Quad Core Digital Signal Processor

- Four StarCore® SC3400 DSP subsystems, each with an SC3400 DSP core, 16 Kbyte L1 instruction cache, 32 Kbyte L1 data cache, memory management unit (MMU), extended programmable interrupt controller (EPIC), two general-purpose 32-bit timers, debug and profiling support, and low-power Wait and Stop processing modes.
- Chip-level arbitration and system (CLASS) that provides full fabric non-blocking arbitration between the processing elements and other initiators and the M2 memory, DDR SRAM controller, device configuration control and status registers, and other targets.
- 128 Kbyte L2 shared instruction cache.
- 512 Kbyte M2 memory for critical data and temporary data buffering.
- 10 Mbyte 128-bit wide M3 memory.
- 96 Kbyte boot ROM.
- Three input clocks (shared, global, and differential).
- Four PLLs (system, core, global, and serial RapidIO).
- DDR controller with up to a 200 MHz clock (400 MHz data rate), 16/32 bit data bus, supporting up to 1 Gbyte in up to two banks and support for DDR1 and DDR2.
- DMA controller with 16 bidirectional channels with up to 1024 buffer descriptors, and programmable priority, buffer, and multiplexing configuration.
- Up to eight independent TDM modules with programmable word size (2, 4, 8, or 16-bit), hardware-base A-law/µ-law conversion, up to 128 Mbps data rate for all channels, with glueless interface to E1 or T1 framers, and can interface with H-MVIP/H.110 devices, TSI, and codecs such as AC-97.
- QUICC Engine™ technology subsystem with dual RISC processors, 48 Kbyte multi-master RAM, 48 Kbyte instruction RAM, supporting three communication controllers with one ATM and two Gigabit Ethernet interfaces, to offload scheduling tasks from the DSP cores.
  - The two Ethernet controllers support 10/100/1000 Mbps operations via MII/RMII/SMII/RGMII/SGMII and the SGMII protocol using a 4-pin SerDes interface at 1000 Mbps data rate only.
  - The ATM controller supports UTOPIA level II 8/16 bits at 25/50 MHz in UTOPIA/POS mode with adaptation layer support AAL0, AAL2, and AAL5.
- PCI designed to comply with the PCI specification revision 2.2 at 33 MHz or 66 MHz with access to all PCI address spaces.
- Serial RapidIO® 1x/4x endpoint corresponds to Specification 1.2 of the RapidIO trade association, and supports read, write, messages, doorbells, and maintenance accesses in inbound mode, and messages and doorbells in outbound mode.
- I/O interrupt concentrator consolidates all chip maskable interrupt and non-maskable interrupt sources and routes them to $\overline{\text{INT_OUT}}$, $\overline{\text{NMI_OUT}}$, and the cores.
- UART that permits full-duplex operation with a bit rate of up to 6.25 Mbps.
- Serial peripheral interface (SPI).
- Four timer modules, each with four configurable16-bit timers.
- Four software watchdog timer (SWT) modules.
- Up to 32 general-purpose input/output (GPIO) ports, 16 of which can be configured as maskable interrupt inputs.
- I^2C interface that allows booting from EEPROM devices.
- Eight programmable hardware semaphores.
- Thirty two virtual maskable interrupts and one virtual $\overline{\text{NMI}}$ that can be generated by a simple write access.
- Optional booting via serial RapidIO port, PCI, I^2C, SPI, or Ethernet interfaces.

Note: This document supports mask set M31H.

1 Pin Assignments and Reset States

This section includes diagrams of the MSC8144 package ball grid array layouts and tables showing how the pinouts are allocated for the package.

1.1 FC-PBGA Ball Layout Diagrams

Top and bottom views of the FC-PBGA package are shown in Figure 3 and Figure 4 with their ball location index numbers.

1.2 Signal List By Ball Location

Table 1 presents the signal list sorted by ball number. The functionality of multi-functional (multiplexed) pins is separated for each mode. When designing a board, make sure that the reference supply for each signal is appropriately considered. The specified reference supply must be tied to the voltage level specified in this document if any of the related signal functions are used (active).

Notes:
1. Reserved signals should be disconnected for compatibility with future revisions of the device.
2. For signals with same functionality in all modes the appropriate cells are empty.
3. The choice between GPIO function and other function is by GPIO registers setup. For configuration details, see **Chapter 23,** *GPIO* in the *MSC8144 Reference Manual*.
4. Open-drain signal.
5. Internal 20 KΩ pull-up resistor.
6. For signals with GPIO functionality, the open-drain and internal 20 KΩ pull-up resistor can be configured by GPIO register programming. See **Chapter 23**, *GPIO* of the *MSC8144 Reference Manual* for configuration details.

This document contains detailed information on power considerations, DC/AC electrical characteristics, and AC timing specifications. For additional information, see the *MSC8144 Reference Manual*.

2.1 Maximum Ratings

CAUTION

This device contains circuitry protecting against damage due to high static voltage or electrical fields; however, normal precautions should be taken to avoid exceeding maximum voltage ratings. Reliability is enhanced if unused inputs are tied to an appropriate logic voltage level (for example, either GND or V_{DD}).

In calculating timing requirements, adding a maximum value of one specification to a minimum value of another specification does not yield a reasonable sum. A maximum specification is calculated using a worst case variation of process parameter values in one direction. The minimum specification is calculated using the worst case for the same parameters in the opposite direction. Therefore, a “maximum” value for a specification never occurs in the same device with a “minimum” value for another specification; adding a maximum to a minimum represents a condition that can never exist.

Table 2 describes the maximum electrical ratings for the MSC8144.

Table 2. Absolute Maximum Ratings

Rating	Symbol	Value	Unit

Notes:
1. Functional operating conditions are given in Table 3.
2. Absolute maximum ratings are stress ratings only, and functional operation at the maximum is not guaranteed. Stress beyond the listed limits may affect device reliability or cause permanent damage.
3. PLL supply voltage is specified at input of the filter and not at pin of the MSC8144 (see Figure 43)

2.2 Recommended Operating Conditions

Note: PLL supply voltage is specified at input of the filter and not at pin of the MSC8144 (see Figure 43).

2.3 Default Output Driver Characteristics

Table 4 provides information on the characteristics of the output driver strengths.

Table 4. Output Drive Impedance

Driver Type	Output Impedance (Ω)
DDR signal	18
DDR2 signal	18 35 (half strength mode)

2.4 Thermal Characteristics

Table 5 describes thermal characteristics of the MSC8144 for the FC-PBGA packages.

Table 5. Thermal Characteristics for the MSC8144

Characteristic	Symbol	FC-PBGA 29 × 29 mm[5]		Unit
		Natural Convection	200 ft/min (1 m/s) airflow	
Junction-to-ambient[1, 2]	$R_{\theta JA}$	20	15	°C/W
Junction-to-ambient, four-layer board[1, 3]	$R_{\theta JA}$	15	12	°C/W
Junction-to-board (bottom)[4]	$R_{\theta JB}$	7		°C/W
Junction-to-case[5]	$R_{\theta JC}$	0.8		°C/W

Notes:
1. Junction temperature is a function of die size, on-chip power dissipation, package thermal resistance, mounting site (board) temperature, ambient temperature, air flow, power dissipation of other components on the board, and board thermal resistance.
2. Per JEDEC JESD51-2 with the single layer board (JESD51-3) horizontal.
3. Per JEDEC JESD51-6 with the board (JESD51-7) horizontal.
4. Thermal resistance between the die and the printed circuit board per JEDEC JESD 51-8. Board temperature is measured on the top surface of the board near the package.
5. Thermal resistance between the active surface of the die and the case top surface determined by the cold plate method (MIL SPEC-883 Method 1012.1) with the calculated case temperature.

2.5 DC Electrical Characteristics

This section describes the DC electrical characteristics for the MSC8144.

2.5.1 DDR SDRAM DC Electrical Characteristics

This section describes the DC electrical specifications for the DDR SDRAM interface of the MSC8144.

Note: DDR SDRAM uses V_{DDDDR}(typ) = 2.5 V and DDR2 SDRAM uses V_{DDDDR}(typ) = 1.8 V.

2.5.1.1 DDR2 (1.8 V) SDRAM DC Electrical Characteristics

Table 6 provides the recommended operating conditions for the DDR2 SDRAM component(s) of the MSC8144 when V_{DDDDR}(typ) = 1.8 V.

Table 6. DDR2 SDRAM DC Electrical Characteristics for V_{DDDDR} (typ) = 1.8 V

Parameter/Condition	Symbol	Min	Max	Unit
I/O supply voltage[1]	V_{DDDDR}	1.7	1.9	V
I/O reference voltage[2]	MV_{REF}	$0.49 \times V_{DDDDR}$	$0.51 \times V_{DDDDR}$	V
I/O termination voltage[3]	V_{TT}	$MV_{REF} - 0.04$	$MV_{REF} + 0.04$	V
Input high voltage	V_{IH}	$MV_{REF} + 0.125$	$V_{DDDDR} + 0.3$	V
Input low voltage	V_{IL}	–0.3	$MV_{REF} - 0.125$	V
Output leakage current[4]	I_{OZ}	–50	50	µA
Output high current (V_{OUT} = 1.420 V)	I_{OH}	–13.4	—	mA
Output low current (V_{OUT} = 0.280 V)	I_{OL}	13.4	—	mA

Notes:
1. V_{DDDDR} is expected to be within 50 mV of the DRAM V_{DD} at all times.
2. MV_{REF} is expected to be equal to $0.5 \times V_{DDDDR}$, and to track V_{DDDDR} DC variations as measured at the receiver. Peak-to-peak noise on MV_{REF} may not exceed ±2% of the DC value.
3. V_{TT} is not applied directly to the device. It is the supply to which far end signal termination is made and is expected to be equal to MV_{REF}. This rail should track variations in the DC level of V_{DDDDR}.
4. Output leakage is measured with all outputs are disabled, $0 V \le V_{OUT} \le V_{DDDDR}$.

2.5.1.2 DDR (2.5V) SDRAM DC Electrical Characteristics

Table 7 provides the recommended operating conditions for the DDR SDRAM component(s) of the MSC8144 when V_{DDDDR}(typ) = 2.5 V.

Table 7. DDR SDRAM DC Electrical Characteristics for V_{DDDDR} (typ) = 2.5 V

Input high voltage	V_{IH}	$MV_{REF} + 0.15$	$V_{DDDDR} + 0.3$	V
Input low voltage	V_{IL}	–0.3	$MV_{REF} - 0.15$	V
Output leakage current[4]	I_{OZ}	–50	50	µA
Output high current (V_{OUT} = 1.95 V)	I_{OH}	–16.2	—	mA
Output low current (V_{OUT} = 0.35 V)	I_{OL}	16.2	—	mA

Notes:
1. V_{DDDDR} is expected to be within 50 mV of the DRAM V_{DD} at all times.
2. MV_{REF} is expected to be equal to $0.5 \times V_{DDDDR}$, and to track V_{DDDDR} DC variations as measured at the receiver. Peak-to-peak noise on MV_{REF} may not exceed ±2% of the DC value.
3. V_{TT} is not applied directly to the device. It is the supply to which far end signal termination is made and is expected to be equal to MV_{REF}. This rail should track variations in the DC level of V_{DDDDR}.
4. Output leakage is measured with all outputs are disabled, $0 V \le V_{OUT} \le V_{DDDDR}$.

Table 8 lists the current draw characteristics for MV_{REF}.

Table 8. Current Draw Characteristics for MV_{REF}

Parameter / Condition	Symbol	Min	Max	Unit
Current draw for MV_{REF}	I_{MVREF}	—	500	µA

Note: The voltage regulator for MV_{REF} must be able to supply up to 500 µA current.

2.5.2 Serial RapidIO DC Electrical Characteristics

DC receiver logic levels are not defined since the receiver is AC-coupled.

2.5.2.1 DC Requirements for SerDes Reference Clocks

The SerDes reference clocks SRIO_REF_CLK and $\overline{\text{SRIO_REF_CLK}}$ are AC-coupled differential inputs. Each differential clock input has an internal 50 Ω termination to GND_{SXC}. The reference clock must be able to drive this termination. The recommended minimum operating voltage is –0.4 V; the recommended maximum operating voltage is 1.32 V; and the maximum absolute voltage is 1.72 V.

The maximum average current allowed in each input is 8 mA. This current limitation sets the maximum common mode input voltage to be less than 0.4 V (0.4 V/50 Ω = 8 mA) while the minimum common mode input level is GND_{SXC}. For example, a clock with a 50/50 duty cycle can be driven by a current source output that ranges from 0 mA to 16 mA (0–0.8 V). The input is AC-coupled internally, so, therefore, the exact common mode input voltage is not critical.

Note: This internal AC-couple network does not function correctly with reference clock frequencies below 90 MHz.

If the device driving the $\overline{\text{SRIO_REF_CLK}}$ inputs cannot drive 50 Ω to GND_{SXC}, or if it exceeds the maximum input current limitations, then it must use external AC-coupling. The minimum differential peak-to-peak amplitude of the input clock is 0.4 V (0.2 V peak-to-peak per phase). The maximum differential peak-to-peak amplitude of the input clock is 1.6 V peak-to-peak (see Figure 5. The termination to GND_{SXC} allows compatibility with HCSL type reference clocks specified for PCI-Express applications. Many other low voltage differential type outputs can be used but will probably need to be AC-coupled due to the limited common mode input range. LVPECL outputs can produce too large an amplitude and may need to be source terminated with a divider network to reduce the amplitude. The amplitude of the clock must be at least a 400 mV differential peak-peak for single-ended clock. If driven differentially, each signal wire needs to drive 100 mV around common mode voltage. The differential reference clock (SRIO_REF_CLK/ $\overline{\text{SRIO_REF_CLK}}$) input is HCSL-compatible DC coupled or LVDS-compatible with AC-coupling.

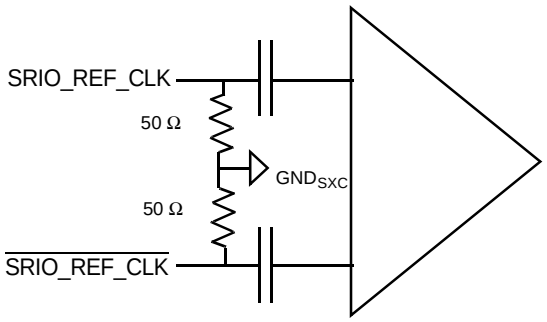

Figure 5. SerDes Reference Clocks Input Stage

2.5.2.2 Spread Spectrum Clock

SRIO_REF_CLK/ $\overline{\text{SRIO_REF_CLK}}$ is designed to work with a spread spectrum clock (0 to 0.5% spreading at 3033 kHz rate is allowed), assuming both ends have same reference clock. For better results use a source without significant unintended modulation.

2.6 AC Timings

The following sections include illustrations and tables of clock diagrams, signals, and parallel I/O outputs and inputs.

2.6.1 Start-Up Timing

Starting the device requires coordination among several input sequences including clocking, reset, and power. **Section 2.6.2** describes the clocking characteristics. **Section 2.6.3** describes the reset and power-up characteristics. You must use the following guidelines when starting up an MSC8144 device:

- $\overline{\text{PORESET}}$ and $\overline{\text{TRST}}$ must be asserted externally for the duration of the power-up sequence using the V_{DDIO} (3.3 V) supply. See Table 19 for timing. $\overline{\text{TRST}}$ deassertion does not have to be synchronized with $\overline{\text{PORESET}}$ deassertion. During functional operation when JTAG is not used, $\overline{\text{TRST}}$ can be asserted and remain asserted after the power ramp.

Note: For applications that use M3 memory, $\overline{\text{M3_RESET}}$ should replicate the $\overline{\text{PORESET}}$ sequence timing, but using the V_{DDM3IO} (2.5 V) supply. See **Section 3.1.1**, *Power-on Sequence* for additional design information.

- CLKIN should start toggling at least 32 cycles before the $\overline{\text{PORESET}}$ deassertion to guarantee correct device operation (see Figure 6). 32 cycles should be accounted only after V_{DDIO} reaches its nominal value.
- CLKIN and PCI_CLK_IN should either be stable low during the power-up of V_{DDIO} supply and start their swings after power-up or should swing within V_{DDIO} range during V_{DDIO} power-up., so their amplitude grows as V_{DDIO} grows during power-up.

Figure 6 shows a sequence in which V_{DDIO} is raised after V_{DD} and CLKIN begins to toggle with the raise of V_{DDIO} supply.

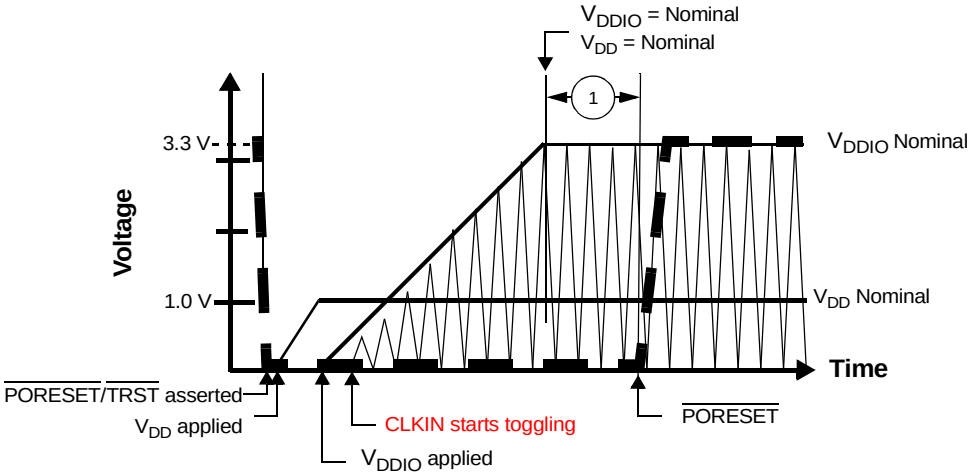

Figure 6. Start-Up Sequence with V_{DD} Raised Before V_{DDIO} with CLKIN Started with V_{DDIO}

2.6.2 Clock and Timing Signals

The following sections include a description of clock signal characteristics. Table 16 shows the maximum frequency values for CLKIN and PCI_CLK_IN. The user must ensure that maximum frequency values are not exceeded.

Table 16. Clock Frequencies

Characteristic	Symbol	Min	Max	Unit
CLKIN frequency	F_{CLKIN}	33	133	MHz
PCI_CLK_IN frequency	$F_{PCI_CLK_IN}$	33	133	MHz
CLKIN duty cycle	D_{CLKIN}	40	60	%
PCI_CLK_IN duty cycle	$D_{PCI_CLK_IN}$	40	60	%

2.6.3 Reset Timing

The MSC8144 has several inputs to the reset logic:

- Power-on reset (PORESET)
- External hard reset (HRESET)
- External soft reset (SRESET)
- Software watchdog reset
- JTAG reset
- RapidIO reset
- Software hard reset
- Software soft reset

All MSC8144 reset sources are fed into the reset controller, which takes different actions depending on the source of the reset. The reset status register indicates the most recent sources to cause a reset. Table 17 describes the reset sources.

Table 17. Reset Sources

Name	Direction	Description
Power-on reset (PORESET)	Input	Initiates the power-on reset flow that resets the MSC8144 and configures various attributes of the MSC8144. On PORESET, the entire MSC8144 device is reset. All PLLs states is reset, HRESET and SRESET are driven, the extended cores are reset, and system configuration is sampled. The reset source and word are configured only when PORESET is asserted.
External hard reset (HRESET)	Input/ Output	Initiates the hard reset flow that configures various attributes of the MSC8144. While HRESET is asserted, SRESET is also asserted. HRESET is an open-drain pin. Upon hard reset, HRESET and SRESET are driven, the extended cores are reset, and system configuration is sampled. Note that the RCW (reset Configuration Word) is not reloaded during HRESET assertion after out of power on reset sequence. The reset configuration word is described in the Reset chapter in the *MSC8144 Reference Manual*.
External soft reset (SRESET)	Input/ Output	Initiates the soft reset flow. The MSC8144 detects an external assertion of SRESET only if it occurs while the MSC8144 is not asserting reset. SRESET is an open-drain pin. Upon soft reset, SRESET is driven, the extended cores are reset, and system configuration is maintained.
Host reset command through the TAP	Internal	When a host reset command is written through the Test Access Port (TAP), the TAP logic asserts the soft reset signal and an internal soft reset sequence is generated.
Software watchdog reset	Internal	When the MSC8144 watchdog count reaches zero, a software watchdog reset is signalled. The enabled software watchdog event then generates an internal hard reset sequence.
RapidIO reset	Internal	When the RapidIO logic asserts the RapidIO hard reset signal, it generates an internal hard reset sequence.
Software hard reset	Internal	A hard reset sequence can be initialized by writing to a memory mapped register (RCR)
Software soft reset	Internal	A soft reset sequence can be initialized by writing to a memory mapped register (RCR)

Table 18 summarizes the reset actions that occur as a result of the different reset sources.

2.6.3.1 Power-On Reset (PORESET) Pin

Asserting PORESET initiates the power-on reset flow. PORESET must be asserted externally for at least 32 CLKIN cycles after V_{DD} and V_{DDIO} are both at their nominal levels.

2.6.3.2 Reset Configuration

The MSC8144 has two mechanisms for writing the reset configuration:

- Through the I^2C port
- Through external pins
- Through internal hard coded

Twenty-three signals (see **Section 1** for signal description details) are sampled during the power-on reset sequence to define the Reset Word Configuration Source and operating conditions:

- RCW_SRC[2–0]
- RC[16–0]

The RCFG_CLKIN_RNG pin must be valid during power-on or hard reset sequence. The STOP_BS pin must be always valid and is also sampled during power-on reset sequence for RCW loading from an I^2C EEPROM.

2.6.3.3 Reset Timing Tables

Table 19 and Figure 7 describe the reset timing for a reset configuration.

2.6.4 DDR SDRAM AC Timing Specifications

This section describes the AC electrical characteristics for the DDR SDRAM interface.

2.6.4.1 DDR SDRAM Input Timings

Table 20 provides the input AC timing specifications for the DDR SDRAM when V_{DDDDR} (typ) = 2.5 V.

Table 20. DDR SDRAM Input AC Timing Specifications for 2.5-V Interface

Parameter	Symbol	Min	Max	Unit
AC input low voltage	V_{IL}	—	MV_{REF} – 0.31	V
AC input high voltage	V_{IH}	MV_{REF} + 0.31	—	V
Note: At recommended operating conditions with V_{DDDDR} of 2.5 ± 5%.				

Table 21 provides the input AC timing specifications for the DDR SDRAM when V_{DDDDR} (typ) = 1.8 V.

Notes:

1. The symbols used for timing specifications follow the pattern of $t_{\text{(first two letters of functional block)(signal)(state) (reference)(state)}}$ for inputs and $t_{\text{(first two letters of functional block)(reference)(state)(signal)(state)}}$ for outputs. Output hold time can be read as DDR timing (DD) from the rising or falling edge of the reference clock (KH or KL) until the output went invalid (AX or DX). For example, t_{DDKHAS} symbolizes DDR timing (DD) for the time t_{MCK} memory clock reference (K) goes from the high (H) state until outputs (A) are setup (S) or output valid time. Also, t_{DDKLDX} symbolizes DDR timing (DD) for the time t_{MCK} memory clock reference (K) goes low (L) until data outputs (D) are invalid (X) or data output hold time.
2. All MCK/$\overline{\text{MCK}}$ referenced measurements are made from the crossing of the two signals ±0.1 V.
3. ADDR/CMD includes all DDR SDRAM output signals except MCK/$\overline{\text{MCK}}$, $\overline{\text{MCS}}$, and MDQ/MECC/MDM/MDQS. For the ADDR/CMD setup and hold specifications, it is assumed that the Clock Control register is set to adjust the memory clocks by 1/2 applied cycle.
4. Note that t_{DDKHMH} follows the symbol conventions described in note 1. For example, t_{DDKHMH} describes the DDR timing (DD) from the rising edge of the MCK(n) clock (KH) until the MDQS signal is valid (MH). t_{DDKHMH} can be modified through control of the DQSS override bits in the TIMING_CFG_2 register. This will typically be set to the same delay as the clock adjust in the CLK_CNTL register. The timing parameters listed in the table assume that these 2 parameters have been set to the same adjustment value. See the *MSC8144 Reference Manual* for a description and understanding of the timing modifications enabled by use of these bits.
5. Determined by maximum possible skew between a data strobe (MDQS) and any corresponding bit of data (MDQ), ECC (MECC), or data mask (MDM). The data strobe should be centered inside of the data eye at the pins of the microprocessor.
6. All outputs are referenced to the rising edge of MCK(n) at the pins of the microprocessor. Note that t_{DDKHMP} follows the symbol conventions described in note 1.
7. At recommended operating conditions with V_{DDDDR} (1.8 V or 2.5 V) ± 5%.

2.6.5 Serial RapidIO Timing and SGMII Timing

2.6.5.1 AC Requirements for SRIO_REF_CLK and $\overline{\text{SRIO_REF_CLK}}$

Table 24 lists AC signal specifications.

Table 24. SD*n*_REF_CLK and $\overline{\text{SD}n\text{_REF_CLK}}$ AC Signal Specifications

Parameter Description	Symbol	Min	Typical	Max	Units	Comments
REFCLK cycle time	t_{REF}	—	10 (8, 6.4)	—	ns	8 ns applies only to serial RapidIO system with 125-MHz reference clock. 6.4 ns applies only to serial RapidIO systems with a 156.25 MHz reference clock. **Note:** SGMII uses the 8 ns (125 MHz) value only.

2.6.5.2 Signal Definitions

LP-Serial links use differential signaling. This section defines terms used in the description and specification of differential signals. Figure 11 shows how the signals are defined. The figure shows waveforms for either a transmitter output (TD and $\overline{\text{TD}}$) or a receiver input (RD and $\overline{\text{RD}}$). Each signal swings between voltage levels A and B, where A > B.

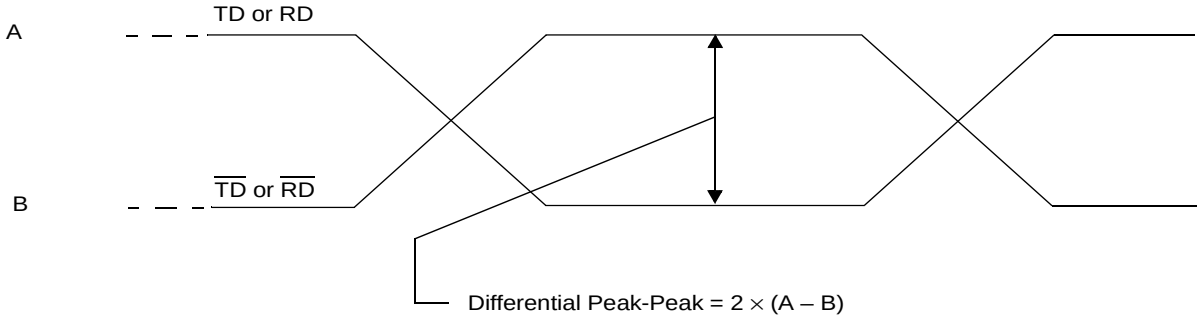

Figure 11. Differential V_{PP} of Transmitter or Receiver

Note: This explanation uses generic TD/$\overline{\text{TD}}$/RD/$\overline{\text{RD}}$ signal names. These correspond to SRIO_TXD/$\overline{\text{SRIO_TXD}}$/ SRIO_RXD/$\overline{\text{SRIO_RXD}}$ respectively.

Using these waveforms, the definitions are as follows:

1. The transmitter output signals and the receiver input signals TD, $\overline{TD}$, RD and $\overline{RD}$ each have a peak-to-peak voltage (V_{PP}) swing of A – B.
2. The differential output signal of the transmitter, V_{OD}, is defined as $V_{TD} - V_{\overline{TD}}$.
3. The differential input signal of the receiver, V_{ID}, is defined as $V_{RD} - V_{\overline{RD}}$.
4. The differential output signal of the transmitter and the differential input signal of the receiver each range from A – B to –(A – B).
5. The peak value of the differential transmitter output signal and the differential receiver input signal is A – B.
6. The value of the differential transmitter output signal and the differential receiver input signal is $2 \times (A - B)$ V_{PP}.

To illustrate these definitions using real values, consider the case of a CML (Current Mode Logic) transmitter that has a common mode voltage of 2.25 V and each of its outputs, TD and $\overline{TD}$, has a swing that goes between 2.5 V and 2.0 V. Using these values, the peak-to-peak voltage swing of the signals TD and $\overline{TD}$ is 500 mV_{PP}. The differential output signal ranges between 500 mV and –500 mV. The peak differential voltage is 500 mV. The peak-to-peak differential voltage is 1000 mV_{PP}.

Note: AC electrical specifications are given for transmitter and receiver. Long run and short run interfaces at three baud rates (a total of six cases) are described. The parameters for the AC electrical specifications are guided by the XAUI electrical interface specified in Clause 47 of **IEEE™** Std 802.3ae-2002™. XAUI has similar application goals to serial RapidIO. The goal of this standard is that electrical designs for serial RapidIO can reuse electrical designs for XAUI, suitably modified for applications at the baud intervals and reaches described herein.

2.6.5.3 Equalization

With the use of high speed serial links, the interconnect media will cause degradation of the signal at the receiver. Effects such as Inter-Symbol Interference (ISI) or data dependent jitter are produced. This loss can be large enough to degrade the eye opening at the receiver beyond what is allowed in the specification. To negate a portion of these effects, equalization can be used. The most common equalization techniques that can be used are:

- A passive high pass filter network placed at the receiver. This is often referred to as passive equalization.
- The use of active circuits in the receiver. This is often referred to as adaptive equalization.

2.6.5.4 Transmitter Specifications

LP-Serial transmitter electrical and timing specifications are stated in the text and tables of this section. The differential return loss, S11, of the transmitter in each case shall be better than

- –10 dB for (baud frequency)/10 < freq(f) < 625 MHz, and
- –10 dB + 10log(f/625 MHz) dB for 625 MHz ≤ freq(f) ≤ baud frequency

The reference impedance for the differential return loss measurements is 100 Ω resistive. Differential return loss includes contributions from internal circuitry, packaging, and any external components related to the driver. The output impedance requirement applies to all valid output levels. It is recommended that the 20–80% rise/fall time of the transmitter, as measured at the transmitter output, have a minimum value 60 ps in each case. It is also recommended that the timing skew at the output of an LP-Serial transmitter between the two signals comprising a differential pair not exceed 25 ps at 1.25 GB, 20 ps at 2.50 GB, and 15 ps at 3.125 GB.

For each baud rate at which an LP-Serial transmitter is specified to operate, the output eye pattern of the transmitter shall fall entirely within the unshaded portion of the transmitter output compliance mask shown in Figure 12 with the parameters specified in Table 31 when measured at the output pins of the device and the device is driving a 100 Ω ±5% differential resistive load. The output eye pattern of an LP-Serial transmitter that implements pre-emphasis (to equalize the link and reduce inter-symbol interference) need only comply with the transmitter output compliance mask when pre-emphasis is disabled or minimized.

2.6.5.5 Receiver Specifications

LP-Serial receiver electrical and timing specifications are stated in the text and tables of this section. Receiver input impedance shall result in a differential return loss better that 10 dB and a common mode return loss better than 6 dB from 100 MHz to 0.8 × baud frequency. This includes contributions from internal circuitry, the package, and any external components related to the receiver. AC coupling components are included in this requirement. The reference impedance for return loss measurements is 100 Ω resistive for differential return loss and 25 Ω resistive for common mode.

Table 32. Receiver AC Timing Specifications—1.25 GBaud

Characteristic	Symbol	Range		Unit	Notes
		Min	Max		
Differential Input Voltage	V_{IN}	200	1600	mV_{PP}	Measured at receiver
Deterministic Jitter Tolerance	J_D	0.37		UI_{PP}	Measured at receiver
Combined Deterministic and Random Jitter Tolerance	J_{DR}	0.55		UI_{PP}	Measured at receiver
Total Jitter Tolerance	J_T	0.65		UI_{PP}	Measured at receiver. Total jitter is composed of three components, deterministic jitter, random jitter and single frequency sinusoidal jitter. The sinusoidal jitter may have any amplitude and frequency in the unshaded region of Figure 13. The sinusoidal jitter component is included to ensure margin for low frequency jitter, wander, noise, crosstalk and other variable system effects.

2.6.5.6 Receiver Eye Diagrams

For each baud rate at which an LP-Serial receiver is specified to operate, the receiver shall meet the corresponding bit error rate specification (Table 32, Table 33, and Table 34) when the eye pattern of the receiver test signal (exclusive of sinusoidal jitter) falls entirely within the unshaded portion of the receiver input compliance mask shown in Figure 14 with the parameters specified in Table 35. The eye pattern of the receiver test signal is measured at the input pins of the receiving device with the device replaced with a 100 Ω ±5% differential resistive load.

2.6.5.7 Measurement and Test Requirements

Since the LP-Serial electrical specification are guided by the XAUI electrical interface specified in Clause 47 of **IEEE** Std. 802.3ae-2002™, the measurement and test requirements defined here are similarly guided by Clause 47. In addition, the CJPAT test pattern defined in Annex 48A of **IEEE** Std. 802.3ae-2002 is specified as the test pattern for use in eye pattern and jitter measurements. Annex 48B of **IEEE** Std. 802.3ae-2002 is recommended as a reference for additional information on jitter test methods.

2.6.5.8 Eye Template Measurements

For the purpose of eye template measurements, the effects of a single-pole high pass filter with a 3 dB point at (baud frequency)/1667 is applied to the jitter. The data pattern for template measurements is the continuous jitter test pattern (CJPAT) defined in Annex 48A of **IEEE** Std. 802.3ae. All lanes of the LP-Serial link shall be active in both the transmit and receive directions, and opposite ends of the links shall use asynchronous clocks. Four lane implementations shall use CJPAT as defined in Annex 48A. Single lane implementations shall use the CJPAT sequence specified in Annex 48A for transmission on lane 0. The amount of data represented in the eye shall be adequate to ensure that the bit error ratio is less than 10^{-12}. The eye pattern shall be measured with AC coupling and the compliance template centered at 0 Volts differential. The left and right edges of the template shall be aligned with the mean zero crossing points of the measured data eye. The load for this test shall be 100 Ω resistive ±5% differential to 2.5 GHz.

2.6.5.9 Jitter Test Measurements

For the purpose of jitter measurement, the effects of a single-pole high pass filter with a 3 dB point at (baud frequency)/1667 is applied to the jitter. The data pattern for jitter measurements is the Continuous Jitter Test Pattern (CJPAT) pattern defined in Annex 48A of **IEEE** Std. 802.3ae. All lanes of the LP-Serial link shall be active in both the transmit and receive directions, and opposite ends of the links shall use asynchronous clocks. Four lane implementations shall use CJPAT as defined in Annex 48A. Single lane implementations shall use the CJPAT sequence specified in Annex 48A for transmission on lane 0. Jitter shall be measured with AC coupling and at 0 V differential. Jitter measurement for the transmitter (or for calibration of a jitter tolerance setup) shall be performed with a test procedure resulting in a BER curve such as that described in Annex 48B of **IEEE** Std. 802.3ae.

2.6.5.10 Transmit Jitter

Transmit jitter is measured at the driver output when terminated into a load of 100 Ω resistive ±5% differential to 2.5 GHz.

2.6.5.11 Jitter Tolerance

Jitter tolerance is measured at the receiver using a jitter tolerance test signal. This signal is obtained by first producing the sum of deterministic and random jitter defined in **Section 2.6.5.9** and then adjusting the signal amplitude until the data eye contacts the 6 points of the minimum eye opening of the receive template shown in Figure 14 and Table 35. Note that for this to occur, the test signal must have vertical waveform symmetry about the average value and have horizontal symmetry (including jitter) about the mean zero crossing. Eye template measurement requirements are as defined above. Random jitter is calibrated using a high pass filter with a low frequency corner at 20 MHz and a 20 dB/decade roll-off below this. The required sinusoidal jitter specified in Section 8.6 is then added to the signal and the test load is replaced by the receiver being tested.

2.6.6 PCI Timing

This section describes the general AC timing parameters of the PCI bus. Table 36 provides the PCI AC timing specifications.

Notes:
1. See the timing measurement conditions in the *PCI 2.2 Local Bus Specifications*.
2. All PCI signals are measured from $0.5 \times V_{DDIO}$ of the rising edge of PCI_CLK_IN to $0.4 \times V_{DDIO}$ of the signal in question for 3.3-V PCI signaling levels.
3. For purposes of active/float timing measurements, the Hi-Z or off state is defined to be when the total current delivered through the component pin is less than or equal to the leakage current specification.
4. Input timings are measured at the pin.
5. The reset assertion timing requirement for $\overline{\text{HRESET}}$ is in Table 19 and Figure 7

2.6.10 Ethernet Timing

This section describes the AC electrical characteristics for the Ethernet interface.

There are programmable delay units (PDU) that should be programmed differently for each Interface to meet timing. There is a general configuration register 4 (GCR4) used to configure the timing. For additional information, see the *MSC8144 Reference Manual*.

2.6.10.1 Management Interface Timing

Table 40. Ethernet Controller Management Interface Timing

Characteristics	Symbol	Min	Max	Unit

ETHMDIO to ETHMDC rising edge setup time	t_{MDDVKH}	7	—	ns
ETHMDC rising edge to ETHMDIO hold time	t_{MDDXKH}	0	—	ns

Notes:
1. Program the ETHMDC frequency (f_{MDC}) to a maximum value of 2.5 MHz (400 ns period for t_{MDC}). The value depends on the source clock and configuration of MIIMCFG[MCS] and UPSMR[MDCP]. For example, for a source clock of 400 MHz, to achieve f_{MDC} = 2.5 MHz, program MIIMCFG[MCS] = 0x4 and UPSMR[MDCP] = 0. See the *MSC8144 Reference Manual* for configuration details.
2. The value depends on the source clock. For example, for a source clock of 267 MHz, the delay is 70 ns. For a source clock of 333 MHz, the delay is 58 ns.

Data to clock output skew (at transmitter)	t_{SKEWT}	-0.5	—	0.5	ns
Data to clock input skew (at receiver) [2]	t_{SKEWR}	0.9	—	2.6	ns

Notes:
1. At recommended operating conditions with LV_{DD} of 2.5 V +/- 5%.
2. This implies that PC board design requires clocks to be routed such that an additional trace delay of greater than 1.5 ns is added to the associated clock signal.
3. GCR4 should be programmed as 0x00001004.

Table 46 presents the RGMII AC timing specification for applications required non-delayed clock on board.

Data to clock input skew (at receiver) [2]	t_{SKEWR}	–0.5	—	0.5	ns

Notes:
1. At recommended operating conditions with LV_{DD} of 2.5 V +/- 5%.
2. This implies that PC board design will require clocks to be routed with no additional trace delay
3. GCR4 should be programmed as 0x0004C130.

Inputs—External clock input setup time	t_{UEIVKH}	4		ns
Inputs—External clock input hold time	t_{UEIXKH}	1		ns

Notes:
1. Not tested. Guaranteed by design.
2. Output specifications are measured from the 50% level of the rising edge of CLKIN to the 50% level of the signal. Timings are measured at the pin. Although the specifications generally reference the rising edge of the clock, these AC timing diagrams also apply when the falling edge is the active edge.

2.6.12 SPI Timing

Table 48 lists the SPI input and output AC timing specifications.

Table 48. SPI AC Timing Specifications [1]

Characteristic	Symbol [2]	Min	Max	Unit
SPI outputs valid—Master mode (internal clock) delay	t_{NIKHOV}		6	ns
SPI outputs hold—Master mode (internal clock) delay	t_{NIKHOX}	0.5		ns
SPI outputs valid—Slave mode (external clock) delay	t_{NEKHOV}		8	ns

SPI inputs—Slave mode (external clock) input setup time	t_{NEIVKH}	4		ns
SPI inputs—Slave mode (external clock) input hold time	t_{NEIXKH}	2		ns

Notes:
1. Output specifications are measured from the 50 percent level of the rising edge of CLKIN to the 50 percent level of the signal. Timings are measured at the pin.
2. The symbols for timing specifications follow the pattern of $t_{\text{(first two letters of functional block)(signal)(state) (reference)(state)}}$ for inputs and $t_{\text{(first two letters of functional block)(reference)(state)(signal)(state)}}$ for outputs. For example, t_{NIKHOX} symbolizes the internal timing (NI) for the time SPICLK clock reference (K) goes to the high state (H) until outputs (O) are invalid (X).

Figure 34 provides the AC test load for the SPI.

The following interfaces use the specified asynchronous signals:

- *GPIO*. Signals GPIO[31–0], when used as GPIO signals, that is, when the alternate multiplexed special functions are not selected.

Note: When used as a GPI, the input should be driven until it is acknowledged by the device; the GPIO input status is read from a register.

- *EE port.* Signals EE0, EE1, EE2_0, EE2_1, EE2_2, and EE2_3.
- *Boot function*. Signal STOP_BS.
- *I^2C interface*. Signals I2C_SCL and I2C_SDA.
- *Interrupt inputs*. Signals $\overline{\text{IRQ}}$[15–0] and $\overline{\text{NMI}}$.
- *Interrupt outputs*. Signals $\overline{\text{INT_OUT}}$ and $\overline{\text{NMI_OUT}}$ (pulse width is 10 ns).

3 Hardware Design Considerations

The following sections discuss areas to consider when the MSC8144 device is designed into a system.

3.1 Start-up Sequencing Recommendations

3.1.1 Power-on Sequence

Use the following guidelines for power-on sequencing:

- There are no dependencies in power-on/power-off sequence between V_{DDM3} and V_{DD} supplies.
- There are no dependencies in power-on/power-off sequence between RapidIO supplies: V_{DDSXC}, V_{DDSXP}, $V_{DDRIOPLL}$ and other MSC8144 supplies.
- V_{DDPLL} should be coupled with the V_{DD} power rail with extremely low impedance path.

External voltage applied to any input line must not exceed the related to this port I/O supply by more than 0.6 V at any time, including during power-up. Some designs require pull-up voltages applied to selected input lines during power-up for configuration purposes. This is an acceptable exception to the rule during start-up. However, each such input can draw up to 80 mA per input pin per MSC8144 device in the system during start-up. An assertion of the inputs to the high voltage level before power-up should be with slew rate less than 4 V/ns.

The following supplies should rise before any other supplies in any sequence

- V_{DD} and V_{DDPLL} coupled together
- V_{DDM3}

After the above supplies rise to 90% of their nominal value the following I/O supplies may rise in any sequence (see Figure 42):

- V_{DDGE1}
- V_{DDGE2}
- V_{DDIO}
- V_{DDDDR} and MV_{REF} coupled one to another. MV_{REF} should be either at same time or after V_{DDDDR}.
- V_{DDM3IO}
- V_{25M3}

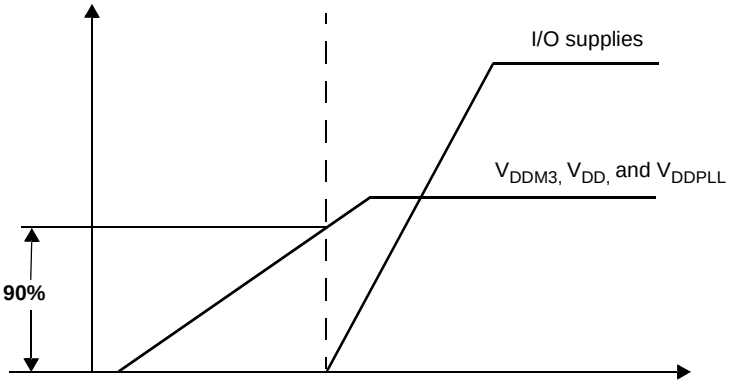

Figure 42. V_{DDM3}, V_{DDM3IO} and V_{25M3} Power-on Sequence

Note:
1. This recommended power sequencing is different from the MSC8122/MSC8126.
2. If no pins that require V_{DDGE1} as a reference supply are used (see Table 1), V_{DDGE1} can be tied to GND.
3. If no pins that require V_{DDGE2} as a reference supply are used (see Table 1), V_{DDGE2} can be tied to GND.
4. If the DDR interface is not used, V_{DDDDR} and MV_{REF} can be tied to GND.
5. If the M3 memory is not used, V_{DDM3}, V_{DDM3IO}, and V_{25M3} can be tied to GND.
6. If the RapidIO interface is not used, V_{DDSX}, V_{DDSXP}, and $V_{DDRIOPLL}$ can be tied to GND.

3.1.2 Start-Up Timing

Section 2.6.1 describes the start-up timing.

3.2 Power Supply Design Considerations

Each PLL supply must have an external RC filter for the V_{DDPLL} input. The filter is a 10 Ω resistor in series with two 2.2 µF, low ESL (<0.5 nH) and low ESR capacitors. All three PLLs can connect to a single supply voltage source (such as a voltage regulator) as long as the external RC filter is applied to each PLL separately (see Figure 43). For optimal noise filtering, place the circuit as close as possible to its V_{DDPLL} inputs. These traces should be short and direct.

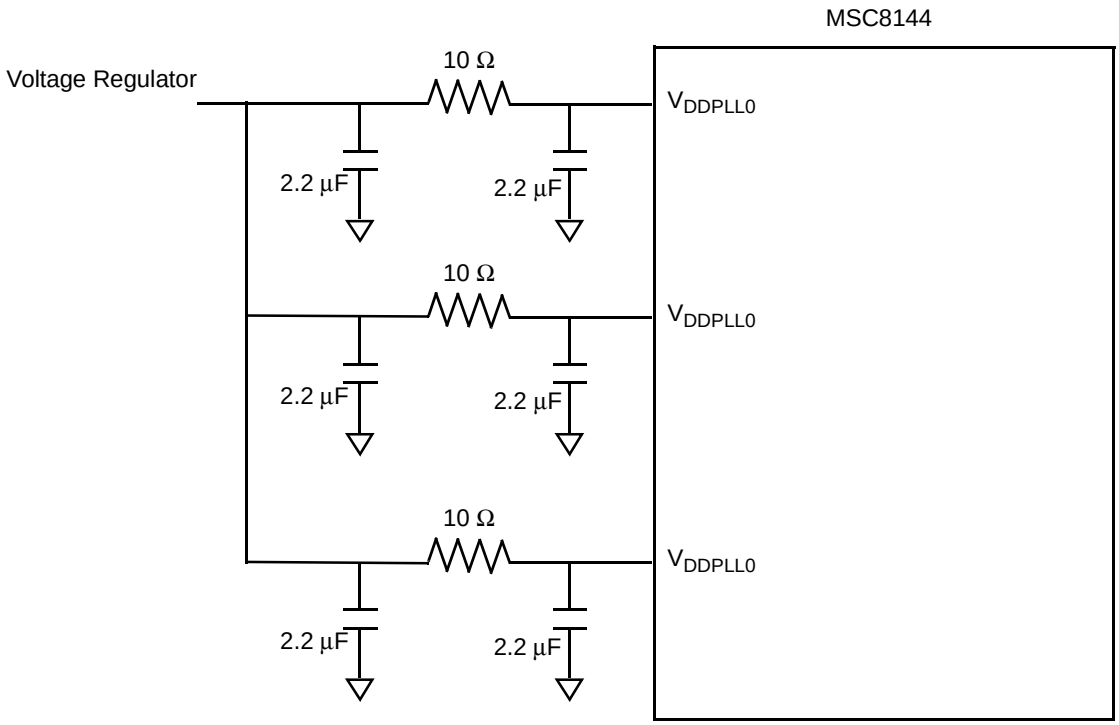

Figure 43. PLL Supplies

3.3 Clock and Timing Signal Board Layout Considerations

When laying out the system board, use the following guidelines:

- Keep clock and timing signal paths as short as possible and route with 50 Ω impedance.
- Use a serial termination resistor placed close to the clock buffer to minimize signal reflection. Use the following equation to compute the resistor value:

  Rterm = Rim – Rbuf

  where Rim = trace characteristic impedance

  Rbuf = clock buffer internal impedance.

Note: See *MSC8144 CLKIN and PCI_CLK_IN Board Layout* (AN3440) for an example layout.

3.4 Connectivity Guidelines

Note: Although the package actually uses a ball grid array, the more conventional term pin is used to denote signal connections in this discussion.

First, select the pin multiplexing mode to allocate the required I/O signals. Then use the guidelines presented in the following subsections for board design and connections. The following conventions are used in describing the connectivity requirements:

1. GND indicates using a 10 kΩ pull-down resistor (recommended) or a direct connection to the ground plane. Direct connections to the ground plane may yield DC current up to 50mA through the I/O supply that adds to overall power consumption.
2. V_{DD} indicates using a 10 kΩ pull-up resistor (recommended) or a direct connection to the appropriate power supply. Direct connections to the supply may yield DC current up to 50mA through the I/O supply that adds to overall power consumption.
3. Mandatory use of a pull-up or pull-down resistor it is clearly indicated as “pull-up/pull-down”.
4. NC indicates “not connected” and means do not connect anything to the pin.
5. The phrase “in use” indicates a typical pin connection for the required function.

Note: Please see recommendations #1 and #2 as mandatory pull-down or pull-up connection for unused pins in case of subset interface connection.

3.4.1 DDR Memory Related Pins

This section discusses the various scenarios that can be used with DDR1 and DDR2 memory.

Note: For information about unused differential/non-differential pins in DDR1/DDR2 modes (that is, unused negative lines of strobes in DDR1), please refer to Table 51.

3.4.4.3 GE1 and GE2 Management Pins

GE_MDC and GE_MDIO pins should be connected as required by the specified protocol. If neither GE1 nor GE2 is used (that is, V_{DDGE2} is connected to GND), Table 61 lists the recommended management pin connections.

Table 61. Connectivity of GE Management Pins When GE1 and GE2 Are Not Used

Signal Name	Pin Connection

3.4.5 UTOPIA/POS Related Pins

Table 62 lists the board connections of the UTOPIA/POS pins when the entire UTOPIA/POS interface is not used or subset of UTOPIA/POS interface is used. For multiplexing options that select a subset of the UTOPIA/POS interface, use the connections described in Table 62 for those signals that are not selected. Table 62 assumes that the alternate function of the specified pin is not used. If the alternate function is used, connect that pin as required to support the selected function.

3.4.6 TDM Interface Related Pins

Table 63 lists the board connections of the TDM pins when an entire specific TDM is not used. For multiplexing options that select a subset of a TDM interface, use the connections described in Table 63 for those signals that are not selected. Table 63 assumes that the alternate function of the specified pin is not used. If the alternate function is used, connect that pin as required to support the selected function.

2. In case of subset of TDM interface usage please make sure to disable unused TDM modules. See **Chapter 20**, *TDM*, in the ***MSC8144 Reference Manual*** for details.

3.4.7 PCI Related Pins

Table 64 lists the board connections of the pins when PCI is not used. Table 64 assumes that the alternate function of the specified pin is not used. If the alternate function is used, connect that pin as required to support the selected function.

7 Revision History

Table 66 provides a revision history for this data sheet.

Table 66. Document Revision History

Rev.	Date	Description
0	Feb. 2007	• Initial public release.
1	Apr. 2007	• Adds new I/O multiplexing mode 7 that supports POS functionality. • Updates reference voltage supply for pins G5, H7, and H8 in Table 1. • Updates start-up timing recommendations with regard to $\overline{\text{TRST}}$ and $\overline{\text{M3_RESET}}$ in Section 2.7.1. • Adds input clock duty cycles in Table 20. • Updates PCI AC timings in Table 41. • Removes UTOPIA internal clock specifications in Table 52. • Updates JTAG timings in Table 56. • Clarifies connectivity guidelines for Ethernet pins in Section 3.3.4. • Miscellaneous pin connectivity guidelines were updated in Table 71. • Updates name of core subsystem reference manual.
2	June 2007	• Corrected AA4 definition in Table 1. Changed TDM5TD3 to correct name TDM5TDAT. • Removed Figure 35 because the device does not support UTOPIA using an internal clock. Renumbered subsequent figures. • Removed Section 3.5 *Thermal Considerations*. To be replaced with an application note.
3	Sep 2007	• Updated M3 voltage range in Table 3. • Changed note in Table 7 for PLL power supplies. • DDR voltage designator changed from V_{DD} to V_{DDDDR} in Table 8, Table 10, **Section 2.7.4.1**, **Section 2.7.4.2**, and Figure 11. Changed range on I_{OZ} in Table 8 and Table 10. • Deleted text before Table 13 and added note 2 to input pin capacitance. • Deleted text before Table 14, added a 1 to the note, and added note 1 to input pin capacitance. • Deleted **Section 2.6.5** on page 32 and renumbered subsequent subsections. • Deleted text before new **Section 2.6.5.1**. • Added a 1 to the note in Table 15 and added note 1 to input pin capacitance. • Deleted ac voltage rows from Table 16. Added note 1 to input pin capacitance. • Changed output high and low voltage levels in Table 17 and Table 18. • Deleted text before Table 19. • Added clock skew ranges in percent in Table 21. • Changed V_{REF} to MV_{REF} in Table 26. • Changed V_{DD} to V_{DDIO} in Table 41 Updated note 2. • Added note 4 to Table 42. Changed $t_{TDMSHOX}$ value. • Changed V_{DD} to V_{DDGE} in Figure 27 and Figure 30. • Changed the value of the data to clock out skew in Table 51. • Changed EE pin timing in Table 55. • Changed the head for the JTAG timing section, now **Section 2.7.15**. • Updated JTAG timing for TCK cycle time, TCK high phase, and boundary scan input data hold time in Table 56. • Added new **Section 3.3** with guidelines for board layout for clock and timing signals. Renumbered subsequent sections.
4	Sep 2007	• Changed leakage current values in Table 13, Table 14, Table 11, Table 16, Table 17, Table 18, and Table 19 from –10 and 10 µa to –30 and 30 µa. • Change the minimum value of t_{MDDVKH} in Table 45 from 5 ns to 7 ns. • Updated note 1 in Table 45.
5	Oct 2007	• Corrected column numbering in Figure 3 and Figure 4. • Updated SPI signal names in Table 1.
6	Oct 2007	• Updated SPI signal names in Table 1.

Table 66. Document Revision History (continued)

Rev.	Date	Description
7	Dec 2007	• Changed minimum voltage level for V_{DDM3} to 1.213 (1.25 – 3%) in Table 3. • Added POS to titles in **Section 2.6.6**. • Added additional signals to titles in **Section 2.6.8**. Added high and low voltage ranges to Table 19. • Added ATM and POS to headings in **Section 2.7.11**. Changed characteristics to generic input/output in Table 52, Figure 33, and Figure 34. • Replaced **Sections 2.7.13** and **2.7.14** with new **Section 2.7.13**, *Asynchronous Signal Timing*. Renumbered subsequent sections, tables, and figures. • Added POS to all UTOPIA references in **Section 3.4.5**.
8	Dec 2007	• Changed GCR4 program value to 0x0004C130 in Note 7 in Table 51.
9	Mar 2008	• Changed description of Table 20 in **Section 2.7.2**.
10	Apr 2008	• Added [3] to the PLL supply voltage row in **Table 2**. • Changed the first sentence in **Section 3.4.8** to reflect that **Table 70** indicates what to do with pins if they are "not" required by the design. Changed the Pin Connection for GPIO[0–31] to GND. • Updated ordering information in **Section 4**. • Multiple corrections of minor punctuation errors.
11	Aug 2008	• Removed the comment about preliminary estimates before Table 4 and removed non-DDR rows in the table. • Table 9 and Table 11 for DDR and DDR2 SDRAM capacitance removed and subsequent tables renumbered. • Changed units for I_{OH} and I_{OL} to mA in Table 9. • Removed signal low and high input current from Table 12. • Added a note to Table 15 to exclude TDM and TMS. Removed reference to overshoot and undershoot and associated figure. • Changed minimum clock frequency to 33 MHz and maximum clock frequency to 133 MHz in Table 16. • Deleted old Table 17 Clock Parameters. • Changed minimum input clock frequency to 33 MHz in Table 19. • Changed the t_{DDKHAX} minimum value in Table 23 to 1.85 ns. • Removed t_{REFPJ} and t_{REFCJ} from Table 24 because the specifications are not required or tested. • Removed $t_{PCRSTCLK}$, $t_{PCRSTOFF}$, t_{PCRST}, and t_{PCRHFA} from Table 36 because the specifications are not required or tested. • Removed t_{UAVKH} and t_{UAVXH} from Table 38 because the specifications are not required or tested. • The parameters t_{MDCH}, t_{MDCR}, and t_{MDHF} were removed from Table 40 because the specifications are not required or tested. • The parameters t_{MTXH}/t_{MTX}, t_{MTXR}, and t_{MTXF} were removed from Table 41 because the specifications are not required or tested. • The parameters t_{MRXH}/t_{MRX}, t_{MRXR}, and t_{MRXF} were removed from Table 42 because the specifications are not required or tested. • The parameters t_{RMXH}/t_{RMX}, t_{RMXR}, and t_{RMXF} were removed from Table 43 because the specifications are not required or tested. • Removed the parameters t_{RGT}, t_{RGTH}/t_{RGT} (1000Base-T), t_{RGTH}/t_{RGT} (10Base-T), t_{RGTR}, t_{RGTF}, t_{G12}, and t_{G125H}/t_{G125} were removed from Table 45 and Table 46 because the specifications are not required or tested. • Changed t_{UEKHOX} to guaranteed by design in Table 47. • Updated Figure 35 and Figure 36 SPI timing diagrams. • Removed TCK rise and fall time from Table 50. • Updated orderable part numbers in **Section 4**.
12	Aug 2008	• Changed b8t to bit in the M3 memory description on the first page. • Changed maximum input high voltage (VIH) for SPI to 3.465 in the first row of Table 14. • Changed packet processor to QUICC Engine Subsystem in the last row of Table 18.
13	Feb 2009	• In Figure 31, for GTX_CLK, changed (at transmitter) to (at DSP) and for RX_CLK, changed (at PHY) to (at DSP). • Updated package drawing to the latest revision, Case No. 1842-04 in Figure 44.
14	Jul 2009	• Updated MV_{REF} equations and temperature ranges in Table 3. • Updated orderable part numbers to **Section 4**.
15	Nov 2009	• Updated Core and PLL input voltage tolerance in Table 3.
16	May 2010	• Corrected typo in Table 23. Changed MCLK minimum time to 5 ns.

All operating parameters, including “Typicals”, must be validated for each customer application by customer’s technical experts. Freescale Semiconductor does not convey any license under its patent rights nor the rights of others. Freescale Semiconductor products are not designed, intended, or authorized for use as components in systems intended for surgical implant into the body, or other applications intended to support or sustain life, or for any other application in which the failure of the Freescale Semiconductor product could create a situation where personal injury or death may occur. Should Buyer purchase or use Freescale Semiconductor products for any such unintended or unauthorized application, Buyer shall indemnify and hold Freescale Semiconductor and its officers, employees, subsidiaries, affiliates, and distributors harmless against all claims, costs, damages, and expenses, and reasonable attorney fees arising out of, directly or indirectly, any claim of personal injury or death associated with such unintended or unauthorized use, even if such claim alleges that Freescale Semiconductor was negligent regarding the design or manufacture of the part.

RoHS-compliant and/or Pb-free versions of Freescale products have the functionality and electrical characteristics as their non-RoHS-compliant and/or non-Pb-free counterparts. For further information, see http://www.freescale.com or contact your Freescale sales representative.
