47MHz to 870MHz Analog CATV Transimpedance Amplifier

MAX3654

General Description

The MAX3654 analog transimpedance amplifier (TIA) is designed for CATV applications in fiber-to-the-home (FTTH) networks. This high-linearity amplifier is intended for 47MHz to 870MHz subcarrier multiplexed (SCM) signals in passive optical networks (PON). A gain-control input supports AGC operation with optical inputs having -6dBm to +2dBm average power. With 62dBΩ maximum gain at 47MHz and 18dB gain control range, the minimum RF output level is 14dBmV/channel at -6dBm optical input. A compact 4mm x 4mm package includes all of the active RF circuitry required to convert analog PIN photocurrent to a 75Ω CATV output.

This 700mW SiGe RF IC provides a low-cost, low-power integrated analog CATV receiver solution for FTTH ONTs.

Features

- ◆ 47MHz to 870MHz Operation
- ◆ -6dBm to +2dBm Optical Input Range
- ◆ 21dBm OIP3, 47dBm OIP2
- ◆ 5.5pA/√Hz EIN (Amplifier Alone)
- ◆ 62dB Gain at 47MHz
- ◆ 18dB Transimpedance (Gain) Control
- ◆ Integrated +4dB Gain Tilt (with Typical Photodiode)
- ◆ +5V Single-Supply Operation
- ◆ 700mW Power Dissipation
- ◆ -40°C to +85°C Operating Temperature Range
- ◆ 4mm x 4mm TQFN Package

Detailed Description

The MAX3654 is a broadband, high-linearity, low-noise transimpedance amplifier. The transimpedance (gain) can be adjusted between 43.5dBΩ and 62dBΩ using the voltage at an external control input (VAGC). When connected as shown in the *Typical Application Circuit*, optical input levels from -6dBm to +2dBm will produce a minimum output of 14dBmV/channel, and 4dB tilt compensation. Gain deviation over frequency from 47MHz to 870MHz is less than ±0.75dB.

Low-Noise Variable Gain Amplifier

The input stage is a low-noise analog transimpedance amplifier (TIA) connected differentially to the analog photodiode. Desired performance can be achieved with a photodiode having capacitance (C_{PD}) up to 1pF.

VAGC and Hysteresis Control

The gain-control pin VAGC sets overall TIA gain implemented as three switchable gain stages, each with a continuously variable gain control, as shown in Figure 3.

This produces a continuously variable gain ranging from 62dBΩ (at VAGC = 0.175V) to 43.5dBΩ at (VAGC=1.4V). A set of comparators examines the

VAGC input to select a gain stage. As the voltage at VAGC crosses the two locations in the gain vs. VAGC curve, where the gain stage changes (350mV and 700mV), there will be small deviations in the output which may lead to a brief interruption of CATV signals. See the *Typical Operating Characteristics* for Gain vs. Control Voltage.

A hysteresis control input is provided to limit dithering when the optical level is close to a gain-switching point. The hysteresis level is controlled by the value of R_{HYST}. Hysteresis is minimum (0.13dB) when this pin is open.

RF Output and Cable Tilt Compensation

With a typical photodiode, the gain at 870MHz is 4dB higher than at 47MHz. The overall frequency response of the TIA is within ±0.75dB of a straight line connecting the values at 47MHz and 870MHz.

Mute

In normal operation, the TTL MUTE pin is held high. When MUTE is low, the output signal is attenuated by more than 45dB.

Applications Information

Photodiode Parasitics

The MAX3654 TIA is designed to operate with a low-capacitance analog photodiode. Proper system design includes considerations of lead configuration, pad, and through-hole geometry, and PC board layer selection for connections to the IC. The TIA is designed to operate correctly when the total capacitance of the photodiode, package, leads and PC board is between 1.0pF and 2.5pF.

RF Output

The differential TIA RF output should be connected (AC-coupled) to a balun transformer for normal single-ended output.

AGC Operation

For AGC operation, the optical average power can be measured from the voltage drop across the lower bias resistor, using high impedance to isolate the photodiode as shown in the EV kit schematic. TIA gain is inversely proportional to the voltage present at VAGC from 0.175V to 1.4V. From 0 to 0.175V, the gain is constant and maximum. The nominal gain is given by:

$$ZT(\text{dB}\Omega) = 62\text{dB}\Omega + 20 \times \log \left[\frac{175\text{mV}}{\text{VAGC}(\text{mV})} \right]$$

$$(0.175\text{V} \leq \text{VAGC} \leq 1.4\text{V}).$$

When connected as shown in the *Typical Applications Circuit*, the MAX3654 will maintain the electrical output constant (15dBmV/ch) for optical signals in the -6dBm to +2dBm range.

Evaluation Kit and PC Board Layout

The factory-assembled EV kit for the MAX3654 provides two versions: optical input and electrical input.

The optical input circuit includes photodiode bias circuitry, an op amp to adjust VAGC according to the DC photodiode current (for AGC operation), an output balun, and a 75 Ω output connector. Through-hole pads are provided to attach the triplexer analog photodiode leads. Since photodiode capacitance and package lead inductance affect the amount of uptilt, in configurations where lead inductance is significantly lower than the value shown in Figure 2, the uptilt may be increased by providing discrete inductance on the PC board. When a $C_{PD} = 0.5\text{pF}$ (typ) photodiode is mount-

ed with 5mm (nominal) leads into through-hole vias as in the EV kit configuration, a 4dB uptilt will normally be achieved. It is important to configure the layout with capacitance and inductance in the anode and cathode connection as symmetric as possible.

The electrical input circuit is normally configured with a 50 Ω input for use with conventional test and measurement equipment. If desired, the MAX3654 input can also be terminated with 75 Ω as shown in the EV kit data sheet. The 75 Ω EV kit outputs should be connected to 50 Ω test and measurement equipment using a minimum loss pad.

NOTES:

1. DIMENSIONING & TOLERANCING CONFORM TO ASME Y14.5M-1994.
2. ALL DIMENSIONS ARE IN MILLIMETERS, ANGLES ARE IN DEGREES.
3. N IS THE TOTAL NUMBER OF TERMINALS.
4. THE TERMINAL #1 IDENTIFIER AND TERMINAL NUMBERING CONVENTION SHALL CONFORM TO JEDEC J-56F-012. DETAILS OF TERMINAL #1 IDENTIFIER ARE OPTIONAL, BUT MUST BE LOCATED WITHIN THE INDICATED AREA. THE TERMINAL #1 IDENTIFIER MAY BE EITHER A HOLLOW OR MARKED FEATURE.
5. DIMENSION B APPLIES TO METALLIZED TERMINALS AND IS MEASURED BETWEEN 0.25 mm AND 0.30 mm FROM TERMINAL TIP.
6. NO AND NE REFER TO THE NUMBER OF TERMINALS ON EACH D AND E SIDE RESPECTIVELY.
7. DEPOLARIZATION IS POSSIBLE IN A SYMMETRICAL FASHION.
8. COPOLARIZATION APPLIES TO THE EXPOSED HEAT SINK SLOPE AS WELL AS THE TERMINALS.
9. COPOLARIZATION CONFORMS TO JEDEC J-56F-012, 12444-1, 12444-3, 12444-4 AND 12484-1.
10. MARKING IS FOR PACKAGE ORIENTATION REFERENCE ONLY.
11. COPOLARIZATION SHALL NOT EXCEED 0.08mm.
12. WARPAGE SHALL NOT EXCEED 0.10mm.
13. LEAD CENTERLINES TO BE AT TRUE POSITION AS DEFINED BY BASIC DIMENSION "a", ± 0.05 .
