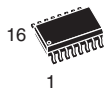
THE DATASHEET OF

M40SZ100WMQ6F

M40SZ100W

3 V NVRAM supervisor for LPSRAM

Datasheet - production data



SO16

Features

- Convert low power SRAMs into NVRAMs
- 3 V operating voltage
- Precision power monitoring and power switching circuitry
- Automatic write-protection when V_{CC} is out-of-tolerance
- Choice of supply voltage and power-fail deselect voltage:
  - V_{CC} = 2.7 to 3.6 V; 2.55 V ≤ V_{PFD} ≤ 2.70 V
- Reset output ($\overline{RST}$) for power on reset
- 1.25 V reference (for PFI/$\overline{PFO}$)
- Less than 15 ns chip enable access propagation delay
- Battery low pin ($\overline{BL}$)
- RoHS compliant
  - Lead-free second level interconnect

Description

The M40SZ100W NVRAM controller is a self-contained device which converts a standard low-power SRAM into a non-volatile memory. A precision voltage reference and comparator monitors the V_{CC} input for an out-of-tolerance condition.

When an invalid V_{CC} condition occurs, the conditioned chip enable output ($\overline{E}_{CON)}$ is forced inactive to write protect the stored data in the SRAM. During a power failure, the SRAM is switched from the V_{CC} pin to the external battery to provide the energy required for data retention. On a subsequent power-up, the SRAM remains write-protected until a valid power condition returns.

2 Operation

The M40SZ100W, as shown in *Figure 4 on page 7*, can control one (two, if placed in parallel) standard low-power SRAM. This SRAM must be configured to have the chip enable input disable all other input signals. Most slow, low-power SRAMs are configured like this, however many fast SRAMs are not. During normal operating conditions, the conditioned chip enable ($\overline{E}_{CON}$) output pin follows the chip enable ($\overline{E}$) input pin with timing shown in *Table 2 on page 10*. An internal switch connects V_{CC} to V_{OUT}. This switch has a voltage drop of less than 0.3 V (I_{OUT1}).

When V_{CC} degrades during a power failure, $\overline{E}_{CON}$ is forced inactive independent of $\overline{E}$. In this situation, the SRAM is unconditionally write protected as V_{CC} falls below an out-of-tolerance threshold (V_{PFD}). For the M40SZ100W the power fail detection value associated with V_{PFD} is shown in *Table 7 on page 16*.

If chip enable access is in progress during a power fail detection, that memory cycle continues to completion before the memory is write protected. If the memory cycle is not terminated within time t_{WPT}, $\overline{E}_{CON}$ is unconditionally driven high, write protecting the SRAM. A power failure during a WRITE cycle may corrupt data at the currently addressed location, but does not jeopardize the rest of the SRAM's contents. At voltages below V_{PFD} (min), the user can be assured the memory will be write protected within the Write Protect Time (t_{WPT}) provided the V_{CC} fall time does not exceed t_F (see *Table 2 on page 10*).

As V_{CC} continues to degrade, the internal switch disconnects V_{CC} and connects the internal battery to V_{OUT}. This occurs at the switchover voltage (V_{SO}). Below the V_{SO}, the battery provides a voltage V_{OHB} to the SRAM and can supply current I_{OUT2} (see *Table 7 on page 16*).

When V_{CC} rises above V_{SO}, V_{OUT} is switched back to the supply voltage. Output $\overline{E}_{CON}$ is held inactive for t_{CER} (120 ms maximum) after the power supply has reached V_{PFD}, independent of the $\overline{E}$ input, to allow for processor stabilization (see *Figure 6 on page 10*).

2.1 Data retention lifetime calculation

Most low power SRAMs on the market today can be used with the M40SZ100W NVRAM controller. There are, however some criteria which should be used in making the final choice of which SRAM to use. The SRAM must be designed in a way where the chip enable input disables all other inputs to the SRAM. This allows inputs to the M40SZ100W and SRAMs to be “Don't care” once V_{CC} falls below V_{PFD}(min) (see *Figure 5 on page 9*). The SRAM should also guarantee data retention down to V_{CC} = 2.0 V. The chip enable access time must be sufficient to meet the system needs with the chip enable propagation delays included.

If data retention lifetime is a critical parameter for the system, it is important to review the data retention current specifications for the particular SRAMs being evaluated. Most SRAMs specify a data retention current at 3.0 V. Manufacturers generally specify a typical condition for room temperature along with a worst case condition (generally at elevated temperatures). The system level requirements will determine the choice of which value to use. The data retention current value of the SRAMs can then be added to the I_{CCDR} value of the M40SZ100W to determine the total current requirements for data retention.

Caution: Take care to avoid inadvertent discharge through V_{OUT} and $\overline{E}_{CON}$ after battery has been attached.

For a further more detailed review of lifetime calculations, please see application note AN1012.

Figure 5. Power-down timing

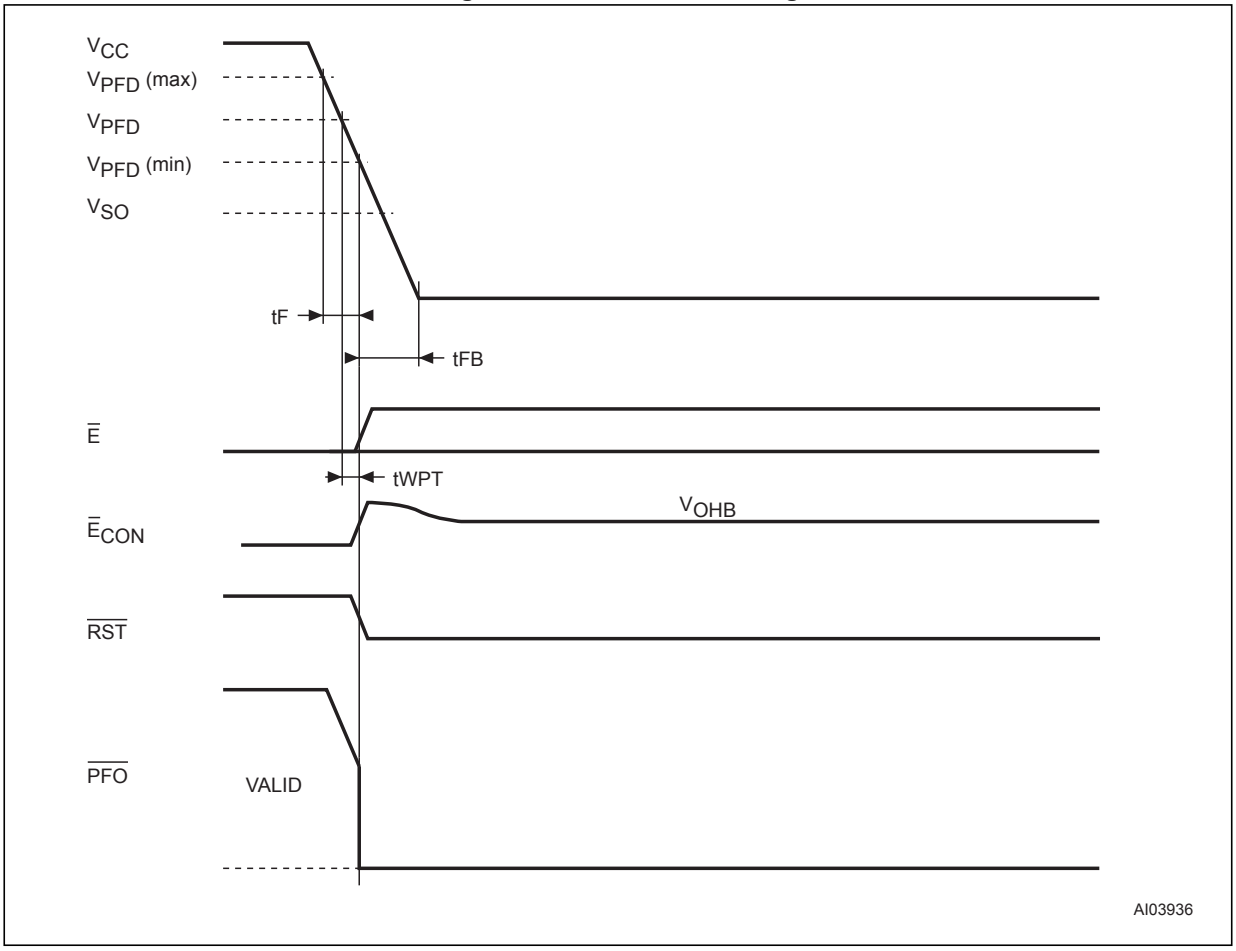

Figure 6. Power-up timing

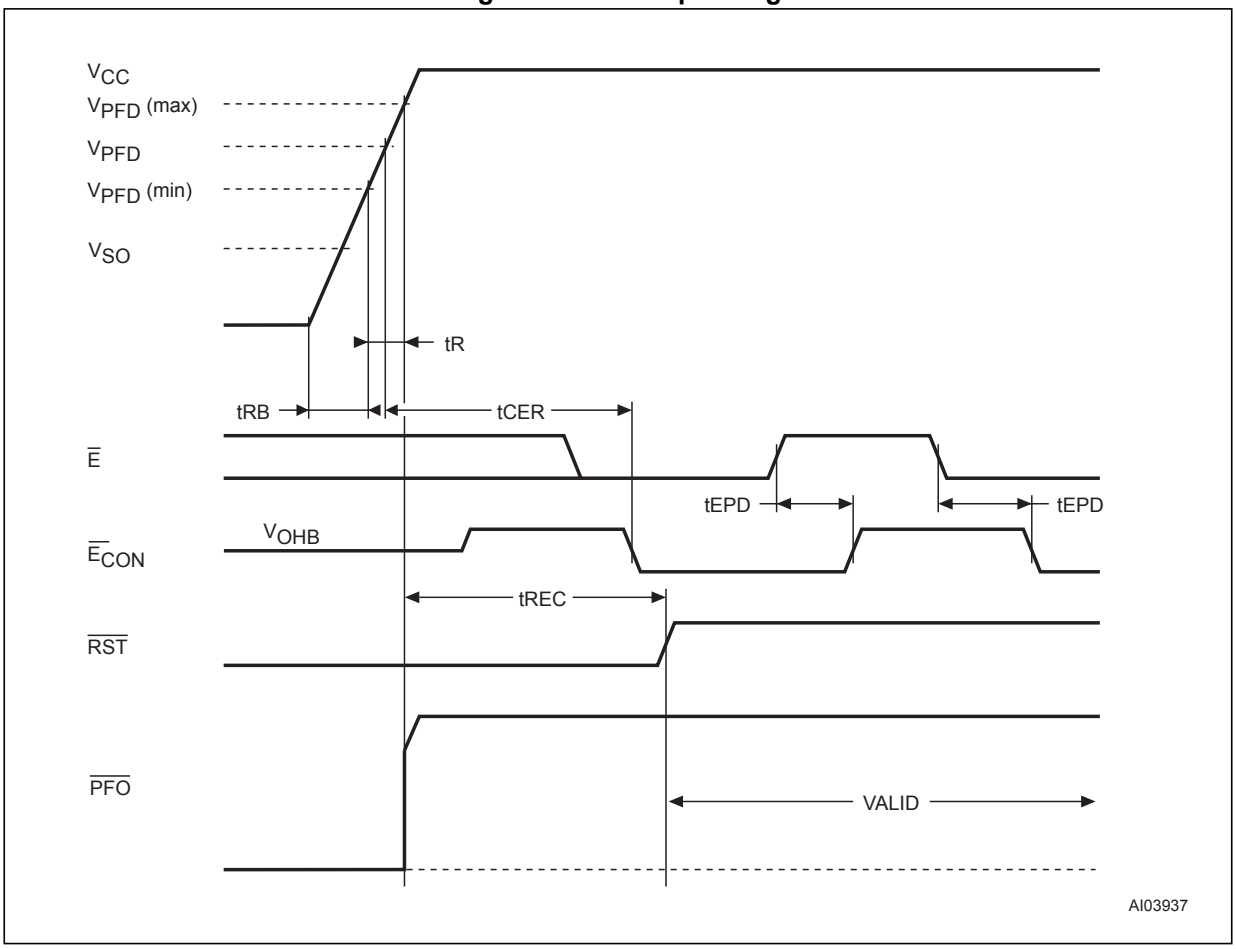

Table 2. Power-down/up AC characteristics

Symbol	Parameter[1]	Min	Max	Unit
t_F[2]	V_{PFD} (max) to V_{PFD} (min) V_{CC} fall time	300		µs
t_{FB}[3]	V_{PFD} (min) to V_{SS} V_{CC} fall time	10		µs
t_{PFD}	PFI to $\overline{PFO}$ propagation delay	15	25	µs
t_R	V_{PFD}(min) to V_{PFD} (max) V_{CC} rise time	10		µs
t_{EPD}	Chip enable propagation delay (low or high)		15	ns
t_{RB}	V_{SS} to V_{PFD} (min) V_{CC} rise time	1		µs
t_{CER}	Chip enable recovery	40	120	ms
t_{REC}	V_{PFD} (max) to $\overline{RST}$ high	40	200	ms
t_{WPT}	Write protect time	40	200	µs

1. Valid for ambient operating temperature: T_A = –40 to 85 °C; V_{CC} = 2.7 to 3.6 V (except where noted).
2. V_{PFD} (max) to V_{PFD} (min) fall time of less than t_F may result in deselection/write protection not occurring until 200 µs after V_{CC} passes V_{PFD} (min).
3. V_{PFD} (min) to V_{SS} fall time of less than t_{FB} may cause corruption of RAM data.

2.2 Power-on reset output

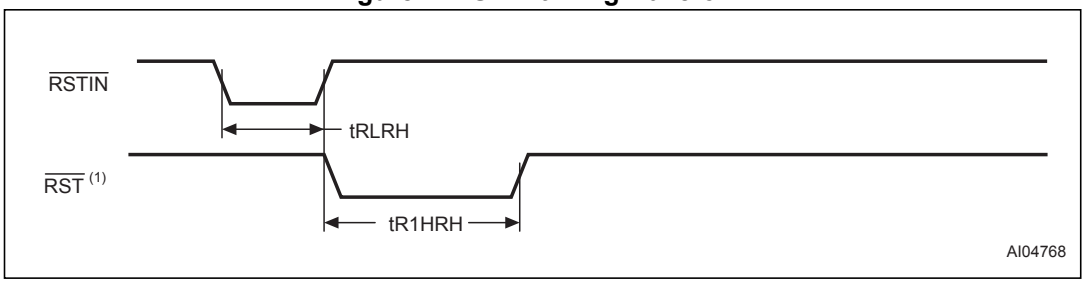
All microprocessors have a reset input which forces them to a known state when starting. The M40SZ100W has a reset output ($\overline{RST}$) pin which is guaranteed to be low by V_{PFD} (see *Table 7 on page 16*). This signal is an open drain configuration. An appropriate pull-up resistor to V_{CC} should be chosen to control the rise time. This signal will be valid for all voltage conditions, even when V_{CC} equals V_{SS} (with valid battery voltage).

Once V_{CC} exceeds the power failure detect voltage V_{PFD}, an internal timer keeps $\overline{RST}$ low for t_{REC} to allow the power supply to stabilize.

2.3 Reset input ($\overline{RSTIN}$)

The M40SZ100W provides one independent input which can generate an output reset. The duration and function of this reset is identical to a reset generated by a power cycle. *Table 3* and *Figure 7* illustrate the AC reset characteristics of this function. Pulses shorter than t_{RLRH} will not generate a reset condition. $\overline{RSTIN}$ is internally pulled up to V_{CC} through a 100 kΩ resistor.

Figure 7. $\overline{RSTIN}$ timing waveform



1. With pull-up resistor

Table 3. Reset AC characteristics

Symbol	Parameter(1)	Min	Max	Unit
t_{RLRH}(2)	$\overline{RSTIN}$ low to $\overline{RSTIN}$ high	200		ns
t_{R1HRH}(3)	$\overline{RSTIN}$ high to $\overline{RST}$ high	40	200	ms

1. Valid for ambient operating temperature: T_A = –40 to 85 °C; V_{CC} = 2.7 to 3.6 V (except where noted).
2. Pulse width less than 50 ns will result in no RESET (for noise immunity).
3. C_L = 50 pF (see *Figure 9 on page 15*).

2.4 Battery low pin

The M40SZ100W automatically performs battery voltage monitoring upon power-up, and at factory-programmed time intervals of at least 24 hours. The Battery Low ($\overline{BL}$) pin will be asserted if the battery voltage is found to be less than approximately 2.5 V. The $\overline{BL}$ pin will remain asserted until completion of battery replacement and subsequent battery low monitoring tests, either during the next power-up sequence or the next scheduled 24-hour interval.

If a battery low is generated during a power-up sequence, this indicates that the battery is below 2.5 V and may not be able to maintain data integrity in the SRAM. Data should be considered suspect, and verified as correct. A fresh battery should be installed.

If a battery low indication is generated during the 24-hour interval check, this indicates that the battery is near end of life. However, data is not compromised due to the fact that a nominal V_{CC} is supplied. In order to insure data integrity during subsequent periods of battery back-up mode, the battery should be replaced.

The M40SZ100W only monitors the battery when a nominal V_{CC} is applied to the device. Thus applications which require extensive durations in the battery backup mode should be powered-up periodically (at least once every few months) in order for this technique to be beneficial. Additionally, if a battery low is indicated, data integrity should be verified upon power-up via a checksum or other technique. The $\overline{BL}$ pin is an open drain output and an appropriate pull-up resistor to V_{CC} should be chosen to control the rise time.

2.5 Power-fail input/output

The power-fail input (PFI) is compared to an internal reference voltage (independent from the V_{PFD} comparator). If PFI is less than the power-fail threshold (V_{PFI}), the power-fail output ($\overline{PFO}$) will go low. This function is intended for use as an undervoltage detector to signal a failing power supply. Typically PFI is connected through an external voltage divider (see *Figure 4 on page 7*) to either the unregulated DC input (if it is available) or the regulated output of the V_{CC} regulator. The voltage divider can be set up such that the voltage at PFI falls below V_{PFI} several milliseconds before the regulated V_{CC} input to the M40SZ100W or the microprocessor drops below the minimum operating voltage.

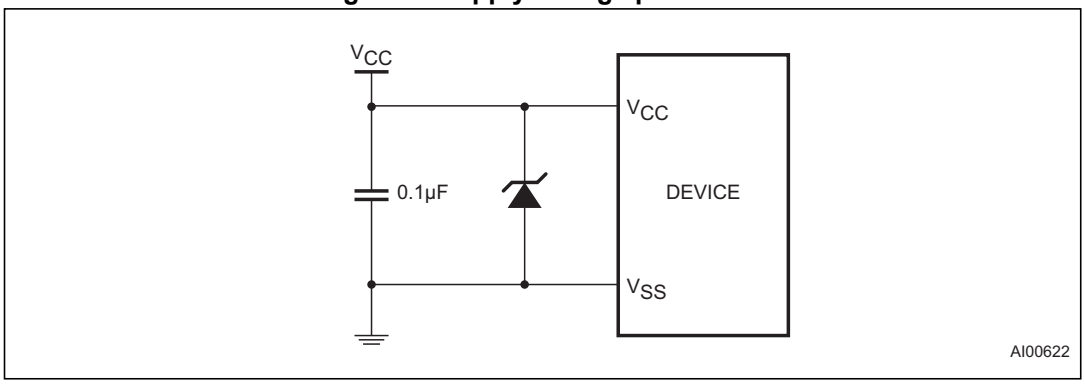
During battery backup, the power-fail comparator turns off and $\overline{PFO}$ goes (or remains) low. This occurs after V_{CC} drops below V_{PFD}(min). When power returns, $\overline{PFO}$ is forced high, irrespective of V_{PFI} for the write protect time (t_{REC}), which is the time from V_{PFD} (max) until the inputs are recognized. At the end of this time, the power-fail comparator is enabled and $\overline{PFO}$ follows PFI. If the comparator is unused, PFI should be connected to V_{SS} and $\overline{PFO}$ left unconnected.

2.6 V_{CC} noise and negative going transients

I_{CC} transients, including those produced by output switching, can produce voltage fluctuations, resulting in spikes on the V_{CC} bus. These transients can be reduced if capacitors are used to store energy which stabilizes the V_{CC} bus. The energy stored in the bypass capacitors will be released as low going spikes are generated or energy will be absorbed when overshoots occur. A ceramic bypass capacitor value of 0.1 µF (as shown in *Figure 8 on page 13*) is recommended in order to provide the needed filtering.

In addition to transients that are caused by normal SRAM operation, power cycling can generate negative voltage spikes on V_{CC} that drive it to values below V_{SS} by as much as one volt. These negative spikes can cause data corruption in the SRAM while in battery backup mode. To protect from these voltage spikes, STMicroelectronics recommends connecting a Schottky diode from V_{CC} to V_{SS} (cathode connected to V_{CC}, anode to V_{SS}). Schottky diode 1N5817 is recommended for through hole and MBRS120T3 is recommended for surface mount.

Figure 8. Supply voltage protection



3 Maximum ratings

Stressing the device above the rating listed in the absolute maximum ratings table may cause permanent damage to the device. These are stress ratings only and operation of the device at these or any other conditions above those indicated in the operating sections of this specification is not implied. Exposure to absolute maximum rating conditions for extended periods may affect device reliability.

Table 4. Absolute maximum ratings

Symbol	Parameter	Value	Unit
T_{STG}	Storage temperature (V_{CC} off)	–55 to 125	°C
T_{SLD}(1)	Lead solder temperature for 10 seconds	260	°C
V_{IO}	Input or output voltages	–0.3 to V_{CC} +0.3	V
V_{CC}	Supply voltage	–0.3 to 4.6	V
I_O	Output current	20	mA
P_D	Power dissipation	1	W

1. For SO package, Lead-free (Pb-free) lead finish: reflow at peak temperature of 260 °C (the time above 255 °C must not exceed 30 seconds).

Caution: Negative undershoots below –0.3 V are not allowed on any pin while in the battery backup mode.

4 DC and AC parameters

This section summarizes the operating and measurement conditions, as well as the DC and AC characteristics of the device. The parameters in the following DC and AC characteristic tables are derived from tests performed under the measurement conditions listed in *Table 5: DC and AC measurement conditions*. Designers should check that the operating conditions in their projects match the measurement conditions when using the quoted parameters.

Table 5. DC and AC measurement conditions

Parameter	Value
V_{CC} supply voltage	2.7 to 3.6 V
Ambient operating temperature	–40 to 85 °C
Load capacitance (C_L)	50 pF
Input rise and fall times	≤ 5 ns
Input pulse voltages	0.2 to 0.8V_{CC}
Input and output timing ref. voltages	0.3 to 0.7V_{CC}

Figure 9. AC testing load circuit

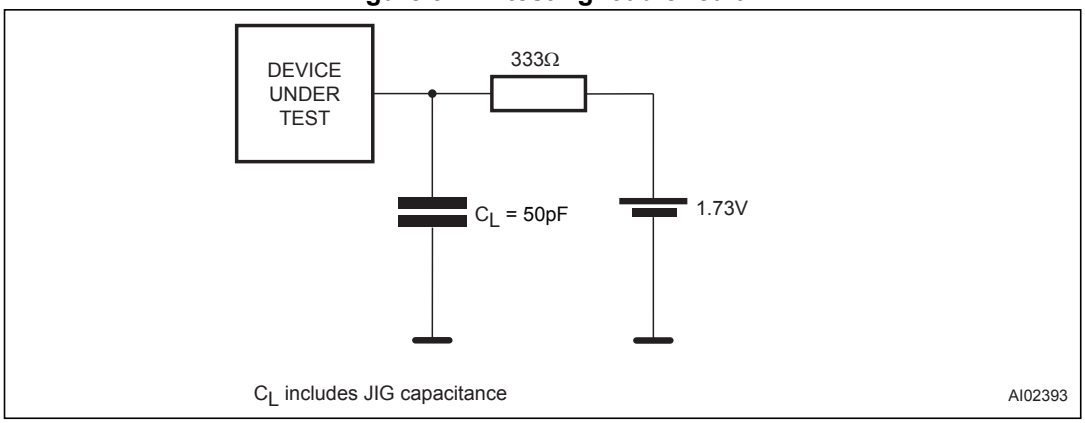


Figure 10. AC testing input/output waveforms

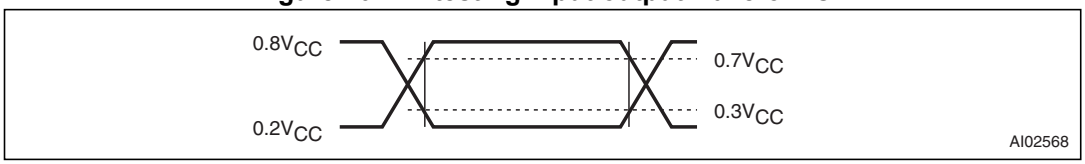

Table 6. Capacitance

Symbol	Parameter[1][2]	Min	Max	Unit
C_{IN}	Input capacitance	-	7	pF
C_{OUT}[3]	Output capacitance	-	10	pF

1. Sampled only, not 100% tested.
2. At 25 °C, f = 1 MHz.
3. Outputs deselected.

Table 7. DC characteristics

Sym	Parameter	Test condition(1)	Min	Typ	Max	Unit
I_{CC}	Supply current	Outputs open			0.5	mA
I_{CCDR}	Data retention mode current(2)			50	200	nA
I_{LI}(3)	Input leakage current	$0 V \le V_{IN} \le V_{CC}$			±1	µA
	Input leakage current (PFI)		–25	2	25	nA
I_{LO}(4)	Output leakage current	$0 V \le V_{OUT} \le V_{CC}$			±1	µA
I_{OUT1}(5)	V_{OUT} current (active)	$V_{OUT} > V_{CC} – 0.3$			100	mA
I_{OUT2}	V_{OUT} current (battery backup)	$V_{OUT} > V_{BAT} – 0.3$			100	µA
V_{BAT}	Battery voltage		2.5	3.0	3.5(6)	V
V_{IH}	Input high voltage		$0.7V_{CC}$		$V_{CC} + 0.3$	V
V_{IL}	Input low voltage		–0.3		$0.3V_{CC}$	V
V_{OH}	Output high voltage(6)	$I_{OH} = –1.0$ mA	2.4			V
V_{OHB}	V_{OH} battery backup(7)	$I_{OUT2} = –1.0$ µA	2.5	2.9	3.5	V
V_{OL}	Output low voltage	$I_{OL} = 3.0$ mA			0.4	V
	Output low voltage (open drain)(8)	$I_{OL} = 10$ mA			0.4	V
V_{PFD}	Power-fail deselect voltage		2.55	2.60	2.70	V
V_{PFI}	PFI input threshold	$V_{CC} = 3$ V	1.225	1.250	1.275	V
	PFI hysteresis	PFI rising		20	70	mV
V_{SO}	Battery backup switchover voltage			2.5		V

1. Valid for ambient operating temperature: T_A = –40 to 85 °C; V_{CC} = 2.7 to 3.6 V (except where noted).
2. Measured with V_{OUT} and $\overline{E}_{CON}$ open.
3. $\overline{RSTIN}$ internally pulled-up to V_{CC} through 100 kΩ resistor.
4. Outputs deselected.
5. External SRAM must match SUPERVISOR chip V_{CC} specification.
6. For $\overline{PFO}$ pin (CMOS).
7. Chip enable output ($\overline{E}_{CON}$) can only sustain CMOS leakage currents in the battery backup mode. Higher leakage currents will reduce battery life.
8. For $\overline{RST}$ & $\overline{BL}$ pins (open drain).

5 Package mechanical data

In order to meet environmental requirements, ST offers these devices in different grades of ECOPACK® packages, depending on their level of environmental compliance. ECOPACK® specifications, grade definitions and product status are available at: *www.st.com*. ECOPACK® is an ST trademark.

7 Revision history

Table 10. Document revision history

Date	Revision	Changes
Dec-2001	1.0	First issue
13-May-2002	1.1	Modify reflow time and temperature footnote (*Table 4*)
01-Aug-2002	1.2	Add marketing status (cover page; *Table 9*)
15-Sep-2003	1.3	Remove reference to M68xxx (obsolete) part (*Figure 4*); update disclaimer
20-Nov-2007	2	Reformatted document; added lead-free second level interconnect information to cover page and *Section 5: Package mechanical data*; updated *Table 4* and *9*.
25-Oct-2010	3	Updated cover page, *Section 3*, *Table 9*, ECOPACK® text in *Section 5*; reformatted document; minor textual changes.
16-Dec-2013	4	Removed SNAPHAT and SOH28 package option as well as 5 V part (M40SZ100Y) from datasheet Removed shipping option in tubes from *Table 9*
