

**THE DATASHEET OF
CM1223-02SO**

Industry First Low Capacitance ESD Protection Arrays with Backdrive Protection

Product Description

The CM1223 family of diode arrays has been designed to provide ESD protection for electronic components or subsystems requiring minimal capacitive loading. These devices are ideal for protecting systems with high data and clock rates or for circuits requiring low capacitive loading. Each ESD channel consists of a pair of diodes in series, which steer the positive or negative ESD current pulse to either the positive (V_P) or negative (V_N) supply rail. A Zener diode is embedded between V_P and V_N , to absorb positive ESD strikes and provide ESD protection for the V_P rail. An additional diode is integrated to serve as backdrive current protection. The CM1223 protects against ESD pulses up to ± 8 kV per the IEC 61000-4-2 standard. In addition, all pins are protected from contact discharges of greater than ± 15 kV as outlined by the MIL-STD-883D (Method 3015) specification for Human Body Model (HBM) ESD.

These devices are particularly well-suited for protecting systems using high-speed ports such as USB2.0, IEEE1394 (Firewire[®], iLink[™]), serial ATA, DVI, HDMI and corresponding ports in removable storage, digital camcorders, DVD-RW drives, as well as other applications where extremely low loading capacitance with ESD protection are required in a small package footprint.

Features

- Two, Four, and Eight Channels of ESD Protection with Integrated Backdrive Protection on all Lines
- Provides ESD Protection to IEC61000-4-2 Level 4: ± 8 kV Contact Discharge & ± 15 kV Air Discharge
- Low Channel Input Capacitance of 1.0 pF (typical)
- Minimal Capacitance Change with Temperature and Voltage
- Channel I/O to GND Capacitance Difference of 0.02 pF Typical is Ideal for Differential Signals
- Mutual Capacitance between Signal Pin and Adjacent Signal Pin at 0.11 pF (typical)
- Zener Diode Protects Supply Rail and Eliminates the Need for External Bypass Capacitors
- Pin Compatible with CM1213-02, -04, and -08
- Each I/O Pin Can Withstand over 1000 ESD Strikes
- Available in SOT, and MSOP Packages
- These Devices are Pb-Free and are RoHS Compliant

Applications

- USB 2.0 Ports at 480 Mbps in Desktop PCs, Notebooks and Peripherals
- IEEE1394 Firewire[®] Ports at 400 Mbps / 800 Mbps
- DVI Ports, HDMI Ports in Notebooks, Set Top Boxes, Digital TVs, LCD Displays

BACKDRIVE PROTECTION

Backdrive protection is needed to block against backdrive current flowing from a high potential voltage node toward a lower potential voltage node through the interface cable.

For example, consider a DVD player connected to a TV via an HDMI interface. If the DVD player is switched off and the TV is left on, there is a possibility of reverse current flow back into the main power supply rail of the DVD player. Typically, the DVD's power supply has some form of associated bulk supply capacitance, and it is possible over time to charge that bulk supply capacitance to some intermediate level.

If that level rises above the power-on-reset (POR) voltage level of some of the integrated circuits, the DVD player may not reset properly when the DVD player is turned back on. This is largely because all CMOS logic exhibits a very high impedance on the power rail node even when "off".

To avoid this situation, the CM1223 with integrated backdrive protection diode was designed to block backdrive current, guaranteeing no more than 5 μA on any I/O pin when the I/O pin voltage is greater than the CM1223 supply voltage.

APPLICATION INFORMATION

Design Considerations

To realize the maximum protection against ESD pulses, care must be taken in the PCB layout to minimize parasitic series inductances on the Supply/Ground rails as well as the signal trace segments between the signal input (typically a connector) and the ESD protection device. Application of Positive ESD Pulse between Input Channel and Ground illustrates an example of a positive 8 kV ESD pulse striking an input channel. The 8 kV ESD current pulse will divert along the path as indicated in Application of Positive ESD Pulse between Input Channel and Ground, through the D1 diode and the Zener diode back to the ground rail.

An ESD current pulse can rise from zero to its peak value in a very short time. For example, a level 4 contact discharge per the IEC61000-4-2 standard results in a current pulse that rises from zero to 30 Amps in 1ns. The CM1223 has a fast response time of less than 1ns and low clamp voltage to handle this pulse scenario.

Similarly for negative ESD pulses, parasitic series inductance from the V_N pin to the ground rail will lead to drastically increased negative voltage on the line being protected.

The CM1223 also has an integrated backdrive diode between V_P and V_N to prevent backdrive current flow from the powered sources.

As a general rule, the ESD Protection Array should be located as close as possible to the point of entry of expected electrostatic discharges.

CM1223

MECHANICAL DETAILS

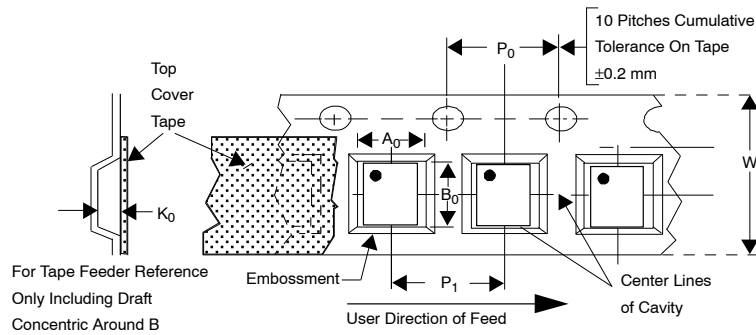

The CM1223 is available in SOT143-4, SOT23-5, SOT23-6, and MSOP-10 packages with a lead-free finishing. The various package drawings are presented below.

SOT143 Mechanical Specifications

The CM1223-02SR is supplied in 4-pin SOT143 package, the CM1223-02SO in a 5-pin SOT23 package, the CM1223-04SO in a 6-pin SOT23 package, and the CM1223-08MR in a 10-lead MSOP package. Dimensions are presented below.

Table 5. TAPE AND REEL SPECIFICATIONS

Part Number	Chip Size (mm)	Pocket Size (mm) $B_0 \times A_0 \times K_0$	Tape Width W	Reel Diameter	Qty per Reel	P_0	P_1
CM1223-02SR	2.92 X 2.37 X 1.01	2.60 X 3.15 X 1.20	8 mm	178 mm (7")	3000	4 mm	4 mm
