

THE DATASHEET OF DVIULC6-2M6

Ultra low capacitance ESD protection

Datasheet - production data

**Features**

- 2-line ESD protection (at 15 kV air and contact discharge, exceeds IEC 61000-4-2)
- Protects V_{BUS} when applicable
- Ultra low capacitance: 0.6 pF at $F = 825$ MHz
- Fast response time compared with varistors
- Low leakage current: 0.5 μ A max
- RoHS compliant

Benefits

- ESD standards compliance guaranteed at device level, hence greater immunity at system level
- ESD protection of V_{BUS} when applicable.
- Large bandwidth to minimize impact on data signal quality
- Consistent D+ / D- signal balance:
 - Ultra low impact on intra- and inter-pair skew
 - Matching high bit rate DVI, and IEEE 1394 requirements
- Low PCB space consumption - 1.45 mm² for μ QFN

- Low leakage current for longer operation of battery powered devices
- Higher reliability offered by monolithic integration
- 500 μ m pitch for μ QFN 6 leads

Complies with these standards

- IEC 61000-4-2 level 4
 - 15 kV air discharge
 - 8 kV contact discharge
- MIL STD883G-Method 3015-7

Applications

- DVI ports up to 1.65 Gb/s
- IEEE 1394a, b, and c up to 3.2 Gb/s
- USB2.0 ports up to 480 Mb/s (high speed), backwards compatible with USB1.1 low and full speed
- Ethernet port: 10/100/1000 Mb/s
- SIM card protection
- Video line protection

Description

The DVIULC6-2M6 is a monolithic, application specific discrete device dedicated to ESD protection of high speed interfaces, such as DVI, IEEE 1394a, b and c, USB2.0, Ethernet links and video lines.

Its ultra low line capacitance secures a high level of signal integrity without compromising in protecting sensitive chips against the most stringently characterized ESD strikes.

1 Characteristics

Figure 1. Functional diagram

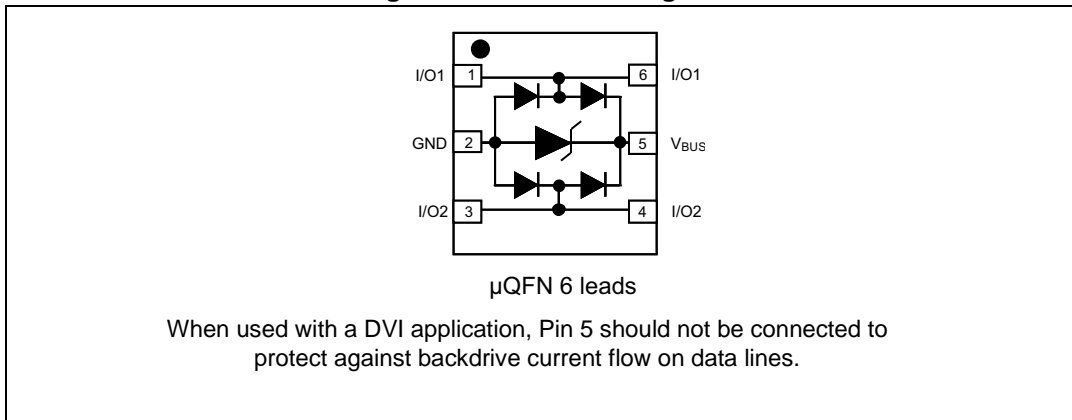

Table 1. Absolute ratings

Symbol	Parameter		Value	Unit
V _{PP}	Peak pulse voltage	IEC61000-4-2 air discharge	±15	kV
		IEC61000-4-2 contact discharge	±15	
		MIL STD883G-Method 3015-7	±25	
T _{stg}	Storage temperature range		-55 to +150	°C
T _j	Maximum junction temperature		125	°C
T _L	Lead solder temperature (10 seconds duration)		260	°C

Table 2. Electrical characteristics (T_{amb} = 25 °C)

Symbol	Parameter	Test Conditions	Value			Unit
			Min.	Typ.	Max	
I _{RM}	Leakage current	V _{RM} = 5 V			0.5	μA
V _{BR}	Breakdown voltage between V _{BUS} and GND	I _R = 1 mA	6			V
V _{CL}	Clamping voltage	I _{PP} = 1 A, t _p = 8/20 μs Any I/O pin to GND			12	V
		I _{PP} = 5 A, t _p = 8/20 μs Any I/O pin to GND			17	V
C _{i/o-GND}	Capacitance between I/O and GND	V _R = 0 V, F = 825 MHz			0.85	pF
ΔC _{i/o-GND}	Capacitance variation between I/O and GND	V _R = 0 V, F = 1 MHz		0.02		pF
C _{i/o-i/o}	Capacitance between I/O	V _R = 0 V, F = 825 MHz			0.5	pF

3 Technical information

3.1 Surge protection

The DVIULC6-2M6 is particularly optimized to perform ESD surge protection based on the rail to rail topology.

The clamping voltage V_{CL} can be calculated as follows:

$$V_{CL+} = V_{TRANSIL} + V_F \quad \text{for positive surges}$$

$$V_{CL-} = -V_F \quad \text{for negative surges}$$

with: $V_F = V_T + R_d \cdot I_p$

(V_F forward drop voltage) / (V_T forward drop threshold voltage)

and $V_{TRANSIL} = V_{BR} + R_{d_TRANSIL} \cdot I_p$

Calculation example

We assume that the value of the dynamic resistance of the clamping diode is typically: $R_d = 0.5 \Omega$ and $V_T = 1.1 V$.

We assume that the value of the dynamic resistance of the transil diode is typically $R_{d_TRANSIL} = 0.5 \Omega$ and $V_{BR} = 6.1 V$

For an IEC 61000-4-2 surge Level 4 (Contact Discharge: $V_g = 8 kV$, $R_g = 330 \Omega$), $V_{BUS} = +5 V$, and, in first approximation, we assume that: $I_p = V_g / R_g = 24 A$.

We find:

$$V_{CL+} = +31.2 V$$

$$V_{CL-} = -13.1 V$$

Note: The calculations do not take into account phenomena due to parasitic inductances.

3.2 Surge protection application example

If we consider that the connections from the pin V_{BUS} to V_{CC} , from I/O to data line, and from GND to PCB GND plane are two tracks 10 mm long and 0.5 mm wide, we can assume that the parasitic inductances, L_{VBUS} , $L_{I/O}$, and L_{GND} , of these tracks are about 6 nH. So when an IEC 61000-4-2 surge occurs on the data line, due to the rise time of this spike ($t_r = 1 ns$), the voltage V_{CL} has an extra value equal to $L_{I/O} \cdot di/dt + L_{GND} \cdot di/dt$.

The di/dt is calculated as: $di/dt = I_p/t_r = 24 A/ns$ for an IEC 61000-4-2 surge level 4 (contact discharge $V_g = 8 kV$, $R_g = 330 \Omega$)

The over voltage due to the parasitic inductances is:

$$L_{I/O} \cdot di/dt = L_{GND} \cdot di/dt = 6 \times 24 = 144 V$$

By taking into account the effect of these parasitic inductances due to unsuitable layout, the clamping voltage will be:

$$V_{CL+} = +31.2 + 144 + 144 = 319.2 V$$

$$V_{CL-} = -13.1 - 144 - 144 = -301.1 V$$

We can reduce as much as possible these phenomena with simple layout optimization.

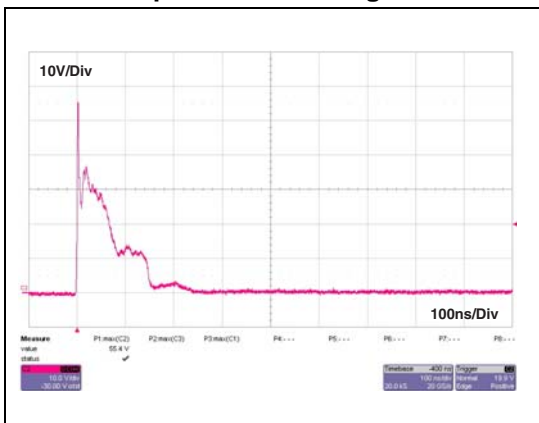

Figure 15. Remaining voltage after the DVIULC6-2M6 during negative ESD surge

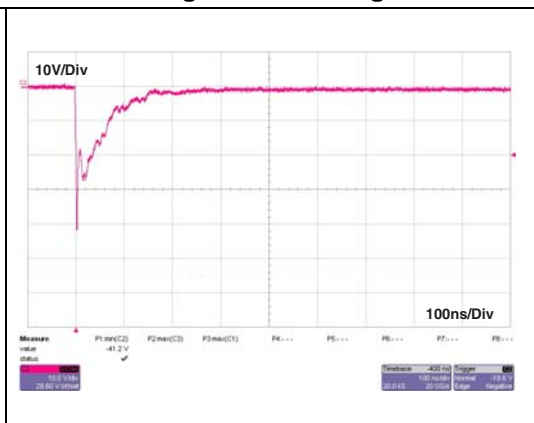

Figure 16. Remaining voltage after the DVIULC6-2M6 during negative ESD surge

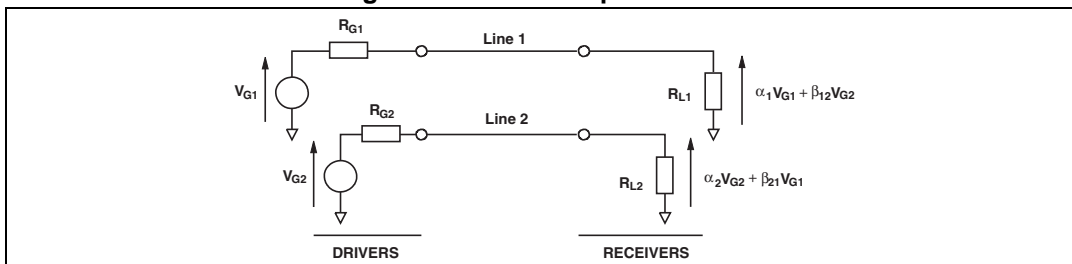

Important

An important precaution to take is to put the protection device as close as possible to the disturbance source (generally the connector).

3.3 Crosstalk behavior

Figure 17. Crosstalk phenomena

The crosstalk phenomena is due to the coupling between 2 lines. The coupling factor (β_{12} or β_{21}) increases when the gap across lines decreases, particularly in silicon dice. In the example above the expected signal on load R_{L2} is $\alpha_2 V_{G2}$, in fact the real voltage at this point has got an extra value $\beta_{21} V_{G1}$. This part of the V_{G1} signal represents the effect of the crosstalk phenomenon of the line 1 on the line 2. This phenomenon has to be taken into account when the drivers impose fast digital data or high frequency analog signals in the disturbing line. The perturbed line will be more affected if it works with low voltage signal or high load impedance (few $k\Omega$).

Figure 18. Analog crosstalk measurements

Figure 18 gives the measurement circuit for the analog application. In usual frequency range of analog signals (up to 240 MHz) the effect on disturbed line is less than -40 dB (see Figure 19).

Figure 19. Analog crosstalk results (typical values) for DVIULC6-2M6

4 Recommendation on PCB assembly

4.1 Stencil opening design

1. General recommendation on stencil opening design
 - a) Stencil opening dimensions: L (Length), W (Width), T (Thickness)

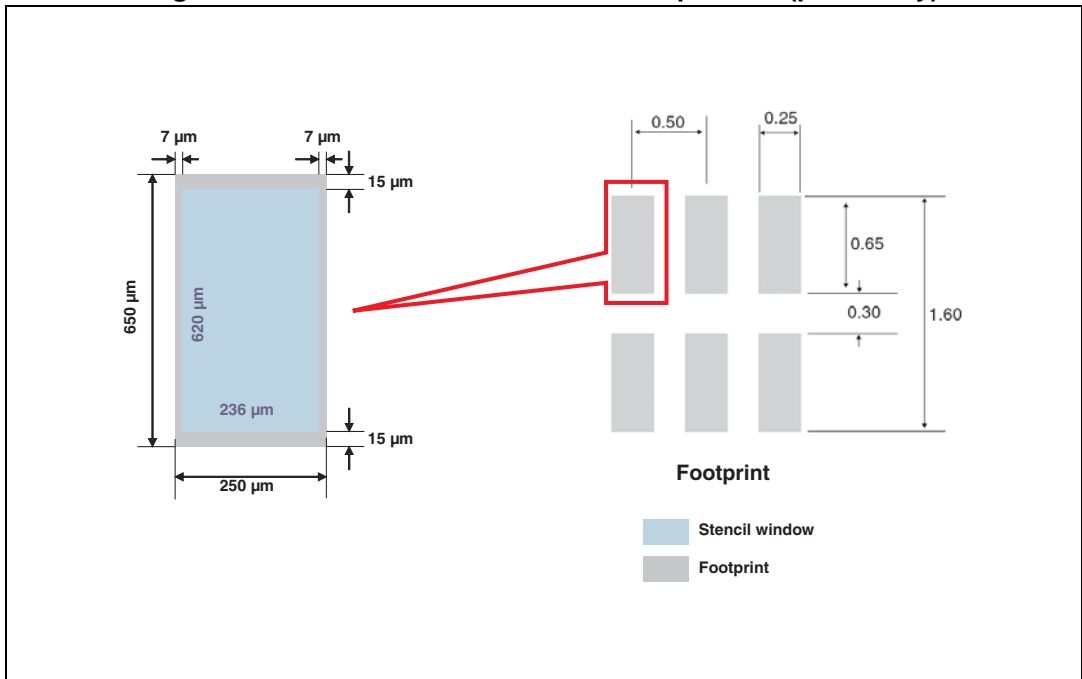

Figure 20. Stencil opening dimensions.

- b) General Design Rule
 - Stencil thickness (T) = 75 ~ 125 μm
 - Aspect Ratio = $\frac{W}{T} \geq 1.5$
 - Aspect Area = $\frac{L \times W}{2T(L + W)} \geq 0.66$

2. Reference design
 - a) Stencil opening thickness: 100 μm
 - b) Stencil opening for leads: Opening to footprint ratio is 90%.

Figure 21. Recommended stencil window position (μQFN only)

4.2 Solder paste

1. Halide-free flux qualification ROL0 according to ANSI/J-STD-004.
2. “No clean” solder paste is recommended.
3. Offers a high tack force to resist component movement during high speed.
4. Solder paste with fine particles: powder particle size is 20-45 μm .

4.3 Placement

1. Manual positioning is not recommended.
2. It is recommended to use the lead recognition capabilities of the placement system, not the outline centering.
3. Standard tolerance of ± 0.05 mm is recommended.
4. 3.5 N placement force is recommended. Too much placement force can lead to squeezed out solder paste and cause solder joints to short. Too low placement force can lead to insufficient contact between package and solder paste that could cause open solder joints or badly centered packages.
5. To improve the package placement accuracy, a bottom side optical control should be performed with a high resolution tool.
6. For assembly, a perfect supporting of the PCB (all the more on flexible PCB) is recommended during solder paste printing, pick and place and reflow soldering by using optimized tools.

4.4 PCB design preference

1. To control the solder paste amount, the closed via is recommended instead of open vias.
2. The position of tracks and open vias in the solder area should be well balanced. The symmetrical layout is recommended, in case any tilt phenomena caused by asymmetrical solder paste amount due to the solder flow away.

4.5 Reflow profile

Figure 22. ST ECOPACK® recommended soldering reflow profile for PCB mounting

Note: Minimize air convection currents in the reflow oven to avoid component movement.

5 Package information

- Epoxy meets UL94, V0

In order to meet environmental requirements, ST offers these devices in ECOPACK[®] packages. These packages have a lead-free second level interconnect. The category of second level interconnect is marked on the inner box label, in compliance with JEDEC Standard JESD97. The maximum ratings related to soldering conditions are also marked on the inner box label. ECOPACK is an ST trademark. ECOPACK specifications are available at www.st.com.
