

## Dual Full-Bridge Motor Driver

### Features

- 750 mA Continuous Output Current
- Load Voltage Supply: 10V to 40V
- Full Bipolar Stepper Motor Drive Capability
- Bidirectional DC Motor Capability
- Internal Fixed T<sub>OFF</sub> Time PWM Current Control
- Internal Protection Diodes
- Internal Thermal Shutdown
- Under Voltage Lockout
- LS-TTL Compatible Logic Inputs with Pull-Up Resistors
- Low R<sub>ON</sub> Output Resistance
- Low Quiescent Current
- Operating Temperature Range: -40°C to +105°C
- Pin Compatible with Allegro 2916

### Applications

- Stepper Motor Actuators
- DC Motor Actuators
- Automotive HVAC Ventilation
- Automotive Power Seats

**Note:** The MTS2916A device is formerly a product of Advanced Silicon.

### Description

The MTS2916A motor driver is a CMOS device capable of driving both windings of a bipolar stepper motor or bidirectionally control two DC motors. Each of the two independent H-bridge outputs is capable of sustaining 40V and delivering up to 750 mA of continuous current. The output current level is controlled by an internal pulse-width modulation (PWM) circuit that is configured using two logic inputs, a current sense resistor and a selectable reference voltage. The H-bridge outputs have been optimized to provide a low output saturation voltage drop.

Full, half, and micro-stepping operations are possible with the PWM current control and logic inputs. The maximum output current is set by a sensing resistor and a user selectable reference voltage. The output current limit is selected using two logic level inputs. The selectable output current limits are 0%, 33%, 67%, or 100% of the maximum output current. Each bridge has a PHASE input signal which is used to control the direction of current flow through the H-bridge and the load.

The H-bridge power stage is controlled by non-overlapping signals which prevent current cross conduction when switching the direction of the current flow. Internal clamp diodes protect against inductive transients. Thermal protection circuitry disables the outputs when the junction temperature exceeds the safe operating limit. No special power-up sequencing is required. Undervoltage Lockout circuitry prevents the chip from operating when the load supply is applied prior to the logic supply.

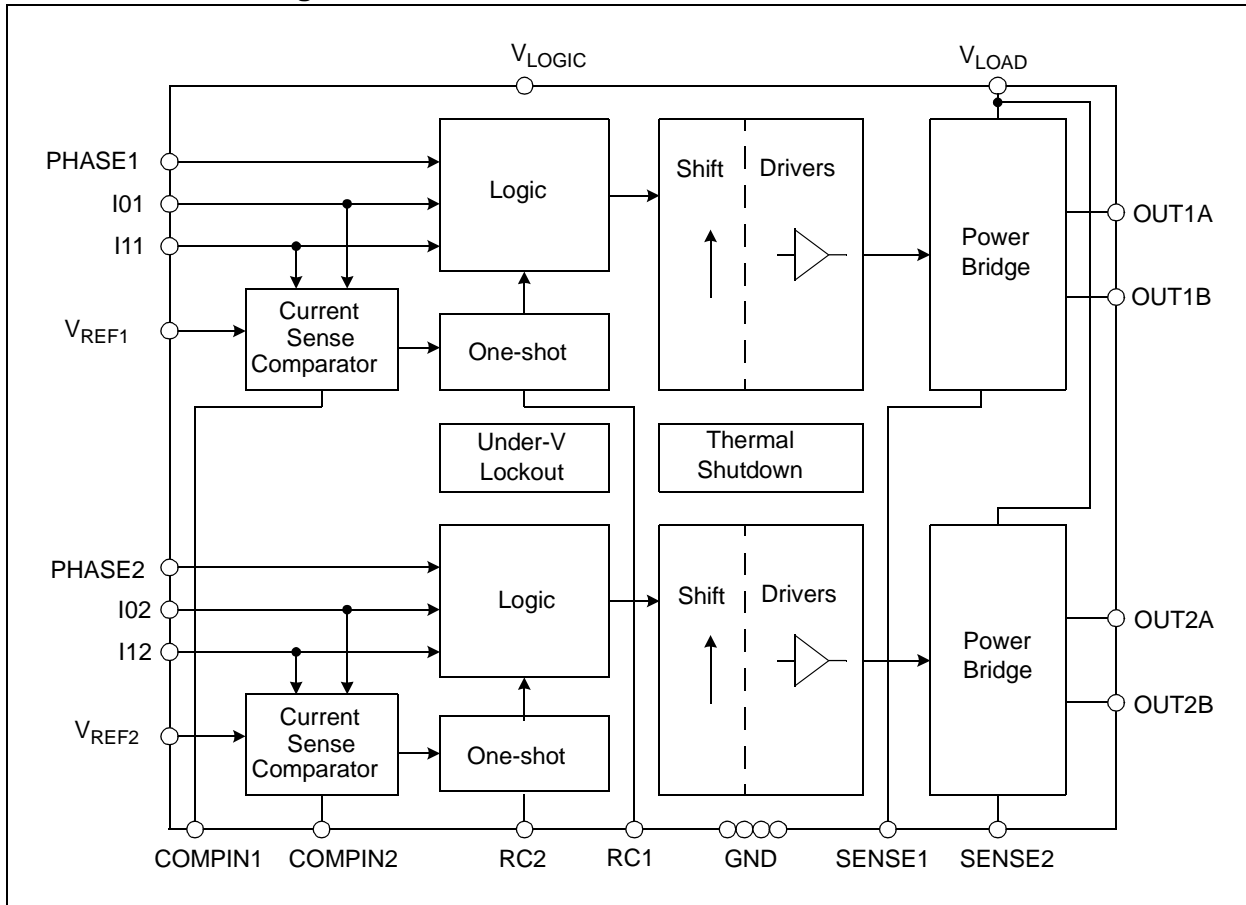

The device is supplied in a 24-pin SOP package.

## 1.0 ELECTRICAL CHARACTERISTICS

### Absolute Maximum Ratings †

Logic Supply Voltage ( $V_{\text{LOGIC}}$ )	-0.3 to +5.5V
Load Supply Voltage ( $V_{\text{LOAD}}$ )	-0.3 to +40.0V
Logic Input Voltage Range ( $V_{\text{IN}}$ )	-0.3 to $V_{\text{LOGIC}} + 0.3\text{V}$
$V_{\text{REF}}$ Voltage Range ( $V_{\text{REF}}$ )	-0.3 to +10.0V
Output Current (Peak)	$\pm 1\text{A}$
Output Current (Continuous)	$\pm 0.75\text{A}$
Sense Output Voltage	-0.3V to 1.5V
Junction Temperature ( $T_{\text{J}}$ )	-40°C to +150°C
Operating Temperature Range ( $T_{\text{OPR}}$ )	-40°C to +105°C
Storage Temperature Range ( $T_{\text{STG}}$ )	-55°C to +150°C

† **Notice:** Stresses above those listed under “Maximum Ratings” may cause permanent damage to the device. This is a stress rating only and functional operation of the device at those or any other conditions above those indicated in the operational listings of this specification is not implied. Exposure to maximum rating conditions for extended periods may affect device reliability.

### ELECTRICAL CHARACTERISTICS

Electrical Specifications: Unless otherwise specified, all limits are established for $V_{\text{LOGIC}} = 4.5\text{V}$ to $5.5\text{V}$ , $V_{\text{LOAD}} = 30\text{V}$ , $V_{\text{REF}} = 5\text{V}$ , $T_{\text{A}} = +25^{\circ}\text{C}$						
Parameters	Sym	Min	Typ	Max	Units	Conditions
<b>DC Characteristics</b>

## 2.0 PIN DESCRIPTIONS

The descriptions of the pins are listed in [Table 2-1](#).

**TABLE 2-1: MTS2916A PIN FUNCTION TABLE**

Pin No. SOP-24	Type	Name	Function
1	Input	I02	Output 2 Current Selection Bit 0
2	Input	I12	Output 2 Current Selection Bit 1
3	Input	PHASE2	Output 2 Phase
4	Input	V <sub>REF2</sub>	Output 2 Current Reference
5	Input	RC2	Output 2 RC Time Constant
6	Power	GND	Negative Logic Supply (Ground)
7	Power	GND	Negative Logic Supply (Ground)
8	Power	V <sub>LOGIC</sub>	Positive Logic Supply Voltage
9	Input	RC1	Output 1 RC Time Constant
10	Input	V <sub>REF1</sub>	Output 1 Current Reference
11	Input	PHASE1	Output 1 Phase
12	Input	I11	Output 1 Current Selection Bit 1
13	Input	I01	Output 1 Current Selection Bit 0
14	Output	OUT1B	Output 1 'B' Side of Motor Winding
15	Input	COMPIN1	Current Sense Comparator Input for Output 1
16	Input	SENSE1	Current Sense for Output 1
17	Output	OUT1A	Output 1 'A' Side of Motor Winding
18	Power	GND	Negative Logic Supply (Ground)
19	Power	GND	Negative Logic Supply (Ground)
20	Output	OUT2A	Output 2 'A' Side of Motor Winding
21	Input	SENSE2	Current Sense for Output 2
22	Input	COMPIN2	Current Sense Comparator Input for Output 2
23	Output	OUT2B	Output 2 'B' Side of Motor Winding
24	Power	V <sub>LOAD</sub>	Positive Load Supply Voltage

## 2.1 Current Detection Selection (I01, I02, I11, I12)

Comparator input for current threshold detection. The voltage across the sense resistor is fed back to this input through the low pass filter R<sub>Cc</sub>. The power transistors are disabled when the sense voltage exceeds the reference voltage of the selected comparator. When this occurs, the current decays for a time set by R<sub>tCt</sub> ( $T_{OFF} = 1.1 R_{tCt}$ ).

## 2.2 Current Flow Direction Selection (PHASE1, PHASE2)

Logic input to select the direction of current flow through the load. A "HIGH" logic signal level causes load current to flow from OUTxA to OUTxB. A "LOW" logic level causes load current to flow from OUTxB to OUTxA.

## 2.3 Current Sense Reference (V<sub>REF1</sub>, V<sub>REF2</sub>)

Reference voltage for current sense comparator. Determines the level of output current detection together with sensing resistor and inputs I0x, I1x.

## 2.4 Output Stage OFF Time (RC1, RC2)

A parallel R<sub>tCt</sub> network connected to this pin sets the OFF time of the power transistors. The monostable pulse generator is triggered by the output of the current sense comparator.

## 2.5 Ground Terminal (GND)

Logic supply ground. Only the driver current flows out of this pin; there is no high current. Minimize voltage drops between this pin and the logic inputs.

## 2.6 Logic Supply Voltage (V<sub>LOGIC</sub>)

Connect V<sub>LOGIC</sub> to the logic source voltage. Decouple the supply with a 0.1 μF ceramic capacitor mounted close to the V<sub>LOGIC</sub> and GND terminals.

## 2.7 Current Sense Comparator Input (COMPIN1, COMPIN2)

Current sense comparator input.

## 2.8 Current Sense Input (SENSE1, SENSE2)

Connection to lower sources of output stage for insertion of current sense resistor.

## 2.9 Output Stage (OUT1A, OUT2A, OUT1B, OUT2B)

Output connection to "A" side and "B" side of motor windings.

## 2.10 Load Supply Voltage (V<sub>LOAD</sub>)

Connect V<sub>LOAD</sub> to the motor positive voltage supply. The motor current is supplied through this pin and the selected output transistors.

# MTS2916A

## 3.0 FUNCTIONAL DESCRIPTION

The circuit is designed to drive the two windings of a bipolar stepper motor, and can be divided into two identical channels (channel 1 and channel 2) and protection circuitry for overtemperature and undervoltage. The functionality of a channel and protection circuitry is presented in the following sections.

## 3.1 Power Bridge Operation

Each motor winding is driven by an H-type bridge consisting of two N- and two P-transistors that allow the current to flow in both winding directions, depending on the value of the PHASE signal (Table 3-1). The H-bridge can be set in five configurations that are related to the digital inputs PHASE, I0 and I1, and to the current sensed. These configurations are shown in Table 3-2.

FIGURE 3-1: Power Bridge Control (PHASE = H/Forward).

TABLE 3-1: CURRENT DIRECTION CONTROL

PHASE	Output Current
L	Current flows from OUTxB to OUTxA
H	Current flows from OUTxA to OUTxB

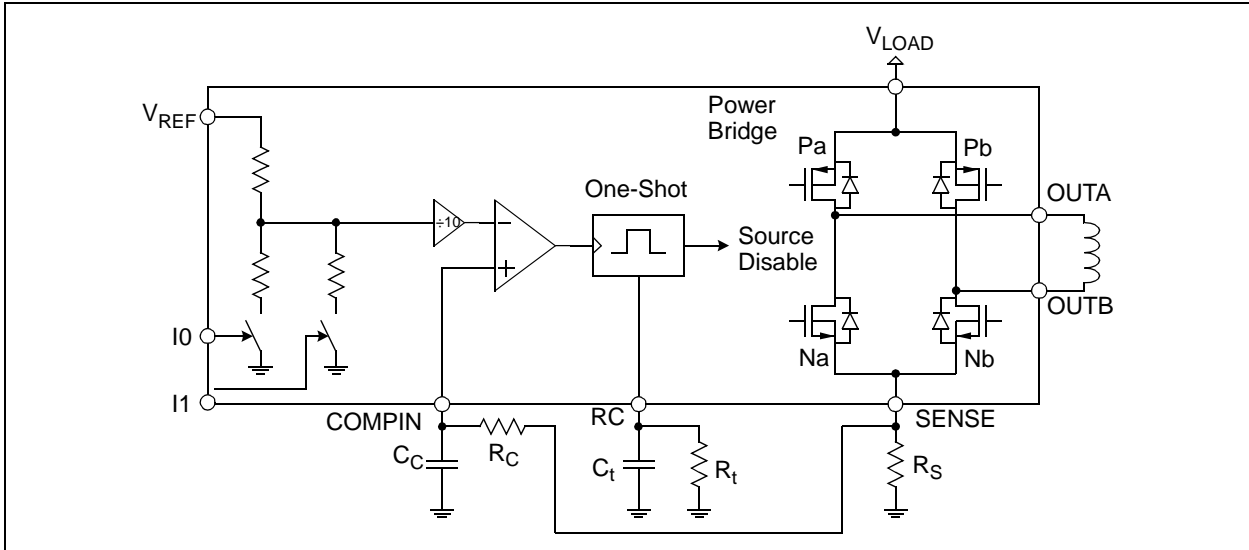

TABLE 3-2: POWER BRIDGE GATE CONTROL TRUTH TABLE

I0I1	PHASE	Overi	T <sub>OFF</sub>	Case/Mode	gna	gpa	gnb	gpb
00/01/10	1	0	0	Forward ON	L	<b>L</b>	<b>H</b>	H
00/01/10	1	x	1	Forward OFF	L	H	<b>H</b>	H
00/01/10	0	0	0	Reverse ON	<b>H</b>	H	L	<b>L</b>
00/01/10	0	x	1	Reverse OFF	<b>H</b>	H	L	H
11	x	x	x	No Current/ Coasting	L	H	L	H

**Legend:** Bold = Active MOS Transistors, Overi = Overcurrent flag, T<sub>OFF</sub> = Channel T<sub>OFF</sub> State Flag

## 3.2 PWM Current Control

The current level in each motor winding is controlled by a PWM circuit with a fixed  $T_{OFF}$  time. The load current flowing in the winding is sensed through an external sensing resistor  $R_S$  connected between the power bridge's source pin SENSE (sources of transistors Na and Nb) and GND.

**FIGURE 3-2:** PWM Current Control Circuit Principle (Channel 1 Shown).

The voltage across  $R_S$  is compared to a fraction of the reference voltage  $V_{REF}$ , chosen with the logic input bits I0 and I1 (Table 3-3). The power bridge, and thus the load current, can also be switched off completely when both logic inputs are high. Note that any logic input left unconnected will be treated as a high level (pull-up resistor).

The maximum trip current for regulation, given for I0 I1 = 0 is calculated in Equation 3-1.

**EQUATION 3-1:**

$$I_{MAX} = \frac{V_{REF}}{10 \times R_S}$$

**TABLE 3-3: CURRENT LEVEL CONTROL TRUTH TABLE**

I0	I1	Comp. Trip Voltage	Output Current
0	0	$V_{TRIP} = 1/10 \times V_{REF}$	$I_{MAX} = V_{REF}/10R_S$
1	0	$V_{TRIP} = 1/15 \times V_{REF}$	$2/3 \times I_{MAX} = V_{REF}/15R_S$
0	1	$V_{TRIP} = 1/30 \times V_{REF}$	$1/3 \times I_{MAX} = V_{REF}/30R_S$
1	1	x	0 (no current)

# MTS2916A

When the maximum allowed current is reached, the bridge source is turned off during a fixed period  $T_{OFF}$  (typically  $50 \mu s$ ) given by a non-retriggerable pulse generator and the external timing components  $R_t$  (20k-100 k $\Omega$  range) and  $C_t$  (100 pF-1000 pF range):

## EQUATION 3-2:

$$T_{OFF} = 1.1 \times (R_t \times C_t)$$

During  $T_{OFF}$ , the winding current decreases. When the driver is re-enabled, the winding current increases again until it reaches the threshold, and the cycle repeats itself, maintaining the load current at the desired level.

**FIGURE 3-3:** PWM Output Current Waveform.

## 3.3 Circuit Protection

A thermal protection circuitry turns off all drivers when the junction temperature exceeds a safe operating limit of  $+170^\circ C$  (typical). This protects the devices from failure due to excessive heating. Despite this thermal protection, output short circuits are not permitted. The output drivers are re-enabled once junction temperature has dropped below  $+145^\circ C$  (typical).

**FIGURE 3-4:** Thermal Shutdown Output vs. Temperature Showing Hysteresis.

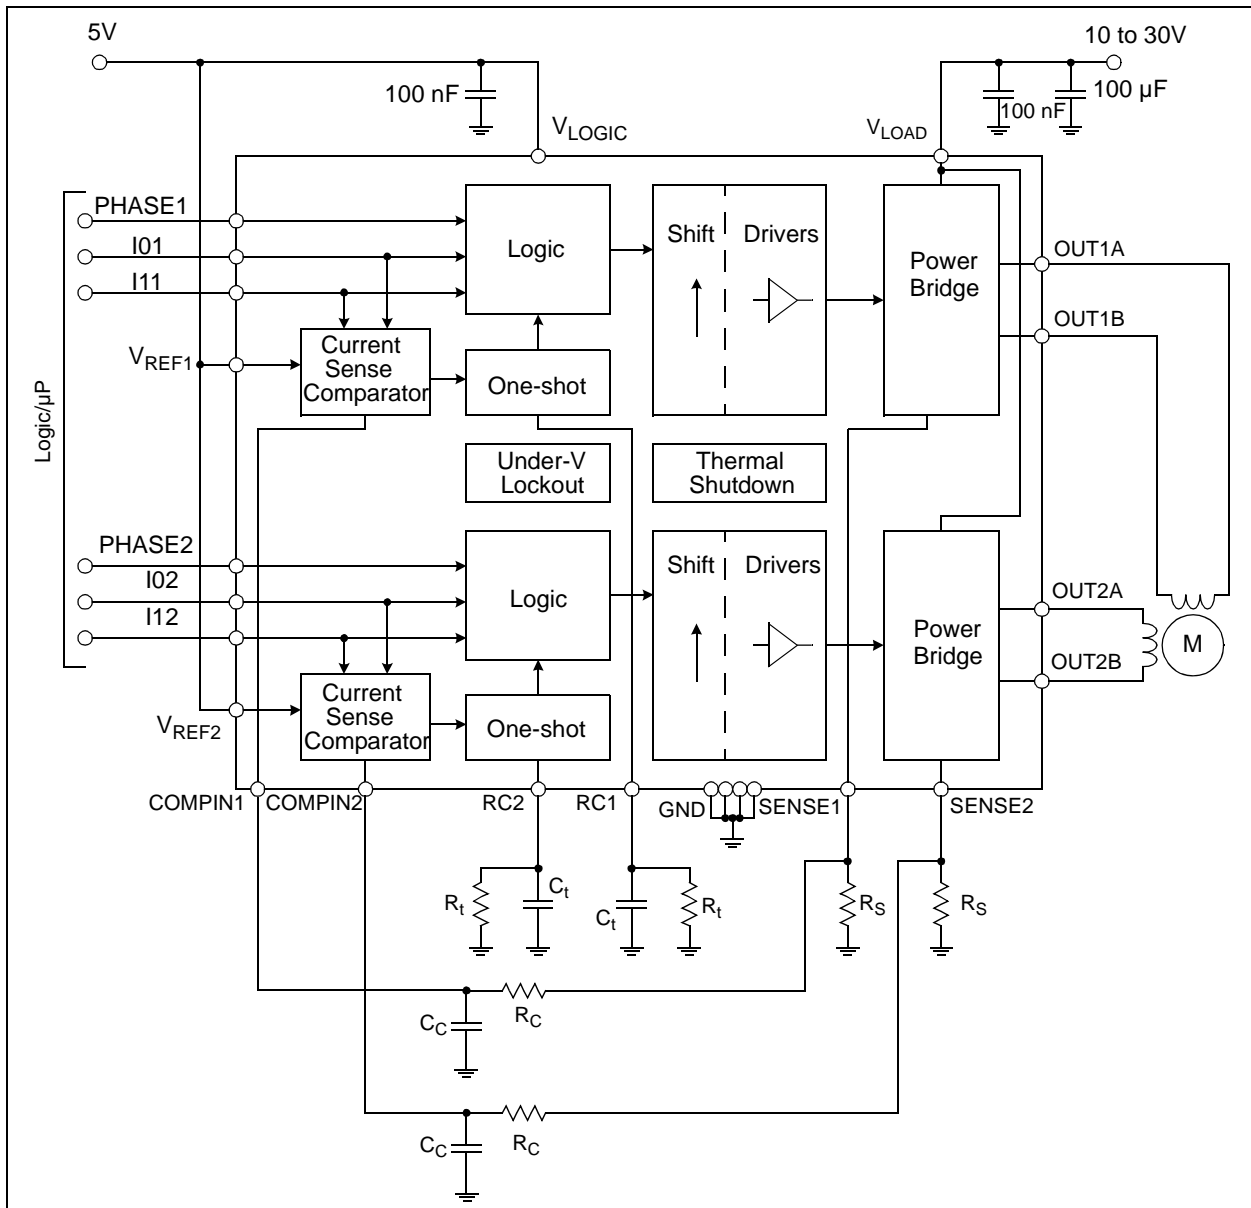

An undervoltage lockout circuit protects the MTS2916A from potential shoot-through currents when the load supply voltage is applied prior to the logic supply voltage. The power bridge and all outputs are disabled if  $V_{LOGIC}$  is smaller than 4V.

With this protection feature, the circuit will withstand any order of turn-on or turn-off of the supply voltages  $V_{LOGIC}$  and  $V_{LOAD}$ . Normal  $dV/dt$  values are assumed.

## 4.0 APPLICATION CIRCUITS AND ISSUES

### 4.1 Typical Application

The MTS2916A circuit, with external components for a typical application, is shown in Figure 4-1. Typical passive component values are:  $R_S = 1\Omega$ ,  $R_C = 1\text{ k}\Omega$ ,  $C_C = 820\text{ pF}$ ,  $R_t = 56\text{ k}\Omega$  and  $C_t = 820\text{ pF}$ .

**FIGURE 4-1:** Typical Application Circuit.

During PWM operation, when the output stage is turned on, large voltage peaks may appear across  $R_S$ , which can wrongly trigger the input comparator. To avoid an unstable current control, an external  $R_C C_C$

filter should be used that delays the comparator action. Depending on load type, many applications will not require this filter (SENSE connected to COMPIN).

# MTS2916A

## 4.2 Stepping Examples

The MTS2916A control modes are full-step, half-step, modified half-step and microstepping control of the motor, as shown in Figure 4-2.

**FIGURE 4-2:** Examples of Stepping Modes Achievable with Typical Application Circuit.

## 4.3 PCB Design Guidelines

Unused inputs should be connected to fixed voltage levels in order to get the highest noise immunity. Typical PCB layout guidelines for power applications should be followed. These include separate power ground planes, supply decoupling capacitors close to the IC, short connections and use of maximized copper areas to improve thermal dissipation.

## 5.0 PACKAGING INFORMATION

### 5.1 Package Marking Information

24-Lead SOP

Example

<b>Legend:</b>	XX...X	Customer-specific information
	Y	Year code (last digit of calendar year)
	YY	Year code (last 2 digits of calendar year)
	WW	Week code (week of January 1 is week '01')
	NNN	Alphanumeric traceability code
	(e3)	Pb-free JEDEC designator for Matte Tin (Sn)
	*	This package is Pb-free. The Pb-free JEDEC designator (e3) can be found on the outer packaging for this package.

**Note:** In the event the full Microchip part number cannot be marked on one line, it will be carried over to the next line, thus limiting the number of available characters for customer-specific information.

# MTS2916A

## SOP 24L Package Outline

**Note:** For the most current package drawings, please see the Microchip Packaging Specification located at <http://www.microchip.com/packaging>.

**Note:** The package drawing dimensions are expressed in inches.

Symbol	Minimum	Typical	Maximum	Unit
A	—	—	2.642 (0.104)	mm (inch)
A1	0.102 (0.004)	—	—	mm (inch)
D	15.545 (0.612)	15.697 (0.618)	15.850 (0.624)	mm (inch)
E	7.417 (0.292)	7.518 (0.296)	7.595 (0.299)	mm (inch)
H	10.287 (0.405)	10.464 (0.412)	10.643 (0.419)	mm (inch)
L	0.533 (0.021)	0.787 (0.031)	1.041 (0.041)	mm (inch)
J	0	4	8	°

**Note 1:** JEDEC outline: M0-119 AA

- Dimensions "D" does not include mold flash, protrusions or gate burrs. Mold flash, protrusions and gate burrs should not exceed 0.25mm (0.010inch) per side.
- Dimensions "E" does not include inter-lead flash, or protrusions. Inter-lead flash and protrusions shall not exceed 0.25mm (0.010 inch) per side.

## APPENDIX A: REVISION HISTORY

### Revision C (March 2013)

The following is the list of modifications:

1. Corrected one dimension in the package drawing. Added a note mentioning the unit type used in the drawing.
2. Minor editorial changes.

### Revision B (December 2012)

The following is the list of modifications:

1. Updated Operating Temperature Range throughout the document.
2. Corrected [Typical Application](#) diagram.
3. Added [Section 5.1, Package Marking Information](#).
4. Added [Product Identification System](#) section.

### Revision A (September 2010)

- Original Release of this Document.

NOTES:

---

**Note the following details of the code protection feature on Microchip devices:**

- Microchip products meet the specification contained in their particular Microchip Data Sheet.
- Microchip believes that its family of products is one of the most secure families of its kind on the market today, when used in the intended manner and under normal conditions.
- There are dishonest and possibly illegal methods used to breach the code protection feature. All of these methods, to our knowledge, require using the Microchip products in a manner outside the operating specifications contained in Microchip's Data Sheets. Most likely, the person doing so is engaged in theft of intellectual property.
- Microchip is willing to work with the customer who is concerned about the integrity of their code.
- Neither Microchip nor any other semiconductor manufacturer can guarantee the security of their code. Code protection does not mean that we are guaranteeing the product as “unbreakable.”

Code protection is constantly evolving. We at Microchip are committed to continuously improving the code protection features of our products. Attempts to break Microchip's code protection feature may be a violation of the Digital Millennium Copyright Act. If such acts allow unauthorized access to your software or other copyrighted work, you may have a right to sue for relief under that Act.
