SLVSAU6H – JUNE 2011 – REVISED APRIL 2016

TPS20xxC and TPS20xxC-2 Current Limited, Power-Distribution Switches

1 Features

- Single Power Switch Family
- Pin-for-Pin With Existing TI Switch Portfolio
- Rated Currents of 0.5 A, 1 A, 1.5 A, 2 A
- ±20% Accurate, Fixed, Constant Current Limit
- Fast Overcurrent Response: 2 µs
- Deglitched Fault Reporting
- Selected Parts With (TPS20xxC) and Without (TPS20xxC-2) Output Discharge
- Reverse Current Blocking
- Built-In Soft Start
- Ambient Temperature Range: –40°C to 85°C
- UL Listed and CB-File No. E169910

2 Applications

- USB Ports and Hubs, Laptops, and Desktops
- High-Definition Digital TVs
- Set-Top Boxes
- Short-Circuit Protection

3 Description

The TPS20xxC and TPS20xxC-2 power-distribution switch family is intended for applications, such as USB, where heavy capacitive loads and short circuits are likely to be encountered. This family offers multiple devices with fixed current-limit thresholds for applications from 0.5 A to 2 A.

The TPS20xxC and TPS20xxC-2 family limits the output current to a safe level by operating in a constant-current mode when the output load exceeds the current limit threshold. This provides a predictable fault current under all conditions. The fast overload response time eases the burden on the main 5-V supply to provide regulated power when the output is shorted. The power-switch rise and fall times are controlled to minimize current surges during turnon and turnoff.

Device Information(1)

PART NUMBER	PACKAGE	BODY SIZE (NOM)
TPS20xxC, TPS20xxC-2	SOT-23 (5)	2.90 mm × 1.60 mm
	VSSOP (8)	3.00 mm × 3.00 mm
	MSOP-PowerPAD (8)	3.00 mm × 3.00 mm

(1) For all available packages, see the orderable addendum at the end of the data sheet.

Typical Application Diagram

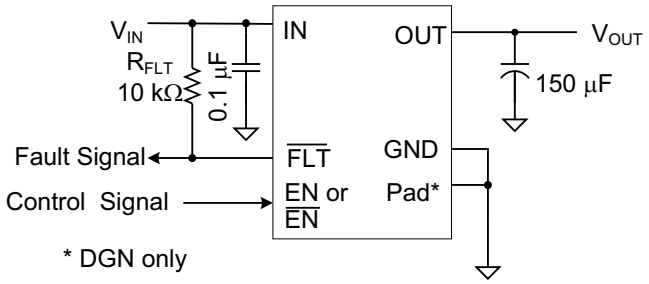

Table of Contents

4 Revision History

NOTE: Page numbers for previous revisions may differ from page numbers in the current version.

Changes from Revision G (July 2013) to Revision H — **Page**

- Added *ESD Ratings* table, *Feature Description* section, *Device Functional Modes*, *Application and Implementation* section, *Power Supply Recommendations* section, *Layout* section, *Device and Documentation Support* section, and *Mechanical, Packaging, and Orderable Information* section ... 1
- Deleted *Devices* table (previously Table 1) ... 4

Changes from Revision F (August 2012) to Revision G — **Page**

- Deleted (See Table 1) from Feature: UL Listed and CB-File No. E169910 ... 1
- Changed From: PXKI To: PYKI in the DEVICE INFORMATION table SOT23-5 (DBV) column (TPS2069C) ... 4
- Deleted Note 2 from : "UL listed and CB complete" ... 4

Changes from Revision E (April 2012) to Revision F — **Page**

- Added device TPS20xxC-2 ... 1
- Changed Feature From: Ouput Discharge When TPS20XXC is Disabled To: Selected parts with (TPS20xxC) and without (TPS20xxC-2) Output Discharge ... 1
- Added devices TPS2041C, TPS2061C, TPS2065C-2, TPS2068C, and TPS2069C-2 to the Device Information table ... 4
- Added the TPS2069C-2 Device ... 4
- Added PXKI in the DEVICE INFORMATION table SOT23-5 (DBV) column (TPS2069C) ... 4
- Added devices TPS2041C, TPS2061C, TPS2065C-2, TPS2068C, and TPS2069C-2 to and removed Product Preview ... 4
- Added Note 1 to the RECOMMENDED OPERATING CONDITIONS table ... 6
- Added TPS2041C, TPS2061C, TPS2068C, TPS2065C-2 and TPS2069C-2 devices to I_{OUT} in the RECOMMENDED OPERATING CONDITIONS table ... 6
- Added the DBV option to Power Switch $R_{DS(on)}$ 1.5 A rated output, 25°C mΩ ... 7
- Added the DBV option to Power Switch $R_{DS(on)}$ 1.5 A rated output ... 7
- Changed I_{SO} Current Limit ... 7

- Added Leakage Current 7
- Added the DBV option to Power Switch $R_{DS(on)}$ 1.5 A rated output 8
- Changed I_{SO} Current Limit 8
- Added Leakage Current 8
- Changed the second para graph of the ENABLE section 15
- Added sentence to end of paragraph in the OUTPUT DISCHARGE section 16

Changes from Revision D (February 2012) to Revision E **Page**

- Changed the POWER DISSIPATION AND JUNCTION TEMPERATURE section. Replaced paragraph " While it is recommended..." 22

Changes from Revision C (October 2011) to Revision D **Page**

- Added Feature UL Listed and CB-File No. E169910 (See) 1
- Added table Note 2, UL listed and CB complete. 4
- Added V_{IH} and V_{IL} information to the ROC Table 6

Changes from Revision B (September 2011) to Revision C **Page**

- Changed From: PXF1 To: PXFI and From: PSG1 To: PXGI in the DEVICE INFORMATION table MOSP-8 (DGK) column 4
- Changed TPS2000C (MSOP-8) status From: Preview To: Active in Table 1 4
- Changed the θJACustom 2 A Rated DGK value from N/A to 110.3 7
- Added Figure 45 - DGK Package PCB Layout Example 23

Changes from Revision A (July 2011) to Revision B **Page**

- Added the DGK Package Information throughout the data sheet 4
- Changed title of Figure 30 From: NEW FIG To: TPS2065C 50 Ω Short Circuit 19

Changes from Original (June 2011) to Revision A **Page**

- Changed the TPS2051C, TPS2065C, and TPS2069C Devices Status From: Preview To: Active 4
- Corrected pinout numbers for the 5-PIN PACKAGE 5

5 Device Comparison Table

MAXIMUM OPERATING CURRENT	OUTPUT DISCHARGE	ENABLE	BASE PART NUMBER	PACKAGED DEVICE AND MARKING(1)		
				MSOP-8 (DGN) PowerPAD™	SOT23-5 (DBV)	VSSOP-8 (DGK)
0.5	Y	Low	TPS2041C	—(2)	PYJI	—
0.5	Y	High	TPS2051C	—	VBYQ	—
1	Y	Low	TPS2061C	PXMI	PXLI	—
1	Y	High	TPS2065C	VCAQ	VCAQ	—
1	N	High	TPS2065C-2	PYRI	PYQI	—
1.5	Y	Low	TPS2068C	PXNI	—	—
1.5	Y	High	TPS2069C	VBUQ	PYKI	—
1.5	N	High	TPS2069C-2	PYSI	—	—
2	Y	Low	TPS2000C	BCMS	—	PXFI
2	Y	High	TPS2001C	VBWQ	–	PXGI

(1) For the most current packaging and ordering information, see the Package Option Addendum at the end of this document, or see the TI website at www.ti.com.
(2) "–" indicates the device is not available in this package.

Pin Functions - 8 Pins

PIN		I/O	DESCRIPTION
NAME	NO.		
EN/$\overline{EN}$	4	I	Enable input, logic high turns on power switch
$\overline{FLT}$	5	O	Active-low open-drain output, asserted during overcurrent, or overtemperature conditions
GND	1	—	Ground connection
IN	2, 3	PWR	Input voltage and power-switch drain; connect a 0.1-µF or greater ceramic capacitor from IN to GND close to the IC
OUT	6, 7, 8	PWR	Power-switch output, connect to load
PowerPAD (DGN Only)	PowerPAD	—	Internally connected to GND. Connect PAD to GND plane as a heatsink for the best thermal performance. PAD may be left floating if desired. See *Power Dissipation and Junction Temperature* for guidance.

Pin Functions - 5 Pins

PIN		I/O	DESCRIPTION
NAME	NO.		
EN/$\overline{EN}$	4	I	Enable input, logic high turns on power switch
$\overline{FLT}$	3	O	Active-low open-drain output, asserted during overcurrent, or overtemperature conditions
GND	2	—	Ground connection
IN	5	PWR	Input voltage and power-switch drain; connect a 0.1-µF or greater ceramic capacitor from IN to GND close to the IC
OUT	1	PWR	Power-switch output, connect to load.

7 Specifications

7.1 Absolute Maximum Ratings

over operating free-air temperature range (unless otherwise noted)(1)(2)(3)

	MIN	MAX	UNIT
Voltage on IN, OUT, EN or $\overline{EN}$, $\overline{FLT}$ (4)	–0.3	6	V
Voltage from IN to OUT	–6	6	V
Maximum junction temperature, T_J	Internally Limited		
Storage temperature, T_{stg}	–60	150	°C

(1) Stresses beyond those listed under *Absolute Maximum Ratings* may cause permanent damage to the device. These are stress ratings only, which do not imply functional operation of the device at these or any other conditions beyond those indicated under *Recommended Operating Conditions*. Exposure to absolute-maximum-rated conditions for extended periods may affect device reliability.
(2) Absolute maximum ratings apply over recommended junction temperature range.
(3) Voltages are with respect to GND unless otherwise noted.
(4) See *Input and Output Capacitance*.

7.2 ESD Ratings

			VALUE	UNIT
$V_{(ESD)}$	Electrostatic discharge	Human-body model (HBM), per ANSI/ESDA/JEDEC JS-001(1)	±2000	V
		Charged-device model (CDM), per JEDEC specification JESD22-C101(2)	±500	
		IEC 61000-4-2 contact discharge	±8000	
		IEC 61000-4-2 air-gap discharge(3)	±15000	

(1) JEDEC document JEP155 states that 500-V HBM allows safe manufacturing with a standard ESD control process.
(2) JEDEC document JEP157 states that 250-V CDM allows safe manufacturing with a standard ESD control process.
(3) V_{OUT} was surged on a PCB with input and output bypassing per the *Typical Application Diagram* on the first page (except input capacitor was 22 µF) with no device failures.

7.3 Recommended Operating Conditions

			MIN	NOM	MAX	UNIT
V_{IN}	Input voltage, IN		4.5		5.5	V
V_{EN}	Input voltage, EN or $\overline{EN}$		0		5.5	V
V_{IH}	High-level input voltage, EN or $\overline{EN}$		2			V
V_{IL}	Low-level input voltage, EN or $\overline{EN}$				0.7	V
I_{OUT}	Continuous output current, OUT(1)	TPS2041C and TPS2051C			0.5	A
		TPS2061C, TPS2065C and TPS2065C-2			1	
		TPS2068C, TPS2069C and TPS2069C-2			1.5	
		TPS2000C and TPS2001C			2	
T_J	Operating junction temperature		–40		125	°C
$I_{\overline{FLT}}$	Sink current into $\overline{FLT}$		0		5	mA

(1) Some package and current rating may request an ambient temperature derating of 85°C.

7.4 Thermal Information: SOT-23

THERMAL METRIC(1)		TPS20xxC, TPS20xxC-2		UNIT
		DBV (SOT-23)(2)	DBV (SOT-23)(3)	
		5 PINS	5 PINS	
$R_{\theta JA}$	Junction-to-ambient thermal resistance	224.9	220.4	°C/W
$R_{\theta JCtop}$	Junction-to-case (top) thermal resistance	95.2	89.7	°C/W
$R_{\theta JB}$	Junction-to-board thermal resistance	51.4	46.9	°C/W
ψ_{JT}	Junction-to-top characterization parameter	6.6	5.2	°C/W
ψ_{JB}	Junction-to-board characterization parameter	50.3	46.2	°C/W
$R_{\theta JCbot}$	Junction-to-case (bottom) thermal resistance	—	—	°C/W
$R_{\theta JA}$Custom	See *Power DIssipation and Junction Temperature*	139.3	134.9	°C/W

(1) For more information about traditional and new thermal metrics, see the *Semiconductor and IC Package Thermal Metrics* application report, SPRA953.
(2) Rated at 0.5 A or 1 A.
(3) Rated at 1.5 A or 2 A.

7.5 Thermal Information: MSOP-PowerPAD

THERMAL METRIC(1)		TPS20xxC, TPS20xxC-2			UNIT
		DGN (MSOP-PowerPAD)(2)	DGN (MSOP-PowerPAD)(3)	DGK (VSSOP)(4)	
		8 PINS	8 PINS	8 PINS	
$R_{\theta JA}$	Junction-to-ambient thermal resistance	72.1	67.1	205.5	°C/W
$R_{\theta JC(top)}$	Junction-to-case (top) thermal resistance	87.3	80.8	94.3	°C/W
$R_{\theta JB}$	Junction-to-board thermal resistance	42.2	37.2	126.9	°C/W
ψ_{JT}	Junction-to-top characterization parameter	7.3	5.6	24.7	°C/W
ψ_{JB}	Junction-to-board characterization parameter	42	36.9	125.2	°C/W
$R_{\theta JC(bot)}$	Junction-to-case (bottom) thermal resistance	39.2	32.1	—	°C/W
$R_{\theta JA}$Custom	See *Power DIssipation and Junction Temperature*	66.5	61.3	110.3	°C/W

(1) For more information about traditional and new thermal metrics, see the *Semiconductor and IC Package Thermal Metrics* application report, SPRA953.
(2) Rated at 0.5 A or 1 A.
(3) Rated at 1.5 A or 2 A.
(4) Rated at 2 A.

7.6 Electrical Characteristics: $T_J = T_A = 25°C$

Unless otherwise noted: V_{IN} = 5 V, V_{EN} = V_{IN} or $V_{\overline{EN}}$ = GND, I_{OUT} = 0 A. See *Device Comparison Table* for the rated current of each part number. Parametrics over a wider operational range are shown in *Electrical Characteristics: –40°C ≤ T_J ≤ 125°C*(1).

PARAMETER		TEST CONDITIONS(1)		MIN	TYP	MAX	UNIT
POWER SWITCH

8 Detailed Description

8.1 Overview

The TPS20xxC and TPS20xxC-2 are current-limited, power-distribution switches providing a range from 0.5 A and 2 A of continuous load current in 5-V circuits. These parts use N-channel MOSFETs for low resistance, maintaining voltage regulation to the load. They are designed for applications where short circuits or heavy capacitive loads are encountered. Device features include enable, reverse blocking when disabled, output discharge pulldown, overcurrent protection, overtemperature protection, and deglitched fault reporting.

8.2 Functional Block Diagram

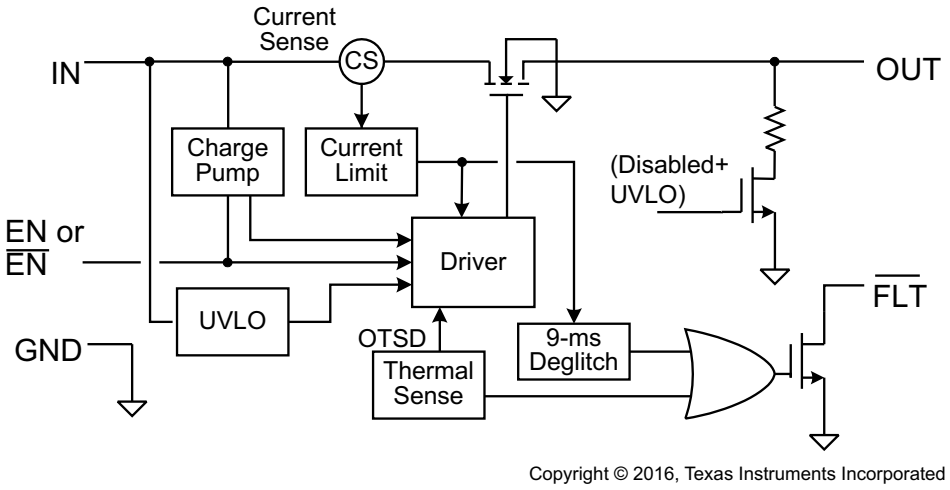

Figure 20. TPS20xxC Block Diagram

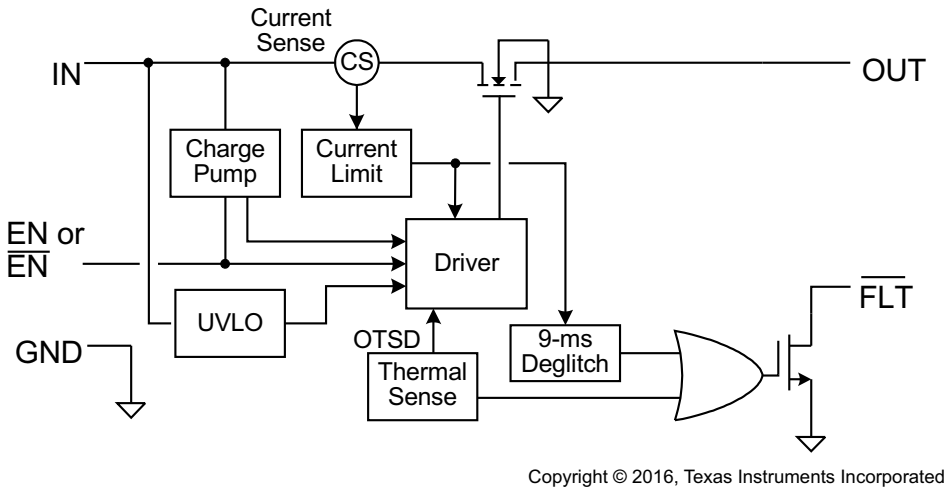

Figure 21. TPS20xxC-2 Block Diagram

8.3 Feature Description

8.3.1 Undervoltage Lockout

The undervoltage lockout (UVLO) circuit disables the power switch until the input voltage reaches the UVLO turnon threshold. Built-in hysteresis prevents unwanted ON/OFF cycling due to input voltage drop from large current surges. $\overline{FLT}$ is high impedance when the TPS20xxC and TPS20xxC-2 are in UVLO.

Feature Description (continued)

8.3.2 Enable

The logic enable input (EN, or $\overline{EN}$), controls the power switch, bias for the charge pump, driver, and other circuits. The supply current is reduced to less than 1 µA when the TPS20xxC and TPS20xxC-2 are disabled. Disabling the TPS20xxC and TPS20xxC-2 immediately clears an active $\overline{FLT}$ indication. The enable input is compatible with both TTL and CMOS logic levels.

The turnon and turnoff times (t_{ON}, t_{OFF}) are composed of a delay and a rise or fall time (t_R, t_F). The delay times are internally controlled. The rise time is controlled by both the TPS20xxC and TPS20xxC-2 and the external loading (especially capacitance). TPS20xxC fall time is controlled by the loading (R and C), and the output discharge (R_{PD}). TPS20xxC-2 does not have the output discharge (R_{PD}), fall time is controlled by the loading (R and C). An output load consisting of only a resistor experiences a fall time set by the TPS20xxC and TPS20xxC-2. An output load with parallel R and C elements experiences a fall time determined by the (R × C) time constant if it is longer than the t_F TPS20xxC and TPS20xxC-2.

The enable must not be left open, and may be tied to VIN or GND depending on the device.

8.3.3 Internal Charge Pump

The device incorporates an internal charge pump and gate drive circuitry necessary to drive the N-channel MOSFET. The charge pump supplies power to the gate driver circuit and provides the necessary voltage to pull the gate of the MOSFET above the source. The driver incorporates circuitry that controls the rise and fall times of the output voltage to limit large current and voltage surges on the input supply, and provides built-in soft-start functionality. The MOSFET power switch blocks current from OUT to IN when turned off by the UVLO or disabled.

8.3.4 Current Limit

The TPS20xxC and TPS20xxC-2 responds to overloads by limiting output current to the static I_{OS} levels shown in *Electrical Characteristics: T_J = T_A = 25°C*. When an overload condition is present, the device maintains a constant output current, with the output voltage determined by (I_{OS} × R_{LOAD}). Two possible overload conditions can occur. The first overload condition occurs when either:

1. input voltage is first applied, enable is true, and a short circuit is present (load which draws $I_{OUT} > I_{OS}$)
2. input voltage is present and the TPS20xxC and TPS20xxC-2 are enabled into a short circuit.

The output voltage is held near zero potential with respect to ground and the TPS20xxC and TPS20xxC-2 ramps the output current to I_{OS}. The TPS20xxC and TPS20xxC-2 limits the current to I_{OS} until the overload condition is removed or the device begins to thermal cycle. This is demonstrated in Figure 26 where the device was enabled into a short, and subsequently cycles current OFF and ON as the thermal protection engages.

The second condition is when an overload occurs while the device is enabled and fully turned on. The device responds to the overload condition within t_{IOS} (Figure 5 and Figure 6) when the specified overload (see *Electrical Characteristics: –40°C ≤ T_J ≤ 125°C*) is applied. The response speed and shape varies with the overload level, input circuit, and rate of application. The current limit response will vary between simply settling to I_{OS}, or turnoff and controlled return to I_{OS}. Similar to the previous case, the TPS20xxC and TPS20xxC-2 limits the current to I_{OS} until the overload condition is removed or the device begins to thermal cycle. This is demonstrated by Figure 27, Figure 28, and Figure 29.

The TPS20xxC and TPS20xxC-2 thermal cycles if an overload condition is present long enough to activate thermal limiting in any of the above cases. This is due to the relatively large power dissipation [(V_{IN} – V_{OUT}) × I_{OS}] driving the junction temperature up. The device turns off when the junction temperature exceeds 135°C (minimum) while in current limit. The device remains off until the junction temperature cools 20°C and then restarts.

There are two kinds of current limit profiles typically available in TI switch products that are similar to the TPS20xxC and TPS20xxC-2. Many older designs have an output I vs V characteristic similar to the plot labeled *Current Limit with Peaking* in Figure 22. This type of limiting can be characterized by two parameters, the current limit corner (I_{OC}), and the short circuit current (I_{OS}). I_{OC} is often specified as a maximum value. The TPS20xxC and TPS20xxC-2 family of parts does not present noticeable peaking in the current limit, corresponding to the characteristic labeled *Flat Current Limit* in Figure 22. This is why the I_{OC} parameter is not present in *Electrical Characteristics: –40°C ≤ T_J ≤ 125°C*.

Feature Description (continued)

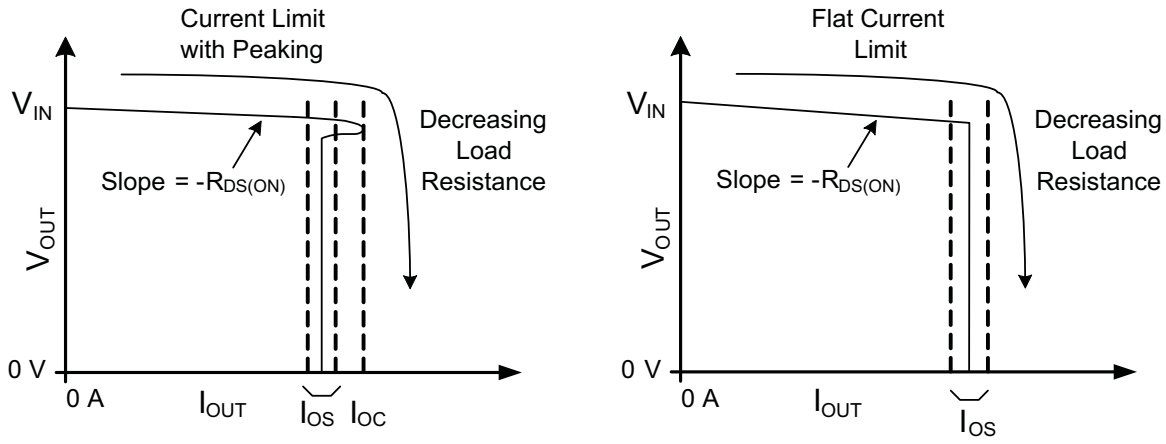

Figure 22. Current Limit Profiles

8.3.5 $\overline{\text{FLT}}$

The $\overline{\text{FLT}}$ open-drain output is asserted (active low) during an overload or overtemperature condition. A 9-ms deglitch on both the rising and falling edges avoids false reporting at start-up and during transients. A current limit condition shorter than the deglitch period clears the internal timer upon termination. The deglitch timer does not integrate multiple short overloads and declare a fault. This is also true for exiting from a faulted state. An input voltage with excessive ripple and large output capacitance may interfere with operation of $\overline{\text{FLT}}$ around I_{OS} as the ripple drives the TPS20xxC and TPS20xxC-2 in and out of current limit.

If the TPS20xxC and TPS20xxC-2 are in current limit and the overtemperature circuit goes active, $\overline{\text{FLT}}$ goes true immediately (see Figure 27); however, the exiting this condition is deglitched (see Figure 29). $\overline{\text{FLT}}$ is tripped just as the knee of the constant-current limiting is entered. Disabling the TPS20xxC and TPS20xxC-2 clears an active $\overline{\text{FLT}}$ as soon as the switch turns off (see Figure 26). $\overline{\text{FLT}}$ is high impedance when the TPS20xxC and TPS20xxC-2 are disabled or in undervoltage lockout (UVLO).

8.3.6 Output Discharge

A 470-Ω (typical) output discharge dissipates stored charge and leakage current on OUT when the TPS20xxC is in UVLO or disabled. The pulldown circuit loses bias gradually as V_{IN} decreases, causing a rise in the discharge resistance as V_{IN} falls towards 0 V. The TPS20xxC-2 does not have this function. The output is be controlled by an external loadings when the device is in ULVO or disabled.

8.4 Device Functional Modes

There are no other functional modes.

9 Application and Implementation

NOTE

Information in the following applications sections is not part of the TI component specification, and TI does not warrant its accuracy or completeness. TI's customers are responsible for determining suitability of components for their purposes. Customers should validate and test their design implementation to confirm system functionality.

9.1 Application Information

The TPS20xxC and TPS20xxC-2 current-limited power switch uses N-channel MOSFETs in applications requiring continuous load current. The device enters constant-current mode when the load exceeds the current limit threshold.

9.2 Typical Application

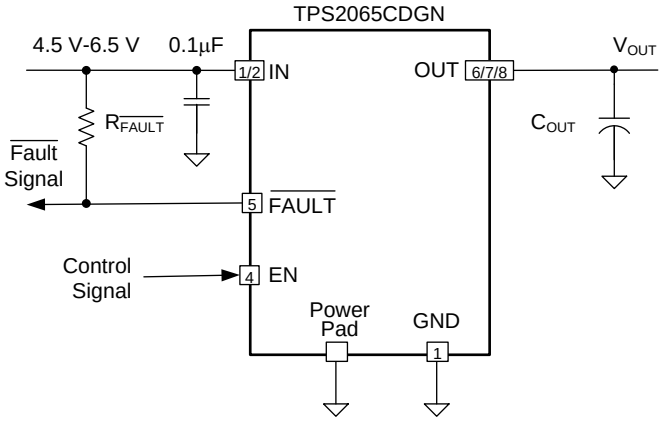

Figure 23. Typical Application Schematic

9.2.1 Design Requirements

For this design example, use the following input parameters:

1. The TPS2065CDGN operates from a 5-V to ±0.5-V input rail.
2. What is the normal operation current, for example, the maximum allowable current drawn by portable equipment for USB 3.0 port is 900 mA, so the normal operation current is 900 mA, and the minimum current limit of power switch must exceed 900 mA to avoid false trigger during normal operation. For the TPS2065C device, target 1-A continuous output current application.
3. What is the maximum allowable current provided by up-stream power, the maximum current limit of power switch that must lower it to ensure power switch can protect the up-stream power when overload is encountered at the output of power switch. For the TPS2065C device, the maximum I_{OS} is 1.8 A.

9.2.2 Detailed Design Procedure

To begin the design process a few parameters must be decided upon. The designer must know the following:

1. Normal input operation voltage
2. Output continuous current
3. Maximum up-stream power supply output current

9.2.2.1 Input and Output Capacitance

Input and output capacitance improves the performance of the device; the actual capacitance must be optimized for the particular application. For all applications, TI recommends placing a 0.1-µF or greater ceramic bypass capacitor between IN and GND, as close to the device as possible for local noise decoupling.

Typical Application (continued)

All protection circuits such as the TPS20xxC and TPS20xxC-2 has the potential for input voltage overshoots and output voltage undershoots.

Input voltage overshoots can be caused by either of two effects. The first cause is an abrupt application of input voltage in conjunction with input power bus inductance and input capacitance when the IN terminal is high impedance (before turnon). Theoretically, the peak voltage is 2× the applied. The second cause is due to the abrupt reduction of output short-circuit current when the TPS20xxC and TPS20xxC-2 turns off and energy stored in the input inductance drives the input voltage high. Input voltage droops may also occur with large load steps and as the TPS20xxC and TPS20xxC-2 output is shorted. Applications with large input inductance (for example, connecting the evaluation board to the bench power-supply through long cables) may require large input capacitance reduce the voltage overshoot from exceeding the absolute maximum voltage of the device. The fast current limit speed of the TPS20xxC and TPS20xxC-2 to hard output short circuits isolates the input bus from faults. However, ceramic input capacitance in the range of 1 µF to 22 µF adjacent to the TPS20xxC and TPS20xxC-2 input aids in both speeding the response time and limiting the transient seen on the input power bus. Momentary input transients to 6.5 V are permitted.

Output voltage undershoot is caused by the inductance of the output power bus just after a short has occurred and the TPS20xxC and TPS20xxC-2 has abruptly reduced OUT current. Energy stored in the inductance drives the OUT voltage down and potentially negative as it discharges. Applications with large output inductance (such as from a cable) benefit from use of a high-value output capacitor to control the voltage undershoot. When implementing USB standard applications, a 120-µF minimum output capacitance is required. Typically a 150-µF electrolytic capacitor is used, which is sufficient to control voltage undershoots. However, if the application does not require 120 µF of capacitance, and there is potential to drive the output negative, then TI recommends a minimum of 10-µF ceramic capacitance on the output. The voltage undershoot must be controlled to less than 1.5 V for 10 µs.

10 Power Supply Recommendations

Design of the devices is for operation from an input voltage supply range of 4.5 V to 5.5 V. The current capability of the power supply should exceed the maximum current limit of the power switch.

11 Layout

11.1 Layout Guidelines

1. Place the 100-nF bypass capacitor near the IN and GND pins, and make the connections using a low inductance trace.
2. Place at least 10-µF low ESR ceramic capacitor near the OUT and GND pins, and make the connections using a low inductance trace.
3. The PowerPAD must be directly connected to PCB ground plane using wide and short copper trace.

11.2 Layout Example

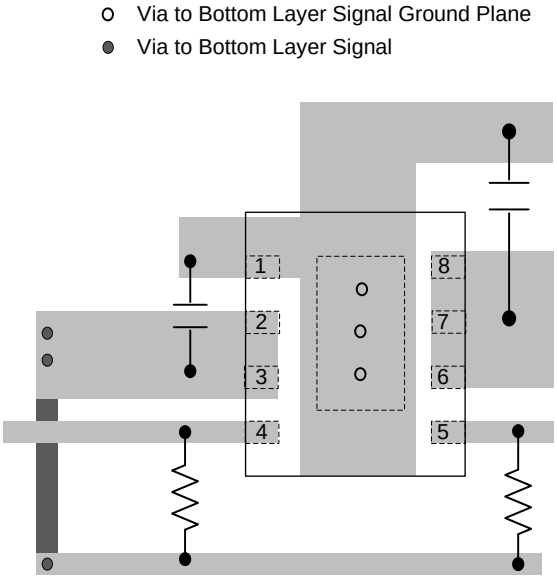

Figure 42. Recommended Layout

11.3 Power Dissipation and Junction Temperature

It is good design practice to estimate power dissipation and maximum expected junction temperature of the TPS20xxC and TPS20xxC-2. The system designer can control choices of package, proximity to other power dissipating devices, and printed-circuit board (PCB) design based on these calculations. These have a direct influence on maximum junction temperature. Other factors, such as airflow and maximum ambient temperature, are often determined by system considerations. It is important to remember that these calculations do not include the effects of adjacent heat sources, and enhanced or restricted air flow.

Addition of extra PCB copper area around these devices is recommended to reduce the thermal impedance and maintain the junction temperature as low as practical. The lower junction temperatures achieved by soldering the pad improve the efficiency and reliability of both TPS20xxC and TPS20xxC-2 parts and the system. The following examples were used to determine the θ_{JA}Custom thermal impedances noted in *Thermal Information: SOT-23* and *Thermal Information: MSOP-PowerPAD*. They were based on use of the JEDEC high-k circuit board construction (2 signal and 2 plane) with 4, 1-oz. copper weight, layers.

While TI recommends that the DGN package PAD be soldered to circuit board copper fill and vias for low thermal impedance, there may be cases where this is not desired. For example, use of routing area under the IC. Some devices are available in packages without the PowerPad (DGK) specifically for this purpose. The θ_{JA} for the DGN package with the pad not soldered and no extra copper, is approximately 141°C/W for 0.5-A and 1-A rated parts, and 139°C/W for the 1.5-A and 2-A rated parts. The θ_{JA} for the DGK mounted per Figure 45 is 110.3°C/W. These values may be used in Equation 1 to determine the maximum junction temperature.

Power Dissipation and Junction Temperature (continued)

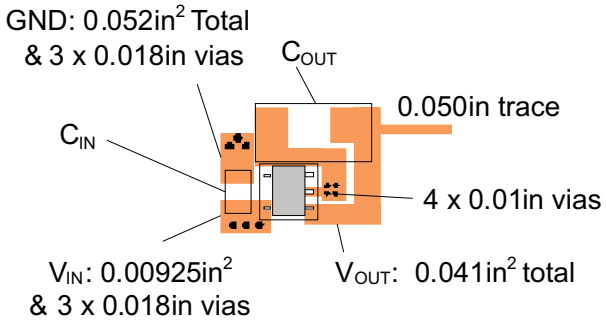

Figure 43. DBV Package PCB Layout Example

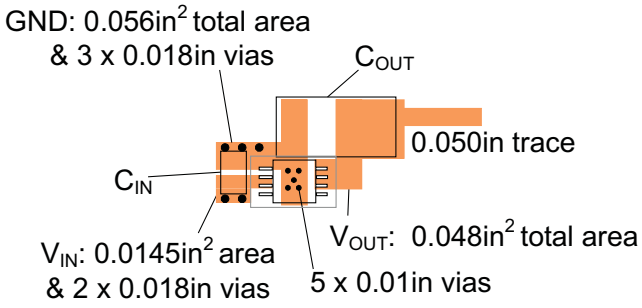

Figure 44. DGN Package PCB Layout Example

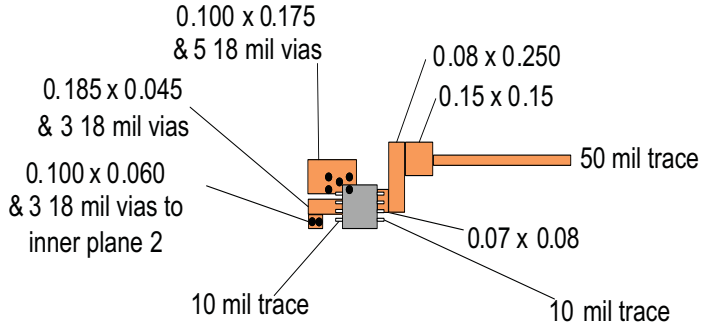

Figure 45. DGK Package PCB Layout Example

As shown in Equation 1, the following procedure requires iteration because power loss is due to the internal MOSFET $I^2 \times R_{DS(ON)}$, and $R_{DS(ON)}$ is a function of the junction temperature. As an initial estimate, use the $R_{DS(ON)}$ at 125°C from the *Typical Characteristics*, and the preferred package thermal resistance for the preferred board construction from the *Thermal Information: SOT-23* table.

Power Dissipation and Junction Temperature (continued)

$$T_J = T_A + ((I_{OUT}^2 \times R_{DS(ON)}) \times \theta_{JA})$$

where

- I_{OUT} = rated OUT pin current (A)
- $R_{DS(ON)}$ = Power switch ON-resistance at an assumed T_J (Ω)
- T_A = Maximum ambient temperature (°C)
- T_J = Maximum junction temperature (°C)
- θ_{JA} = Thermal resistance (°C/W) (1)

If the calculated T_J is substantially different from the original assumption, estimate a new value of $R_{DS(ON)}$ using the typical characteristic plot and recalculate.

If the resulting T_J is not less than 125°C, try a PCB construction or a package with lower θ_{JA}.

(1) The marketing status values are defined as follows:
ACTIVE: Product device recommended for new designs.
LIFEBUY: TI has announced that the device will be discontinued, and a lifetime-buy period is in effect.
NRND: Not recommended for new designs. Device is in production to support existing customers, but TI does not recommend using this part in a new design.
PREVIEW: Device has been announced but is not in production. Samples may or may not be available.
OBSOLETE: TI has discontinued the production of the device.

(2) **RoHS:** TI defines "RoHS" to mean semiconductor products that are compliant with the current EU RoHS requirements for all 10 RoHS substances, including the requirement that RoHS substance do not exceed 0.1% by weight in homogeneous materials. Where designed to be soldered at high temperatures, "RoHS" products are suitable for use in specified lead-free processes. TI may reference these types of products as "Pb-Free".
RoHS Exempt: TI defines "RoHS Exempt" to mean products that contain lead but are compliant with EU RoHS pursuant to a specific EU RoHS exemption.
Green: TI defines "Green" to mean the content of Chlorine (Cl) and Bromine (Br) based flame retardants meet JS709B low halogen requirements of <=1000ppm threshold. Antimony trioxide based flame retardants must also meet the <=1000ppm threshold requirement.

(3) MSL, Peak Temp. - The Moisture Sensitivity Level rating according to the JEDEC industry standard classifications, and peak solder temperature.

(4) There may be additional marking, which relates to the logo, the lot trace code information, or the environmental category on the device.

(5) Multiple Device Markings will be inside parentheses. Only one Device Marking contained in parentheses and separated by a "~" will appear on a device. If a line is indented then it is a continuation of the previous line and the two combined represent the entire Device Marking for that device.

(6) Lead finish/Ball material - Orderable Devices may have multiple material finish options. Finish options are separated by a vertical ruled line. Lead finish/Ball material values may wrap to two lines if the finish value exceeds the maximum column width.

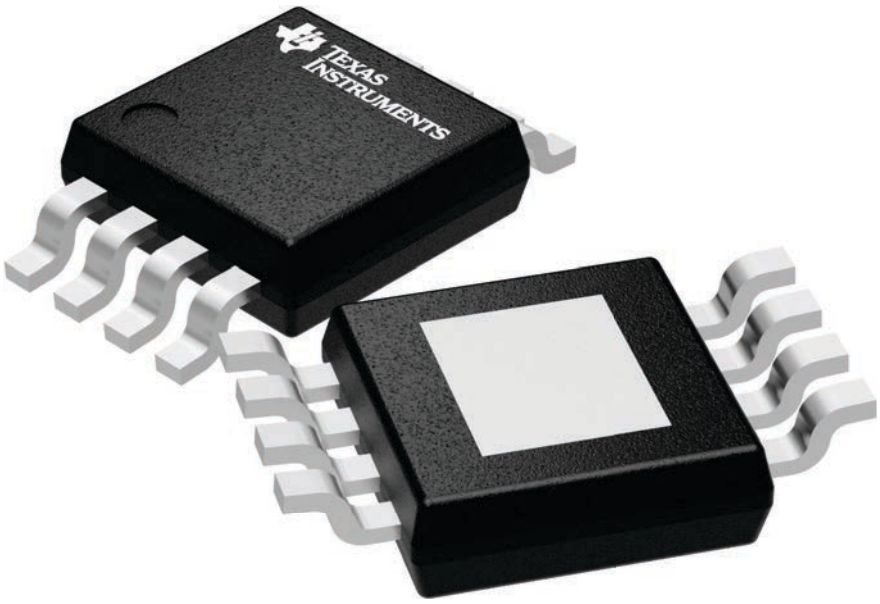
PowerPAD VSSOP - 1.1 mm max height

3 x 3, 0.65 mm pitch

SMALL OUTLINE PACKAGE

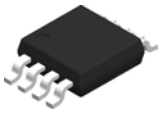
This image is a representation of the package family, actual package may vary.
Refer to the product data sheet for package details.



4225482/A

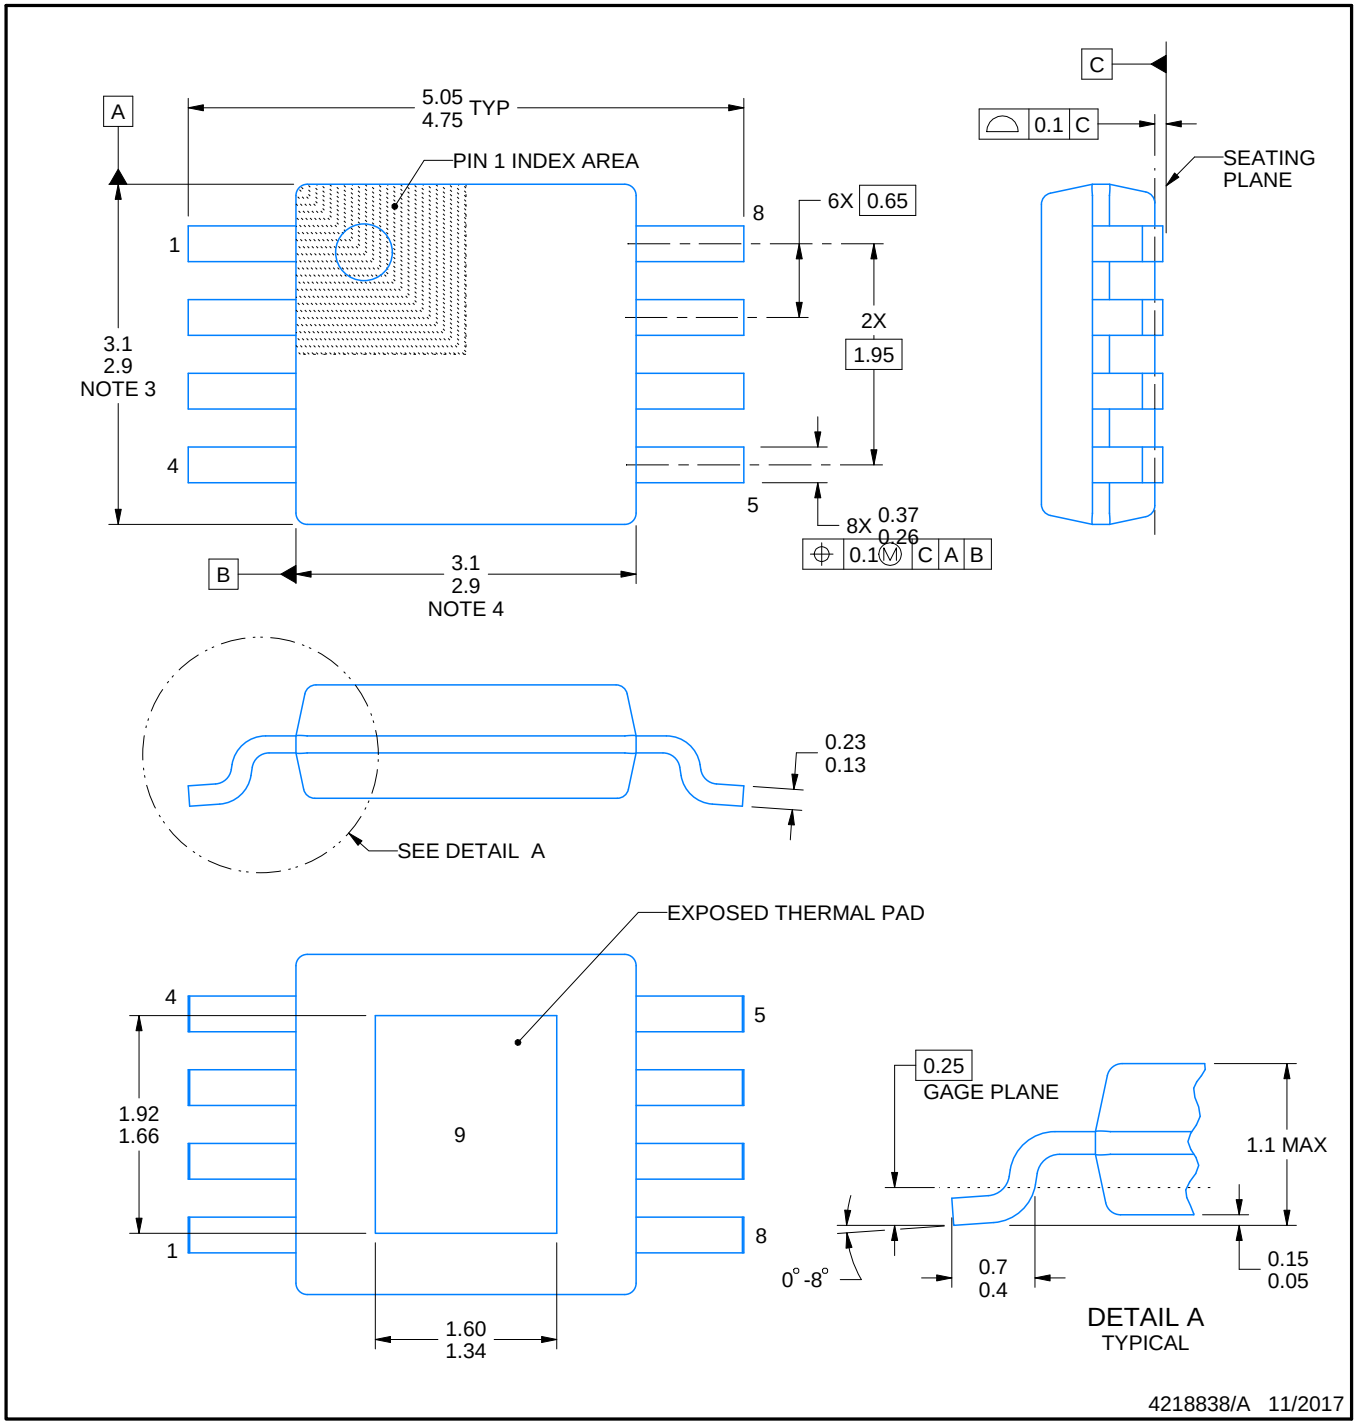
PACKAGE OUTLINE

DGN0008C



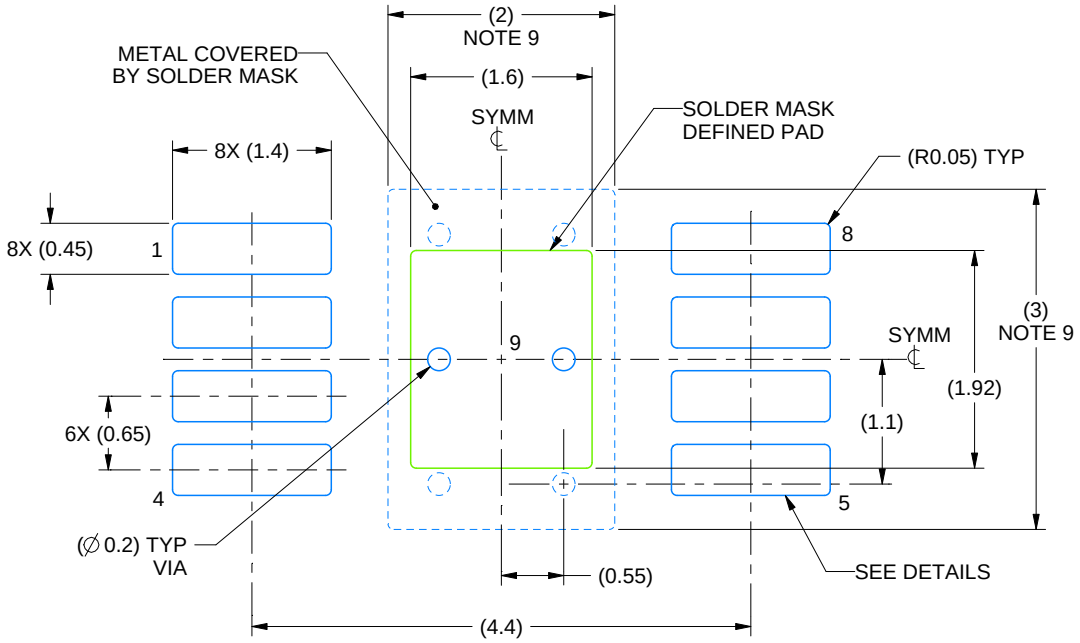
HVSSOP - 1.1 mm max height

SMALL OUTLINE PACKAGE

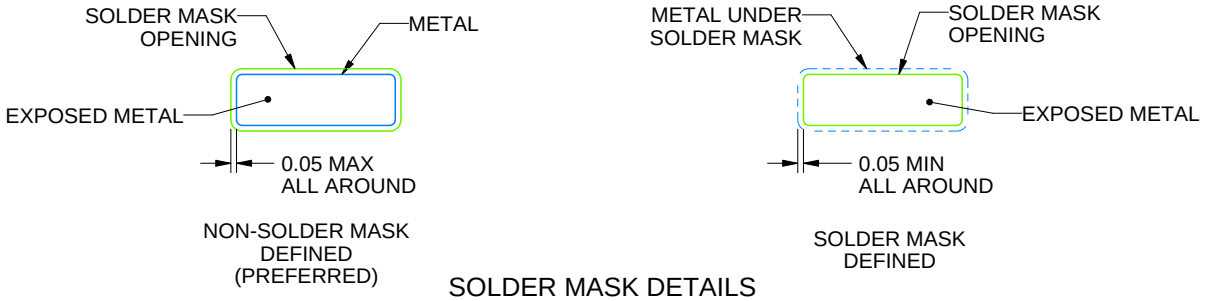


NOTES:

1. All linear dimensions are in millimeters. Any dimensions in parenthesis are for reference only. Dimensioning and tolerancing per ASME Y14.5M.
2. This drawing is subject to change without notice.
3. This dimension does not include mold flash, protrusions, or gate burrs. Mold flash, protrusions, or gate burrs shall not exceed 0.15 mm per side.
4. This dimension does not include interlead flash. Interlead flash shall not exceed 0.25 mm per side.
5. Reference JEDEC registration MO-187.



LAND PATTERN EXAMPLE
EXPOSED METAL SHOWN
SCALE: 15X

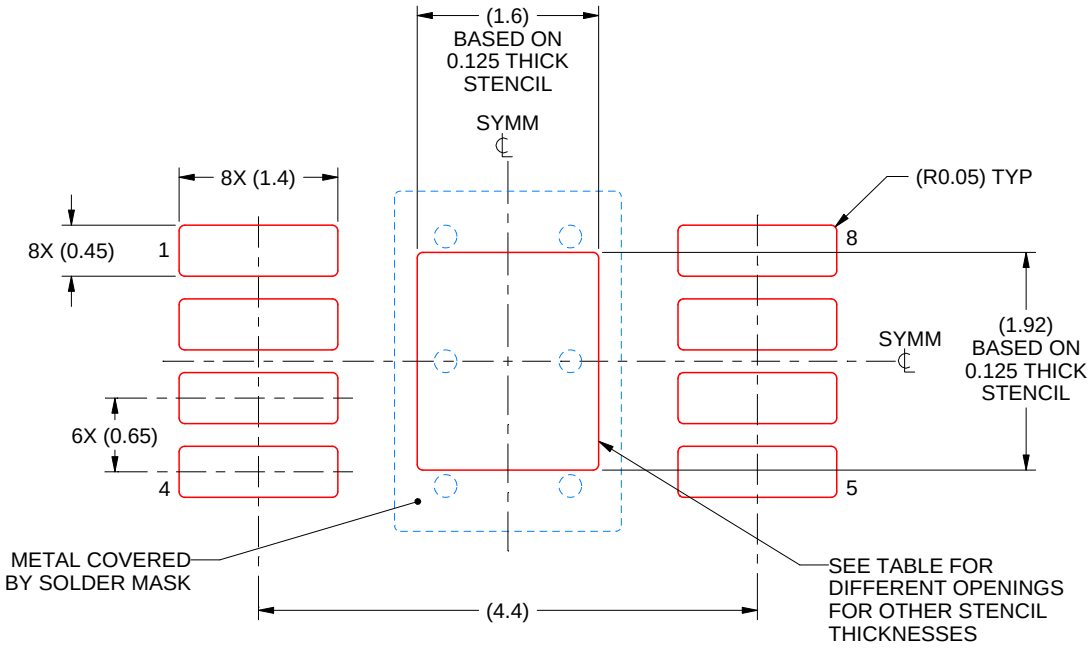


SOLDER MASK DETAILS

4218838/A 11/2017

NOTES: (continued)

6. Publication IPC-7351 may have alternate designs.
7. Solder mask tolerances between and around signal pads can vary based on board fabrication site.
8. Vias are optional depending on application, refer to device data sheet. If any vias are implemented, refer to their locations shown on this view. It is recommended that vias under paste be filled, plugged or tented.
9. Size of metal pad may vary due to creepage requirement.



SOLDER PASTE EXAMPLE
EXPOSED PAD 9:
100% PRINTED SOLDER COVERAGE BY AREA
SCALE: 15X

STENCIL THICKNESS	SOLDER STENCIL OPENING
0.1	1.79 X 2.15
0.125	1.60 X 1.92 (SHOWN)
0.15	1.46 X 1.75
0.175	1.35 X 1.62

4218838/A 11/2017

NOTES: (continued)

10. Laser cutting apertures with trapezoidal walls and rounded corners may offer better paste release. IPC-7525 may have alternate design recommendations.
11. Board assembly site may have different recommendations for stencil design.
