

# THE DATASHEET OF LMV822AIDT

## Low power, high accuracy, general-purpose operational amplifier

Datasheet — production data

### Features

- Low power consumption: 400  $\mu$ A max at 5 V
- Low power shutdown mode: 50 nA max
- Low offset voltage: 0.8 mV max at 25°C
- Tiny packages
- Extended temperature range: -40°C to +125°C
- Low supply voltage: 2.5 V - 5.5 V
- Gain bandwidth product: 5.5 MHz
- Automotive qualification

### Benefits

- Longer lifetime in battery-powered applications
- Higher accuracy without calibration
- Smaller form factor than equivalent competitor devices
- Application performances guaranteed over wide temperature range

### Related products

- See TSV85x series for lower power consumption (180  $\mu$ A max at 5 V)

### Applications

- Battery-powered applications
- Portable devices
- Automotive signal conditioning
- Active filtering
- Medical instrumentation

### Description

The LMV82x and LMV82xA series of single, dual, and quad operational amplifiers offer low voltage operation with rail-to-rail output swing. They outperform the industry standard LMV321, especially with regard to the gain bandwidth

product (5.5 MHz). The LMV821, LMV822 and LMV824 are offered with standard pinouts.

The LMV820, LMV823, and LMV825 include a power-saving shutdown feature that reduces the supply current to a maximum of 50 nA at 25 °C.

The wide temperature range, high ESD tolerance, and automotive grade qualification make them particularly suitable for use in harsh automotive applications.

**Table 1. Device summary**

	Without shutdown		With shutdown	
	Standard Vio	Enhanced Vio	Standard Vio	Enhanced Vio
Single	LMV821	LMV821A	LMV820	LMV820A
Dual	LMV822	LMV822A	LMV823	LMV823A
Quad	LMV824	LMV824A	LMV825	LMV825A

# 1 Package pin connections

Figure 1. Pin connections for each package (top view)

1. The exposed pad of DFN8 2x2 can be connected to VCC- or left floating.

## 2 Absolute maximum ratings and operating conditions

**Table 2. Absolute maximum ratings (AMR)**

Symbol	Parameter	Value	Unit
$V_{CC}$	Supply voltage <sup>(1)</sup>	6	V
$V_{id}$	Differential input voltage <sup>(2)</sup>	$\pm V_{CC}$	
$V_{in}$	Input pins (IN+ and IN- pins) voltage <sup>(3)</sup>	$V_{CC-} - 0.3$ to $V_{CC+} + 0.3$	
$I_{in}$	Input current <sup>(4)</sup>	10	mA
SHDN	Shutdown voltage <sup>(5)</sup>	$V_{CC-} - 0.2$ to $V_{CC+} + 0.2$	V
$T_{stg}$	Storage temperature	-65 to +150	°C
$R_{thja}$	Thermal resistance junction to ambient <sup>(6)(7)</sup>		°C/W
	– SC70-5	205	
	– SOT23-5	250	
	– DFN8 2x2	57	
	– MiniSO8	190	
	– SO8	125	
	– TSSOP14	100	
	– SO14	105	
	– SOT23-6	240	
	– MiniSO10	113	
– TSSOP16	95		
$T_j$	Maximum junction temperature	150	°C
ESD	HBM: human body model (except shutdown pin) <sup>(8)</sup>	4	kV
	HBM: human body model (shutdown pin) <sup>(8)</sup>	3.5	
	MM: machine model <sup>(9)</sup>	250	V
	CDM: charged device model <sup>(10)</sup>	1.3	kV
	CDM: charged device model LMV825 <sup>(10)</sup>	1	
	Latch-up immunity	200	mA

1. All voltage values, except the differential voltage are with respect to the network ground terminal.
2. Differential voltages are the non-inverting input terminal with respect to the inverting input terminal.
3.  $V_{CC-} - V_{in}$  must not exceed 6 V,  $V_{in}$  must not exceed 6 V.
4. The input current must be limited by a resistor in series with the inputs.
5.  $V_{CC-} - V_{shdn}$  must not exceed 6 V,  $V_{in}$  must not exceed 6 V.
6. Short-circuits can cause excessive heating and destructive dissipation.
7.  $R_{th}$  are typical values.
8. Human body model: a 100 pF capacitor is discharged through a 1.5 kΩ resistor between two pins of the device. This is done for all couples of pin combinations while other pins are floating.
9. Machine model: a 200 pF capacitor is charged to the specified voltage, then discharged directly between two pins of the device with no external series resistor (internal resistor < 5 Ω). This is done for all couples of pin combinations while other pins are floating.
10. Charged device model: all pins and package are charged together to the specified voltage and then discharged directly to ground.

Table 3. Operating conditions

Symbol	Parameter	Value	Unit
$V_{CC}$	Supply voltage	2.5 to 5.5	V
$V_{ICM}$	Common mode input voltage range	$V_{CC-} - 0.2$ to $V_{CC+} - 1$	
$T_{oper}$	Operating free air temperature range	-40 to +125	°C

### 3 Electrical characteristics

## 4 Application information

### 4.1 Operating voltages

The LMV82x and LMV82xA can operate from 2.5 to 5.5 V. The devices' parameters are fully specified for 2.5, 2.7, and 5 V power supplies. Additionally, the main specifications are guaranteed at extended temperature ranges from -40° C to +125° C.

### 4.2 Input common mode range

The LMV82x and LMV82xA devices have an input common mode range that includes ground. The input common mode range is extended from  $V_{CC-} - 0.2$  V to  $V_{CC+} - 1$  V, with no output phase reversal.

### 4.3 Rail-to-rail output

The operational amplifiers' output levels can go close to the rails: 150 mV maximum above and below the rail when connected to a 2 k $\Omega$  resistive load to  $V_{CC}/2$ .

### 4.4 Input offset voltage drift over temperature

The maximum input voltage drift over temperature variation is defined in [Equation 1](#).

#### Equation 1

$$\frac{\Delta V_{io}}{\Delta T} = \max \left| \frac{V_{io}(T) - V_{io}(25^{\circ}\text{C})}{T - 25^{\circ}\text{C}} \right|$$

for  $T_{\min} < T < T_{\max}$ .

### 4.5 PCB layouts

For correct operation, it is advised to add 10 nF decoupling capacitors as close as possible to the power supply pins.

### 4.6 Macromodel

Accurate macromodels of the LMV82x and LMV82xA are available on STMicroelectronics' web site at [www.st.com](http://www.st.com). These models are a trade-off between accuracy and complexity (that is, time simulation) of the LMV82x and LMV82xA operational amplifiers. They emulate the nominal performances of a typical device within the specified operating conditions mentioned in the datasheet. They also help to validate a design approach and to select the right operational amplifier, *but they do not replace on-board measurements*.

### 4.7 Shutdown function

The operational amplifier is enabled when the  $\overline{\text{SHDN}}$  pin is pulled high. To disable the amplifier, the  $\overline{\text{SHDN}}$  pin must be pulled down to  $V_{CC-}$ . When in shutdown mode, the amplifier output is in a high impedance state. The  $\overline{\text{SHDN}}$  pin must never be left floating but tied to  $V_{CC+}$  or  $V_{CC-}$ .

The turn-on and turn-off times are calculated for an output variation of  $\pm 200$  mV. *Figure 21* and *Figure 22* show the test configurations. *Figure 23* and *Figure 24* show the respective results with these test configurations.

**Figure 21. Test configuration for turn-on time (Vout pulled down)**

**Figure 22. Test configuration for turn-off time (Vout pulled down)**

**Figure 23. Turn-on time,  $V_{CC} = 5$  V, Vout pulled down,  $T = 25$  °C**

**Figure 24. Turn-off time,  $V_{CC} = 5$  V, Vout pulled down,  $T = 25$  °C**

## 5 Package information

In order to meet environmental requirements, ST offers these devices in different grades of ECOPACK<sup>®</sup> packages, depending on their level of environmental compliance. ECOPACK<sup>®</sup> specifications, grade definitions and product status are available at: [www.st.com](http://www.st.com). ECOPACK<sup>®</sup> is an ST trademark.
