MC10H116

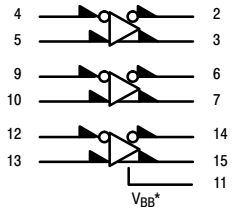
Triple Line Receiver

Description

The MC10H116 is a triple differential amplifier designed for use in sensing differential signals over long lines and is a functional/pinout duplication of the MC10116, with 100% improvement in propagation delay and no increase in power supply current. For termination information see AND8020.

Features

- Propagation Delay, 1.0 ns Typical
- Power Dissipation 85 mW Typ/Pkg (same as MECL 10K™)
- Improved Noise Margin 150 mV (Over Operating Voltage and Temperature Range)
- Voltage Compensated
- MECL 10K Compatible
- These Devices are Pb-Free, Halogen Free and are RoHS Compliant



V_{CC1} = Pin 1
V_{CC2} = Pin 16
V_{EE} = Pin 8

When input pin with bubble goes positive it's respective output pin with bubble goes positive.

*V_{BB} to be used to supply bias to the MC10H116 only and bypassed (when used) with 0.01 μF to 0.1 μF capacitor to ground (0 V). V_{BB} can source < 1.0 mA.

The MC10H116 is designed to be used in sensing differential signals over long lines. The bias supply (V_{BB}) is made available to make the device useful as a Schmitt trigger, or in other applications where a stable reference voltage is necessary.

Active current sources provide these receivers with excellent common−mode noise rejection. If any amplifier in a package is not used, one input of that amplifier must be connected to V_{BB} to prevent unbalancing the current−source bias network.

The MC10H116 does not have internal−input pull− down resistors. This provides high impedance to the amplifier input and facilitates differential connections.

Applications:

- Low Level Receiver
- Schmitt Trigger
- Voltage Level Interface
