

## ME005-Series Power Modules: 39.5 Vdc to 60 Vdc Input; 5 W

The ME005-Series Power Modules use advanced, surface-mount technology and deliver high-quality, compact, dc-dc conversion at an economical price.

### Applications

- Communication equipment
- Computer equipment
- Digital circuitry
- Distributed power architectures

### Description

The ME005-Series Power Modules are dc-dc converters that operate over an input voltage range of 39.5 Vdc to 60 Vdc and provide precisely regulated dc outputs. The outputs are fully isolated from the inputs, allowing versatile polarity configurations and grounding connections. The modules have maximum power ratings of 5 W at typical full-load efficiencies of 80% to 83% depending on the code.

The modules are encapsulated in nonconductive cases that mount on PC boards. In a natural convection environment, the modules are rated to full load at 85 °C with no heat sinking or external filtering.

\* *UL* is a registered trademark of Underwriters Laboratories, Inc.

† *CSA* is a registered trademark of Canadian Standards Association.

‡ *TUV* is a registered trademark of Technischer Überwachungs-Verein.

### Features

- Small size: 50.8 mm x 27.9 mm x 11.7 mm (2.00 in. x 1.10 in. x 0.46 in.)
- Operating ambient temperature range: -40 °C to +85 °C
- High reliability
- Input-to-output isolation
- No external filtering required
- Load regulation: 0.15% max (ME005A, B, C, N)
- Line regulation: 0.05% max (ME005A, B, C, N)
- Overcurrent protection
- Output overvoltage protection
- PC board mountable
- *UL*\* 1950 Recognized, *CSA*† C22.2 No. 950-95 Certified, VDE 0805 (EN60950, IEC950) and *TUV*‡ Licensed
- Within FCC Class B requirements for radiated emissions

### Options

- Long pins: 5.8 mm (0.230 in.)

## Absolute Maximum Ratings

Stresses in excess of the absolute maximum ratings can cause permanent damage to the device. These are absolute stress ratings only. Functional operation of the device is not implied at these or any other conditions in excess of those given in the operations sections of the data sheet. Exposure to absolute maximum ratings for extended periods can adversely affect device reliability.

| Parameter  | Symbol    | Min | Max | Unit |
|--|-----------|-----|-----|------|
| Input Voltage (continuous)                         | $V_I$     | —   | 60  | Vdc  |
| Operating Ambient Temperature (natural convection) | $T_A$     | -40 | 85  | °C   |
| Storage Temperature                                | $T_{stg}$ | -40 | 100 | °C   |
| I/O Isolation Voltage                              | —         | —   | 500 | Vdc  |

## Electrical Specifications

Unless otherwise indicated, specifications apply over all operating input voltage, resistive load, and temperature conditions.

**Table 1. Input Specifications**

| Parameter  | Symbol       | Min  | Typ | Max | Unit             |
|--|--------------|------|-----|-----|------------------|
| Operating Input Voltage  | $V_I$        | 39.5 | 48  | 60  | Vdc              |
| Maximum Input Current<br>( $V_I = 0$ V to 60 V; $I_O = I_{O, max}$ ;<br>see Figures 1—5.)  | $I_{I, max}$ | —    | —   | 600 | mA               |
| Inrush Transient   | $i^2t$       | —    | 0.3 | 1.0 | A <sup>2</sup> s |
| Input Reflected-ripple Current, Peak-to-peak<br>(5 Hz to 20 MHz, 12 $\mu$ H source impedance,<br>$T_A = 25$ °C; see Figure 31 and Design<br>Considerations section.) | $I_I$        | —    | 30  | —   | mAp-p            |
| Input Ripple Rejection (120 Hz)  | —            | —    | 53  | —   | dB               |

## Fusing Considerations

**CAUTION: This power module is not internally fused. An input line fuse must always be used.**

This encapsulated power module can be used in a wide variety of applications, ranging from simple stand-alone operation to an integrated part of a sophisticated power architecture. To preserve maximum flexibility, internal fusing is not included; however, to achieve maximum safety and system protection, always use an input line fuse. The safety agencies require a normal-blow fuse with a maximum rating of 5 A in series with the input (see Safety Considerations section). Based on the information provided in this data sheet on inrush energy and maximum dc input current, the same type of fuse with a lower rating can be used. However, for *UL* recognition, the dc rating of the fuse must not exceed 5 A. Refer to the fuse manufacturer's data for further information.

Electrical Specifications (continued)

Table 2. Output Specifications

| Parameter  | Device          | Symbol               | Min    | Typ   | Max    | Unit    |
|--|-----------------|----------------------|--------|-------|--------|---------|
| Output Voltage Set Point<br>( $V_I = 48\text{ V}$ ; $I_O = I_{O, \text{max}}$ ; $T_A = 25\text{ }^\circ\text{C}$ )   | ME005A          | $V_{O, \text{set}}$  | 4.85   | 5.0   | 5.20   | Vdc     |

Figure 30. ME005C Typical Output Voltage Waveform for a Step Load Change from 50% to 25% of  $I_{o,max}$  with  $V_i = 48\text{ V}$  and  $T_A = 25\text{ }^\circ\text{C}$

Test Configurations

Note: Input reflected-ripple current is measured with a simulated source impedance of  $12\ \mu\text{H}$ . Capacitor  $C_s$  offsets possible battery impedance. Current is measured at the input of the module.

Figure 31. Input Reflected-Ripple Test Setup

Note: Use a  $0.1\ \mu\text{F}$  ceramic capacitor. Scope measurement should be made using a BNC socket. Position the load between 50 mm and 75 mm (2 in. and 3 in.) from the module.

Figure 32. Peak-to-Peak Output Noise Measurement Test Setup

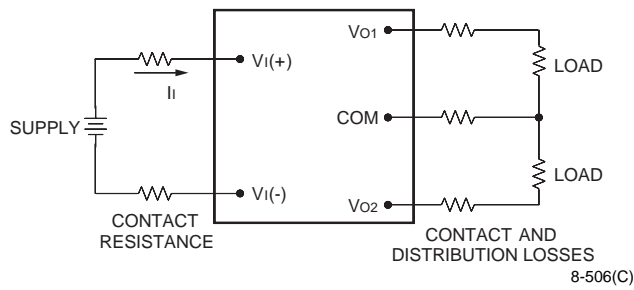

Note: All measurements are taken at the module terminals. When socketing, place Kelvin connections at module terminals to avoid measurement errors due to socket contact resistance.

$$\eta = \frac{[V_o(+)-V_o(-)] I_o}{[V_i(+)-V_i(-)] I_i} \times 100\ \%$$

Figure 33. ME005A, B, C, N Output Voltage and Efficiency Measurement Test Setup

## Test Configurations (continued)

Note: All measurements are taken at the module terminals. When socketing, place Kelvin connections at module terminals to avoid measurement errors due to socket contact resistance.

$$\eta = \frac{\sum_{j=1}^n [|V_{Oj}(+) - V_{COM}| I_{Oj}]}{[V_I(+)-V_I(-)] I_i} \times 100 \quad \%$$

Figure 34. ME005BK, CL Output Voltage and Efficiency Measurement Test Setup

## Design Considerations

### Input Reflected Ripple

An internal aluminum electrolytic input capacitor is used for filtering; therefore, input ripple increases as temperature decreases. There is approximately two times more ripple at 0 °C than at 25 °C and eight times more ripple at -40 °C than at 25 °C. The power module functions properly down to -40 °C with no additional filtering. If ripple comparable to that at 25 °C is needed at low temperatures, an external capacitor across the input with an impedance of 0.5 Ω at 100 kHz over the desired temperature range is recommended.

### Output Voltage Reversal

**CAUTION:** Applying a reverse voltage across the module output forward biases an internal diode. Attempting to start the module under this condition can damage the module.

## Safety Considerations

For safety-agency approval of the system in which the power module is used, the power module must be installed in compliance with the spacing and separation requirements of the end-use safety agency standard, i.e., UL 1950, CSA C22.2 No. 950-95, and VDE 0805 (EN60950, IEC950).

If the input source is non-SELV (ELV or a hazardous voltage greater than 60 Vdc and less than or equal to 75 Vdc), for the module's output to be considered meeting the requirements of safety extra-low voltage (SELV), all of the following must be true:

- n The input source is to be provided with reinforced insulation from any other hazardous voltages, including the ac mains.
- n One VI pin and one VO pin are to be grounded or both the input and output pins are to be kept floating.
- n The input pins of the module are not operator accessible.
- n Another SELV reliability test is conducted on the whole system, as required by the safety agencies, on the combination of supply source and the subject module to verify that under a single fault, hazardous voltages do not appear at the module's output.

**Note:** Do not ground either of the input pins of the module without grounding one of the output pins. This may allow a non-SELV voltage to appear between the output pins and ground.

The power module has extra-low voltage (ELV) outputs when all inputs are ELV.

The input to these units is to be provided with a maximum 5 A normal-blow fuse in the ungrounded lead.

## Feature Descriptions

### Overcurrent Protection

To provide protection in a fault (output overload) condition, the unit is equipped with internal current-limiting circuitry and can endure current limiting for an unlimited duration. At the point of current-limit inception, the unit shifts from voltage control to current control. If the output voltage is pulled very low during a severe fault, the current-limit circuit can exhibit either foldback or tailout characteristics (output current decrease or increase). The unit operates normally once the output current is brought back into its specified range.

### Output Overvoltage Protection

The output overvoltage clamp consists of control circuitry, which is independent of the primary regulation loop, that monitors the voltage on the output terminals. The control loop of the clamp has a higher voltage set point than the primary loop (see Feature Specifications table). This provides a redundant voltage-control that reduces the risk of output overvoltage.
