MAX6225/MAX6241/MAX6250

Low-Noise, Precision, +2.5V/+4.096V/+5V Voltage References

General Description

The MAX6225/MAX6241/MAX6250 are low-noise, precision voltage references with extremely low 1ppm/°C temperature coefficients and excellent $\pm 0.02\%$ initial accuracy. These devices feature buried-zener technology for lowest noise performance. Load-regulation specifications are guaranteed for source and sink currents up to 15mA. Excellent line and load regulation and low output impedance at high frequency make them ideal for high-resolution data-conversion systems up to 16 bits.

The MAX6225 is set for 2.500V output, the MAX6241 is set for 4.096V output, and the MAX6250 is set for 5.000V output. All three devices provide for the option of external trimming and noise reduction.

Applications

- High-Resolution Analog-to-Digital and Digital-to-Analog Converters
- High-Accuracy Reference Standard
- High-Accuracy Industrial and Process Control
- Digital Voltmeters
- ATE Equipment
- Precision Current Sources

Typical Operating Circuit

Features

- Low 1.0ppm/°C Temperature Coefficient
- Very Low 1.5µV_{p-p} Noise (0.1Hz to 10Hz)
- $\pm 0.02\%$ Initial Accuracy
- $\pm 15\text{mA}$ Output Source and Sink Current
- Low, 18mW Power Consumption (MAX6225)
- Industry-Standard Pinout
- Optional Noise Reduction and Voltage Trim
- Excellent Transient Response
- 8-Pin SO Package Available
- Low 20ppm/1000h Long-Term Stability
- Stable for All Capacitive Loads

Note 1: Temperature coefficient is measured by the box method; i.e., the maximum ΔV_{OUT} is divided by ΔT × V_{OUT}.**Note 2:** Line regulation (ΔV_{OUT} / (V_{OUT} × ΔV_{IN})) and load regulation (ΔV_{OUT} / (V_{OUT} × ΔI_{OUT})) are measured with pulses and do not include output voltage changes due to die-temperature changes.**Note 3:** Noise specifications are 100% tested for the 10Hz to 1kHz bandwidth. Contact factory for 100% noise testing in the 0.1Hz to 10Hz bandwidth.**Note 4:** Temperature hysteresis is specified at T_A = +25°C by measuring V_{OUT} before and after changing temperature by +25°C using the PDIP package.

Detailed Description

Temperature Stability

The MAX6225/MAX6241/MAX6250 are highly stable, low-noise voltage references that use a low-power temperature-compensation scheme to achieve laboratory-standard temperature stability. This produces a nearly flat temperature curve, yet does not require the power associated with heated references.

The output voltage can be trimmed a minimum of 0.6% by connecting a 10k Ω potentiometer between OUT and GND, and connecting its tap to the TRIM pin, as shown in Figure 1. The external trimming does not affect temperature stability.

Figure 1. Output Voltage Adjustment

Noise Reduction

To augment wideband noise reduction, add a 1 μ F capacitor to the NR pin (Figure 2). Larger values do not improve noise appreciably (see *Typical Operating Characteristics*).

Noise in the power-supply input can affect output noise, but can be reduced by adding an optional bypass capacitor to the IN pin and GND.

Bypassing

The MAX6225/MAX6241/MAX6250 are stable with capacitive load values from 0 μ F to 100 μ F, for all values of load current. Adding an output bypass capacitor can help reduce noise and output glitching caused by load transients.

Applications Information

Negative Regulator

Figure 3 shows how both a +5V and -5V precision reference can be obtained from a single unregulated +5V supply. A MAX681 generates approximately ± 9 V to operate the MAX6250 reference and MAX432 inverting amplifier. The +5V is inverted by the MAX432 chopper-stabilized amplifier. Resistor R1 is optional, and may be used to trim the ± 5 V references. R2 and R4 should be matched, both in absolute resistance and temperature coefficient. R3 is optional, and is adjusted to set the -5V reference.
