| $f_{REF\_EXT\_BYPASS}$  | External clock reference (PLL in BYPASS mode) <sup>a</sup>                    | 0    | -   | 80     | MHz  |

a. The ADC must be clocked from the PLL or directly from a 14- to 18-MHz clock source to operate properly.

**Table 26-17. MOSC Oscillator Input Characteristics**

| Name                               | Value    |          |          |          |          |          | Condition |
|------------------------------------|----------|----------|----------|----------|----------|----------|-----------|
| Frequency                          | 16       | 12       | 8        | 6        | 4        | 3.5      | MHz       |
| Frequency tolerance                | ±100     | ±100     | ±100     | ±100     | ±100     | ±100     | PPM       |
| Oscillation mode                   | parallel | parallel | parallel | parallel | parallel | parallel | -         |
| Equivalent series resistance (max) | 70       | 90       | 120      | 160      | 200      | 220      | Ω         |
| Load capacitance                   | 16       | 16       | 16       | 16       | 16       | 16       | pF        |
| Drive level (typ)                  | 100      | 100      | 100      | 100      | 100      | 100      | μw        |

### 26.2.2.6 System Clock Specifications with ADC Operation

**Table 26-18. System Clock Characteristics with ADC Operation**

| Parameter           | Parameter Name                                                                 | Min | Nom | Max | Unit |
|---------------------|--------------------------------------------------------------------------------|-----|-----|-----|------|
| f <sub>sysadc</sub> | System clock frequency when the ADC module is operating (when PLL is bypassed) | 16  | -   | -   | MHz  |

### 26.2.3 JTAG and Boundary Scan

**Table 26-19. JTAG Characteristics**

| Parameter No.               | Parameter                              | Parameter Name                    | Min | Nom              | Max | Unit |
|-----------------------------|----------------------------------------|-----------------------------------|-----|------------------|-----|------|
| J1                          | f <sub>TCK</sub>                       | TCK operational clock frequency   | 0   | -                | 10  | MHz  |
| J2                          | t <sub>TCK</sub>                       | TCK operational clock period      | 100 | -                | -   | ns   |
| J3                          | t <sub>TCK_LOW</sub>                   | TCK clock Low time                | -   | t <sub>TCK</sub> | -   | ns   |
| J4                          | t <sub>TCK_HIGH</sub>                  | TCK clock High time               | -   | t <sub>TCK</sub> | -   | ns   |
| J5                          | t <sub>TCK_R</sub>                     | TCK rise time                     | 0   | -                | 10  | ns   |
| J6                          | t <sub>TCK_F</sub>                     | TCK fall time                     | 0   | -                | 10  | ns   |
| J7                          | t <sub>TMS_SU</sub>                    | TMS setup time to TCK rise        | 20  | -                | -   | ns   |
| J8                          | t <sub>TMS_HLD</sub>                   | TMS hold time from TCK rise       | 20  | -                | -   | ns   |
| J9                          | t <sub>TDI_SU</sub>                    | TDI setup time to TCK rise        | 25  | -                | -   | ns   |
| J10                         | t <sub>TDI_HLD</sub>                   | TDI hold time from TCK rise       | 25  | -                | -   | ns   |
| J11<br>t <sub>TDO_ZDV</sub> | TCK fall to Data Valid from High-Z     | 2-mA drive                        | -   | 23               | 35  | ns   |
|                             |                                        | 4-mA drive                        |     | 15               | 26  | ns   |
|                             |                                        | 8-mA drive                        |     | 14               | 25  | ns   |
|                             |                                        | 8-mA drive with slew rate control |     | 18               | 29  | ns   |
| J12<br>t <sub>TDO_DV</sub>  | TCK fall to Data Valid from Data Valid | 2-mA drive                        | -   | 21               | 35  | ns   |
|                             |                                        | 4-mA drive                        |     | 14               | 25  | ns   |
|                             |                                        | 8-mA drive                        |     | 13               | 24  | ns   |
|                             |                                        | 8-mA drive with slew rate control |     | 18               | 28  | ns   |
| J13<br>t <sub>TDO_DVZ</sub> | TCK fall to High-Z from Data Valid     | 2-mA drive                        | -   | 9                | 11  | ns   |
|                             |                                        | 4-mA drive                        |     | 7                | 9   | ns   |
|                             |                                        | 8-mA drive                        |     | 6                | 8   | ns   |
|                             |                                        | 8-mA drive with slew rate control |     | 7                | 9   | ns   |

## 26.2.4 Reset

Table 26-20. Reset Characteristics

| Parameter No. | Parameter     | Parameter Name                                               | Min  | Nom | Max  | Unit          |
|---------------|---------------|--------------------------------------------------------------|------|-----|------|---------------|
| R1            | $V_{TH}$      | Reset threshold                                              | -    | 2.0 | -    | V             |
| R2            | $V_{BTH}$     | Brown-Out threshold                                          | 2.85 | 2.9 | 2.95 | V             |
| R3            | $T_{POR}$     | Power-On Reset timeout                                       | 6    | -   | 18   | ms            |
| R4            | $T_{BOR}$     | Brown-Out timeout                                            | -    | 500 | -    | $\mu$ s       |
| R5            | $T_{IRPOR}$   | Internal reset timeout after POR                             | -    | -   | 95   | system clocks |
| R6            | $T_{IRBOR}$   | Internal reset timeout after BOR                             | -    | -   | 7    | system clocks |
| R7            | $T_{IRHWR}$   | Internal reset timeout after hardware reset (RST pin)        | -    | -   | 7    | system clocks |
| R8            | $T_{IRSWR}$   | Internal reset timeout after software-initiated system reset | -    | -   | 16   | system clocks |
| R9            | $T_{IRWDR}$   | Internal reset timeout after watchdog reset                  | -    | -   | 16   | system clocks |
| R10           | $T_{IRMFR}$   | Internal reset timeout after MOSC failure reset              | -    | -   | 32   | system clocks |
| R11           | $T_{VDDRISE}$ | Supply voltage ( $V_{DD}$ ) rise time (0V-3.3V)              | -    | -   | 10   | ms            |
| R12           | $T_{MIN}$     | Minimum RST pulse width                                      | 2    | -   | -    | $\mu$ s       |

## 26.2.5 Sleep Modes

Table 26-21. Sleep Modes AC Characteristics<sup>a</sup>

| Parameter No | Parameter                 | Parameter Name                                                             | Min | Nom | Max                | Unit          |
|--------------|---------------------------|----------------------------------------------------------------------------|-----|-----|--------------------|---------------|
| D1           | $t_{\text{WAKE\_S}}$      | Time to wake from interrupt in sleep or deep-sleep mode, not using the PLL | -   | -   | 7                  | system clocks |
| D2           | $t_{\text{WAKE\_PLL\_S}}$ | Time to wake from interrupt in sleep or deep-sleep mode when using the PLL | -   | -   | $T_{\text{READY}}$ | ms            |
| D3           | $t_{\text{ENTER\_DS}}$    | Time to enter deep-sleep mode from sleep request                           | -   | 0   | $16^b$             | ms            |

a. Values in this table assume the IOSCC is the clock source during sleep or deep-sleep mode.

b. Nominal specification occurs 99.9995% of the time.

## 26.2.6 Hibernation Module

The Hibernation Module requires special system implementation considerations because it is intended to power down all other sections of its host device, refer to “Hibernation Module” on page 203.

Table 26-22. Hibernation Module AC Characteristics

| Parameter No | Parameter                  | Parameter Name                                                                                          | Min | Nom | Max | Unit          |
|--------------|----------------------------|---------------------------------------------------------------------------------------------------------|-----|-----|-----|---------------|
| H1           | $t_{\text{HIB\_LOW}}$      | Internal 32.768 KHz clock reference rising edge to HIB asserted                                         | 20  | -   | -   | $\mu\text{s}$ |
| H2           | $t_{\text{HIB\_HIGH}}$     | Internal 32.768 KHz clock reference rising edge to HIB deasserted                                       | -   | 30  | -   | $\mu\text{s}$ |
| H3           | $t_{\text{WAKE\_TO\_HIB}}$ | WAKE assert to HIB desassert (wake up time), internal Hibernation oscillator running during hibernation | 62  | -   | 124 | $\mu\text{s}$ |
| H4           | $t_{\text{WAKE\_TO\_HIB}}$ | WAKE assert to HIB desassert (wake up time), internal Hibernation oscillator stopped during hibernation | -   | -   | 10  | ms            |

Table 26-22. Hibernation Module AC Characteristics (continued)

| Parameter No | Parameter              | Parameter Name                                                                               | Min | Nom | Max             | Unit    |
|--------------|------------------------|----------------------------------------------------------------------------------------------|-----|-----|-----------------|---------|
| H5           | $t_{WAKE\_CLOCK}$      | WAKE assertion time, internal Hibernation oscillator running during hibernation              | 62  | -   | -               | $\mu s$ |
| H6           | $t_{WAKE\_NOCLOCK}$    | WAKE assertion time, internal Hibernation oscillator stopped during hibernation <sup>a</sup> | 10  | -   | -               | ms      |
| H7           | $t_{HIB\_REG\_ACCESS}$ | Access time to or from a non-volatile register in HIB module to complete                     | 92  | -   | -               | $\mu s$ |
| H8           | $t_{HIB\_TO\_HIB}$     | HIB high time between assertions                                                             | 100 | -   | -               | ms      |
| H9           | $t_{ENTER\_HIB}$       | Time to enter hibernation mode from hibernation request                                      | -   | 0   | 50 <sup>b</sup> | ms      |

a. This mode is used when the PINWEN bit is set and the RTCEN bit is clear in the HIBCTL register.

b. Nominal specification occurs 99.998% of the time.

Figure 26-10. Hibernation Module Timing with Internal Oscillator Running in Hibernation

Figure 26-11. Hibernation Module Timing with Internal Oscillator Stopped in Hibernation

## 26.2.7 General-Purpose I/O (GPIO)

**Note:** All GPIOs are 5-V tolerant.

Table 26-23. GPIO Characteristics

| Parameter   | Parameter Name                                | Condition                         | Min | Nom | Max | Unit |
|-------------|-----------------------------------------------|-----------------------------------|-----|-----|-----|------|
| $t_{GPIOR}$ | GPIO Rise Time (from 20% to 80% of $V_{DD}$ ) | 2-mA drive                        | -   | 14  | 20  | ns   |
|             |                                               | 4-mA drive                        |     | 7   | 10  | ns   |
|             |                                               | 8-mA drive                        |     | 4   | 5   | ns   |
|             |                                               | 8-mA drive with slew rate control |     | 6   | 8   | ns   |

Table 26-23. GPIO Characteristics (continued)

| Parameter   | Parameter Name                                | Condition                         | Min | Nom | Max | Unit |
|-------------|-----------------------------------------------|-----------------------------------|-----|-----|-----|------|
| $t_{GPIOF}$ | GPIO Fall Time (from 80% to 20% of $V_{DD}$ ) | 2-mA drive                        | -   | 14  | 21  | ns   |
|             |                                               | 4-mA drive                        |     | 7   | 11  | ns   |
|             |                                               | 8-mA drive                        |     | 4   | 6   | ns   |
|             |                                               | 8-mA drive with slew rate control |     | 6   | 8   | ns   |

## 26.2.8 External Peripheral Interface (EPI)

When the EPI module is in SDRAM mode, the drive strength must be configured to 8 mA. Table 26-24 on page 1122 shows the rise and fall times in SDRAM mode with 16 pF load conditions. When the EPI module is in Host-Bus or General-Purpose mode, the values in Table 26-23 on page 1121 should be used.

Table 26-24. EPI SDRAM Characteristics

| Parameter    | Parameter Name                               | Condition                 | Min | Nom | Max | Unit |
|--------------|----------------------------------------------|---------------------------|-----|-----|-----|------|
| $t_{SDRAMR}$ | EPI Rise Time (from 20% to 80% of $V_{DD}$ ) | 8-mA drive, $C_L = 16$ pF | -   | 2   | 3   | ns   |
| $t_{SDRAMF}$ | EPI Fall Time (from 80% to 20% of $V_{DD}$ ) | 8-mA drive, $C_L = 16$ pF | -   | 2   | 3   | ns   |

Table 26-25. EPI SDRAM Interface Characteristics<sup>a</sup>

| Parameter No | Parameter | Parameter Name         | Min | Nom | Max | Unit    |
|--------------|-----------|------------------------|-----|-----|-----|---------|
| E1           | $t_{CK}$  | SDRAM Clock period     | 20  | -   | -   | ns      |
| E2           | $t_{CH}$  | SDRAM Clock high time  | 10  | -   | -   | ns      |
| E3           | $t_{CL}$  | SDRAM Clock low time   | 10  | -   | -   | ns      |
| E4           | $t_{COV}$ | CLK to output valid    | -5  | -   | 5   | ns      |
| E5           | $t_{COI}$ | CLK to output invalid  | -5  | -   | 5   | ns      |
| E6           | $t_{COT}$ | CLK to output tristate | -5  | -   | 5   | ns      |
| E7           | $t_S$     | Input set up to CLK    | 10  | -   | -   | ns      |
| E8           | $t_H$     | CLK to input hold      | 0   | -   | -   | ns      |
| E9           | $t_{PU}$  | Power-up time          | 100 | -   | -   | $\mu$ s |
| E10          | $t_{RP}$  | Precharge all banks    | 20  | -   | -   | ns      |
| E11          | $t_{RFC}$ | Auto refresh           | 66  | -   | -   | ns      |
| E12          | $t_{MRD}$ | Program mode register  | 40  | 40  | 40  | ns      |

a. The EPI SDRAM interface must use 8-mA drive.

**Figure 26-17. General-Purpose Mode Read and Write Timing**

The above figure illustrates accesses where the FRM50 bit is clear, the FRMCNT field is 0x0, the RD2CYC bit is clear, and the WR2CYC bit is clear.

**Figure 26-18. General-Purpose Mode iRDY Timing**

## 26.2.9 Analog-to-Digital Converter

**Table 26-28. ADC Characteristics<sup>a</sup>**

| Parameter            | Parameter Name                                                                  | Min  | Nom | Max                 | Unit               |
|----------------------|---------------------------------------------------------------------------------|------|-----|---------------------|--------------------|
| $V_{\text{ADCIN}}$   | Maximum single-ended, full-scale analog input voltage, using internal reference | -    | -   | 3.0                 | V                  |
|                      | Maximum single-ended, full-scale analog input voltage, using external reference | -    | -   | $V_{\text{REFA}}$   | V                  |
|                      | Minimum single-ended, full-scale analog input voltage                           | 0.0  | -   | -                   | V                  |
|                      | Maximum differential, full-scale analog input voltage, using internal reference | -    | -   | 1.5                 | V                  |
|                      | Maximum differential, full-scale analog input voltage, using external reference | -    | -   | $V_{\text{REFA}}/2$ | V                  |
|                      | Minimum differential, full-scale analog input voltage                           | 0.0  | -   | -                   | V                  |
| N                    | Resolution                                                                      | 10   |     |                     | bits               |
| $f_{\text{ADC}}$     | ADC internal clock frequency <sup>b</sup>                                       | 14   | 16  | 18                  | MHz                |
| $t_{\text{ADCCONV}}$ | Conversion time <sup>c</sup>                                                    | 1    |     |                     | $\mu\text{s}$      |
| $f_{\text{ADCCONV}}$ | Conversion rate <sup>c</sup>                                                    | 1000 |     |                     | k samples/s        |
| $t_{\text{LT}}$      | Latency from trigger to start of conversion                                     | -    | 2   | -                   | system clocks      |
| $I_{\text{L}}$       | ADC input leakage                                                               | -    | -   | $\pm 1.0$           | $\mu\text{A}$      |
| $R_{\text{ADC}}$     | ADC equivalent resistance                                                       | -    | -   | 10                  | $\text{k}\Omega$   |
| $C_{\text{ADC}}$     | ADC equivalent capacitance                                                      | 0.9  | 1.0 | 1.1                 | pF                 |
| $E_{\text{L}}$       | Integral nonlinearity error                                                     | -    | -   | $\pm 1$             | LSB                |
| $E_{\text{D}}$       | Differential nonlinearity error                                                 | -    | -   | $\pm 1$             | LSB                |
| $E_{\text{O}}$       | Offset error                                                                    | -    | -   | $\pm 1$             | LSB                |
| $E_{\text{G}}$       | Full-scale gain error                                                           | -    | -   | $\pm 3$             | LSB                |
| $E_{\text{TS}}$      | Temperature sensor accuracy                                                     | -    | -   | $\pm 5$             | $^{\circ}\text{C}$ |

a. The ADC reference voltage is 3.0 V. This reference voltage is internally generated from the 3.3 VDDA supply by a band gap circuit.

b. The ADC must be clocked from the PLL or directly from an external clock source to operate properly.

c. The conversion time and rate scale from the specified number if the ADC internal clock frequency is any value other than 16 MHz.

Figure 26-19. ADC Input Equivalency Diagram

Table 26-29. ADC Module External Reference Characteristics<sup>a</sup>

| Parameter  | Parameter Name                                  | Min | Nom       | Max      | Unit    |
|------------|-------------------------------------------------|-----|-----------|----------|---------|
| $V_{REFA}$ | External voltage reference for ADC <sup>b</sup> | 2.4 | -         | $V_{DD}$ | V       |
| $I_L$      | External voltage reference leakage current      | -   | $\pm 1.0$ | -        | $\mu A$ |

a. Care must be taken to supply a reference voltage of acceptable quality.

b. Ground is always used as the reference level for the minimum conversion value.

Table 26-30. ADC Module Internal Reference Characteristics

| Parameter  | Parameter Name                     | Min | Nom | Max       | Unit |
|------------|------------------------------------|-----|-----|-----------|------|
| $V_{REFI}$ | Internal voltage reference for ADC | -   | 3.0 | -         | V    |
| $E_{IR}$   | Internal voltage reference error   | -   | -   | $\pm 2.5$ | %    |

## 26.2.10 Synchronous Serial Interface (SSI)

Table 26-31. SSI Characteristics

| Parameter No. | Parameter       | Parameter Name                    | Min | Nom | Max   | Unit          |
|---------------|-----------------|-----------------------------------|-----|-----|-------|---------------|

### 26.2.13 Ethernet Controller

Table 26-36. 100BASE-TX Transmitter Characteristics<sup>a</sup>

| Parameter Name            | Min | Nom | Max  | Unit |
|---------------------------|-----|-----|------|------|
| Peak output amplitude     | 950 | -   | 1050 | mVpk |
| Output amplitude symmetry | 98  | -   | 102  | %    |
| Output overshoot          | -   | -   | 5    | %    |
| Rise/Fall time            | 3   | -   | 5    | ns   |
| Rise/Fall time imbalance  | -   | -   | 500  | ps   |
| Duty cycle distortion     | -   | -   | -    | ps   |
| Jitter                    | -   | -   | 1.4  | ns   |

a. Measured at the line side of the transformer.

Table 26-37. 100BASE-TX Transmitter Characteristics (informative)<sup>a</sup>

| Parameter Name          | Min | Nom | Max | Unit |
|-------------------------|-----|-----|-----|------|
| Return loss             | 16  | -   | -   | dB   |
| Open-circuit inductance | 350 | -   | -   | μH   |

a. The specifications in this table are included for information only. They are mainly a function of the external transformer and termination resistors used for measurements.

Table 26-38. 100BASE-TX Receiver Characteristics

| Parameter Name                       | Min | Nom | Max | Unit  |
|--------------------------------------|-----|-----|-----|-------|
| Signal detect assertion threshold    | 600 | 700 | -   | mVppd |
| Signal detect de-assertion threshold | 350 | 425 | -   | mVppd |
| Differential input resistance        | -   | 3.6 | -   | kΩ    |
| Jitter tolerance (pk-pk)             | 4   | -   | -   | ns    |
| Baseline wander tracking             | -80 | -   | +80 | %     |

**Table 26-38. 100BASE-TX Receiver Characteristics (continued)**

| Parameter Name                  | Min | Nom | Max  | Unit |
|---------------------------------|-----|-----|------|------|
| Signal detect assertion time    | -   | -   | 1000 | µs   |
| Signal detect de-assertion time | -   | -   | 4    | µs   |

**Table 26-39. 10BASE-T Transmitter Characteristics<sup>a</sup>**

| Parameter Name                  | Min | Nom        | Max | Unit |
|---------------------------------|-----|------------|-----|------|
| Peak differential output signal | 2.2 | -          | 2.7 | V    |
| Harmonic content                | 27  | -          | -   | dB   |
| Link pulse width                | -   | 100        | -   | ns   |
| Start-of-idle pulse width       | -   | 300<br>350 | -   | ns   |

a. The Manchester-encoded data pulses, the link pulse and the start-of-idle pulse are tested against the templates and using the procedures found in Clause 14 of *IEEE 802.3*.

**Table 26-40. 10BASE-T Transmitter Characteristics (informative)<sup>a</sup>**

| Parameter Name                  | Min               | Nom | Max | Unit |
|---------------------------------|-------------------|-----|-----|------|
| Output return loss              | 15                | -   | -   | dB   |
| Output impedance balance        | $29-17\log(f/10)$ | -   | -   | dB   |
| Peak common-mode output voltage | -                 | -   | 50  | mV   |
| Common-mode rejection           | -                 | -   | 100 | mV   |
| Common-mode rejection jitter    | -                 | -   | 1   | ns   |

a. The specifications in this table are included for information only. They are mainly a function of the external transformer and termination resistors used for measurements.

**Table 26-41. 10BASE-T Receiver Characteristics**

| Parameter Name                | Min | Nom | Max | Unit  |
|-------------------------------|-----|-----|-----|-------|
| Jitter tolerance (pk-pk)      | 30  | 26  | -   | ns    |
| Input squelched threshold     | 340 | 440 | 540 | mVppd |
| Differential input resistance | -   | 3.6 | -   | kΩ    |
| Common-mode rejection         | 25  | -   | -   | V     |

**Table 26-42. Isolation Transformers<sup>a</sup>**

| Name                      | Value         | Condition       |
|---------------------------|---------------|-----------------|
| Turns ratio               | 1 CT : 1 CT   | +/- 5%          |
| Open-circuit inductance   | 350 uH (min)  | @ 10 mV, 10 kHz |
| Leakage inductance        | 0.40 uH (max) | @ 1 MHz (min)   |
| Inter-winding capacitance | 25 pF (max)   |                 |
| DC resistance             | 0.9 Ohm (max) |                 |
| Insertion loss            | 0.4 dB (typ)  | 0-65 MHz        |
| HIPOT                     | 1500          | Vrms            |

a. Two simple 1:1 isolation transformers are required at the line interface. Transformers with integrated common-mode chokes are recommended for exceeding FCC requirements. This table gives the recommended line transformer characteristics.

**Note:** The 100Base-TX amplitude specifications assume a transformer loss of 0.4 dB.

**Table 26-43. Ethernet Reference Crystal**

| Name                                            | Value                                | Condition |
|-------------------------------------------------|--------------------------------------|-----------|
| Frequency                                       | 25.00000                             | MHz       |
| Frequency tolerance <sup>a</sup>                | ±50                                  | PPM       |
| Oscillation mode                                | Parallel resonance, fundamental mode |           |
| Parameters at 25° C ±2° C; Drive level = 0.5 mW |                                      |           |
| Drive level (typ)                               | 50-100                               | μW        |
| Shunt capacitance (max)                         | 10                                   | pF        |
| Motional capacitance (min)                      | 10                                   | fF        |
| Series resistance (max)                         | 60                                   | Ω         |
| Spurious response (max)                         | > 5 dB below main within 500 kHz     |           |

a. This tolerance provides a guard band for temperature stability and aging drift.

**Figure 26-28. External XTLP Oscillator Characteristics**

**Table 26-44. External XTLP Oscillator Characteristics**

| Parameter    | Parameter Name              | Min | Nom  | Max | Unit |
|--------------|-----------------------------|-----|------|-----|------|
| $XTLN_{ILV}$ | XTLN Input Low Voltage      | -   | -    | 0.8 | -    |
| $XTLP_F$     | XTLP Frequency <sup>a</sup> | -   | 25.0 | -   | -    |
| $T_{CLKPER}$ | XTLP Period <sup>a</sup>    | -   | 40   | -   | -    |
| $XTLP_{DC}$  | XTLP Duty Cycle             | 40  | -    | 60  | %    |
| $T_r, T_f$   | Rise/Fall Time              | -   | -    | 4.0 | ns   |
| $T_{JITTER}$ | Absolute Jitter             | -   | -    | 0.1 | ns   |

a. IEEE 802.3 frequency tolerance ±50 ppm.

## 26.2.14 Universal Serial Bus (USB) Controller

The Stellaris® USB controller AC electrical specifications are compliant with the *Universal Serial Bus Specification Rev. 2.0* (full-speed and low-speed support) and the *On-The-Go Supplement to the USB 2.0 Specification Rev. 1.0*.

## 26.2.15 Analog Comparator

**Table 26-45. Analog Comparator Characteristics**

| Parameter        | Parameter Name                         | Min | Nom | Max                  | Unit |
|------------------|----------------------------------------|-----|-----|----------------------|------|
| V <sub>OS</sub>  | Input offset voltage                   | -   | ±10 | ±25                  | mV   |
| V <sub>CM</sub>  | Input common mode voltage range        | 0   | -   | V <sub>DD</sub> -1.5 | V    |
| C <sub>MRR</sub> | Common mode rejection ratio            | 50  | -   | -                    | dB   |
| T <sub>RT</sub>  | Response time                          | -   | -   | 1                    | µs   |
| T <sub>MC</sub>  | Comparator mode change to Output Valid | -   | -   | 10                   | µs   |

**Table 26-46. Analog Comparator Voltage Reference Characteristics**

| Parameter       | Parameter Name               | Min | Nom                 | Max  | Unit |
|-----------------|------------------------------|-----|---------------------|------|------|
| R <sub>HR</sub> | Resolution high range        | -   | V <sub>DD</sub> /31 | -    | LSB  |
| R <sub>LR</sub> | Resolution low range         | -   | V <sub>DD</sub> /23 | -    | LSB  |
| A <sub>HR</sub> | Absolute accuracy high range | -   | -                   | ±1/2 | LSB  |
| A <sub>LR</sub> | Absolute accuracy low range  | -   | -                   | ±1/4 | LSB  |

## B Ordering and Contact Information

### B.1 Ordering Information

**Table B-1. Part Ordering Information**

| Orderable Part Number | Description                                                                           |
|-----------------------|---------------------------------------------------------------------------------------|
| LM3S9B90-IQC80-C1     | Stellaris® LM3S9B90 Microcontroller Industrial Temperature 100-pin LQFP               |
| LM3S9B90-IBZ80-C1     | Stellaris® LM3S9B90 Microcontroller Industrial Temperature 108-ball BGA               |
| LM3S9B90-IQC80-C1T    | Stellaris® LM3S9B90 Microcontroller Industrial Temperature 100-pin LQFP Tape-and-reel |
| LM3S9B90-IBZ80-C1T    | Stellaris® LM3S9B90 Microcontroller Industrial Temperature 108-ball BGA Tape-and-reel |

### B.2 Part Markings

The Stellaris® microcontrollers are marked with an identifying number. This code contains the following information:

- The first line indicates the part number. In the example below, this is the LM3S9B90.
- In the second line, the first seven characters indicate the temperature, package, speed, and revision. In the example below, this is an Industrial temperature (I), 100-pin LQFP package (QC), 80-MHz (80), revision C0 (C0) device.
- The third line contain internal tracking numbers.

## B.3 Kits

The Stellaris<sup>®</sup> Family provides the hardware and software tools that engineers need to begin development quickly.

- Reference Design Kits accelerate product development by providing ready-to-run hardware and comprehensive documentation including hardware design files
- Evaluation Kits provide a low-cost and effective means of evaluating Stellaris<sup>®</sup> microcontrollers before purchase
- Development Kits provide you with all the tools you need to develop and prototype embedded applications right out of the box

See the website at [www.ti.com/stellaris](http://www.ti.com/stellaris) for the latest tools available, or ask your distributor.

## B.4 Support Information

For support on Stellaris<sup>®</sup> products, contact the TI Worldwide Product Information Center nearest you: <http://www-k.ext.ti.com/sc/technical-support/product-information-centers.htm>.

## C Package Information

Figure C-1. 100-Pin LQFP Package

**Note:** The following notes apply to the package drawing.

1. All dimensions shown in mm.
2. Dimensions shown are nominal with tolerances indicated.
3. Foot length 'L' is measured at gage plane 0.25 mm above seating plane.

| Body +2.00 mm Footprint, 1.4 mm package thickness |             |                     |
|---------------------------------------------------|-------------|---------------------|

Figure C-2. 108-Ball BGA Package

**Note:** The following notes apply to the package drawing.

1. ALL DIMENSIONS ARE IN MILLIMETERS.
2. 'e' REPRESENTS THE BASIC SOLDER BALL GRID PITCH.
3. 'M' REPRESENTS THE BASIC SOLDER BALL MATRIX SIZE.  
AND SYMBOL 'N' IS THE NUMBER OF BALLS AFTER DEPOPULATING.
4. 'b' IS MEASURABLE AT THE MAXIMUM SOLDER BALL DIAMETER AFTER REFLOW  
PARALLEL TO PRIMARY DATUM [C].
5. DIMENSION 'ccc' IS MEASURED PARALLEL TO PRIMARY DATUM [C].
6. PRIMARY DATUM [C] AND SEATING PLANE ARE DEFINED BY THE SPHERICAL  
CROWNS OF THE SOLDER BALLS.
7. PACKAGE SURFACE SHALL BE MATTE FINISH CHARMILLES 24 TO 27.
8. SUBSTRATE MATERIAL BASE IS BT RESIN.
9. THE OVERALL PACKAGE THICKNESS "A" ALREADY CONSIDERS COLLAPSE BALLS
10. DIMENSIONING AND TOLERANCING PER ASME Y14.5M 1994.
11. EXCEPT DIMENSION b.

## IMPORTANT NOTICE

Texas Instruments Incorporated and its subsidiaries (TI) reserve the right to make corrections, modifications, enhancements, improvements, and other changes to its products and services at any time and to discontinue any product or service without notice. Customers should obtain the latest relevant information before placing orders and should verify that such information is current and complete. All products are sold subject to TI's terms and conditions of sale supplied at the time of order acknowledgment.

TI warrants performance of its hardware products to the specifications applicable at the time of sale in accordance with TI's standard warranty. Testing and other quality control techniques are used to the extent TI deems necessary to support this warranty. Except where mandated by government requirements, testing of all parameters of each product is not necessarily performed.

TI assumes no liability for applications assistance or customer product design. Customers are responsible for their products and applications using TI components. To minimize the risks associated with customer products and applications, customers should provide adequate design and operating safeguards.

TI does not warrant or represent that any license, either express or implied, is granted under any TI patent right, copyright, mask work right, or other TI intellectual property right relating to any combination, machine, or process in which TI products or services are used. Information published by TI regarding third-party products or services does not constitute a license from TI to use such products or services or a warranty or endorsement thereof. Use of such information may require a license from a third party under the patents or other intellectual property of the third party, or a license from TI under the patents or other intellectual property of TI.

Reproduction of TI information in TI data books or data sheets is permissible only if reproduction is without alteration and is accompanied by all associated warranties, conditions, limitations, and notices. Reproduction of this information with alteration is an unfair and deceptive business practice. TI is not responsible or liable for such altered documentation. Information of third parties may be subject to additional restrictions.

Resale of TI products or services with statements different from or beyond the parameters stated by TI for that product or service voids all express and any implied warranties for the associated TI product or service and is an unfair and deceptive business practice. TI is not responsible or liable for any such statements.

TI products are not authorized for use in safety-critical applications (such as life support) where a failure of the TI product would reasonably be expected to cause severe personal injury or death, unless officers of the parties have executed an agreement specifically governing such use. Buyers represent that they have all necessary expertise in the safety and regulatory ramifications of their applications, and acknowledge and agree that they are solely responsible for all legal, regulatory and safety-related requirements concerning their products and any use of TI products in such safety-critical applications, notwithstanding any applications-related information or support that may be provided by TI. Further, Buyers must fully indemnify TI and its representatives against any damages arising out of the use of TI products in such safety-critical applications.

TI products are neither designed nor intended for use in military/aerospace applications or environments unless the TI products are specifically designated by TI as military-grade or "enhanced plastic." Only products designated by TI as military-grade meet military specifications. Buyers acknowledge and agree that any such use of TI products which TI has not designated as military-grade is solely at the Buyer's risk, and that they are solely responsible for compliance with all legal and regulatory requirements in connection with such use.

TI products are neither designed nor intended for use in automotive applications or environments unless the specific TI products are designated by TI as compliant with ISO/TS 16949 requirements. Buyers acknowledge and agree that, if they use any non-designated products in automotive applications, TI will not be responsible for any failure to meet such requirements.
