## 1 Introduction

This document provides an overview of the MCF5253 ColdFire processor and general descriptions of the MCF5253 features and modules. Also provided are electrical specifications, pin assignments, and package diagrams for MCF5253 ColdFire® processor. For functional characteristics, refer to the *MCF5253 Reference Manual* (MCF5253RM).

The MCF5253 is a general purpose system controller with over 125 Dhrystone 2.1 MIPS @ 140 MHz performance. The integrated peripherals and EMAC allow the MCF5253 to replace both the microcontroller and the DSP in certain applications. Most peripheral pins can also be remapped as general purpose I/O pins.

Low power features include flexible PLL (with power-down mode) with dynamic clock switching, a hardwired CD ROM decoder, advanced 0.13 µm CMOS process technology, 1.2 V core power supply, and on-chip 128K-byte SRAM.

## 2 Functional Description

### 2.1 Version 2 ColdFire Core

The Version 2 ColdFire (CF2) core consists of two independent, decoupled pipeline structures to maximize performance while minimizing core size. The instruction fetch pipeline (IFP) is a two-stage pipeline for prefetching instructions. The prefetched instruction stream is then gated into the two-stage operand execution pipeline (OEP), which decodes the instruction, fetches the required operands, and then executes the required function.

### 2.2 Module Inventory

Table 2 shows an alphabetical listing of the modules in the processor.

**Table 2. Digital and Analog Modules**

Block Mnemonic	Block Name	Functional Grouping	Brief Description
ATA	Advanced Technology Attachment Controller	Connectivity Peripheral	The ATA block is an AT attachment host interface. Its main use is to interface with IDE hard disc drives and ATAPI optical disc drives.
ADC	Battery Level/Keypad Analog/Digital Converter	Analog Input	The six-channel ADC is based on the Sigma-Delta concept with 12-bit resolution. Both the analog comparator and digital sections are integrated in the MCF5253.
AB	Audio Bus	Audio Interface	The audio interfaces connect to an internal bus that carries all audio data. Each receiver places its received data on the audio bus and each transmitter takes data from the audio bus for transmission.
AIM	Audio Interface	Audio Interface	The audio interface module provides the necessary input and output features to receive and transmit digital audio signals over serial audio interfaces (IIS/EIAJ) and over digital audio interfaces (IEC958).
BROM	Bootloader	Boot ROM	The MCF5253 incorporates a ROM Bootloader, which enables booting from UART, I2C, SPI, or IDE devices.
FlexCAN	Twin Controller Area Network 2.0B Communication Unit	Connectivity Peripheral	The FlexCan module is a full implementation of the Bosch CAN protocol specification 2.0B, which supports both standard and extended message frames.
CSM	Chip Select Module	Connectivity Peripheral	Three programmable chip-select outputs ( $\overline{CS0/CS4}$ , $\overline{CS1}$ , and $\overline{CS2}$ ) provide signals that enable glueless connection to external memory and peripheral circuits.
DMAC	Direct Memory Access Controller Module	Connectivity Peripheral	There are four fully programmable DMA channels for quick data transfer.
eMAC	enhanced Multiply Accumulate Module	Core	The integrated eMAC unit provides a common set of DSP operations and enhances the integer multiply instructions in the ColdFire architecture.
MBUS	Memory Bus Interface	Bus Operation	The bus interface controller transfers data between the ColdFire core or DMA and memory, peripherals, or other devices on the external bus.
MMC/SD	Multimedia Card/Secure Digital Interface	Flash Memory Card Interface	The interface is Sony® Memory Stick®, SecureDigital, and Multi-Media card compatible. <b>Note:</b> The Sony Memory Interface does not support Sony MagicGate™.

**Table 2. Digital and Analog Modules (continued)**

<b>Block Mnemonic</b>	<b>Block Name</b>	<b>Functional Grouping</b>	<b>Brief Description</b>
GPIO	General Purpose I/O Interface	System integration	GPIO signals are multiplexed with various other signals.
GPT	General Timer Module	Timer peripheral	The timer module includes two general-purpose timers, each of which contains a free-running 16-bit timer.
IDE	Integrated Drive Electronics	Connectivity peripheral	The IDE hardware consists of bus buffers for address and data and are intended to reduce the load on the bus and prevent SDRAM and Flash accesses from propagating to the IDE bus.
INC	Instruction Cache	Core	The instruction cache improves system performance by providing cached instructions to the execution unit in a single clock cycle.
I <sup>2</sup> C	Inter IC Communication Module	Connectivity peripheral	The two-wire I <sup>2</sup> C bus interfaces, compliant with the Philips I <sup>2</sup> C bus standard, are bidirectional serial buses that exchange data between devices.
SRAM	Internal 128-KB SRAM	Internal memory	The 128-Kbyte on-chip SRAM is split over two banks, SRAM0 (64K) and SRAM1 (64K). It provides single clock-cycle access for the ColdFire core.
LIN	Internal Voltage Regulator	Linear regulator	An internal 1.2 V regulator is used to supply the CPU and PLL sections of the MCF5253, reducing the number of external components required and allowing operation from a single supply rail, typically 3.3 volts.
JTAG	Joint Test Action Group	Test and debug	To help with system diagnostics and manufacturing testing, the MCF5253 includes dedicated user-accessible test logic that complies with the IEEE 1149.1A standard for boundary scan testability, often referred to as Joint Test Action Group, or JTAG.
QSPI	Queued Serial Peripheral Interface	Connectivity Interface	The QSPI module provides a serial peripheral interface with queued transfer capability.
RTC	Real-Time Clock	Timer Peripheral	The RTC is a clock that keeps track of the current time even if the clock is turned off.
BDM	Background Debug Interface	Test and debug	A background-debug mode (BDM) interface provides system debug.
SDRAMC	Synchronous DRAM Memory Controller	Peripheral Interface	The SDRAM controller provides a glueless interface for one bank of SDRAM, and can address up to 32MB. The controller supports a 16-bit data bus. The controller operates in page mode, non-page mode, and burst-page mode and supports SDRAMs.
SIM	System Integration Module	System Integration	The SIM provides overall control of the internal and external buses and serves as the interface between the ColdFire core and the internal peripherals or external devices. The SIM is responsible for the two interrupt controllers (setting priorities and levels). And it also configures the GPIO ports.
PLL	System Oscillator and Phase Lock Loop	System Clocking	The oscillator operates from an external crystal connected across CRIN and CROUT. The circuit can also operate from an external clock connected to CRIN. The on-chip programmable PLL, which generates the processor clock, allows the use of almost any low frequency external clock (5–35 MHz).

**Table 2. Digital and Analog Modules (continued)**

Block Mnemonic	Block Name	Functional Grouping	Brief Description
UART	Universal Asynchronous Receiver /Transmitter Module	Connectivity Peripheral	Three UARTs handle asynchronous serial communication.
USBOTG	USB 2.0 High-Speed On-The-Go	Connectivity Peripheral	The USB module is used for communication to a PC or communication to slave devices; for example, to download data from a hard disc player to a flash player, and to other devices.

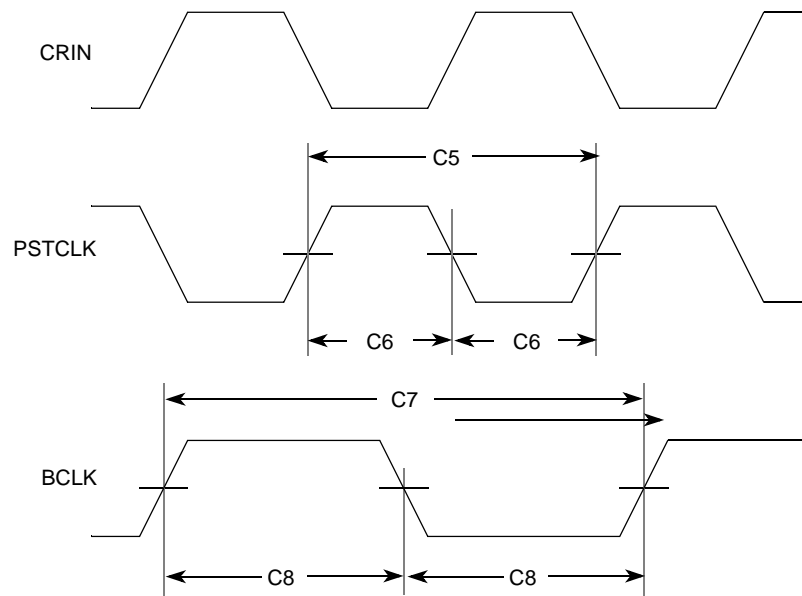

Figure 3. Clock Timing Definition

**NOTE**

Signals shown in Figure 3 are in relation to the SYSCLK clock. No relationship between signals is implied or intended.

Table 11 shows the clock timing parameters.

Table 12 shows the CRIN Crystal suggested parameters.

**Table 12. CRIN Crystal Suggested Parameters**

## 4.1 SDRAM Bus Timing

The SDRAM bus is a synchronous bus. Propagation delays, set-up times and hold times with respect to the SDRAM clock BCLK are shown in Figure 4 and the parameters provided in Table 13. When BCLK clock is not active, SDRAM interface is not valid and the external bus cannot be used.

**Figure 4. SDRAM Bus Timing Diagram**

**Table 13. SDRAM Bus Timing Parameters**

ID	Characteristic	Timing to 50% Points Maximum			Units
		30 pF Load	40 pF Load	50 pF Load	
D1	Propagation delay BCLK rising to data valid	7.88	8.8	9.6	ns
D2	Propagation delay BCLK rising to BCLKE, $\overline{\text{SDLQ\!M}}$ , $\overline{\text{SDUDQ\!M}}$ , $\overline{\text{SDWE}}$ , $\overline{\text{SDCS0}}$ , SDRAS, SDCAS valid	8.7	–	–	ns
D3	Propagation delay BCLK rising to A[24:9] valid	8.3	9.2	–	ns
D4	Set-up time data valid to BCLK rising	0	0	0	ns
D5	Hold time BCLK rising to data valid	0.7	0.7	0.7	ns

## 4.2 SPDIF Timing

The Sony/Philips Digital Interface (SPDIF) timing parameters are provided in [Table 14](#). SPDIF timing is totally asynchronous, therefore there is no need for relationship with the clock. [Table 14](#) shows the differences between high-low and low-high propagation delay which is called the skew.

**Table 14. SPDIF Propagation Skew and Transition Parameters**

Characteristic	Pin Load	Prop Delay Maximum	Skew <sup>1</sup> Maximum	Transition <sup>2</sup> Rise Maximum	Transition Fall Maximum	Units
EBUIN1, EBUIN2, EBUIN3, EBUIN4: asynchronous inputs, no specs apply	–	–	0.7	–	–	ns
EBUOUT1, EBUOUT2 output	40 pF	–	1.5	24.2	31.3	ns
EBUOUT1, EBUOUT2 output	20 pF	–	1.5	13.6	18.0	ns

<sup>1</sup> Skew value does not include the skew introduced by different rise and fall times.

<sup>2</sup> Transition times between 10% V<sub>dd</sub> and 90% V<sub>dd</sub>.

## 4.3 Serial Audio Interface Timing

The Serial Audio Interface fully complies with the Industry standard Philips IIS (InterIC Serial Audio Bus) timings.

## 4.4 DDATA/PST/PSTCLK Debug Interface

[Table 15](#) provides the timing parameters.

**Table 15. DDATA/PST/PSTCLK Debug Interface Timing Parameters**

Characteristic	Pin Load	Min	Max	Units
PSTCLK clock rise edge to DDATA/PSTDATA <sup>1</sup> invalid	15 pF	–1.0	–	ns
PSTCLK clock rise edge to DDATA/PSTDATA <sup>2</sup> valid	15 pF	–	4.0	ns

## Electrical Specifications

- <sup>1</sup> Note that output data may go invalid *before* rising edge of the clock. To clock data in reliably, you need to sample data, for example, 2 ns before rising edge of clock.
- <sup>2</sup> Timing figure given takes 50% margin for noise and uncertainty on pin capacitance. Simulated clock-to-data, not taking noise effects into account is 2.7 ns.

## 4.5 BDM and JTAG Timing

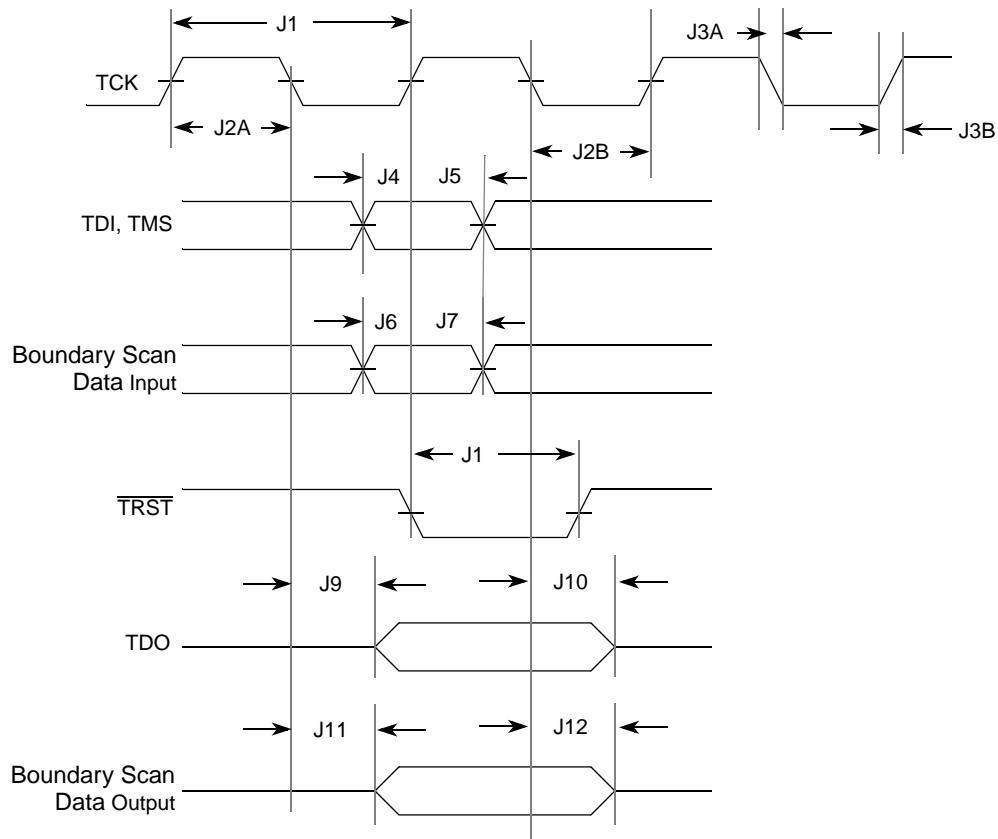

Table 16 provides the BDM timing parameters.

**Table 16. BDM Interface Timing Parameters**

Characteristic	Min	Max	Units
Clock period for DSCLK clock	—	$5T^1$	ns
Set-up time DSI, $\overline{BKPT}$ , to DSCLK rising edge	4.0	—	ns
Hold time DSI, $\overline{BKPT}$ to DSCLK rising edge	—	$T + 4.0$	ns
Propagation delay DSCLK rising edge to TDO/DSO change	$3T$	$4T + 32$	ns

<sup>1</sup> T denotes the CPU clock period. E.g. if the CPU is running at 100 MHz,  $T = 10$  ns

Figure 5 provides the JTAG timing diagram and Table 17 provides the JTAG timing parameters.

**Figure 5. JTAG Timing Diagram**

3.3 V I/O (with core supplied separately)	150 mA <sup>1</sup>
3.3 V I/O (with core supplied via internal 1.2 V regulator which is fed from the 3.3 V supply)	400 mA

<sup>1</sup> This does not include the current required for any externally connected 3.3V device (e.g., flash, SDRAM, and other I/O devices).
