This PLL Clock Buffer is designed for a V_{DD} of 2.5V, an AV_{DD} of 2.5V and differential data input and output levels.

The **95V857** is a zero delay buffer that distributes a differential clock input pair (CLK_INC, CLK_INT) to ten differential pair of clock outputs (CLKT[0:9], CLKC[0:9]) and one differential pair feedback clock output (FB_OUT, FB_OUTC). The clock outputs are controlled by the input clocks (CLK_INC, CLK_INT), the feedback clocks (FB_INT, FB_INC), the 2.5-V LVCMOS input (PD#) and the Analog Power input (AV_{DD}). When input (PD#) is low while power is applied, the receivers are disabled, the PLL is turned off and the differential clock outputs are tri-stated. When AV_{DD} is grounded, the PLL is turned off and bypassed for test purposes.

When the input frequency is less than the operating frequency of the PLL, approximately 20MHz, the device will enter a low power mode. An input frequency detection circuit on the differential inputs, independent from the input buffers, will detect the low frequency condition and perform the same low power features as when the (PD#) input is low. When the input frequency increases to greater than approximately 20 MHz, the PLL will be turned back on, the inputs and outputs will be enabled and PLL will obtain phase lock between the feedback clock pair (FB_INT, FB_INC) and the input clock pair (CLK_INC, CLK_INT).

The PLL to the **95V857** clock driver uses the input clocks (CLK_INC, CLK_INT) and the feedback clocks (FB_INT, FB_INC) provide high-performance, low-skew, low-jitter, output differential clocks (CLKT[0:9], CLKC[0:9]). The **95V857** is also able to track Spread Spectrum Clock (SSC) for reduced EMI.

The **95V857** is characterized for operation from 0°C to 85°C, and will meet JEDEC Standard 82-1 and 82-1A Class A+ for registered DDR clock drivers.

| | |
|-------------------------------|---------------------------------------|
| Supply Voltage (VDD & AVDD) | -0.5V to 4.6V |
| Logic Inputs | GND -0.5 V to V _{DD} + 0.5 V |
| Ambient Operating Temperature | 0°C to +85°C |
| Storage Temperature | -65°C to +150°C |

Stresses above those listed under *Absolute Maximum Ratings* may cause permanent damage to the device. These ratings are stress specifications only and functional operation of the device at these or any other conditions above those listed in the operational sections of the specifications is not implied. Exposure to absolute maximum rating conditions for extended periods may affect product reliability.

2. DC input signal voltage specifies the allowable DC execution of differential input.
3. Differential inputs signal voltages specifies the differential voltage [VTR-VCP] required for switching, where VT is the true input level and VCP is the complementary input level.
4. Differential cross-point voltage is expected to track variations of V_{DD} and is the voltage at which the differential signal must be crossing.

| Output to Output Skew | T_{skew} | | | | 40 | ps |

Notes:

1. Refers to transition on noninverting output in PLL bypass mode.
2. While the pulse skew is almost constant over frequency, the duty cycle error increases at higher frequencies. This is due to the formula: $\text{duty cycle} = t_{\text{wH}}/t_{\text{c}}$, where the cycle (t_{c}) decreases as the frequency goes up.
3. Switching characteristics guaranteed for application frequency range.
4. Static phase offset shifted by design.
