SN65HVD10, SN65HVD11, SN65HVD12
SN75HVD10, SN75HVD11, SN75HVD12

SLLS505O – FEBRUARY 2002 – REVISED FEBRUARY 2017

SNx5HVD1x 3.3-V RS-485 Transceivers

1 Features

- Operates With a 3.3-V Supply
- Bus-Pin ESD Protection Exceeds 16-kV HBM
- 1/8 Unit-Load Option Available (Up to 256 Nodes on the Bus)
- Optional Driver Output Transition Times for Signaling Rates (1) of 1 Mbps, 10 Mbps, and 32 Mbps
- Meets or Exceeds the Requirements of ANSI TIA/EIA-485-A
- Bus-Pin Short-Circuit Protection From –7 V to 12 V
- Low-Current Standby Mode: 1 µA, Typical
- Open-Circuit, Idle-Bus, and Shorted-Bus Failsafe Receiver
- Thermal Shutdown Protection
- Glitch-Free Power-Up and Power-Down Protection for Hot-Plugging Applications
- SN75176 Footprint

2 Applications

- Digital Motor Control
- Utility Meters
- Chassis-to-Chassis Interconnects
- Electronic Security Stations
- Industrial Process Control
- Building Automation
- Point-of-Sale (POS) Terminals and Networks

(1) The signaling rate of a line is the number of voltage transitions that are made per second expressed in the units bps (bits per second).

3 Description

The SN65HVD10, SN75HVD10, SN65HVD11, SN75HVD11, SN65HVD12, and SN75HVD12 bus transceivers combine a 3-state differential line driver and differential input line receiver that operate with a single 3.3-V power supply. They are designed for balanced transmission lines and meet or exceed ANSI standard TIA/EIA-485-A and ISO 8482:1993. These differential bus transceivers are monolithic integrated circuits designed for bidirectional data communication on multipoint bus-transmission lines. The drivers and receivers have active-high and active-low enables, respectively, that can be externally connected together to function as direction control. Very low device standby supply current can be achieved by disabling the driver and the receiver.

The driver differential outputs and receiver differential inputs connect internally to form a differential input/output (I/O) bus port that is designed to offer minimum loading to the bus whenever the driver is disabled or V_{CC} = 0. These parts feature wide positive and negative common-mode voltage ranges making them suitable for party-line applications.

Device Information(1)

PART NUMBER	PACKAGE	BODY SIZE (NOM)
SN65HVD10 SN65HVD11 SN65HVD12	SOIC (8)	4.90 mm × 3.91 mm
SN75HVD10 SN75HVD11 SN75HVD12	PDIP (8)	9.81 mm × 6.35 mm

(1) For all available packages, see the orderable addendum at the end of the data sheet.

4 Revision History

Changes from Revision N (July 2015) to Revision O — **Page**

- Added MIN value of –55°C to the Storage temperature in *Absolute Maximum Ratings* ... 4

Changes from Revision M (July 2013) to Revision N — **Page**

- Added *Pin Configuration and Functions* section, *ESD Ratings* table, *Feature Description* section, *Device Functional Modes*, *Application and Implementation* section, *Power Supply Recommendations* section, *Layout* section, *Device and Documentation Support* section, and *Mechanical, Packaging, and Orderable Information* section ... 1

Changes from Revision L (July 2013) to Revision M — **Page**

- Changed the V_{IT+} TYP value From: –0.65 V To: –0.065 V ... 6

Changes from Revision K (September 2011) to Revision L — **Page**

- Added TYP = –0.65 V to V_{IT+} ... 6
- Added TYP = –0.1 V to $V_{IT–}$ ... 6

Changes from Revision J (February 2009) to Revision K — **Page**

- Added new section 'LOW-POWER STANDBY MODE', in the Application Information section ... 18

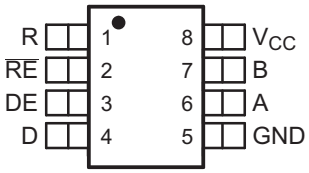
5 Device Comparison Table

PART NUMBER		SIGNALING RATE	UNIT LOADS	T_A	SOIC MARKING
SOIC(1)	PDIP				
SN65HVD10D	SN65HVD10P	32 Mbps	1/2	–40°C to 85°C	VP10
SN65HVD11D	SN65HVD11P	10 Mbps	1/8		VP11
SN65HVD12D	SN65HVD12P	1 Mbps	1/8		VP12
SN75HVD10D	SN75HVD10P	32 Mbps	1/2	–0°C to 70°C	VN10
SN75HVD11D	SN75HVD11P	10 Mbps	1/8		VN11
SN75HVD12D	SN75HVD12P	1 Mbps	1/8		VN12
SN65HVD10QD	SN65HVD10QP	32 Mbps	1/2	–40°C to 125°C	VP10Q
SN65HVD11QD	SN65HVD11QP	10 Mbps	1/8		VP11Q

(1) The D package is available as a tape and reel. Add an R suffix to the part number (that is, SN75HVD11DR) for this option.

6 Pin Configuration and Functions

D, JD, or HKJ Package
8-Pin SOIC or PDIP
Top View



Pin Functions

PIN		TYPE	DESCRIPTION
NAME	NO.		
A	6	Bus input/output	Driver output or receiver input (complementary to B)
B	7	Bus input/output	Driver output or receiver input (complementary to A)
D	4	Digital input	Driver data input
DE	3	Digital input	Active-high driver enable
GND	5	Reference potential	Local device ground
R	1	Digital output	Receive data output
$\overline{RE}$	2	Digital input	Active-low receiver enable
V_{CC}	8	Supply	3-V to 3.6-V supply

7 Specifications

7.1 Absolute Maximum Ratings

over operating free-air temperature range unless otherwise noted (1) (2)

		MIN	MAX	UNIT
V_{CC}	Supply voltage	–0.3	6	V
	Voltage at A or B	–9	14	V
	Input voltage at D, DE, R, or $\overline{RE}$	–0.5	V_{CC} + 0.5	V
	Voltage input, transient pulse, A and B, through 100 Ω, see Figure 22	–50	50	V
I_O	Receiver output current	–11	11	mA
	Continuous total power dissipation	See *Dissipation Ratings*		
T_J	Junction temperature		170	°C
T_{stg}	Storage temperature	–55	145	°C

(1) Stresses beyond those listed under *Absolute Maximum Ratings* may cause permanent damage to the device. These are stress ratings only, and functional operation of the device at these or any other conditions beyond those indicated under *Recommended Operating Conditions* is not implied. Exposure to absolute-maximum-rated conditions for extended periods may affect device reliability.
(2) All voltage values, except differential I/O bus voltages, are with respect to network ground terminal.

7.2 ESD Ratings

				VALUE	UNIT
$V_{(ESD)}$	Electrostatic discharge	Human body model (HBM), per ANSI/ESDA/JEDEC JS-001 (1)	Pins 5, 6, and 7	±16000	V
			All pins	±4000	
		Charged device model (CDM), per JEDEC specification JESD22-C101 (2)	All pins	±1000	
		Electrical fast transient/burst (3)	Pins 5, 6, and 7	±4000	

(1) JEDEC document JEP155 states that 500-V HBM allows safe manufacturing with a standard ESD control process.
(2) JEDEC document JEP157 states that 250-V CDM allows safe manufacturing with a standard ESD control process.
(3) Tested in accordance with IEC 61000-4-4.

7.3 Recommended Operating Conditions

over operating free-air temperature range unless otherwise noted

			MIN	NOM	MAX	UNIT
V_{CC}	Supply voltage		3		3.6	V
V_I or V_{IC}	Voltage at any bus terminal (separately or common mode)		–7 (1)		12	
V_{IH}	High-level input voltage	D, DE, $\overline{RE}$	2		V_{CC}	
V_{IL}	Low-level input voltage	D, DE, $\overline{RE}$	0		0.8	
V_{ID}	Differential input voltage	See Figure 18	–12		12	
I_{OH}	High-level output current	Driver	–60			mA
		Receiver	–8			
I_{OL}	Low-level output current	Driver			60	mA
		Receiver			8	
R_L	Differential load resistance		54	60		Ω
C_L	Differential load capacitance			50		pF
	Signaling rate	HVD10			32	Mbps
		HVD11			10	
		HVD12			1	
T_J (2)	Junction temperature				145	°C

(1) The algebraic convention, in which the least positive (most negative) limit is designated as minimum is used in this data sheet.
(2) See thermal characteristics table for information regarding this specification.

Copyright © 2002–2017, Texas Instruments Incorporated

7.4 Thermal Information

THERMAL METRIC			SNx5HVD1xx		UNIT
			D (SOIC)	P (PDIP)	
			8 Pins	8 Pins	
$R_{\theta JA}$	Junction-to-ambient thermal resistance (1)	High−K board (2), No airflow	121		°C/W
		No airflow (3)		93	
$R_{\theta JB}$	Junction-to-board thermal resistance	High−K board	67		°C/W
		See (3)		57	
$R_{\theta JC}$	Junction-to-case thermal resistance		41	55	°C/W

(1) The intent of $R_{\theta JA}$ specification is solely for a thermal performance comparison of one package to another in a standardized environment. This methodology is not meant to and will not predict the performance of a package in an application-specific environment.
(2) JSD51−7, High Effective Thermal Conductivity Test Board for Leaded Surface Mount Packages.
(3) JESD51−10, Test Boards for Through-Hole Perimeter Leaded Package Thermal Measurements.

7.5 Driver Electrical Characteristics

over recommended operating conditions unless otherwise noted

PARAMETER			TEST CONDITIONS		MIN	TYP (1)	MAX	UNIT
V_{IK}	Input clamp voltage		I_I = –18 mA		–1.5			V
$\|V_{OD}\|$	Differential output voltage (2)		I_O = 0		2		V_{CC}	V
			R_L = 54 Ω, See Figure 11		1.5			
			V_{test} = –7 V to 12 V, See Figure 12		1.5			
$\Delta\|V_{OD}\|$	Change in magnitude of differential output voltage		See Figure 11 and Figure 12		–0.2		0.2	V
$V_{OC(PP)}$	Peak-to-peak common-mode output voltage		See Figure 13			400		mV
$V_{OC(SS)}$	Steady-state common-mode output voltage				1.4		2.5	V
$\Delta V_{OC(SS)}$	Change in steady-state common-mode output voltage				–0.05		0.05	V
I_{OZ}	High-impedance output current		See receiver input currents					
I_I	Input current	D			–100		0	μA
		DE			0		100	
I_{OS}	Short-circuit output current		–7 V ≤ V_O ≤ 12 V		–250		250	mA
$C_{(OD)}$	Differential output capacitance		V_{OD} = 0.4 sin(4E6πt) + 0.5 V, DE at 0 V			16		pF
I_{CC}	Supply current		$\overline{RE}$ at V_{CC}, D and DE at V_{CC}, No load	Receiver disabled and driver enabled		9	15.5	mA
			$\overline{RE}$ at V_{CC}, D at V_{CC}, DE at 0 V, No load	Receiver disabled and driver disabled (standby)		1	5	μA
			$\overline{RE}$ at 0 V, D and DE at V_{CC}, No load	Receiver enabled and driver enabled		9	15.5	mA

(1) All typical values are at 25°C and with a 3.3-V supply.
(2) For T_A > 85°C, V_{CC} is ±5%.

7.6 Receiver Electrical Characteristics

over recommended operating conditions unless otherwise noted

PARAMETER		TEST CONDITIONS		MIN	TYP(1)	MAX	UNIT
V_{IT+}	Positive-going input threshold voltage	I_O = –8 mA			–0.065	–0.01	V
V_{IT-}	Negative-going input threshold voltage	I_O = 8 mA		–0.2	–0.1		V
V_{hys}	Hysteresis voltage ($V_{IT+} – V_{IT-}$)				35		mV
V_{IK}	Enable-input clamp voltage	I_I = –18 mA		–1.5			V
V_{OH}	High-level output voltage	V_{ID} = 200 mV, I_{OH} = –8 mA, see Figure 18		2.4			V
V_{OL}	Low-level output voltage	V_{ID} = –200 mV, I_{OL} = 8 mA, see Figure 18				0.4	V
I_{OZ}	High-impedance-state output current	V_O = 0 or V_{CC}, $\overline{RE}$ at V_{CC}		–1		1	µA
I_I	Bus input current	V_A or V_B = 12 V	HVD11, HVD12, Other inputs at 0 V		0.05	0.11	mA
		V_A or V_B = 12 V, V_{CC} = 0 V			0.06	0.13	
		V_A or V_B = –7 V		–0.1	–0.05		
		V_A or V_B = –7 V, V_{CC} = 0 V		–0.05	–0.04		
		V_A or V_B = 12 V	HVD10, Other inputs at 0 V		0.2	0.5	mA
		V_A or V_B = 12 V, V_{CC} = 0 V			0.25	0.5	
		V_A or V_B = –7 V		–0.4	–0.2		
		V_A or V_B = –7 V, V_{CC} = 0 V		–0.4	–0.15		
I_{IH}	High-level input current, $\overline{RE}$	V_{IH} = 2 V		–30		0	µA
I_{IL}	Low-level input current, $\overline{RE}$	V_{IL} = 0.8 V		–30		0	µA
C_{ID}	Differential input capacitance	V_{ID} = 0.4 sin(4E6πt) + 0.5 V, DE at 0 V			15		pF
I_{CC}	Supply current	$\overline{RE}$ at 0 V, D and DE at 0 V, No load	Receiver enabled and driver disabled		4	8	mA
		$\overline{RE}$ at V_{CC}, D at V_{CC}, DE at 0 V, No load	Receiver disabled and driver disabled (standby)		1	5	µA
		$\overline{RE}$ at 0 V, D and DE at V_{CC}, No load	Receiver enabled and driver enabled		9	15.5	mA

(1) All typical values are at 25°C and with a 3.3-V supply.

7.7 Power Dissipation Characteristics

PARAMETER		TEST CONDITIONS		MIN	TYP	MAX	UNIT
P_D	Device power dissipation	R_L= 60 Ω, C_L = 50 pF, DE at V_{CC}, $\overline{RE}$ at 0 V, Input to D is a 50% duty-cycle square wave at indicated signaling rate	HVD10 (32Mbps)		198	250	mW
			HVD11 (10Mbps)		141	176	
			HVD12 (500 kbps)		133	161	
T_A	Ambient air temperature(1)	High-K board, no airflow	D pkg	–40		116	°C
		No airflow(2)	P pkg	–40		123	
T_{JSD}	Thermal shutdown junction temperature(1)				165		°C

(1) See *Thermal Characteristics of IC Packages* section for an explanation of these parameters.
(2) JESD51−10, Test Boards for Through-Hole Perimeter Leaded Package Thermal Measurements.

7.8 Driver Switching Characteristics

over recommended operating conditions unless otherwise noted

PARAMETER			TEST CONDITIONS	MIN	TYP(1)	MAX	UNIT
t_{PLH}	Propagation delay time, low-to-high-level output	HVD10	R_L = 54 Ω, C_L = 50 pF See Figure 14	5	8.5	16	ns
		HVD11		18	25	40	
		HVD12		135	200	300	
t_{PHL}	Propagation delay time, high-to-low-level output	HVD10		5	8.5	16	ns
		HVD11		18	25	40	
		HVD12		135	200	300	
t_r	Differential output signal rise time	HVD10		3	4.5	10	ns
		HVD11		10	20	30	
		HVD12		100	170	300	
t_f	Differential output signal fall time	HVD10		3	4.5	10	ns
		HVD11		10	20	30	
		HVD12		100	170	300	
$t_{sk(p)}$	Pulse skew ($\lvert t_{PHL} - t_{PLH} \rvert$)	HVD10				1.5	ns
		HVD11				2.5	
		HVD12				7	
$t_{sk(pp)}$ (2)	Part-to-part skew	HVD10				6	ns
		HVD11				11	
		HVD12				100	
t_{PZH}	Propagation delay time, high-impedance-to-high-level output	HVD10	R_L = 110 Ω, $\overline{RE}$ at 0 V See Figure 15			31	ns
		HVD11				55	
		HVD12				300	
t_{PHZ}	Propagation delay time, high-level-to-high-impedance output	HVD10				25	ns
		HVD11				55	
		HVD12				300	
t_{PZL}	Propagation delay time, high-impedance-to-low-level output	HVD10	R_L = 110 Ω, $\overline{RE}$ at 0 V See Figure 16			26	ns
		HVD11				55	
		HVD12				300	
t_{PLZ}	Propagation delay time, low-level-to-high-impedance output	HVD10				26	ns
		HVD11				75	
		HVD12				400	
t_{PZH}	Propagation delay time, standby-to-high-level output		R_L = 110 Ω, $\overline{RE}$ at 3 V See Figure 15			6	µs
t_{PZL}	Propagation delay time, standby-to-low-level output		R_L = 110 Ω, $\overline{RE}$ at 3 V See Figure 16			6	µs

(1) All typical values are at 25°C and with a 3.3-V supply.
(2) $t_{sk(pp)}$ is the magnitude of the difference in propagation delay times between any specified terminals of two devices when both devices operate with the same supply voltages, at the same temperature, and have identical packages and test circuits.

7.9 Receiver Switching Characteristics

over recommended operating conditions unless otherwise noted

PARAMETER			TEST CONDITIONS	MIN	TYP(1)	MAX	UNIT
t_{PLH}	Propagation delay time, low-to-high-level output	HVD10	V_{ID} = –1.5 V to 1.5 V C_L = 15 pF See Figure 19	12.5	20	25	ns
t_{PHL}	Propagation delay time, high-to-low-level output	HVD10		12.5	20	25	
t_{PLH}	Propagation delay time, low-to-high-level output	HVD11 HVD12		30	55	70	ns
t_{PHL}	Propagation delay time, high-to-low-level output	HVD11 HVD12		30	55	70	ns
$t_{sk(p)}$	Pulse skew ($\lvert t_{PHL} - t_{PLH} \rvert$)	HVD10				1.5	ns
		HVD11				4	
		HVD12				4	
$t_{sk(pp)}$ (2)	Part-to-part skew	HVD10				8	ns
		HVD11				15	
		HVD12				15	
t_r	Output signal rise time		C_L = 15 pF See Figure 19	1	2	5	ns
t_f	Output signal fall time			1	2	5	
t_{PZH} (1)	Output enable time to high level		C_L = 15 pF, DE at 3 V See Figure 20			15	ns
t_{PZL} (1)	Output enable time to low level					15	
t_{PHZ}	Output disable time from high level					20	
t_{PLZ}	Output disable time from low level					15	
t_{PZH} (2)	Propagation delay time, standby-to-high-level output		C_L = 15 pF, DE at 0 See Figure 21			6	µs
t_{PZL} (2)	Propagation delay time, standby-to-low-level output					6	

(1) All typical values are at 25°C and with a 3.3-V supply
(2) $t_{sk(pp)}$ is the magnitude of the difference in propagation delay times between any specified terminals of two devices when both devices operate with the same supply voltages, at the same temperature, and have identical packages and test circuits.

7.10 Dissipation Ratings

PACKAGE	$T_A \le 25°C$ POWER RATING	DERATING FACTOR(1) ABOVE T_A = 25°C	T_A = 70°C POWER RATING	T_A = 85°C POWER RATING	T_A = 125°C POWER RATING
D(2)	597 mW	4.97 mW/°C	373 mW	298 mW	100 mW
D(3)	990 mW	8.26 mW/°C	620 mW	496 mW	165 mW
P	1290 mW	10.75 mW/°C	806 mW	645 mW	215 mW

(1) This is the inverse of the junction-to-ambient thermal resistance when board-mounted and with no air flow.
(2) Tested in accordance with the Low-K thermal metric definitions of EIA/JESD51-3.
(3) Tested in accordance with the High-K thermal metric definitions of EIA/JESD51-7.

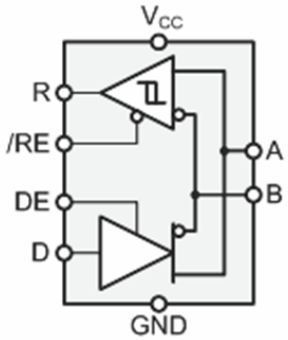
9 Detailed Description

9.1 Overview

The SN65HVD10, SN65HVD11, and SN65HVD12 are 3.3 V, half-duplex, RS-485 transceivers available in 3 speed grades suitable for data transmission up to 32 Mbps, 10 Mbps, and 1 Mbps, respectively.

These devices have active-high driver enables and active-low receiver enables. A standby current of less than 5 µA can be achieved by disabling both driver and receiver.

9.2 Functional Block Diagram



Copyright © 2016, Texas Instruments Incorporated

9.3 Feature Description

Internal ESD protection circuits protect the transceiver bus terminals against ±16-kV Human Body Model (HBM) electrostatic discharges and ±4-kV electrical fast transients (EFT) according to IEC61000-4-4.

The SN65HVD1x half-duplex family provides internal biasing of the receiver input thresholds for open-circuit, bus-idle, or short-circuit failsafe conditions, and a typical receiver hysteresis of 35 mV.

9.4 Device Functional Modes

When the driver enable pin, DE, is logic high, the differential outputs A and B follow the logic states at data input D. A logic high at D causes A to turn high and B to turn low. In this case the differential output voltage defined as $V_{OD} = V_A - V_B$ is positive. When D is low, the output states reverse, B turns high, A becomes low, and V_{OD} is negative.

When DE is low, both outputs turn high-impedance. In this condition the logic state at D is irrelevant. The DE pin has an internal pulldown resistor to ground; thus, when left open, the driver is disabled (high-impedance) by default. The D pin has an internal pullup resistor to V_{CC}; thus, when left open while the driver is enabled, output A turns high and B turns low.

Table 1. Driver Functions(1)

INPUT	ENABLE	OUTPUTS		FUNCTION
D	DE	A	B	
H	H	H	L	Actively drive bus High
L	H	L	H	Actively drive bus Low
X	L	Z	Z	Driver disabled
X	OPEN	Z	Z	Driver disabled by default
OPEN	H	H	L	Actively drive bus High by default

(1) H = high level; L = low level; Z = high impedance; X = irrelevant; ? = indeterminate

When the receiver enable pin, $\overline{RE}$, is logic low, the receiver is enabled. When the differential input voltage defined as $V_{ID} = V_A - V_B$ is positive and higher than the positive input threshold, V_{IT+}, the receiver output, R, turns high. When V_{ID} is negative and lower than the negative input threshold, V_{IT-}, the receiver output, R, turns low. If V_{ID} is between V_{IT+} and V_{IT-}, the output is indeterminate.

When $\overline{RE}$ is logic high or left open, the receiver output is high-impedance and the magnitude and polarity of V_{ID} are irrelevant. Internal biasing of the receiver inputs causes the output to go failsafe-high when the transceiver is disconnected from the bus (open-circuit), the bus lines are shorted (short-circuit), or the bus is not actively driven (idle bus).

Table 2. Receiver Functions(1)

DIFFERENTIAL INPUT $V_{ID} = V_A - V_B$	ENABLE $\overline{RE}$	OUTPUT R	FUNCTION
$V_{ID} > V_{IT+}$	L	H	Receive valid bus High
$V_{IT-} < V_{ID} < V_{IT+}$	L	?	Indeterminate bus state
$V_{ID} < V_{IT-}$	L	L	Receive valid bus Low
X	H	Z	Receiver disabled
X	OPEN	Z	Receiver disabled by default
Open-circuit bus	L	H	Fail-safe high output
Short-circuit bus	L	H	Fail-safe high output

(1) H = high level; L = low level; Z = high impedance; X = irrelevant; ? = indeterminate

9.4.1 Low-Power Standby Mode

When both the driver and receiver are disabled (DE low and $\overline{RE}$ high) the device is in standby mode. If the enable inputs are in this state for less than 60 ns, the device does not enter standby mode. This guards against inadvertently entering standby mode during driver or receiver enabling. Only when the enable inputs are held in this state for 300 ns or more, the device is assured to be in standby mode. In this low-power standby mode, most internal circuitry is powered down, and the supply current is typically less than 1 µA. When either the driver or the receiver is re-enabled, the internal circuitry becomes active.

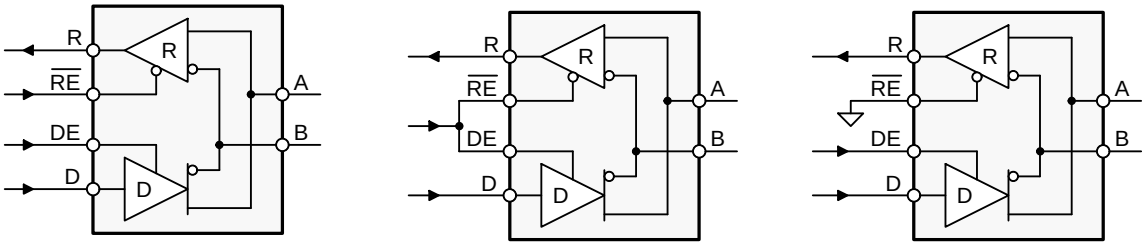
10 Application and Implementation

NOTE

Information in the following applications sections is not part of the TI component specification, and TI does not warrant its accuracy or completeness. TI's customers are responsible for determining suitability of components for their purposes. Customers should validate and test their design implementation to confirm system functionality.

10.1 Application Information

The SN65HVD10, 'HVD11, and 'HVD12 are half-duplex RS-485 transceivers commonly used for asynchronous data transmissions. The driver and receiver enable pins allow for the configuration of different operating modes.



a) Independent driver and receiver enable signals

b) Combined enable signals for use as directional control pin

c) Receiver always on

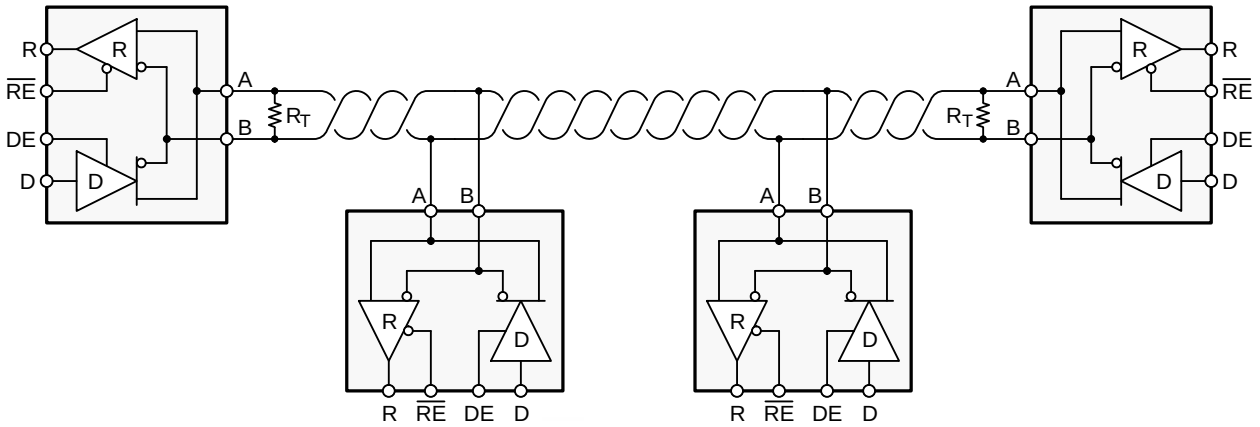
Copyright © 2016, Texas Instruments Incorporated

Figure 24. Half-Duplex Transceiver Configurations

a. Using independent enable lines provides the most flexible control as it allows for the driver and the receiver to be turned on and off individually. While this configuration requires two control lines, it allows for selective listening into the bus traffic, whether the driver is transmitting data or not.
b. Combining the enable signals simplifies the interface to the controller by forming a single direction-control signal. In this configuration, the transceiver operates as a driver when the direction-control line is high, and as a receiver when the direction-control line is low.
c. Only one line is required when connecting the receiver-enable input to ground and controlling only the driver-enable input. In this configuration, a node not only receives the data from the bus, but also the data it sends and can verify that the correct data have been transmitted.

10.2 Typical Application

An RS-485 bus consists of multiple transceivers connected in parallel to a bus cable. To eliminate line reflections, each cable end is terminated with a termination resistor, R_T, whose value matches the characteristic impedance, Z_0, of the cable. This method, known as parallel termination, allows for higher data rates over a longer cable length.



Copyright © 2016, Texas Instruments Incorporated

Figure 25. Typical RS-485 Network With Half-Duplex Transceivers

10.2.1 Design Requirements

RS-485 is a robust electrical standard suitable for long-distance networking that may be used in a wide range of applications with varying requirements, such as distance, data rate, and number of nodes.

10.2.1.1 Data Rate and Bus Length

There is an inverse relationship between data rate and bus length, meaning the higher the data rate, the shorter the cable length; and conversely, the lower the data rate, the longer the cable may be without introducing data errors. While most RS-485 systems use data rates between 10 kbps and 100 kbps, some applications require data rates up to 250 kbps at distances of 4000 feet and longer. Longer distances are possible by allowing for small signal jitter of up to 5 or 10%.

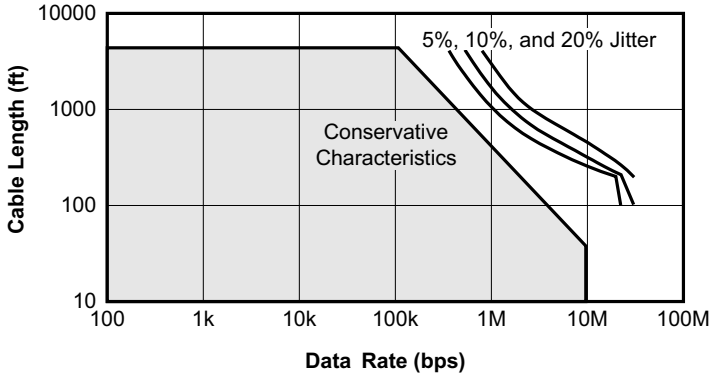


Figure 26. Cable Length vs Data Rate Characteristic

Copyright © 2002–2017, Texas Instruments Incorporated

Typical Application (continued)

10.2.1.2 Stub Length

When connecting a node to the bus, the distance between the transceiver inputs and the cable trunk, known as the stub, should be as short as possible. Stubs present a nonterminated piece of bus line which can introduce reflections as the length of the stub increases. As a general guideline, the electrical length, or round-trip delay, of a stub should be less than one-tenth of the rise time of the driver, thus giving a maximum physical stub length as shown in Equation 1.

$$L_{(STUB)} \leq 0.1 \times t_r \times v \times c \quad (1)$$

where

- t_r is the 10/90 rise time of the driver
- v is the signal velocity of the cable or trace as a factor of c
- c is the speed of light (3×10^8 m/s)

Per Equation 1, Table 3 lists the maximum cable-stub lengths for the minimum-driver output rise-times of the SN65HVD1x full-duplex family of transceivers for a signal velocity of 78%.

Table 3. Maximum Stub Length

DEVICE	MINIMUM DRIVER OUTPUT RISE TIME (ns)	MAXIMUM STUB LENGTH	
		(m)	(ft)
SN65HVD10	3	0.07	0.23
SN65HVD11	10	0.23	0.75
SN65HVD12	100	2.34	7.67

10.2.1.3 Bus Loading

The RS-485 standard specifies that a compliant driver must be able to driver 32 unit loads (UL), where 1 unit load represents a load impedance of approximately 12 kΩ. Because the SN65HVD11 and HVD12 are each 1/8 UL transceivers, it is possible to connect up to 256 receivers to the bus. The SN65HVD10 is a 1/4 UL transceiver, and up to 64 receivers may be connected to the bus.

10.2.1.4 Receiver Failsafe

The differential receivers of the SN65HVD1x family are failsafe to invalid bus states caused by:

- Open bus conditions, such as a disconnected connector
- Shorted bus conditions, such as cable damage shorting the twisted-pair together
- Idle bus conditions that occur when no driver on the bus is actively driving.

In any of these cases, the differential receiver will output a failsafe logic High state so that the output of the receiver is not indeterminate.

Receiver failsafe is accomplished by offsetting the receiver thresholds such that the input indeterminate range does not include zero volts differential. To comply with the RS-422 and RS-485 standards, the receiver output must output a High when the differential input V_{ID} is more positive than +200 mV, and must output a Low when V_{ID} is more negative than –200 mV. The receiver parameters which determine the failsafe performance are $V_{IT(+)}$ and $V_{IT(–)}$. As shown in *Receiver Electrical Characteristics*, differential signals more negative than –200 mV will always cause a Low receiver output, and differential signals more positive than +200 mV will always cause a High receiver output.

When the differential input signal is close to zero, it is still above the maximum $V_{IT(+)}$ threshold of –10 mV, and the receiver output will be High.

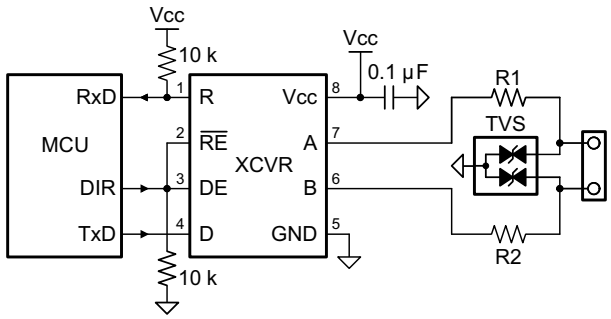
10.2.2 Detailed Design Procedure

To protect bus nodes against high-energy transients, the implementation of external transient protection devices is therefore necessary. Figure 27 shows a protection circuit against 10-kV ESD (IEC 61000-4-2), 4-kV EFT (IEC 61000-4-4), and 1-kV surge (IEC 61000-4-5) transients.



Copyright © 2017, Texas Instruments Incorporated

Figure 27. Transient Protection Against ESD, EFT, and Surge Transients

Table 4. Bill of Materials

DEVICE	FUNCTION	ORDER NUMBER	MANUFACTURER
XCVR	3.3-V, full-duplex RS-485 transceiver	SN65HVD1xD	TI
R1, R2	10-Ω, pulse-proof, thick-film resistor	CRCW0603010RJNEAHP	Vishay
TVS	Bidirectional 400-W transient suppressor	CDSOT23-SM712	Bourns

10.2.3 Application Curve

Figure 28 demonstrates operation of the SN65HVD12 at a signaling rate of 250 kbps. Two SN65HVD12 transceivers are used to transmit data through a 2,000 foot (600 m) segment of Commscope 5524 category 5e+ twisted pair cable. The bus is terminated at each end by a 100-Ω resistor, matching the cable characteristic impedance.

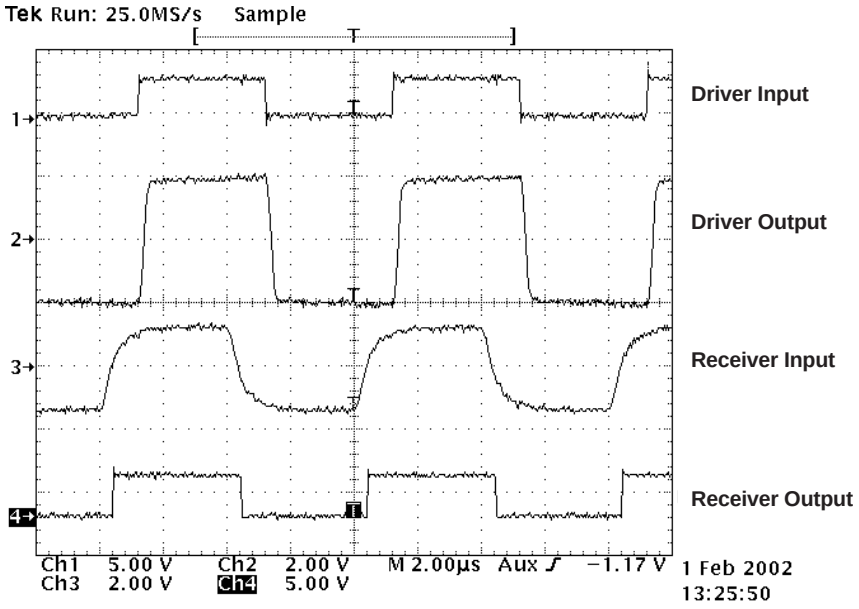


Figure 28. SN65HVD12 Input and Output Through 2000 Feet of Cable

11 Power Supply Recommendations

To assure reliable operation at all data rates and supply voltages, each supply must be buffered with a 100-nF ceramic capacitor located as close to the supply pins as possible. The TPS76333 linear voltage regulator is suitable for the 3.3-V supply.

12 Layout

12.1 Layout Guidelines

On-chip IEC-ESD protection is sufficient for laboratory and portable equipment but never sufficient for EFT and surge transients occurring in industrial environments. Therefore, robust and reliable bus node design requires the use of external transient protection devices.

Because ESD and EFT transients have a wide frequency bandwidth from approximately 3 MHz to 3 GHz, high-frequency layout techniques must be applied during PCB design.

1. Place the protection circuitry close to the bus connector to prevent noise transients from entering the board.
2. Use V_{CC} and ground planes to provide low-inductance. Note that high-frequency currents follow the path of least inductance and not the path of least impedance.
3. Design the protection components into the direction of the signal path. Do not force the transient currents to divert from the signal path to reach the protection device.
4. Apply 100-nF to 220-nF bypass capacitors as close as possible to the V_{CC} pins of transceiver, UART, and controller ICs on the board.
5. Use at least two vias for V_{CC} and ground connections of bypass capacitors and protection devices to minimize effective via-inductance.
6. Use 1-kΩ to 10-kΩ pull-up or pull-down resistors for enable lines to limit noise currents in these lines during transient events.
7. Insert pulse-proof series resistors into the A and B bus lines if the TVS clamping voltage is higher than the specified maximum voltage of the transceiver bus terminals. These resistors limit the residual clamping current into the transceiver and prevent it from latching up.
8. While pure TVS protection is sufficient for surge transients up to 1 kV, higher transients require metal-oxide varistors (MOVs) which reduce the transients to a few hundred volts of clamping voltage, and transient blocking units (TBUs) that limit transient current to less than 1 mA.

12.2 Layout Example

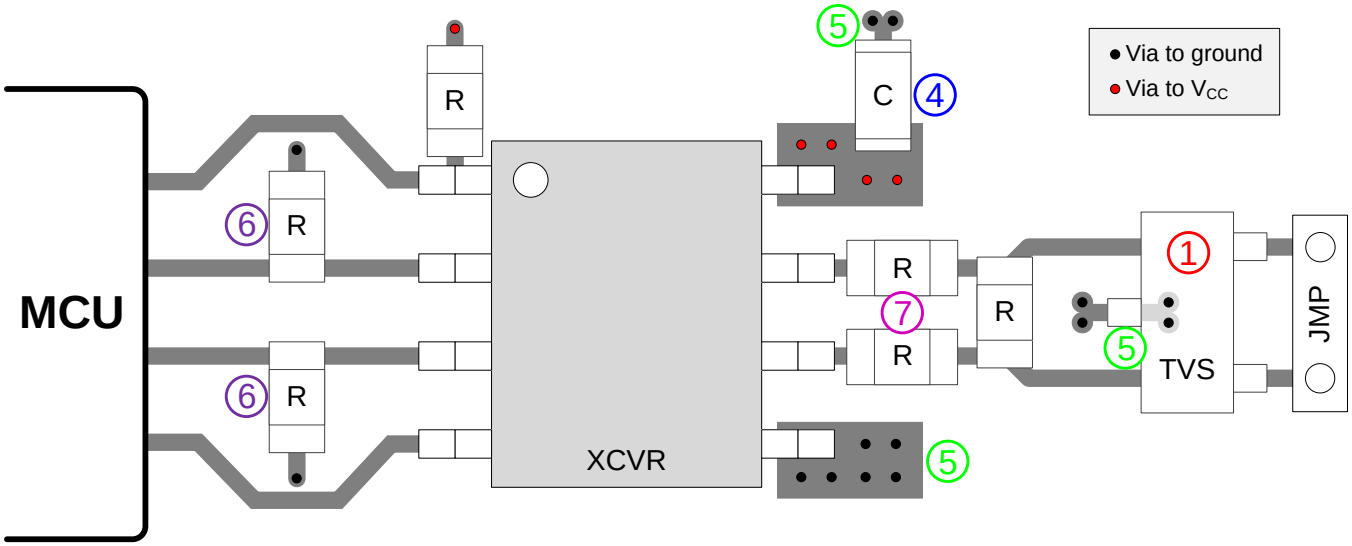

Figure 29. SN65HVD1x Layout Example

12.3 Thermal Considerations

12.3.1 Thermal Characteristics of IC Packages

$R_{\theta JA}$ (Junction-to-Ambient Thermal Resistance) is defined as the difference in junction temperature to ambient temperature divided by the operating power.

$R_{\theta JA}$ is not a constant and is a strong function of:

- the PCB design (50% variation)
- altitude (20% variation)
- device power (5% variation)

$R_{\theta JA}$ can be used to compare the thermal performance of packages if the specific test conditions are defined and used. Standardized testing includes specification of PCB construction, test chamber volume, sensor locations, and the thermal characteristics of holding fixtures. $R_{\theta JA}$ is often misused when it is used to calculate junction temperatures for other installations.

TI uses two test PCBs as defined by JEDEC specifications. The low-k board gives average in-use condition thermal performance, and it consists of a single copper trace layer 25 mm long and 2-oz thick. The high-k board gives best case in-use condition, and it consists of two 1-oz buried power planes with a single copper trace layer 25 mm long and 2-oz thick. A 4% to 50% difference in $R_{\theta JA}$ can be measured between these two test cards.

$R_{\theta JC}$ (Junction-to-Case Thermal Resistance) is defined as difference in junction temperature to case divided by the operating power. It is measured by putting the mounted package up against a copper block cold plate to force heat to flow from die, through the mold compound into the copper block.

$R_{\theta JC}$ is a useful thermal characteristic when a heatsink is applied to package. It is not a useful characteristic to predict junction temperature because it provides pessimistic numbers if the case temperature is measured in a nonstandard system and junction temperatures are backed out. It can be used with $R_{\theta JB}$ in 1-dimensional thermal simulation of a package system.

$R_{\theta JB}$ (Junction-to-Board Thermal Resistance) is defined as the difference in the junction temperature and the PCB temperature at the center of the package (closest to the die) when the PCB is clamped in a cold-plate structure. $R_{\theta JB}$ is only defined for the high-k test card.

$R_{\theta JB}$ provides an overall thermal resistance between the die and the PCB. It includes a bit of the PCB thermal resistance (especially for BGAs with thermal balls) and can be used for simple 1-dimensional network analysis of package system, see Figure 30.

(1) The marketing status values are defined as follows:
ACTIVE: Product device recommended for new designs.
LIFEBUY: TI has announced that the device will be discontinued, and a lifetime-buy period is in effect.
NRND: Not recommended for new designs. Device is in production to support existing customers, but TI does not recommend using this part in a new design.

PREVIEW: Device has been announced but is not in production. Samples may or may not be available.
OBSOLETE: TI has discontinued the production of the device.

(2) **RoHS:** TI defines "RoHS" to mean semiconductor products that are compliant with the current EU RoHS requirements for all 10 RoHS substances, including the requirement that RoHS substance do not exceed 0.1% by weight in homogeneous materials. Where designed to be soldered at high temperatures, "RoHS" products are suitable for use in specified lead-free processes. TI may reference these types of products as "Pb-Free".
RoHS Exempt: TI defines "RoHS Exempt" to mean products that contain lead but are compliant with EU RoHS pursuant to a specific EU RoHS exemption.
Green: TI defines "Green" to mean the content of Chlorine (Cl) and Bromine (Br) based flame retardants meet JS709B low halogen requirements of <=1000ppm threshold. Antimony trioxide based flame retardants must also meet the <=1000ppm threshold requirement.

(3) MSL, Peak Temp. - The Moisture Sensitivity Level rating according to the JEDEC industry standard classifications, and peak solder temperature.

(4) There may be additional marking, which relates to the logo, the lot trace code information, or the environmental category on the device.

(5) Multiple Device Markings will be inside parentheses. Only one Device Marking contained in parentheses and separated by a "~" will appear on a device. If a line is indented then it is a continuation of the previous line and the two combined represent the entire Device Marking for that device.

(6) Lead/Ball Finish - Orderable Devices may have multiple material finish options. Finish options are separated by a vertical ruled line. Lead/Ball Finish values may wrap to two lines if the finish value exceeds the maximum column width.

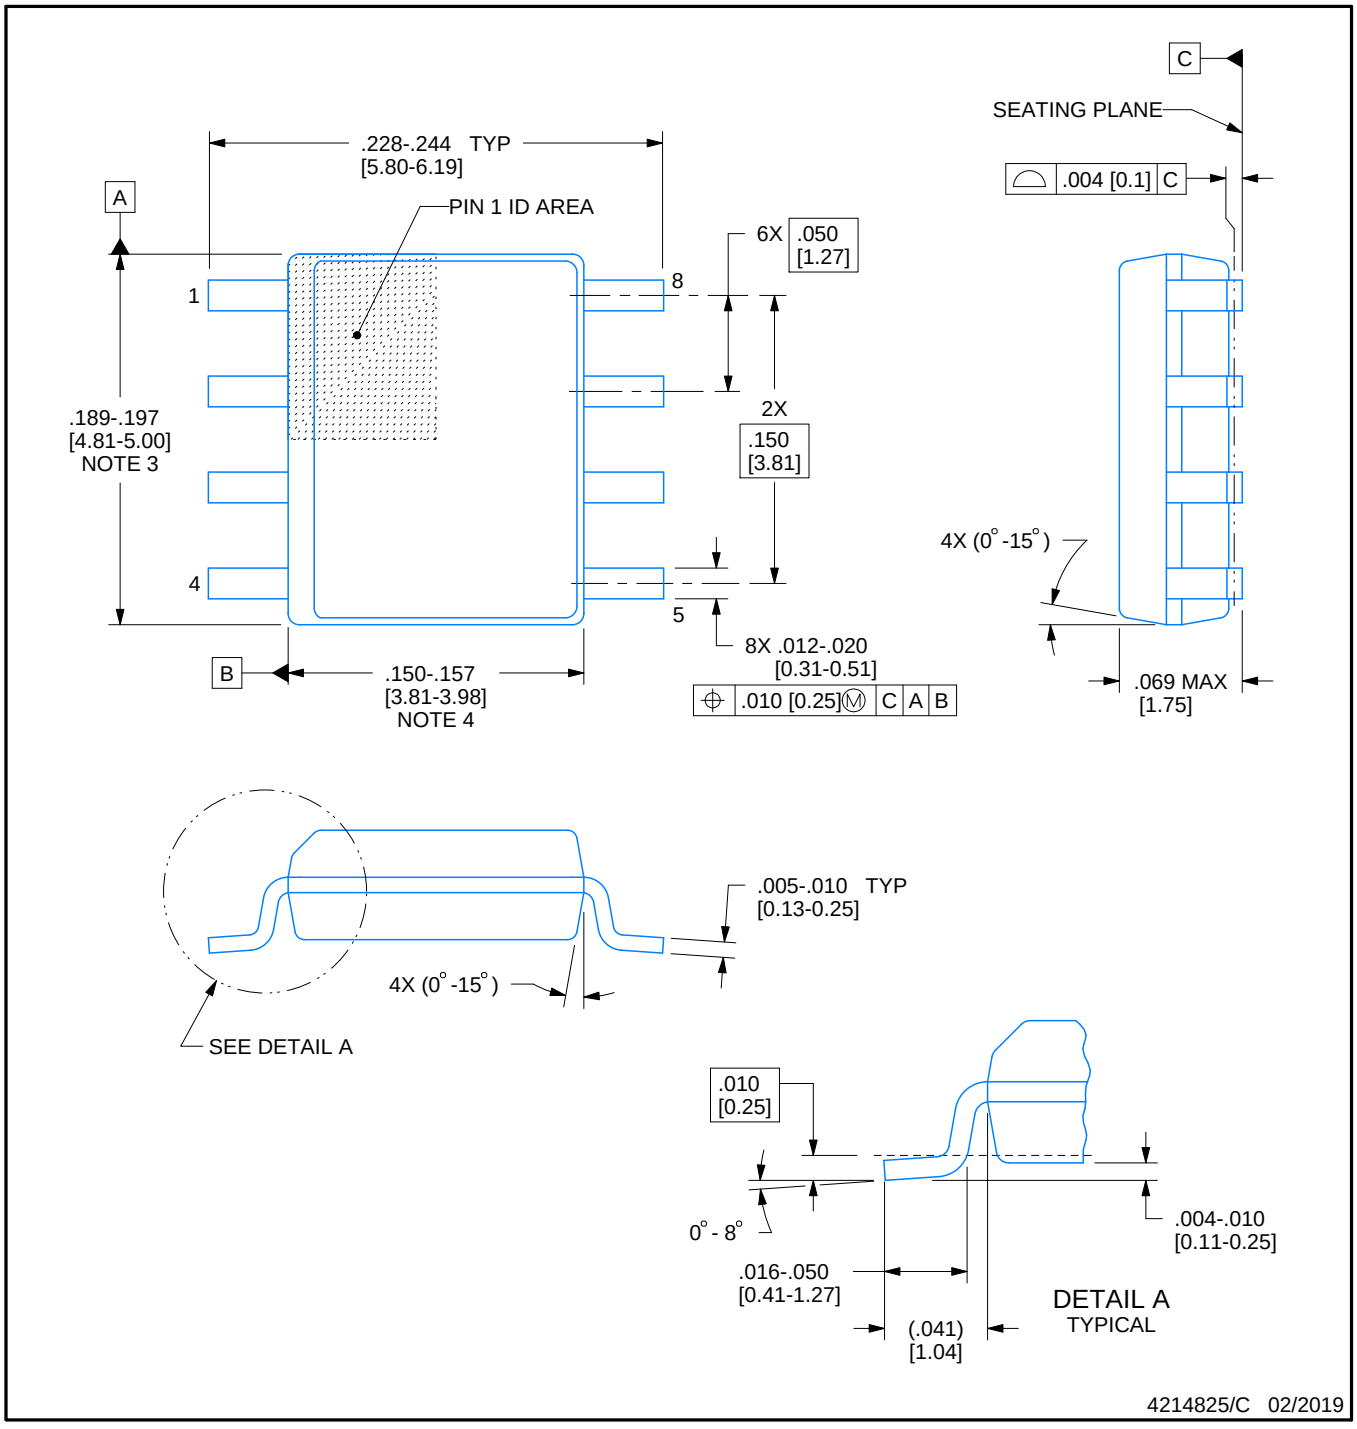
PACKAGE OUTLINE

D0008A

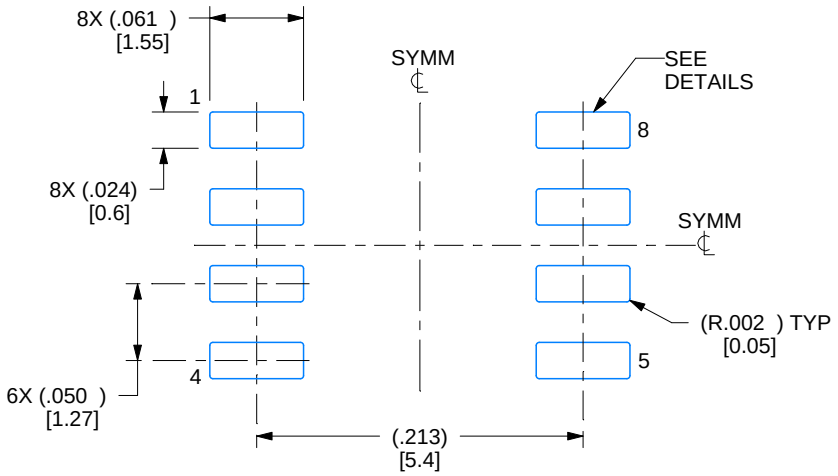
SOIC - 1.75 mm max height

SMALL OUTLINE INTEGRATED CIRCUIT

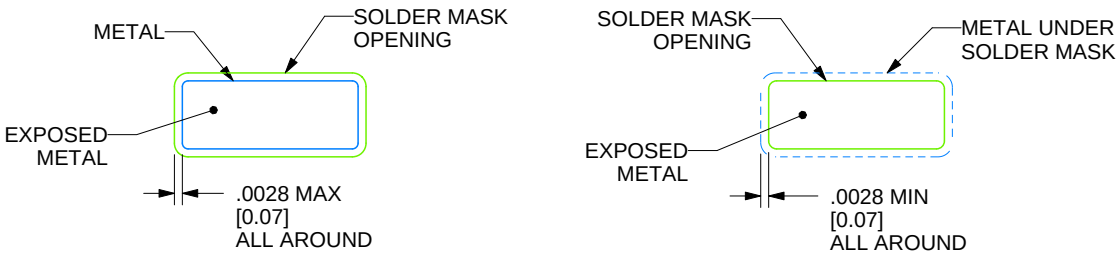


NOTES:

1. Linear dimensions are in inches [millimeters]. Dimensions in parenthesis are for reference only. Controlling dimensions are in inches. Dimensioning and tolerancing per ASME Y14.5M.
2. This drawing is subject to change without notice.
3. This dimension does not include mold flash, protrusions, or gate burrs. Mold flash, protrusions, or gate burrs shall not exceed .006 [0.15] per side.
4. This dimension does not include interlead flash.
5. Reference JEDEC registration MS-012, variation AA.



LAND PATTERN EXAMPLE
EXPOSED METAL SHOWN
SCALE:8X



SOLDER MASK DETAILS

4214825/C 02/2019

NOTES: (continued)

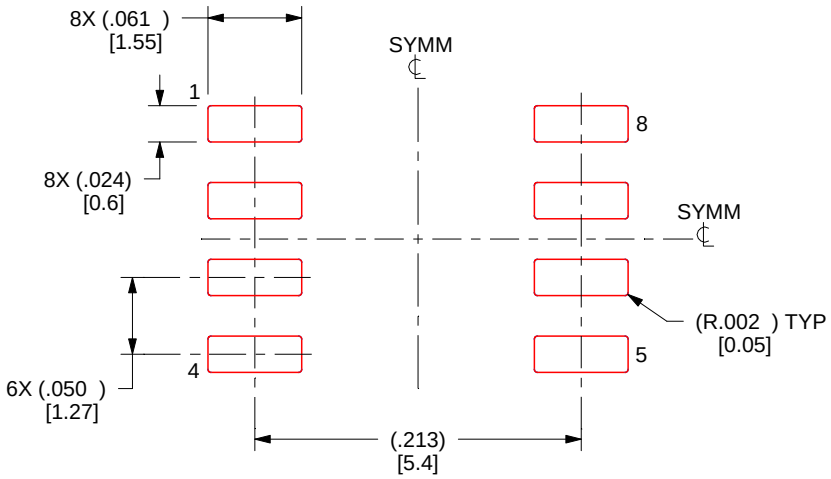
6. Publication IPC-7351 may have alternate designs.
7. Solder mask tolerances between and around signal pads can vary based on board fabrication site.

EXAMPLE STENCIL DESIGN

D0008A

SOIC - 1.75 mm max height

SMALL OUTLINE INTEGRATED CIRCUIT



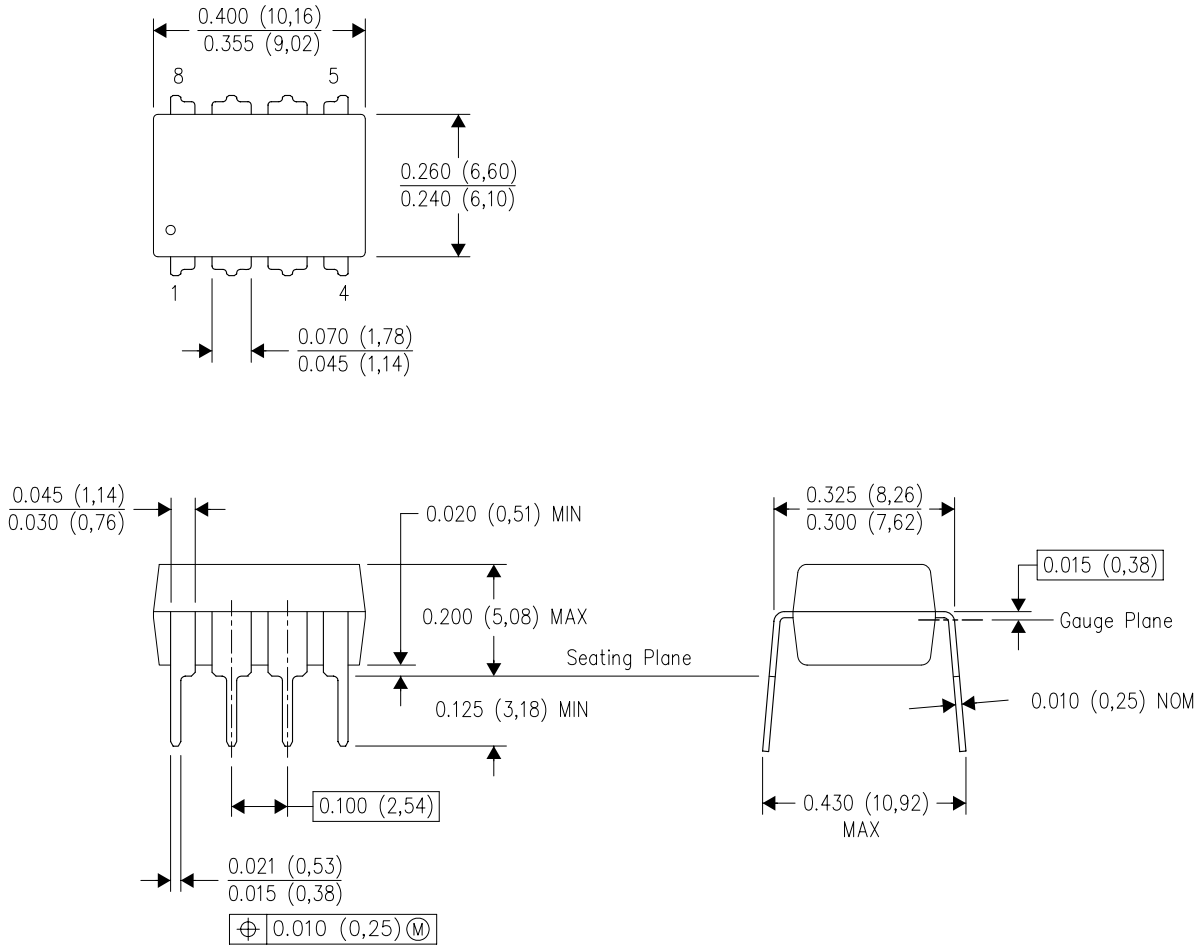
SOLDER PASTE EXAMPLE
BASED ON .005 INCH [0.125 MM] THICK STENCIL
SCALE:8X

4214825/C 02/2019

NOTES: (continued)

8. Laser cutting apertures with trapezoidal walls and rounded corners may offer better paste release. IPC-7525 may have alternate design recommendations.
9. Board assembly site may have different recommendations for stencil design.

P (R–PDIP–T8) PLASTIC DUAL–IN–LINE PACKAGE



NOTES:
A. All linear dimensions are in inches (millimeters).
B. This drawing is subject to change without notice.
C. Falls within JEDEC MS–001 variation BA.
