M74HC40103RM13TR**

M74HC40103

8 STAGE PRESETTABLE SYNCHRONOUS DOWN COUNTER

- HIGH SPEED :
 $f_{MAX} = 38\text{MHz}$ (TYP.) at $V_{CC} = 6\text{V}$
- LOW POWER DISSIPATION:
 $I_{CC} = 4\mu\text{A}$ (MAX.) at $T_A = 25^\circ\text{C}$
- HIGH NOISE IMMUNITY:
 $V_{NIH} = V_{NIL} = 28\% V_{CC}$ (MIN.)
- SYMMETRICAL OUTPUT IMPEDANCE:
 $|I_{OH}| = I_{OL} = 4\text{mA}$ (MIN)
- BALANCED PROPAGATION DELAYS:
 $t_{PLH} \approx t_{PHL}$
- WIDE OPERATING VOLTAGE RANGE:
 V_{CC} (OPR) = 2V to 6V
- PIN AND FUNCTION COMPATIBLE WITH
 74 SERIES 40103

DESCRIPTION

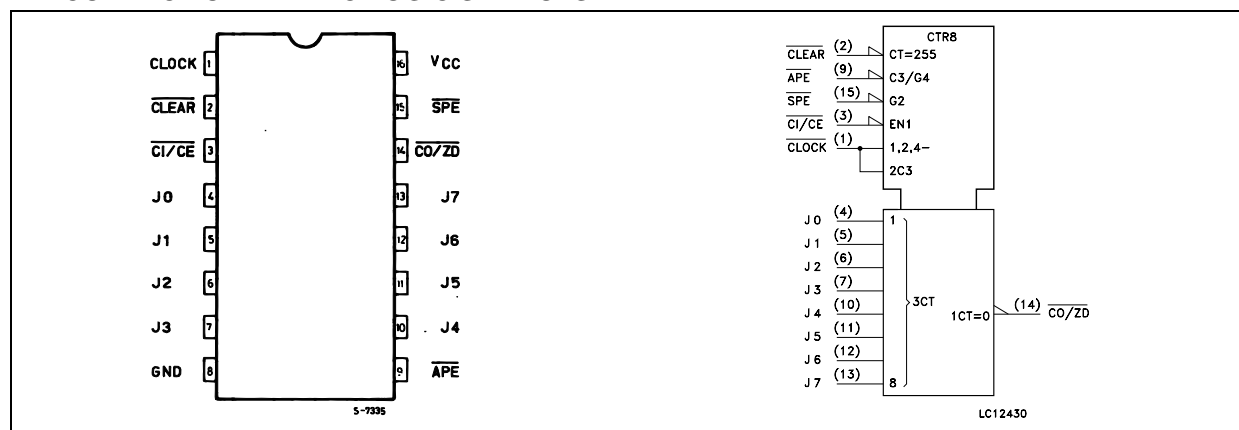

The M74HC40103 is an high speed CMOS 8-STAGE PRESETTABLE SYNCHRONOUS DOWN COUNTER fabricated with silicon gate C²MOS technology.

The HC40103 consists of an 8 stage synchronous down counter with a single output which is active when the internal count is zero. The HC40103 contains a single 8-bit binary counter. This device has control inputs for enabling or disabling the clock, for clearing the counter to its maximum count, and for presetting the counter either synchronously or asynchronously. All control inputs and the CARRY-OUT / ZERO DETECT output are active low logic. In normal operation the counter is decremented by one count on each positive transition of the CLOCK. Counting is

inhibited when the CARRY-IN / COUNTER ENABLE (CI/CE) input is high. The CARRY-OUT / ZERO-DETECT (CO/ZD) output goes low when the count reaches zero if the CI/CE input is low, and remains low for one full clock period. When the SYNCHRONOUS PRESET-ENABLE (SPE) input is low, data at the J input is clocked into the counter on the next positive clock transition regardless of the state of the CI/CE input.

When the ASYNCHRONOUS PRESET-ENABLE (APE) input is low, data at the J inputs is asynchronously forced into the counter regardless of the state of the SPE CI/CE or CLOCK inputs. J input J0-J7 represent a singular 8-bit binary word. When the CLEAR, CLR input is low, the counter is asynchronously cleared to its maximum count

PIN CONNECTION AND IEC LOGIC SYMBOLS

M74HC40103

(255₁₀) regardless of the state of any other input. The precedence relationship between control input is indicated in the truth table. If all control inputs are high at the time of zero count, the counters will jump to the maximum count giving a

INPUT AND OUTPUT EQUIVALENT CIRCUIT

counting sequence of 256 clock pulses long. The HC40103 may be cascaded using the $\overline{CI/CE}$ input and the $\overline{CO/ZD}$ output, in either a synchronous or ripple mode. All inputs are equipped with protection circuits against static discharge and transient excess voltage.

PIN DESCRIPTION

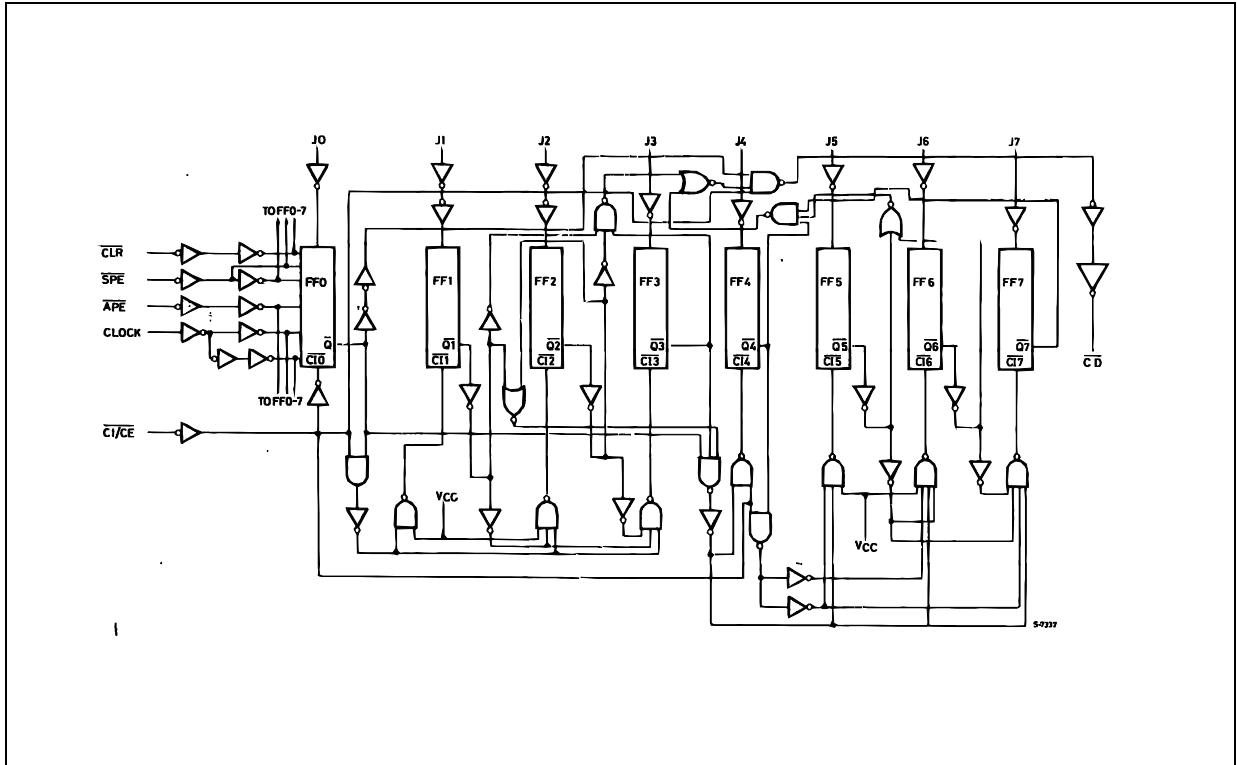

PIN No	SYMBOL	NAME AND FUNCTION
1	CLOCK	Clock Input (LOW to HIGH edge triggered)
2	$\overline{\text{CLEAR}}$	Asynchronous Master Reset Input (Active Low)
3	$\overline{CI/CE}$	Terminal Enable Input
4, 5, 6, 7, 10, 11, 12, 13	J0 to J9	Jam Inputs
9	\overline{APE}	Asynchronous Preset Enable Inputs (Active Low)
14	$\overline{CO/ZD}$	Terminal Count Output (Active Low)
15	\overline{SPE}	Synchronous Preset Enable Input (Active Low)
8	GND	Ground (0V)
16	Vcc	Positive Supply Voltage

TRUTH TABLE

CONTROL INPUTS				MODE	FUNCTIONAL DESCRIPTION
$\overline{\text{CLEAR}}$	\overline{APE}	\overline{SPE}	$\overline{CI/CE}$		
H	H	H	H	COUNT INHIBIT	EVEN IF CLOCK IS GIVEN, NO COUNT IS MADE
H	H	H	L	REGULAR COUNT	DOWN COUNT AT RISING EDGE OF CLOCK

CAPACITIVE CHARACTERISTICS

Symbol	Parameter	Test Condition		Value						Unit	
		V _{CC} (V)		T _A = 25°C			-40 to 85°C		-55 to 125°C		
				Min.	Typ.	Max.	Min.	Max.	Min.		Max.
C _{IN}	Input Capacitance	5.0			5	10		10		10	pF
C _{PD}	Power Dissipation Capacitance (note 1)	5.0			60						pF

1) C_{PD} is defined as the value of the IC's internal equivalent capacitance which is calculated from the operating current consumption without load. (Refer to Test Circuit). Average operating current can be obtained by the following equation. $I_{CC(oper)} = C_{PD} \times V_{CC} \times f_{IN} + I_{CC}$

FUNCTIONAL DESCRIPTION

This device is an 8-stage presetable synchronous down counter. Carry Out/Zero Detect ($\overline{CO/ZD}$) is output at the "L" level for the period of 1 bit when the readout becomes "0". This device adopts 8-bit-binary counter decimal notation, making setting up to 255 counts possible.

COUNT OPERATION

At the "H" level of control input of \overline{CLEAR} , \overline{SPE} and \overline{APE} , the counter carries out down count operation one by one at the rise of pulse given to \overline{CLOCK} input. Count operation can be inhibited by setting Carry Input/Clock Enable $\overline{CI/CE}$ to the "H" level.

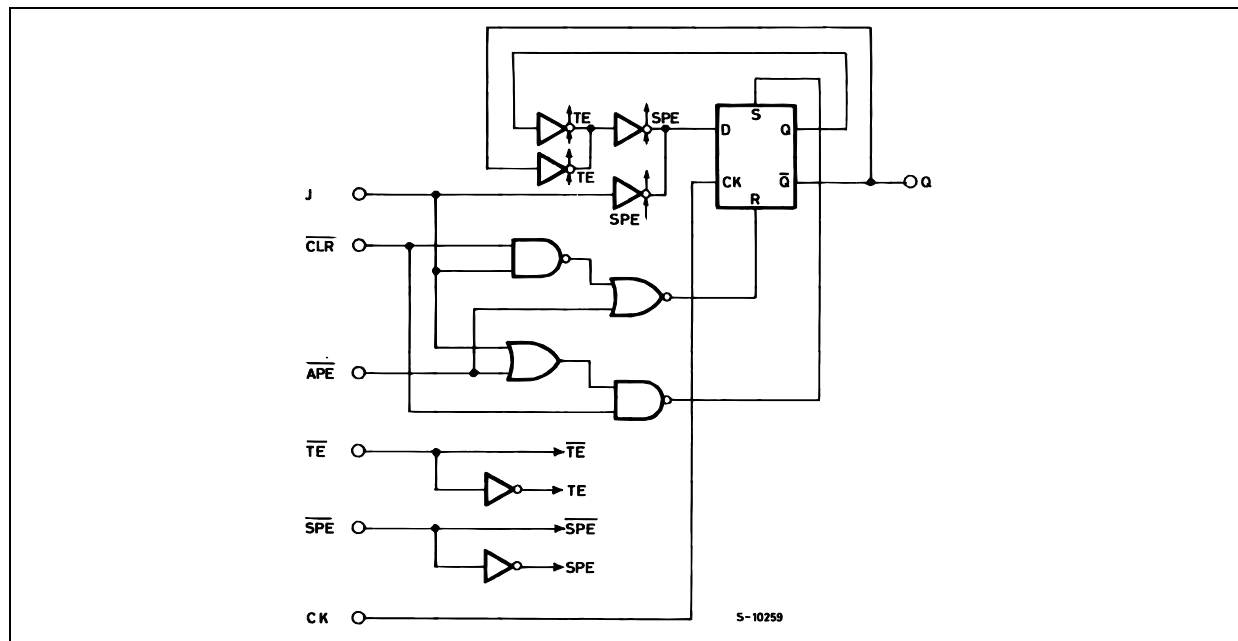

$\overline{CO/ZD}$ is output at the "L" level when the readout becomes "0" but is not output even if the readout becomes "0" when $\overline{CI/CE}$ is at the "H" level, thus maintaining the "H" level.

Synchronous cascade operation can be carried out by using $\overline{CI/CE}$ input and $\overline{CO/ZD}$ output.

The contents of count jump to maximum count (255) if clock is given when the readout is "0". Therefore, operation of 256-frequency division is carried out when clock input alone is given without various kinds of preset operation.

PRESET AND RESET OPERATION

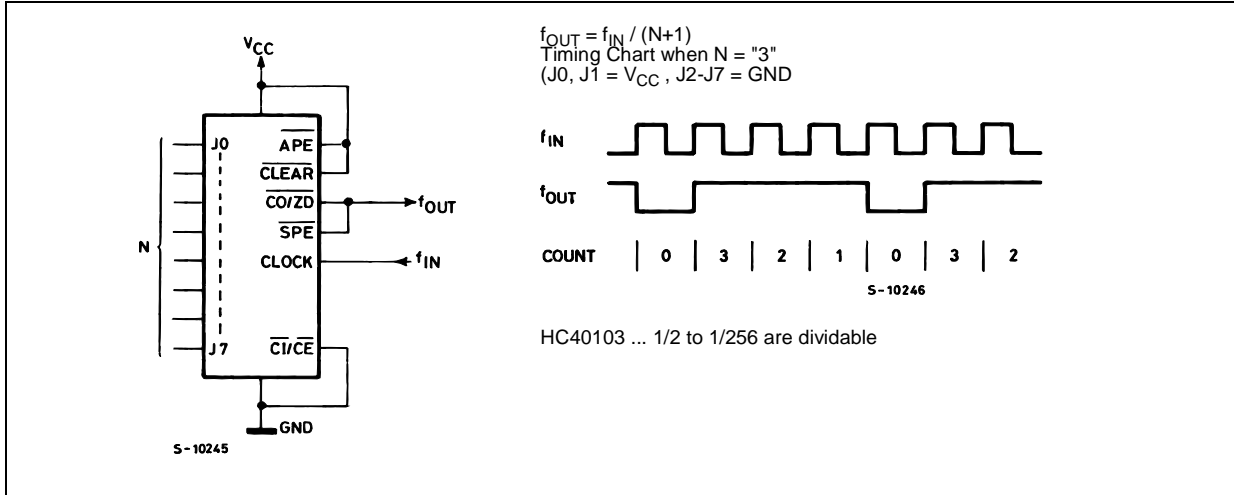

When Clear (\overline{CLEAR}) input is set to the "L" level, the readout is set to the maximum count independently of other inputs. When Asynchronous Preset Enable (\overline{APE}) input is set to the "L" level, readouts given on J0 to J7 can be preset asynchronously to the counter independently of inputs other than \overline{CLEAR} input. When Synchronous Preset Enable (\overline{SPE}) is set to the "L" level the readouts given on J0 to J7 can be preset to counter synchronously with the rise of clock. As to these operation mode, refer to the truth table.
