

## **LM4675 Boomer<sup>®</sup> Audio Power Amplifier Series Ultra-Low EMI, Filterless, 2.65W, Mono, Class D Audio Power Amplifier with Spread Spectrum**

Check for Samples: [LM4675](#), [LM4675SDBD](#), [LM4675TLBD](#)

### **FEATURES**

- **Spread Spectrum Architecture Reduces EMI**
- **Mono Class D Operation**
- **No Output Filter Required for Inductive Loads**
- **Externally Configurable Gain**
- **Very Fast Turn On Time: 17 $\mu$ s (typ)**
- **Minimum External Components**
- **"Click and Pop" Suppression Circuitry**
- **Micro-Power Shutdown Mode**
- **Available in Space-Saving 0.5mm Pitch DSBGA and WSON Packages**

### **APPLICATIONS**

- **Mobile Phones**
- **PDA's**
- **Portable Electronic Devices**

### **KEY SPECIFICATIONS**

- **Efficiency at 3.6V, 400mW into 8 $\Omega$  Speaker: 89% (typ)**
- **Efficiency at 3.6V, 100mW into 8 $\Omega$  Speaker: 80% (typ)**
- **Efficiency at 5V, 1W into 8 $\Omega$  Speaker: 89% (typ)**
- **Quiescent Current, 3.6V Supply: 2.2mA (typ)**
- **Total Shutdown Power Supply Current: 0.01 $\mu$ A (typ)**
- **Single Supply Range: 2.4V to 5.5V**
- **PSRR, f = 217Hz: 82dB**

### **DESCRIPTION**

The LM4675 is a single supply, high efficiency, 2.65W, mono, Class D audio amplifier. A spread spectrum, filterless PWM architecture reduces EMI and eliminates the output filter, reducing external component count, board area consumption, system cost, and simplifying design.

The LM4675 is designed to meet the demands of mobile phones and other portable communication devices. Operating on a single 5V supply, it is capable of driving a 4 $\Omega$  speaker load at a continuous average output of 2.2W with less than 1% THD+N. Its flexible power supply requirements allow operation from 2.4V to 5.5V. The wide band spread spectrum architecture of the LM4675 reduces EMI-radiated emissions due to the modulator frequency.

The LM4675 has high efficiency with speaker loads compared to a typical Class AB amplifier. With a 3.6V supply driving an 8 $\Omega$  speaker, the IC's efficiency for a 100mW power level is 80%, reaching 89% at 400mW output power.

The LM4675 features a low-power consumption shutdown mode. Shutdown may be enabled by driving the Shutdown pin to a logic low (GND).

The gain of the LM4675 is externally configurable which allows independent gain control from multiple sources by summing the signals. Output short circuit and thermal overload protection prevent the device from damage during fault conditions.

Please be aware that an important notice concerning availability, standard warranty, and use in critical applications of Texas Instruments semiconductor products and disclaimers thereto appears at the end of this data sheet.

See YZR0009 Package

**Figure 4. 8-Pin WSON - Top View**  
See NGQ0008A Package

These devices have limited built-in ESD protection. The leads should be shorted together or the device placed in conductive foam during storage or handling to prevent electrostatic damage to the MOS gates.

## Absolute Maximum Ratings<sup>(1)(2)(3)</sup>

Supply Voltage <sup>(1)</sup>	6.0V
Storage Temperature	-65°C to +150°C
Voltage at Any Input Pin	$V_{DD} + 0.3V \geq V \geq GND - 0.3V$
Power Dissipation <sup>(4)</sup>	Internally Limited
ESD Susceptibility, all other pins <sup>(5)</sup>	2.0kV
ESD Susceptibility <sup>(6)</sup>	200V
Junction Temperature ( $T_{JMAX}$ )	150°C
Thermal Resistance	$\theta_{JA}$ (DSBGA) 220°C/W
	$\theta_{JA}$ (WSON) 73°C/W
Soldering Information	See (SNVA009) "microSMD Wafers Level Chip Scale Package."

- (1) All voltages are measured with respect to the ground pin, unless otherwise specified.
- (2) *Absolute Maximum Ratings* indicate limits beyond which damage to the device may occur. *Operating Ratings* indicate conditions for which the device is functional, but do not ensure specific performance limits. *Electrical Characteristics* state DC and AC electrical specifications under particular test conditions which ensure specific performance limits. This assumes that the device is within the Operating Ratings. Specifications are not ensured for parameters where no limit is given, however, the typical value is a good indication of device performance.
- (3) If Military/Aerospace specified devices are required, please contact the TI Sales Office/ Distributors for availability and specifications.
- (4) The maximum power dissipation must be derated at elevated temperatures and is dictated by  $T_{JMAX}$ ,  $\theta_{JA}$ , and the ambient temperature  $T_A$ . The maximum allowable power dissipation is  $P_{DMAX} = (T_{JMAX} - T_A) / \theta_{JA}$  or the number given in Absolute Maximum Ratings, whichever is lower. For the LM4675,  $T_{JMAX} = 150^\circ\text{C}$ . The typical  $\theta_{JA}$  is 99.1°C/W for the DSBGA package.
- (5) Human body model, 100pF discharged through a 1.5kΩ resistor.
- (6) Machine Model, 220pF – 240pF discharged through all pins.

## Operating Ratings<sup>(1)(2)</sup>

Temperature Range $T_{MIN} \leq T_A \leq T_{MAX}$	$-40^\circ\text{C} \leq T_A \leq 85^\circ\text{C}$
Supply Voltage	$2.4V \leq V_{DD} \leq 5.5V$

- (1) All voltages are measured with respect to the ground pin, unless otherwise specified.
- (2) *Absolute Maximum Ratings* indicate limits beyond which damage to the device may occur. *Operating Ratings* indicate conditions for which the device is functional, but do not ensure specific performance limits. *Electrical Characteristics* state DC and AC electrical specifications under particular test conditions which ensure specific performance limits. This assumes that the device is within the Operating Ratings. Specifications are not ensured for parameters where no limit is given, however, the typical value is a good indication of device performance.

**Electrical Characteristics**<sup>(1)(2)</sup>

The following specifications apply for  $A_V = 2V/V$  ( $R_I = 150k\Omega$ ),  $R_L = 15\mu H + 8\Omega + 15\mu H$  unless otherwise specified. Limits apply for  $T_A = 25^\circ C$ .

Symbol	Parameter	Conditions	LM4675		Units (Limits)
			Typical <sup>(3)</sup>	Limit <sup>(4)(5)</sup>	
$ V_{OS} $	Differential Output Offset Voltage	$V_I = 0V, A_V = 2V/V, V_{DD} = 2.4V$ to $5.0V$	3		mV
$ I_{IH} $	Logic High Input Current	$V_{DD} = 5.0V, V_I = 5.5V$	17	100	$\mu A$ (max)
$ I_{IL} $	Logic Low Input Current	$V_{DD} = 5.0V, V_I = -0.3V$	0.9	5	$\mu A$ (max)
$I_{DD}$	Quiescent Power Supply Current	$V_{IN} = 0V$ , No Load, $V_{DD} = 5.0V$	2.8	3.9	$mA$ (max)
		$V_{IN} = 0V$ , No Load, $V_{DD} = 3.6V$	2.2	2.9	$mA$
		$V_{IN} = 0V$ , No Load, $V_{DD} = 2.4V$	1.6	2.3	$mA$ (max)
		$V_{IN} = 0V, R_L = 8\Omega, V_{DD} = 5.0V$	2.8		
		$V_{IN} = 0V, R_L = 8\Omega, V_{DD} = 3.6V$	2.2		
		$V_{IN} = 0V, R_L = 8\Omega, V_{DD} = 2.4V$	1.6		
$I_{SD}$	Shutdown Current <sup>(6)</sup>	$V_{SHUTDOWN} = 0V, V_{DD} = 2.4V$ to $5.0V$	0.01	1.0	$\mu A$ (max)
$V_{SDIH}$	Shutdown voltage input high			1.4	V (min)
$V_{SDIL}$	Shutdown voltage input low			0.4	V (max)
$R_{OSD}$	Output Impedance	$V_{SHUTDOWN} = 0.4V$	100		$k\Omega$
$A_V$	Gain		$300k\Omega/R_I$		$V/V$ (min) $V/V$ (max)
$R_{SD}$	Resistance from Shutdown Pin to GND		300		$k\Omega$

			$V_{DD} = 3.6V$	1.08	W
			$V_{DD} = 2.5V$	450	mW
		$R_L = 15\mu H + 8\Omega + 15\mu H$ THD = 10% (max) $f = 1kHz, 22kHz$ BW	$V_{DD} = 5V$	1.6	W
			$V_{DD} = 3.6V$	820	mW
			$V_{DD} = 2.5V$	350	mW
		$R_L = 15\mu H + 8\Omega + 15\mu H$ THD = 1% (max) $f = 1kHz, 22kHz$ BW	$V_{DD} = 5V$	1.3	W
			$V_{DD} = 3.6V$	650	$600$ mW
			$V_{DD} = 2.5V$	290	mW
THD+N	Total Harmonic Distortion + Noise	$V_{DD} = 5V, P_O = 0.1W, f = 1kHz$	0.03		%
		$V_{DD} = 3.6V, P_O = 0.1W, f = 1kHz$	0.02		%
		$V_{DD} = 2.5V, P_O = 0.1W, f = 1kHz$	0.04		%

- (1) All voltages are measured with respect to the ground pin, unless otherwise specified.
- (2) *Absolute Maximum Ratings* indicate limits beyond which damage to the device may occur. *Operating Ratings* indicate conditions for which the device is functional, but do not ensure specific performance limits. *Electrical Characteristics* state DC and AC electrical specifications under particular test conditions which ensure specific performance limits. This assumes that the device is within the Operating Ratings. Specifications are not ensured for parameters where no limit is given, however, the typical value is a good indication of device performance.
- (3) Typical specifications are specified at  $25^\circ C$  and represent the parametric norm.
- (4) Tested limits are specified to TI's AOQL (Average Outgoing Quality Level).
- (5) Datasheet min/max specification limits are ensured by design, test, or statistical analysis.
- (6) Shutdown current is measured in a normal room environment. Exposure to direct sunlight will increase  $I_{SD}$  by a maximum of  $2\mu A$ . The Shutdown pin should be driven as close as possible to GND for minimal shutdown current and to  $V_{DD}$  for the best THD performance in PLAY mode. See the [Application Information](#) section under [SHUTDOWN FUNCTION](#) for more information.

**Electrical Characteristics<sup>(1)(2)</sup> (continued)**

The following specifications apply for  $A_V = 2V/V$  ( $R_I = 150k\Omega$ ),  $R_L = 15\mu H + 8\Omega + 15\mu H$  unless otherwise specified. Limits apply for  $T_A = 25^\circ C$ .

Symbol	Parameter	Conditions	LM4675		Units (Limits)
			Typical <sup>(3)</sup>	Limit <sup>(4)(5)</sup>	
PSRR	Power Supply Rejection Ratio (Input Referred)	$V_{Ripple} = 200mV_{PP}$ Sine, $f_{Ripple} = 217Hz$ , $V_{DD} = 3.6, 5V$ Inputs to AC GND, $C_I = 2\mu F$	82		dB
		$V_{Ripple} = 200mV_{PP}$ Sine, $f_{Ripple} = 1kHz$ , $V_{DD} = 3.6, 5V$ Inputs to AC GND, $C_I = 2\mu F$	80		dB
SNR	Signal to Noise Ratio	$V_{DD} = 5V$ , $P_O = 1W_{RMS}$	97		dB

## APPLICATION INFORMATION

### GENERAL AMPLIFIER FUNCTION

The LM4675 features a filterless modulation scheme. The differential outputs of the device switch at 300kHz from  $V_{DD}$  to GND. When there is no input signal applied, the two outputs ( $V_{O1}$  and  $V_{O2}$ ) switch with a 50% duty cycle, with both outputs in phase. Because the outputs of the LM4675 are differential, the two signals cancel each other. This results in no net voltage across the speaker, thus there is no load current during an idle state, conserving power.

With an input signal applied, the duty cycle (pulse width) of the LM4675 outputs changes. For increasing output voltages, the duty cycle of  $V_{O1}$  increases, while the duty cycle of  $V_{O2}$  decreases. For decreasing output voltages, the converse occurs, the duty cycle of  $V_{O2}$  increases while the duty cycle of  $V_{O1}$  decreases. The difference between the two pulse widths yields the differential output voltage.

### SPREAD SPECTRUM MODULATION

The LM4675 features a filterless spread spectrum modulation scheme that eliminates the need for output filters, ferrite beads or chokes. The switching frequency varies by  $\pm 30\%$  about a 300kHz center frequency, reducing the wideband spectral content, improving EMI emissions radiated by the speaker and associated cables and traces. Where a fixed frequency class D exhibits large amounts of spectral energy at multiples of the switching frequency, the spread spectrum architecture of the LM4675 spreads that energy over a larger bandwidth. The cycle-to-cycle variation of the switching period does not affect the audio reproduction of efficiency.

### POWER DISSIPATION AND EFFICIENCY

In general terms, efficiency is considered to be the ratio of useful work output divided by the total energy required to produce it with the difference being the power dissipated, typically, in the IC. The key here is "useful" work. For audio systems, the energy delivered in the audible bands is considered useful including the distortion products of the input signal. Sub-sonic (DC) and super-sonic components ( $>22\text{kHz}$ ) are not useful. The difference between the power flowing from the power supply and the audio band power being transduced is dissipated in the LM4675 and in the transducer load. The amount of power dissipation in the LM4675 is very low. This is because the ON resistance of the switches used to form the output waveforms is typically less than  $0.25\Omega$ . This leaves only the transducer load as a potential "sink" for the small excess of input power over audio band output power. The LM4675 dissipates only a fraction of the excess power requiring no additional PCB area or copper plane to act as a heat sink.

### DIFFERENTIAL AMPLIFIER EXPLANATION

As logic supply voltages continue to shrink, designers are increasingly turning to differential analog signal handling to preserve signal to noise ratios with restricted voltage swing. The LM4675 is a fully differential amplifier that features differential input and output stages. A differential amplifier amplifies the difference between the two input signals. Traditional audio power amplifiers have typically offered only single-ended inputs resulting in a 6dB reduction in signal to noise ratio relative to differential inputs. The LM4675 also offers the possibility of DC input coupling which eliminates the two external AC coupling, DC blocking capacitors. The LM4675 can be used, however, as a single ended input amplifier while still retaining its fully differential benefits. In fact, completely unrelated signals may be placed on the input pins. The LM4675 simply amplifies the difference between the signals. A major benefit of a differential amplifier is the improved common mode rejection ratio (CMRR) over single input amplifiers. The common-mode rejection characteristic of the differential amplifier reduces sensitivity to ground offset related noise injection, especially important in high noise applications.

### PCB LAYOUT CONSIDERATIONS

As output power increases, interconnect resistance (PCB traces and wires) between the amplifier, load and power supply create a voltage drop. The voltage loss on the traces between the LM4675 and the load results in lower output power and decreased efficiency. Higher trace resistance between the supply and the LM4675 has the same effect as a poorly regulated supply, increased ripple on the supply line also reducing the peak output power. The effects of residual trace resistance increases as output current increases due to higher output power, decreased load impedance or both. To maintain the highest output voltage swing and corresponding peak output power, the PCB traces that connect the output pins to the load and the supply pins to the power supply should be as wide as possible to minimize trace resistance.

The use of power and ground planes will give the best THD+N performance. While reducing trace resistance, the use of power planes also creates parasite capacitors that help to filter the power supply line.

The inductive nature of the transducer load can also result in overshoot on one or both edges, clamped by the parasitic diodes to GND and  $V_{DD}$  in each case. From an EMI standpoint, this is an aggressive waveform that can radiate or conduct to other components in the system and cause interference. It is essential to keep the power and output traces short and well shielded if possible. Use of ground planes, beads, and micro-strip layout techniques are all useful in preventing unwanted interference.

As the distance from the LM4675 and the speaker increase, the amount of EMI radiation will increase since the output wires or traces acting as antenna become more efficient with length. What is acceptable EMI is highly application specific. Ferrite chip inductors placed close to the LM4675 may be needed to reduce EMI radiation. The value of the ferrite chip is very application specific.

## POWER SUPPLY BYPASSING

As with any power amplifier, proper supply bypassing is critical for low noise performance and high power supply rejection ratio (PSRR). The capacitor ( $C_S$ ) location should be as close as possible to the LM4675. Typical applications employ a voltage regulator with a 10 $\mu$ F and a 0.1 $\mu$ F bypass capacitors that increase supply stability. These capacitors do not eliminate the need for bypassing on the supply pin of the LM4675. A 4.7 $\mu$ F tantalum capacitor is recommended.

## SHUTDOWN FUNCTION

In order to reduce power consumption while not in use, the LM4675 contains shutdown circuitry that reduces current draw to less than 0.01 $\mu$ A. The trigger point for shutdown is shown as a typical value in the Electrical Characteristics Tables and in the Shutdown Hysteresis Voltage graphs found in the [Typical Performance Characteristics](#) section. It is best to switch between ground and supply for minimum current usage while in the shutdown state. While the LM4675 may be disabled with shutdown voltages in between ground and supply, the idle current will be greater than the typical 0.01 $\mu$ A value.

The LM4675 has an internal resistor connected between GND and Shutdown pins. The purpose of this resistor is to eliminate any unwanted state changes when the Shutdown pin is floating. The LM4675 will enter the shutdown state when the Shutdown pin is left floating or if not floating, when the shutdown voltage has crossed the threshold. To minimize the supply current while in the shutdown state, the Shutdown pin should be driven to GND or left floating. If the Shutdown pin is not driven to GND, the amount of additional resistor current due to the internal shutdown resistor can be found by [Equation 1](#) below.

$$(V_{SD} - GND) / 300k\Omega \quad (1)$$

With only a 0.5V difference, an additional 1.7 $\mu$ A of current will be drawn while in the shutdown state.

## PROPER SELECTION OF EXTERNAL COMPONENTS

The gain of the LM4675 is set by the external resistors,  $R_i$  in [Figure 2](#), The Gain is given by [Equation 2](#) below. Best THD+N performance is achieved with a gain of 2V/V (6dB).

$$A_V = 2 * 150 k\Omega / R_i \quad (V/V) \quad (2)$$

It is recommended that resistors with 1% tolerance or better be used to set the gain of the LM4675. The  $R_i$  resistors should be placed close to the input pins of the LM4675. Keeping the input traces close to each other and of the same length in a high noise environment will aid in noise rejection due to the good CMRR of the LM4675. Noise coupled onto input traces which are physically close to each other will be common mode and easily rejected by the LM4675.

Input capacitors may be needed for some applications or when the source is single-ended (see [Figure 26](#), [Figure 28](#)). Input capacitors are needed to block any DC voltage at the source so that the DC voltage seen between the input terminals of the LM4675 is 0V. Input capacitors create a high-pass filter with the input resistors,  $R_i$ . The -3dB point of the high-pass filter is found using [Equation 3](#) below.

$$f_C = 1 / (2\pi R_i C_i) \quad (Hz) \quad (3)$$

The input capacitors may also be used to remove low audio frequencies. Small speakers cannot reproduce low bass frequencies so filtering may be desired. When the LM4675 is using a single-ended source, power supply noise on the ground is seen as an input signal by the +IN input pin that is capacitor coupled to ground (See Figure 28 – Figure 30). Setting the high-pass filter point above the power supply noise frequencies, 217Hz in a GSM phone, for example, will filter out this noise so it is not amplified and heard on the output. Capacitors with a tolerance of 10% or better are recommended for impedance matching.

### DIFFERENTIAL CIRCUIT CONFIGURATIONS

The LM4675 can be used in many different circuit configurations. The simplest and best performing is the DC coupled, differential input configuration shown in Figure 25. Equation 2 above is used to determine the value of the  $R_i$  resistors for a desired gain.

Input capacitors can be used in a differential configuration as shown in Figure 26. Equation 3 above is used to determine the value of the  $C_i$  capacitors for a desired frequency response due to the high-pass filter created by  $C_i$  and  $R_i$ . Equation 2 above is used to determine the value of the  $R_i$  resistors for a desired gain.

The LM4675 can be used to amplify more than one audio source. Figure 27 shows a dual differential input configuration. The gain for each input can be independently set for maximum design flexibility using the  $R_i$  resistors for each input and Equation 2. Input capacitors can be used with one or more sources as well to have different frequency responses depending on the source or if a DC voltage needs to be blocked from a source.

### SINGLE-ENDED CIRCUIT CONFIGURATIONS

The LM4675 can also be used with single-ended sources but input capacitors will be needed to block any DC at the input terminals. Figure 28 shows the typical single-ended application configuration. The equations for Gain, Equation 2, and frequency response, Equation 3, hold for the single-ended configuration as shown in Figure 28.

When using more than one single-ended source as shown in Figure 29, the impedance seen from each input terminal should be equal. To find the correct values for  $C_{i3}$  and  $R_{i3}$  connected to the +IN input pin the equivalent impedance of all the single-ended sources are calculated. The single-ended sources are in parallel to each other. The equivalent capacitor and resistor,  $C_{i3}$  and  $R_{i3}$ , are found by calculating the parallel combination of all  $C_i$  values and then all  $R_i$  values. Equation 4 and Equation 5 below are for any number of single-ended sources.

$$C_{i3} = C_{i1} + C_{i2} + C_{in} \quad (F) \quad (4)$$

$$R_{i3} = 1 / (1/R_{i1} + 1/R_{i2} + 1/R_{in}) \quad (\Omega) \quad (5)$$

The LM4675 may also use a combination of single-ended and differential sources. A typical application with one single-ended source and one differential source is shown in Figure 30. Using the principle of superposition, the external component values can be determined with the above equations corresponding to the configuration.

**REFERENCE DESIGN BOARD SCHEMATIC**

In addition to the minimal parts required for the application circuit, a measurement filter is provided on the evaluation circuit board so that conventional audio measurements can be conveniently made without additional equipment. This is a balanced input, grounded differential output low pass filter with a 3dB frequency of approximately 35kHz and an on board termination resistor of 300Ω (see [schematic](#)). Note that the capacitive load elements are returned to ground. This is not optimal for common mode rejection purposes, but due to the independent pulse format at each output there is a significant amount of high frequency common mode component on the outputs. The grounded capacitive filter elements attenuate this component at the board to reduce the high frequency CMRR requirement placed on the analysis instruments.

Even with the grounded filter the audio signal is still differential, necessitating a differential input on any analysis instrument connected to it. Most lab instruments that feature BNC connectors on their inputs are **NOT** differential responding because the ring of the BNC is usually grounded.

The commonly used Audio Precision analyzer is differential, but its ability to accurately reject high frequency signals is questionable necessitating the on board measurement filter. When in doubt or when the signal needs to be single-ended, use an audio signal transformer to convert the differential output to a single ended output. Depending on the audio transformer's characteristics, there may be some attenuation of the audio signal which needs to be taken into account for correct measurement of performance.

Measurements made at the output of the measurement filter suffer attenuation relative to the primary, unfiltered outputs even at audio frequencies. This is due to the resistance of the inductors interacting with the termination resistor (300Ω) and is typically about -0.25dB (3%). In other words, the voltage levels (and corresponding power levels) indicated through the measurement filter are slightly lower than those that actually occur at the load placed on the unfiltered outputs. This small loss in the filter for measurement gives a lower output power reading than what is really occurring on the unfiltered outputs and its load.

**REVISION HISTORY**

Rev	Date	Description
1.0	08/16/06	Initial release.
1.1	09/01/06	Added the DSBGA (YZR009) package.
1.2	10/12/06	Text edit (X-axis label) on Rf Emissions on page 1.
1.3	07/02/08	Text edits.

LM4675SDX/NOPB	ACTIVE	WSO	NGQ	8	4500	Green (RoHS & no Sb/Br)	CU SN	Level-1-260C-UNLIM		L4675	<a href="#">Samples</a>
LM4675TL/NOPB	ACTIVE	DSBGA	YZR	9	250	Green (RoHS & no Sb/Br)	SNAGCU	Level-1-260C-UNLIM	-40 to 85	G H8	<a href="#">Samples</a>
LM4675TLX/NOPB	ACTIVE	DSBGA	YZR	9	3000	Green (RoHS & no Sb/Br)	SNAGCU	Level-1-260C-UNLIM	-40 to 85	G H8	<a href="#">Samples</a>

(1) The marketing status values are defined as follows:

**ACTIVE:** Product device recommended for new designs.

**LIFEBUY:** TI has announced that the device will be discontinued, and a lifetime-buy period is in effect.

**NRND:** Not recommended for new designs. Device is in production to support existing customers, but TI does not recommend using this part in a new design.

**PREVIEW:** Device has been announced but is not in production. Samples may or may not be available.

**OBSELETE:** TI has discontinued the production of the device.

(2) Eco Plan - The planned eco-friendly classification: Pb-Free (RoHS), Pb-Free (RoHS Exempt), or Green (RoHS & no Sb/Br) - please check <http://www.ti.com/productcontent> for the latest availability information and additional product content details.

**TBD:** The Pb-Free/Green conversion plan has not been defined.

**Pb-Free (RoHS):** TI's terms "Lead-Free" or "Pb-Free" mean semiconductor products that are compatible with the current RoHS requirements for all 6 substances, including the requirement that lead not exceed 0.1% by weight in homogeneous materials. Where designed to be soldered at high temperatures, TI Pb-Free products are suitable for use in specified lead-free processes.

**Pb-Free (RoHS Exempt):** This component has a RoHS exemption for either 1) lead-based flip-chip solder bumps used between the die and package, or 2) lead-based die adhesive used between the die and leadframe. The component is otherwise considered Pb-Free (RoHS compatible) as defined above.

**Green (RoHS & no Sb/Br):** TI defines "Green" to mean Pb-Free (RoHS compatible), and free of Bromine (Br) and Antimony (Sb) based flame retardants (Br or Sb do not exceed 0.1% by weight in homogeneous material)

(3) MSL, Peak Temp. - The Moisture Sensitivity Level rating according to the JEDEC industry standard classifications, and peak solder temperature.

(4) There may be additional marking, which relates to the logo, the lot trace code information, or the environmental category on the device.

(5) Multiple Device Markings will be inside parentheses. Only one Device Marking contained in parentheses and separated by a "~" will appear on a device. If a line is indented then it is a continuation of the previous line and the two combined represent the entire Device Marking for that device.

(6) Lead/Ball Finish - Orderable Devices may have multiple material finish options. Finish options are separated by a vertical ruled line. Lead/Ball Finish values may wrap to two lines if the finish value exceeds the maximum column width.

**Important Information and Disclaimer:**The information provided on this page represents TI's knowledge and belief as of the date that it is provided. TI bases its knowledge and belief on information provided by third parties, and makes no representation or warranty as to the accuracy of such information. Efforts are underway to better integrate information from third parties. TI has taken and continues to take reasonable steps to provide representative and accurate information but may not have conducted destructive testing or chemical analysis on incoming materials and chemicals. TI and TI suppliers consider certain information to be proprietary, and thus CAS numbers and other limited information may not be available for release.

In no event shall TI's liability arising out of such information exceed the total purchase price of the TI part(s) at issue in this document sold by TI to Customer on an annual basis.

6. Laser cutting apertures with trapezoidal walls and rounded corners may offer better paste release. IPC-7525 may have alternate design recommendations.

YZR0009

NOTES: A. All linear dimensions are in millimeters. Dimensioning and tolerancing per ASME Y14.5M-1994.  
B. This drawing is subject to change without notice.

## IMPORTANT NOTICE

Texas Instruments Incorporated (TI) reserves the right to make corrections, enhancements, improvements and other changes to its semiconductor products and services per JESD46, latest issue, and to discontinue any product or service per JESD48, latest issue. Buyers should obtain the latest relevant information before placing orders and should verify that such information is current and complete.

TI's published terms of sale for semiconductor products (<http://www.ti.com/sc/docs/stdterms.htm>) apply to the sale of packaged integrated circuit products that TI has qualified and released to market. Additional terms may apply to the use or sale of other types of TI products and services.

Reproduction of significant portions of TI information in TI data sheets is permissible only if reproduction is without alteration and is accompanied by all associated warranties, conditions, limitations, and notices. TI is not responsible or liable for such reproduced documentation. Information of third parties may be subject to additional restrictions. Resale of TI products or services with statements different from or beyond the parameters stated by TI for that product or service voids all express and any implied warranties for the associated TI product or service and is an unfair and deceptive business practice. TI is not responsible or liable for any such statements.

Buyers and others who are developing systems that incorporate TI products (collectively, "Designers") understand and agree that Designers remain responsible for using their independent analysis, evaluation and judgment in designing their applications and that Designers have full and exclusive responsibility to assure the safety of Designers' applications and compliance of their applications (and of all TI products used in or for Designers' applications) with all applicable regulations, laws and other applicable requirements. Designer represents that, with respect to their applications, Designer has all the necessary expertise to create and implement safeguards that (1) anticipate dangerous consequences of failures, (2) monitor failures and their consequences, and (3) lessen the likelihood of failures that might cause harm and take appropriate actions. Designer agrees that prior to using or distributing any applications that include TI products, Designer will thoroughly test such applications and the functionality of such TI products as used in such applications.

TI's provision of technical, application or other design advice, quality characterization, reliability data or other services or information, including, but not limited to, reference designs and materials relating to evaluation modules, (collectively, "TI Resources") are intended to assist designers who are developing applications that incorporate TI products; by downloading, accessing or using TI Resources in any way, Designer (individually or, if Designer is acting on behalf of a company, Designer's company) agrees to use any particular TI Resource solely for this purpose and subject to the terms of this Notice.

TI's provision of TI Resources does not expand or otherwise alter TI's applicable published warranties or warranty disclaimers for TI products, and no additional obligations or liabilities arise from TI providing such TI Resources. TI reserves the right to make corrections, enhancements, improvements and other changes to its TI Resources. TI has not conducted any testing other than that specifically described in the published documentation for a particular TI Resource.

Designer is authorized to use, copy and modify any individual TI Resource only in connection with the development of applications that include the TI product(s) identified in such TI Resource. NO OTHER LICENSE, EXPRESS OR IMPLIED, BY ESTOPPEL OR OTHERWISE TO ANY OTHER TI INTELLECTUAL PROPERTY RIGHT, AND NO LICENSE TO ANY TECHNOLOGY OR INTELLECTUAL PROPERTY RIGHT OF TI OR ANY THIRD PARTY IS GRANTED HEREIN, including but not limited to any patent right, copyright, mask work right, or other intellectual property right relating to any combination, machine, or process in which TI products or services are used. Information regarding or referencing third-party products or services does not constitute a license to use such products or services, or a warranty or endorsement thereof. Use of TI Resources may require a license from a third party under the patents or other intellectual property of the third party, or a license from TI under the patents or other intellectual property of TI.

TI RESOURCES ARE PROVIDED "AS IS" AND WITH ALL FAULTS. TI DISCLAIMS ALL OTHER WARRANTIES OR REPRESENTATIONS, EXPRESS OR IMPLIED, REGARDING RESOURCES OR USE THEREOF, INCLUDING BUT NOT LIMITED TO ACCURACY OR COMPLETENESS, TITLE, ANY EPIDEMIC FAILURE WARRANTY AND ANY IMPLIED WARRANTIES OF MERCHANTABILITY, FITNESS FOR A PARTICULAR PURPOSE, AND NON-INFRINGEMENT OF ANY THIRD PARTY INTELLECTUAL PROPERTY RIGHTS. TI SHALL NOT BE LIABLE FOR AND SHALL NOT DEFEND OR INDEMNIFY DESIGNER AGAINST ANY CLAIM, INCLUDING BUT NOT LIMITED TO ANY INFRINGEMENT CLAIM THAT RELATES TO OR IS BASED ON ANY COMBINATION OF PRODUCTS EVEN IF DESCRIBED IN TI RESOURCES OR OTHERWISE. IN NO EVENT SHALL TI BE LIABLE FOR ANY ACTUAL, DIRECT, SPECIAL, COLLATERAL, INDIRECT, PUNITIVE, INCIDENTAL, CONSEQUENTIAL OR EXEMPLARY DAMAGES IN CONNECTION WITH OR ARISING OUT OF TI RESOURCES OR USE THEREOF, AND REGARDLESS OF WHETHER TI HAS BEEN ADVISED OF THE POSSIBILITY OF SUCH DAMAGES.

Unless TI has explicitly designated an individual product as meeting the requirements of a particular industry standard (e.g., ISO/TS 16949 and ISO 26262), TI is not responsible for any failure to meet such industry standard requirements.

Where TI specifically promotes products as facilitating functional safety or as compliant with industry functional safety standards, such products are intended to help enable customers to design and create their own applications that meet applicable functional safety standards and requirements. Using products in an application does not by itself establish any safety features in the application. Designers must ensure compliance with safety-related requirements and standards applicable to their applications. Designer may not use any TI products in life-critical medical equipment unless authorized officers of the parties have executed a special contract specifically governing such use. Life-critical medical equipment is medical equipment where failure of such equipment would cause serious bodily injury or death (e.g., life support, pacemakers, defibrillators, heart pumps, neurostimulators, and implantables). Such equipment includes, without limitation, all medical devices identified by the U.S. Food and Drug Administration as Class III devices and equivalent classifications outside the U.S.

TI may expressly designate certain products as completing a particular qualification (e.g., Q100, Military Grade, or Enhanced Product). Designers agree that it has the necessary expertise to select the product with the appropriate qualification designation for their applications and that proper product selection is at Designers' own risk. Designers are solely responsible for compliance with all legal and regulatory requirements in connection with such selection.

Designer will fully indemnify TI and its representatives against any damages, costs, losses, and/or liabilities arising out of Designer's non-compliance with the terms and provisions of this Notice.
